FAÇADE - INSTALLATION DETAILS

The linear cold cathode will be located discreetly to ensure that a pleasing visual result is maintained for views from the interior of the building to the outside. A co-ordinated approach to the detail of the gill and the location of associated control gear will be essential to achieve a high quality of finish and aesthetic. The cold cathode will be located such that the majority of the light grazes the façade and does not provide a distracting source of light to people inside the facility.
