

International Power

Parkes Peaking Power Plant Environmental Assessment

Volume 1 • **MAIN REPORT** • November 2007

URS

Statement of Validity

Submission of Environmental Assessment

Prepared under Part 3A of the *Environmental Planning and Assessment Act 1979*

Environmental Assessment prepared by

Name Chris Jack

Qualifications B Science (Hons),
Dip Env. Studies
M. Env. Planning

Principal Environmental Scientist

Address URS Australia Pty Ltd
Level 3
116 Miller Street NORTH SYDNEY NSW 2060

In respect of

Applicant & Land Details

Applicant International Power (Australia) Pty Ltd
L37 Rialto North Tower
525 Collins Street
Melbourne VIC 3000

Subject Site Parkes, NSW

Land to be developed

Lot & DP Development Site Lot 1 DP 602329

Gas Pipeline Goldrush Road Reserve; Lot 344 DP 750152; Lot 1 DP 1015719; Lot 173 DP 750152; Lot 760 DP 750152; Lot 760 DP 750152; Lots 759, 758 DP 750152; Lots 765, 764, 763, 762, 500 DP 750152; Lot 500 DP 750152; Lot 2 DP 808701; Lot 502 DP 808701; Lot 1 DP 877903; Lot 1 DP 877903; Lot 409 DP 750152; and DP 1059946 PT 7044.

Project Summary Construction and operation of a gas-fired peaking power station and associated gas pipeline infrastructure.

Environmental Assessment

An Environmental Assessment is attached.

Declaration

I certify that I have prepared the contents of the Environmental Assessment in accordance with the requirements of the *Environmental Planning and Assessment Act 1979* and Regulation and that, to the best of my knowledge, the information contained in this report is not false or misleading.

Notes on Text

As a determination of the project will only be made after the Environmental Assessment has been on public display and submissions considered, the future conditional tense is used throughout this Environmental Assessment when describing the project, alternatives and assessing impacts. “Would” is, therefore, used throughout the text in preference to “will”.

If all approvals are given for the project to proceed, all “would” references should be interpreted as “will”, subject to final conditions of consent.

Acknowledgements

The study team wishes to thank members of the public who greatly contributed to the preparation of this Environmental Assessment as well as the individuals, organisations and government bodies who generously provided their assistance.

Yr	Year

Glossary

Aboriginal archaeological site (Aboriginal site)	A place where physical remains or modification of the natural environment indicate past and 'traditional' activities by Aboriginal people. Site types include artefact scatters, isolated artefacts, burials, shell middens, scarred trees, quarries and contact sites.
acid sulphate soils (ASS)	Soils containing pyrite which produces sulphuric acid when exposed to oxygen.
ambient	Surrounding environment.
aquifer	Rock formation containing water in recoverable quantities.
background scatter	Aboriginal artefacts that cannot be usefully related to a place or focus of past activity.
biodiversity	First coined in 1988 as a contraction of biological diversity; diversity traditionally referring to species richness and species abundance. Biodiversity has been defined subsequently as encompassing biological variety at genetic, species and ecosystem scales (DASETT 1992). The maintenance of biodiversity, at all levels, is acknowledged internationally as a high conservation priority, and is protected by the International Convention on Biological Diversity 1992.
bunds	An earthwork or wall to contain and control spillages, normally associated with tank farms, fuelling and chemical storage facilities.
Construction Environmental Management Plan	An element of an Environmental Management Plan that addresses the control, training and monitoring measures to be implemented during the construction phase of a project in order to avoid, minimise or ameliorate potentially adverse impacts identified during environmental assessments.
conservation	The management of natural resources in a way that will benefit both present and future generations.
cumulative effect	Refers to the accumulation of effects over time.
dB(A)	The most common measurement of environmental noise – measured using a simple sound level meter having an A-weighting filter to simulate the subjective response of the human ear.
Ecologically Sustainable Development	Using, conserving and enhancing the community's resources so that ecological processes, on which life depends, are maintained and the total quality of life, now and in the future can be increased. ecosystem An interdependent system of interacting plants, animals and other organisms together with the non-living (physical and chemical) components of their surroundings.
effluent	The outflow of liquid e.g. from sewage or an industrial process.
emergency response	The reaction by emergency services such as Fire, Police, Ambulance, Industrial Fire Brigades, etc., to an emergency.
endangered species	Those plants and animal species likely to become extinct unless action is taken to remove or control the factors that threaten their survival.
environment	The physical, biological, cultural, economic and social characteristics of an area, region or site.

Glossary

Environmental Assessment	The orderly and systematic evaluation of a proposal, including alternatives and objectives, and its effects on the environment, including the mitigation and management of these effects.
environmental management	That part of the overall management system which includes organisational structure, planning activities, responsibilities, procedures, processes and resources for developing, implementing, achieving, reviewing and maintaining environmental policy. (Refer to related term Environmental Management System).
Environmental Management Plan	The control, training and monitoring measures to be implemented during the design, construction and operation phases of a project in order to avoid, minimise or ameliorate potentially adverse impacts identified during environmental (being socio-economic, cultural, physical, biological) assessments. Prepared within the framework of Defence policies, objectives, strategies and actions.
Environmental Management System	The concept and major components of an Environmental Management System (EMS) are set out in the Australian/New Zealand Standard (AS/NZS) ISO 14001. An EMS has several key components as set out below: organisational commitment, corporate environmental policy, environmental aspects register, objectives and performance indicators, environmental management program documentation (often called an Environmental Management Plan or EMP), operational and emergency procedures, responsibility and reporting structure, training and awareness program, environmental impact, regulatory and legal compliance, and environmental performance review audits performance monitoring and measurement.
fauna	Animals.
fire fence	A gap in vegetation or fuels which prevents or hinders the spread of fire.
flora	Plants.
floristic composition	The plant species present in a particular community, sub-community or site.
free ammonia	The toxic fraction of ammonia (NH ₃) that is undissociated and therefore available for uptake by organisms. The usual source of ammonia to waterways is domestic sewage and industrial effluents.
geotechnical	Relating to the form, arrangement and structure of the geology.
Greenhouse Gas	A gas which has an effect on the radioactive absorptivity of the earth's atmosphere and the atmosphere's temperature.
Greenhouse Effect	Predicted global climatic change (e.g. global warming) associated with build up of certain gases (such as water vapour, carbon dioxide, methane, chlorofluorocarbons, ozone, nitrous oxide, etc.) within the atmospheric environment of the earth. These are known as Greenhouse Gases.
Greenhouse gas intensity	the amount of greenhouse gases per unit of energy produced from a power station (eg in units of kg CO ₂ -e/MWh).

Glossary

groundwater	Subsurface water contained within the saturated zone.
heritage (cultural heritage)	A term which encompasses Aboriginal and post-contact archaeological sites and material remains (cultural resources).
higher heating value	The heat content of fuel, measured in a bomb calorimeter when the products of combustion are cooled to the initial temperature and all of the water vapour formed during combustion is condensed to liquid. This gives the gross, or higher heat content of the fuel, which includes in the reported value the heat of vaporisation of the water produced from combustion of hydrogen atoms in the fuel. The lower heating value excludes the heat of vaporisation of the water produced from combustion of hydrogen atoms in the fuel.
Hydrocarbons	A class or compounds containing only carbon and hydrogen in various structures. Both naturally occurring and from anthropogenic sources.
Hydrology	Surface water and groundwater and their interaction with earth materials.
Hydrogeology	The study of subsurface water in its geological context.
INTANAL	Specialist traffic model for intersection analysis.
Invertebrate	An animal without a backbone.
Isolated find	Single stone artefact, not located within a rock shelter which occurs without any associated evidence of Aboriginal occupation within a radius of 60 m.
LA1	The noise level exceeded for 1% of the 15 minute interval.
LA10	The noise level exceeded for 10% of the 15 minute interval. This is commonly referred to as the average maximum noise level.
LA90	The noise level exceeded for 90% of the 15 minute interval. This is commonly referred to as the average background noise level.
LAeq	The energy averaged noise level over the 15 minute interval.
Leq	The equivalent continuous sound level in dB(A); that is, the constant sound level which has the same acoustic energy as the original fluctuating noise for the same period of time.
Level of Service	A description of the operating performance of a road or intersection as defined in Austroads 'Guide to Traffic Engineering Practice, Pt 2 – Road Capacity.'
Lithologies	Rock types.
Lower heating value	The heat content of fuel, measured in a bomb calorimeter when the products of combustion are cooled to the initial temperature and all of the water vapour formed during combustion is condensed to liquid. The lower heating value excludes the heat of vaporisation of the water produced from combustion of hydrogen atoms in the fuel.
mean	The sum of n values divided by n.
median	The middle value of a set of values.
middens	Evidence of Aboriginal occupation of an area.

Glossary

Monitoring	The checking of impacts of a proposal or an existing activity in order to improve or evaluate environmental management practices. To check the efficiency and effectiveness of the environmental impact assessment process. To determine if the requirements of environmental legislation and associated regulations are being met.
native vegetation	A broad term for vegetation comprised of plant species which occur naturally in Australia (but which are not necessarily indigenous).
natural gas	Combustible gas formed naturally in the earth.
Organochlorines	A group of organic chemicals used in pesticides. Most organochlorine pesticides have low water-solubility, but high chemical and biological stability. They are fat soluble and tend to accumulate in the fat tissue of organisms.
Operation Environmental Management Plan	An element of an Environmental Management Plan that addresses the control, training and monitoring measures to be implemented during the construction phase of a project in order to avoid, minimise or ameliorate potentially adverse impacts identified during environmental assessments.
Ozone	A form of oxygen having three atoms to the molecule. Ozone is a powerful oxidising agent.
Particulate	Small particles, usually in suspension.
Petroleum hydrocarbons [total petroleum hydrocarbons (TPH)]	A class of organic compounds arising from unburnt fuel sources.
Piles	Type of foundation using columns of concrete, steel or timber.
Plume	Area of impact extending from a source.
Polycyclic aromatic hydrocarbons (PAH)	A class of organic chemicals, PAHs are formed by incomplete combustion or organic material, diagenesis (during or throughout generation) and biosynthesis. PAHs are naturally occurring, however, a significant proportion are the result of anthropogenic combustion.
potable water	Water suitable for drinking.
potential acid sulphate soil (PASS)	Soil material which is waterlogged and contains oxidisable sulphur compounds, usually iron sulphide (pyrite) that has a field pH of 4 or more (1:5 soil:water).
Register of the National Estate	A list of the National Estate developed under the provisions of the Commonwealth's Australian Heritage Commission Act 1975.
risk	Likelihood of a specific undesirable event occurring within a specified period or in specified circumstances. Listed as a frequency or probability.
risk assessment	A process used to determine whether people and the environment are at risk (e.g. health and safety) from exposure to hazardous substances used or produced (mainly in an industrial or work place) so that appropriate control measures or management practices can be introduced to prevent or minimise the risk.
security fence	A fence designed to prevent unlawful intrusion to a prohibited area.
sediment/detention pond	Artificial earthen depression to retain water runoff for a period of time so as to control high intensity runoff.

Glossary

sustainable use	Use of organism, ecosystem or their renewable resource at a rate within its capacity for renewal.
terrestrial	Of or pertaining to the land as distinct from the water.
thermal efficiency	The proportion of energy converted from the fuel to electricity in the generation process is an indication of CO ₂ emissions.
total aromatic hydrocarbons	A class of organic chemicals which contain an aromatic ring (e.g. benzene, anthracene, naphthalene and their derivatives). Used in chemical and pharmaceutical industries.
total organic carbon (TOC)	The amount of carbon in the organic form contained in a sample, measured as a percentage.
total suspended solids (TSS)	Total load of particulates in water, measured in mg/L.
turbidity	Liquid's ability to intercept light. Measured in nephelometric turbidity units (NTU). Cannot be consistently correlated with the concentration of suspended matter.
visibility	Measure of extent to which particular components of a development may be visible from surrounding areas.
visual absorption capacity	An estimation of the capacity of the landscape to absorb development without creating a significant change in visual character or producing a reduction in scenic quality.
volatiles	Any chemical compound which will evaporate quickly due to its low boiling point.
vulnerable species	Those that may soon become endangered unless action is taken.
waders	Synonymous with shorebirds.
weed	Naturalised, non-indigenous plant species which may be noxious weeds (or agriculture), environmental weeds or any other generally undesirable introduced species.
wetlands	Areas largely inundated with water, yet offering elevated land as a habitat for wildlife, notably waterfowl. Can be landlocked.
wind climate	A description of the meteorological conditions created by the wind involving measurements of wind speed, direction and frequency of gusts for average, seasonal and annual conditions.
