**Borg Panels Timber Processing Facility (SSD-7016) Spring Fed Dam Reclamation
Management Plan - Request for Additional Information**

Dear Mrs Morales

The infrastructure in terms of water collection should not need to change as the current layout includes a pit and pipe system rather than a bore. This means water from the dam is pumped to the water treatment plant from an open pit which will not be covered in the proposed works. As can be seen in the management plan to ensure the water still has flow, Borg has proposed to use the same methodology as the first 30% fill works and include slotted pipes to allow infiltration of water through the walls of the filled area.

I believe the measures that are listed in regards to contamination prevention should be adequate enough as Borg will be sourcing the material (confirmed to be appropriate by Envirowest Consulting Pty Ltd) from one certified local quarry as well as having regular site inspections by the Environmental Manager and Site Supervisors.
