Department of Planning, Housing and Infrastructure Locked Bag 5022 PARRAMATTA NSW 2124

Attention: Ms Megan Ramsdale

#### Dear Ms Ramsdale

Re: Request for Input to Planning Secretary's Environmental Assessment Requirements – Environmental Impact Statement – Gara Battery Energy Storage System Project (SSD-71680710)

Thank you for the notification in the planning portal on 6 June 2024 inviting input to the preparation of Secretary's Environmental Assessment Requirements (SEARs) for the Gara Battery Energy Storage System project Environmental Impact Statement (EIS) from the Biodiversity, Conservation and Science Group (BCS) of the Department of Climate Change, Energy, the Environment and Water. I appreciate the opportunity to provide advice.

We note the project will be assessed as State Significant Development in accordance with Part 4 Division 4.7 of the *Environmental Planning and Assessment Act 1979* (EP&A Act). The environmental assessment requirements (EARs) provided by BCS for the EIS are limited to biodiversity and flooding.

BCS anticipates the EIS will be sufficiently comprehensive to enable unambiguous determination of the extent of the direct and indirect impact(s) of the project, particularly on threatened species known to occur in the locality, including:

- narrow-leaved black peppermint (Eucalyptus nicholii)
- bluegrass (Dichanthium setosum)
- little eagle (Hieroaetus morphnoides)
- koala (Phascolarctos cinereus).

Target survey for these species in accordance with relevant survey guidelines undertaken early in the assessment process can enable the proponent to design the proposal so it maximises avoiding impacts to these species.

The subject land may contain plant community types representative of state and/or commonwealth listed endangered ecological communities (EECs) or critically endangered ecological communities (CEECs), noting that CEECs are Serious and Irreversible Impact entities under the Biodiversity Assessment Method (BAM) 2020.

We expect the EIS will map the extent of any woodland EECs or CEECs in accordance with the BCS North East Branch Principles set out in our project-specific environmental assessment requirements (EARs). Early and accurate identification of the locations and condition of these

communities in the project area can enable the proponent to design the proposal so it maximises avoiding impacts to these communities.

Other than assessment of prescribed impacts, clearing of native vegetation on land that meets the definition of Category 1 Exempt Land, as defined under the *Local Land Services Act 2013*, does not require assessment or offsetting under the *Biodiversity Conservation Act 2016*.

The applicant will need to confirm the location and extent of Category 1 Exempt Land within the subject land by undertaking site-based floristic assessment to verify the presence or absence of CEECs, critically endangered plants and threatened grasslands. BCS North East Branch guidance on land categorisation and the Native Vegetation Regulatory Map is provided in our project-specific EARs.

We consider this information is necessary to assess an EIS for the project.

The full list of our standard EARs that may need to be addressed in the EIS are provided in **Attachment A**. Our project-specific EARs that must be addressed in the EIS are provided in **Attachment B**. In preparing the EIS, the proponent can refer to the relevant guidance material listed in **Attachment C**.

If you have any further questions about this issue, please contact Mr Don Owner, Senior Conservation Planning Officer North East, BCS, on 6659 8239 or at don.owner@environment.nsw.gov.au.

Yours sincerely

GABRIELLE PIETRINI Director North East

**Biodiversity, Conservation and Science** 

19 June 2024

Enclosures:

Attachment A – DCCEEW BCS Standard EARs (SSD-71680710)

Attachment B – DCCEEW BCS Project-specific EARs (SSD-71680710)

Attachment C - EIS Guidance Material (SSD-71680710)

# Attachment A – DCCEEW Biodiversity, Conservation and Science Group (BCS) Standard Environmental Assessment Requirements (EARs) (SSD-71680710)

## **Biodiversity**

- 1. The EIS must assess biodiversity impacts related to the project in accordance with <u>Section 7.9 of the Biodiversity Conservation Act 2017</u> using the <u>Biodiversity Assessment Method (BAM)</u> and must document this assessment in a <u>Biodiversity Development Assessment Report (BDAR)</u>. The BDAR must include information in the form detailed in the *Biodiversity Conservation Act 2016* (s6.12), *Biodiversity Conservation Regulation 2017* (s6.8) and the BAM, unless BCS and the Department of Planning, Housing and Infrastructure determine that the project is not likely to have any significant impacts on biodiversity values.
- 2. The BDAR must document the application of the avoid, minimise and offset framework including assessing all direct, indirect and prescribed impacts in accordance with the BAM.
- 3. The BDAR must include details of the measures proposed to address the offset obligation as follows:
  - The total number and classes of biodiversity credits required to be retired for the project;
  - The number and classes of like-for-like biodiversity credits proposed to be retired;
  - The number and classes of biodiversity credits proposed to be retired in accordance with the variation rules:
  - Any proposal to fund a <u>biodiversity conservation action</u>;
  - Any proposal to conduct ecological rehabilitation (if a mining project);
  - Any proposal to make a payment to the Biodiversity Conservation Fund.

If seeking approval to use the variation rules, the BDAR must contain details of the <u>reasonable steps</u> that have been taken to obtain requisite like-for-like biodiversity credits.

- 4. The BDAR must be submitted with all spatial data associated with the survey and assessment as per Appendix 11 of the BAM.
- 5. The BDAR must be prepared by a person accredited in accordance with the Accreditation Scheme for the Application of the Biodiversity Assessment Method Order 2017 under s6.10 of the *Biodiversity Conservation Act 2016*.

#### Water and soils

- 6. The EIS must map the following features relevant to water and soils including:
  - a. Rivers, streams, wetlands, estuaries (as described in s4.2 of the BAM).
  - b. Wetlands as described in s4.2 of the BAM.
  - c. Groundwater.
  - d. Groundwater dependent ecosystems.
  - e. Proposed intake and discharge locations.
- 7. The EIS must describe background conditions for any water resource likely to be affected by the project, including:
  - a. Existing surface and groundwater.
  - b. Hydrology, including volume, frequency and quality of discharges at proposed intake and discharge locations.

- c. Water Quality Objectives (as endorsed by the NSW Government <a href="http://www.environment.nsw.gov.au/ieo/index.htm">http://www.environment.nsw.gov.au/ieo/index.htm</a>) including groundwater as appropriate that represent the community's uses and values for the receiving waters.
- d. Indicators and trigger values/criteria for the environmental values identified at (c) in accordance with the <u>ANZECC (2000) Guidelines for Fresh and Marine Water Quality</u> and/or local objectives, criteria or targets endorsed by the NSW Government.
- e. Risk-based Framework for Considering Waterway Health Outcomes in Strategic Land-use Planning Decisions <a href="http://www.environment.nsw.gov.au/research-and-publications/publications-search/risk-based-framework-for-considering-waterway-health-outcomes-in-strategic-land-use-planning">http://www.environment.nsw.gov.au/research-and-publications-search/risk-based-framework-for-considering-waterway-health-outcomes-in-strategic-land-use-planning</a>
- 8. The EIS must assess the impacts of the project on water quality, including:
  - a. The nature and degree of impact on receiving waters for both surface and groundwater, demonstrating how the project protects the Water Quality Objectives where they are currently being achieved, and contributes towards achievement of the Water Quality Objectives over time where they are currently not being achieved. This should include an assessment of the mitigating effects of proposed stormwater and wastewater management during and after construction.
  - b. Identification of proposed monitoring of water quality.
  - Consistency with any relevant certified Coastal Management Program (or Coastal Zone Management Plan)
- 9. The EIS must assess the impact of the project on hydrology, including:
  - a. Water balance including quantity, quality and source.
  - b. Effects to downstream rivers, wetlands, estuaries, marine waters and floodplain areas.
  - c. Effects to downstream water-dependent fauna and flora including groundwater dependent ecosystems.
  - d. Impacts to natural processes and functions within rivers, wetlands, estuaries and floodplains that affect river system and landscape health such as nutrient flow, aquatic connectivity and access to habitat for spawning and refuge (e.g. river benches).
  - e. Changes to environmental water availability, both regulated/licensed and unregulated/rules-based sources of such water.
  - f. Mitigating effects of proposed stormwater and wastewater management during and after construction on hydrological attributes such as volumes, flow rates, management methods and re-use options.
  - g. Identification of proposed monitoring of hydrological attributes.

## **Flooding**

- 10. The EIS must map the following features relevant to flooding as described in the Floodplain Development Manual 2005 (NSW Government 2005) including:
  - a. Flood prone land.
  - b. Flood planning area, the area below the flood planning level.
  - c. Hydraulic categorisation (floodways and flood storage areas).
  - d. Flood hazard

- 11. The EIS must describe flood assessment and modelling undertaken in determining the project's design flood levels for events, including a minimum of the 5% Annual Exceedance Probability (AEP), 1% AEP, flood levels and the probable maximum flood, or an equivalent extreme event.
- 12. The EIS must model the effect of the project (including fill) on the current flood behaviour for a range of design events as identified in 11 above including the 0.5% and 0.2% AEP year flood events as proxies for assessing sensitivity to an increase in rainfall intensity of flood producing rainfall events due to climate change.
- 13. Modelling in the EIS must consider and document:
  - a. Existing council flood studies in the area and examine consistency to the flood behaviour documented in these studies.
  - b. The impact on existing flood behaviour for a full range of flood events including up to the probable maximum flood, or an equivalent extreme flood.
  - c. Impacts of the project on flood behaviour resulting in detrimental changes in potential flood affection of other developments or land. This may include redirection of flow, flow velocities, flood levels, hazard categories and hydraulic categories.
  - d. Relevant provisions of the NSW Floodplain Development Manual 2005.
- 14. The EIS must assess the impacts of the project on flood behaviour, including:
  - a. Whether there will be detrimental increases in the potential flood affectation of other properties, assets, and infrastructure.
  - b. Consistency with Council floodplain risk management plans.
  - c. Consistency with any Rural Floodplain Management Plans.
  - d. Compatibility with the flood hazard of the land.
  - e. Compatibility with the hydraulic functions of flow conveyance in floodways and storage in flood storage areas of the land.
  - f. Whether there will be adverse effect to beneficial inundation of the floodplain environment, on, adjacent to or downstream of the site.
  - g. Whether there will be direct or indirect increase in erosion, siltation, destruction of riparian vegetation or a reduction in the stability of river banks or watercourses.
  - h. Any impacts the project may have upon existing community emergency management arrangements for flooding. These matters are to be discussed with the NSW SES and Council.
  - i. Whether the project incorporates specific measures to manage risk to life from flood. These matters are to be discussed with the NSW SES and Council.
  - j. Emergency management, evacuation and access, and contingency measures for the project considering the full range of flood risk (based upon the probable maximum flood or an equivalent extreme flood event). These matters are to be discussed with and have the support of Council and the NSW SES.
  - k. Any impacts the project may have on the social and economic costs to the community as consequence of flooding.

## **Biodiversity**

# Principles for Mapping the Extent of Woodland Critically Endangered and Endangered Ecological Communities

#### Introduction

The NSW Threatened Species Scientific Committee's final determinations for woodland endangered ecological communities (EECs) must be considered when preparing vegetation maps for impact assessments. The determination for White Box – Yellow Box – Blakely's Red Gum Grassy Woodland and Derived Native Grassland states it covers all occurrences of this ecological community independent of their condition and the determination for Ribbon Gum - Mountain Gum - Snow Gum Grassy Forest/Woodland describes the ecological community in several condition states. Hence, vegetation mapping must ensure that all condition states referenced in these determinations are mapped appropriately.

The Biodiversity, Conservation and Science Group (BCS) North East Branch has prepared these guidelines to assist proponents and their consultant ecologists with identifying, describing, and mapping the extent of these EECs in accordance with those final determinations.

## Underpinning Considerations from Hnatiuk et al. (2009) (see Tables 6 and 7 below)

- 1. Open Forest has crowns touching or slightly separated up to 0.25 crown widths apart.
- 2. Woodland has crowns clearly separated up to one crown width apart.
- 3. Open Woodland has crowns well separated up to 20 crown widths apart.

Emergents

4. Isolated trees - more than 20 crown widths apart.

# Principles for Mapping the Extent of White Box – Yellow Box – Blakely's Red Gum Grassy Woodland and Derived Native Grassland Critically Endangered Ecological Community (CEEC)

- based on NSW Scientific Committee Final Determination
- can be a woodland, open woodland or derived native grassland
- open woodland tree crown separation is based on the definition of scattered trees in Appendix B of the Biodiversity Assessment Method 2020 (i.e. scattered trees are more than 50 metres apart)
- 1. Woodland Form (trees up to one average crown width apart)
  - a. For areas with tree crowns up to one average crown width apart, map all the following as CEEC the outer edges of tree crowns up to one average crown width apart (including those of regenerating canopy trees) plus a buffer with a width of one average crown width from the outer edges of those tree crowns, noting that there can be exotic or native understorey and/or groundcover, or bare earth, within each mapped polygon.
  - b. For areas with tree crowns more than one average crown width apart, follow the open woodland form procedures in 2 below.
- 2. Open Woodland Form (trees more than one average crown width apart and up to 50 metres apart)
  - a. For areas with tree crowns more than one average crown width apart and up to 50 metres apart, map all the following as CEEC - the outer edges of tree crowns more than one average crown width apart and up to 50 metres apart (including those of regenerating canopy trees) plus a buffer with a width of 50 metres from the outer edges of those tree crowns, noting that there can be exotic or native understorey and/or groundcover, or bare earth, within each mapped polygon.
  - b. For areas with tree crowns more than 50 metres apart, map all the following as CEEC the outer edges of each tree crown more than 50 metres apart, including those of regenerating canopy trees.

## 3. Treeless Form

a. For areas beyond the buffers in 1a and 2a above, or beyond the tree crowns in 2b above, or areas with no canopy trees or regenerating canopy trees, map all the following as CEEC - areas of understorey and/or groundcover containing native species.

# Principles for Mapping the Extent of Ribbon Gum - Mountain Gum - Snow Gum Grassy Forest/Woodland Endangered Ecological Community (EEC)

- based on NSW Scientific Committee Final Determination
- can be an open forest, woodland or derived native grassland
- woodland tree average crown separation is used to define scattered trees (i.e. scattered trees are more than one average crown width apart)
- 1. Open Forest Form (trees up to 0.25 average crown widths apart)
  - a. For areas with tree crowns up to 0.25 average crown widths apart, map all the following as EEC the outer edges of tree crowns up to 0.25 average crown widths apart (including those of regenerating canopy trees) plus a buffer with a width of 0.25 average crown widths to the outer edges of those tree crowns, noting there can be exotic or native understorey and/or groundcover, or bare earth, within each mapped polygon.
  - b. For areas with tree crowns more than 0.25 average crown widths apart, follow the woodland form procedures in 2 below.

- 2. Woodland Form (trees more than 0.25 average crown widths apart and up to one average crown width apart)
  - a. For areas with tree crowns more than 0.25 average crown widths apart and up to one average crown width apart, map all of the following as EEC the outer edges of tree crowns more than 0.25 average crown widths apart and up to one average crown width apart (including those of regenerating canopy trees) plus a buffer with a width of one average crown width to the outer edges of those tree crowns, noting there can be exotic or native understorey and/or groundcover, or bare earth, within each mapped polygon.
  - b. For areas with tree crowns more than one average crown width apart, map all the following as EEC the outer edges of each tree crown more than one average crown width apart, including those of regenerating canopy trees.

#### 3. Treeless Form

a. For areas beyond the buffers in 1a and 2a above, or beyond the tree crowns in 2b above, or areas with no canopy trees or regenerating canopy trees, map all the following as EEC – areas of understorey and/or groundcover containing native species.

## BCS Guidance - Land Categorisation - Native Vegetation Regulatory Map

Clearing of native vegetation on land that meets the definition of Category 1 Exempt Land (as defined under the Local Land Services Act 2013 (LLS Act)) does
not require assessment or offsetting under the Biodiversity Conservation Act 2016,
however the following must still be considered:

- Prescribed impacts as outlined in chapter 6 of the Biodiversity Assessment Method (BAM) (2020). E.g. there are threatened fauna species whose habitat may include land which meets Category 1- Exempt criteria. Fauna survey on Category 1 land may be necessary to meet the requirements of the BAM.
- Potential impacts to Matters of National Environmental Significance under the Environment Protection and Biodiversity Conservation Act 1999 on Category 1 – exempt land.

Section 60F of the LLS Act provides the transitional arrangements that are in place until a comprehensive Native Vegetation Regulatory (NVR) Map is published. During the 'transitional period' assessors can make a reasonable approximation of land categorisation for unpublished layers, in consultation with the landholder.

Where a reasonable approximation is required, the Biodiversity, Conservation and Science Group (BCS) of the NSW Department of Climate Change, Energy, the Environment and Water recommends that assessors first identify whether land meets the criteria for Category 2 - Regulated Land, prior to Category 1 - Exempt Land, noting that: in some circumstances, land may meet multiple map criteria i.e. criteria for

Category 2 - Regulated Land, AND criteria for Category 1 - Exempt land
 In most circumstances' Category 2 - Regulated Land criteria will determine the categorisation of the land, rather than Category 1 - Exempt Land criteria.

For State Significant Development and State Significant Infrastructure proposals that affect rural land as defined under Part 5A of the LLS Act, a draft NVR Map is available from the Department upon request. This map as it relates to the development site must be requested from the Department's Data Broker (data.broker@environment.nsw.gov.au) during preparation of the Biodiversity Development Assessment Report (BDAR) and prior to the BDAR being submitted to the consent authority.

Where Category 2 – Regulated land is mapped as present on a development site, this will be identified on the draft map supplied by the Data Broker and is land where the BAM must be applied. However, there are some Category 2 criteria for which state-wide comprehensive mapping is not currently incorporated within the draft NVR map.

Where the draft map indicates that Category 1 – Exempt Land is present on a development site, early engagement with the Department's Biodiversity and Conservation Division (BCD) is encouraged. To confirm at the site scale whether the criteria for Category 1 – Exempt Land is met:

- Site-based floristic assessment is required to verify the presence or absence of critically endangered ecological communities (CEECs), critically endangered plants and threatened grasslands
- Review of any Environmental Planning and Assessment Act 1979 development consents or approvals applicable to the land is required to demonstrate whether

the land has an existing obligation to be set aside for nature conservation; revegetation of native vegetation; or as a native vegetation offset.

Prior to the BDAR being submitted to the consent authority, the accredited assessor should submit their proposed land categorisation method and outcomes to the BCS North East Branch Planning team at <a href="mailto:planning.northeast@environment.nsw.gov.au">planning.northeast@environment.nsw.gov.au</a> for review.

<u>For more information, see Determining native vegetation land categorisation for</u> application in the Biodiversity Offsets Scheme
