I wish to OBJECT to the above application

The National Waste Policy Action Plan 2019 included targets and actions to implement which include: *Australia working towards **reducing the total waste generated in Australia by 10% per person by 2030**. Achieving an 80% average recovery rate, from all waste streams by 2030. Significantly increasing the use of recycled content by Governments and industry and phasing out problematic and unnecessary plastics by 2025.* <https://www.dcceew.gov.au> So with all this in mind and 2030 being only 8 years away why would a waste incinerator even be necessary? What would need to go into the incinerator if the plan is to reduce our waste? Supermarkets and retailers are also aiming to reduce the amount of waste they produce which would have a flow on effect to the population, thus you would think rendering an incinerator unnecessary? Surely there are better options and alternatives than this?

Wouldn't it be better and safer for the environment to reduce, reuse and recycle as opposed to burning?

I have not made a reportable political donation.

I acknowledge and accept the Department's disclaimer and declaration.

Regards
Jessica Lopez
