1 INTRODUCTION

The Mount Pleasant Operation (MPO) is located in the Upper Hunter Valley of New South Wales (NSW), approximately 3 kilometres (km) north-west of Muswellbrook and approximately 50 km north-west of Singleton (Figure 1). The village of Aberdeen and locality of Kayuga are also located approximately 5 km north-northeast and 1 km north of the MPO boundary, respectively (Figure 1). MACH Energy purchased the MPO from Coal & Allied Operations Pty Ltd (Coal & Allied) in 2016.

MACH Mount Pleasant Operations Pty Ltd is the manager of the MPO as agent for, and on behalf of, the unincorporated Mount Pleasant Joint Venture between MACH Energy Australia Pty Ltd (MACH Energy) (95 per cent [%] owner) and J.C.D. Australia Pty Ltd (5% owner). This Water Management Plan (WMP) is implemented at the MPO by MACH Energy.

The initial development application for the MPO was made in 1997. This was supported by an Environmental Impact Statement (EIS) prepared by Environmental Resources Management (ERM) Mitchell McCotter (ERM Mitchell McCotter, 1997). On 22 December 1999, the then Minister for Urban Affairs and Planning granted Development Consent DA 92/97 to Coal & Allied. This allowed for the "Construction and operation of an open cut coal mine, coal preparation plant, transport and rail loading facilities and associated facilities" at the MPO. The consent allowed for operations 24 hours per day, seven days per week and the extraction of 197 million tonnes (Mt) of run-of-mine (ROM) coal over a 21 year period, at a rate of up to 10.5 Mt of ROM coal per year.

The Mount Pleasant Project Modification (MOD 1) was submitted on 19 May 2010 with a supporting Environmental Assessment (EA) prepared by EMGA Mitchell McLennan (EMGA Mitchell McLennan, 2010). MOD 1 included the provision of an infrastructure envelope for siting the mine infrastructure, the provision of an optional conveyor/service corridor linking the MPO facilities with the Muswellbrook-Ulan Rail Line and modification of the existing Development Consent DA 92/97 boundaries to accommodate the optional conveyor/service corridor and minor administrative changes. MOD 1 was approved on 19 September 2011.

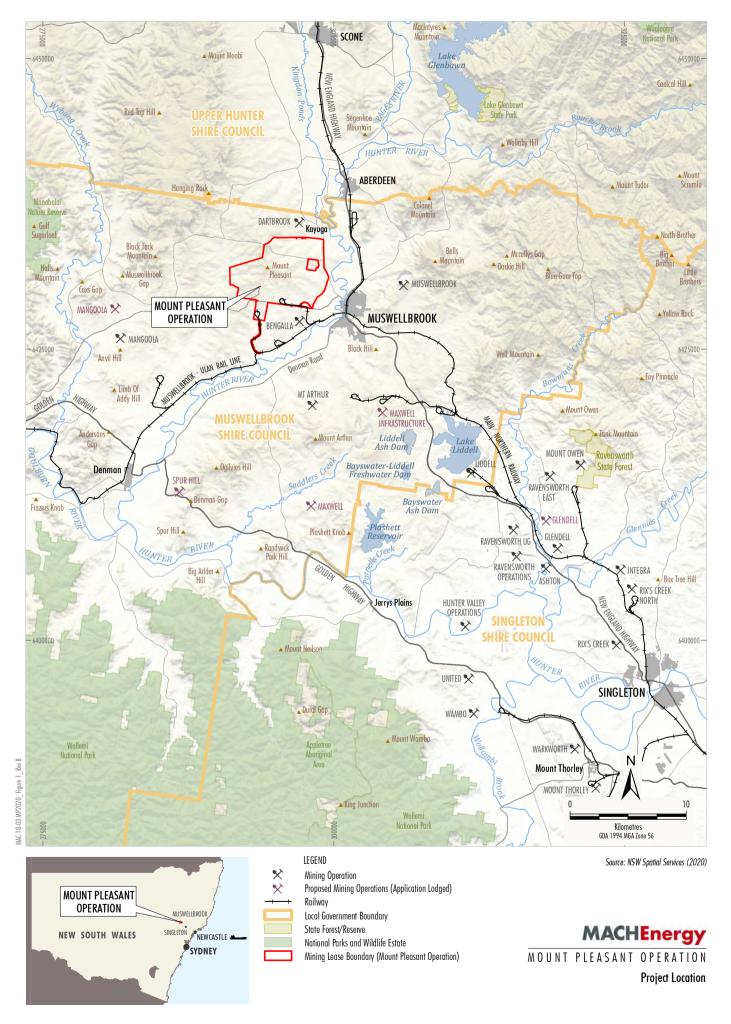

The MPO South Pit Haul Road Modification (MOD 2) was submitted on 30 January 2017 with a supporting EA prepared by MACH Energy (MACH Energy, 2017a). MOD 2 proposed to realign an internal haul road to enable more efficient access to the South Pit open cut, with no other material changes to the approved MPO. MOD 2 was approved on 29 March 2017.

The MPO Mine Optimisation Modification (MOD 3) was submitted on 31 May 2017 with a supporting EA prepared by MACH Energy (MACH Energy, 2017b). MOD 3 comprised an extension to the time limit on mining operations (to 22 December 2026) and extensions to the South Pit Eastern Out of Pit Emplacement to facilitate development of an improved final landform. MOD 3 was approved on 24 August 2018.

The MPO Rail Modification (MOD 4) was submitted on 18 December 2017 with a supporting EA prepared by MACH Energy (MACH Energy, 2017c). MOD 4 proposed the following changes:

- duplication of the approved rail spur, rail loop, conveyor and rail load-out facility and associated services;
- duplication of the Hunter River water supply pump station, water pipeline and associated electricity supply that followed the original rail spur alignment; and
- demolition and removal of the redundant approved infrastructure within the extent of the Bengalla Mine, once the new rail, product loading and water supply infrastructure has been commissioned and is fully operational.

00941135-005 1 **MACHEnergy**

MOD 4 was approved on 16 November 2018 by the Secretary of the Department of Planning and Environment (under Delegation). Appendix 2 of the modified Development Consent DA 92/97 illustrates the Conceptual Project Layout Plan of the approved MPO at 2021 and 2025, Approved Surface Disturbance Plan and Conceptual Final Landform (Attachment 1) incorporating the MOD 4 infrastructure relocations.

1.1 PURPOSE AND SCOPE

This WMP has been prepared by MACH Energy to satisfy the requirements under Development Consent DA 92/97 and specifically Condition 28, Schedule 3.

The WMP applies to all employees and contractors at the MPO and covers all areas within the MPO boundary. The WMP applies to the life of the MPO, including (but not limited to) the period of mining operations specified in Development Consent DA 92/97, which currently permits mining until 22 December 2026. As required by Condition 5, Schedule 2 of Development Consent DA 92/97, the WMP will continue to apply (excluding mining operations) beyond 22 December 2026, as required, until the rehabilitation and any additional undertakings (required by the Secretary of the Department of Planning, Industry and the Environment (DPIE), or the Department of Mining, Exploration and Geoscience [MEG] within the Department of Regional NSW) have been carried out satisfactorily.

This WMP has been prepared to manage surface water and groundwater related impacts associated with construction and operation of the MPO, including for example, initial establishment and development works, open cut mining, operation of the coal handling and preparation plant (CHPP), rail spur/loop, and Fines Emplacement Area, and the supply of water to the MPO.

1.1.1 Previous Versions

A previous version of the WMP was submitted by Coal & Allied Operations Pty Ltd as a Construction Water Management Plan (CWMP) and was approved on 23 July 2012. The CWMP was submitted as a staged plan limited to the management of water during the construction stage of the MPO, excluding the development of the box-cut and any extraction of coal.

An addendum to the CWMP was submitted by MACH Energy and approved on 8 February 2017. This addendum included a revised figure (Figure B.1A) replacing Figure B.1, which showed an updated alignment for the Hunter River water supply pipeline.

A new version of the WMP was prepared by MACH Energy to replace the CWMP described above. Consistent with Condition 28, Schedule 3 of Development Consent DA 92/97, this version of the WMP was prepared to allow for both construction and operation of the MPO and was approved on 3 August 2017.

The WMP was updated by MACH Energy in March 2018, to include description of the Surface Water Management Procedure (an internal procedure used to manage construction dams on-site) in the Surface Water Management Plan (SWMP). The updated WMP was approved on 16 March 2018.

The WMP was revised by MACH Energy in July 2018, to update a timing commitment within the Groundwater Management Plan (GWMP) relating to inclusion of information regarding the final void.

The previously approved version of the WMP was prepared to reflect the approval of MOD 3/MOD 4 and was approved on 31 October 2019.

1.1.2 Current Version

The current version of the WMP was prepared following the completion of the Independent Environmental Audit undertaken by MACH Energy in accordance with Condition 9, Schedule 5 of Development Consent DA 92/97, and replace the previously approved version of the WMP described in Section 1.1.1.

1.2 STRUCTURE OF THE WMP

In accordance with Condition 28, Schedule 3 of Development Consent DA 92/97, the WMP includes the following five appendices:

- Site Water Balance (SWB) (Appendix 1);
- Erosion and Sediment Control Plan (ESCP) (Appendix 2);
- SWMP (Appendix 3);
- GWMP (Appendix 4); and
- Surface and Ground Water Response Plan (SGWRP) (Appendix 5).

A brief overview of the documentation referred to above is provided in Table 1.

Table 1
Overview of WMP Documentation

#	Appendix / Document	Description / Scope	
1	Site Water Balance	Describes the MPO water management system (including modelling results) detailing water supply, use, management, transfers, and measures to minimise water use.	
2	Erosion and Sediment Control Plan	Describes the management of potential erosion impacts (including details of erosion and sediment control structures and their maintenance), as well as implementation of measures to minimise soil erosion, generation of sediment and transport of sediment to downstream waters. The document also identifies activities that could affect flooding and describes how flood risk is managed.	
3	Surface Water Management Plan	Describes the baseline surface water data, surface water impact assessment criteria (including trigger levels for investigation), surface water monitoring program and reporting procedures.	
4	Groundwater Management Plan	Describes the baseline groundwater data, groundwater impact assessment criteria (including trigger levels for investigation), groundwater monitoring program and reporting procedures. The document also provides details of the design and management of the proposed final voids.	
5	Surface and Ground Water Response Plan	Describes the response protocols (including trigger action response plans [TARPs]) for any exceedance of the surface water and groundwater impact assessment criteria, where relevant, including measures to prevent, minimise, mitigate, compensate and/or offset.	

The remainder of the WMP is structured as follows:

- Section 2: Outlines the statutory obligations applicable to the WMP.
- Section 3: Provides an overview of the MPO water management system.
- Section 4: Provides details for the review and improvement of environmental performance.

- Section 5: Describes the management and reporting of incidents, complaints and non-compliances.
- Section 6: Provides a list of references cited in this report.
- Appendix 6: Lists comments received from the relevant consultees during the consultation period.

1.3 CONSULTATION

1.3.1 NSW Government Agencies

This WMP has been provided to DPIE Water (previously NSW Department of Primary Industries – Water) and the NSW Environment Protection Authority (EPA) for the purposes of consultation in accordance with Condition 28, Schedule 3 of Development Consent DA 92/97.

On 15 October 2020 and 21 October 2020, the EPA indicated that their role is to set environmental management objectives rather than being involved in development strategies to meet the objectives (i.e. management plans). The EPA therefore did not provide any comments on this WMP.

On 6 November 2020, MACH Energy contacted DPIE – Water to confirm whether DPIE – Water has any comments on the WMP. To date DPIE – Water has not provided any comments on this WMP.

1.3.2 Community Consultation

MACH Energy's approach to community relations is focused on building enduring relationships based on mutual respect, active partnerships and a long-term commitment. MACH Energy is committed to:

- Having robust relationships with our communities of interest this requires understanding the issues and needs of different stakeholders, as well as active engagement.
- Effectively contributing to communities this means understanding the socio-economic environment and the community's vision for the future, and providing contributions that are sustainable and build long-term community capacity.

These objectives also form the primary goals for the MPO community relation activities and are reflected in our Community and Stakeholder Engagement Plan for the MPO and the Muswellbrook community. There are a variety of communication channels available for community members to become engaged with the MPO's progress (e.g. the MPO's Community Hotline [1800 886 889)]. MACH Energy is an active and accessible member of the community in which we live and operate. The hotline number will be published in a variety of MACH Energy's public communication tools.

The community is also invited to find out more about the MPO by accessing MACH Energy's website (https://machenergyaustralia.com.au/). Details on the site will allow interested parties to become informed about the MPO's progress and it provides a platform for publishing key monitoring results and public reports alongside information such as minutes from the MPO's Community Consultative Committee (CCC).

MACH Energy's approach to community engagement and consultation involves providing information regarding its activities in a timely, clear, open and transparent manner, and seeking feedback from communities to understand the potential impacts of its activities. MACH Energy will engage in regular consultation and on-going communication with our community members and stakeholders. Feedback from neighbours and local communities is used to inform MPO decisions.

2 STATUTORY OBLIGATIONS

MACH Energy's statutory obligations are contained in:

- the conditions of Development Consent DA 92/97 (as modified);
- the conditions of the Commonwealth Approvals EPBC 2011/5795;
- relevant licences (including EPL 20850) and permits and mining leases (MLs) (ML 1645, ML 1708, ML 1709, ML 1750 and ML 1713); and
- other relevant legislation.

Obligations relevant to this WMP are described below.

2.1 DEVELOPMENT CONSENT DA 92/97

2.1.1 WMP Requirements

Condition 28, Schedule 3 of Development Consent DA 92/97 requires the preparation of a WMP. Table 2 presents these requirements and indicates where they are addressed in this WMP.

Table 2
Water Management Plan Requirements in Development Consent DA 92/97

MPO Development Consent DA 92/97 Schedule 3	Section where addressed in this WMP document
28. The Applicant must prepare a Water Management Plan for the development to the satisfaction of the Secretary. This plan must be prepared in consultation with Dol Water and EPA, and be submitted to the Secretary for approval by 30 June 2019, unless otherwise agreed by the Secretary.	This document (and Section 1.3.1)
The plan must include:	
(a) a Site Water Balance,	Appendix 1
(b) an Erosion and Sediment Control Plan,	Appendix 2
(c) a Surface Water Management Plan,	Appendix 3
(d) a Groundwater Management Plan,	Appendix 4
(e) a Surface and Ground Water Response Plan,	Appendix 5

A comprehensive list of all conditions in Development Consent DA 92/97 relevant to water is provided in Attachment 2.

2.1.2 Management Plan (General) Requirements

Condition 2, Schedule 5 of Development Consent DA 92/97 outlines the general management plan requirements that are applicable to the preparation of the WMP.

Table 3 presents these requirements and indicates where each is addressed within this WMP.

Table 3
General Development Consent DA 92/97 Conditions

MPO Development Consent DA 92/97 Schedule 5	Section where addressed in this WMP document
The Applicant must ensure that the management plans required under this consent are prepared in accordance with any relevant guidelines, and include:	
(a) detailed baseline data;	Appendices 1–4
(b) a description of:	
 the relevant statutory requirements (including any relevant consent, licence or lease conditions); 	Section 2
any relevant limits or performance measures/criteria;	Appendices 1–4
 the specific performance indicators that are proposed to be used to judge the performance of, or guide the implementation of, the development or any management measures; 	Appendices 1–4
 (c) a description of the measures that would be implemented to comply with the relevant statutory requirements, limits, or performance measures/criteria; 	Appendices 1–4
(d) a program to monitor and report on the:	Appendices 1–4
 impacts and environmental performance of the development; 	
 effectiveness of any management measures (see c above); 	
(e) a contingency plan to manage any unpredicted impacts and their consequences;	Appendix 5
 (f) a program to investigate and implement ways to improve the environmental performance of the development over time; 	Appendices 1–5 and Section 4
(g) a protocol for managing and reporting any:	Section 5
• incidents;	
complaints;	
 non-compliances with statutory requirements; and 	
 exceedances of the impact assessment criteria and/or performance criteria; and 	
(h) a protocol for periodic review of the plan.	Appendices 1–5 and
Note: The Secretary may waive some of these requirements if they are unnecessary or unwarranted for particular management plans.	Section 4

2.2 EPBC ACT CONTROLLED ACTION DECISION

Commonwealth approval for the MPO (EPBC 2011/5795) was granted on 29 February 2012. EPBC 2011/5795 does not include any specific water-related conditions.

2.3 LICENCES, PERMITS AND LEASES

Water management at the MPO is conducted in accordance with a number of licences, permits and leases. Key licences, permits and leases relating to water at the MPO include:

- Water Access Licences (WALs) issued under the Water Management Act, 2000.
- Discharge credits (46) held under the NSW Protection of the Environment Operations (Hunter River Salinity Trading Scheme) Regulation, 2002.
- Environment Protection Licence (EPL) 20850 issued under Part 3 of the NSW *Protection of the Environment Operations Act, 1997* by the EPA.

- ML 1645, ML 1708, ML 1709, ML 1713 and ML 1750 issued under Part 5 of the NSW *Mining Act, 1992* and approved by the Minister for Mineral Resources.
- Mining Operations Plan approved by MEG.

2.3.1 Water Access Licences

Details of the WALs held by MACH Energy are summarised in Tables 4 and 5 below.

Table 4
Water Access Licences—Groundwater Sources

Water Access Licence	Water Source	Share (units)
18253	Hunter Regulated River Alluvial Water Source	74
18266	Hunter Regulated River Alluvial Water Source	68
18206	Hunter Regulated River Alluvial Water Source	24
18199	Hunter Regulated River Alluvial Water Source	5
18122	Hunter Regulated River Alluvial Water Source	33
18131	Hunter Regulated River Alluvial Water Source	60
21503	Hunter Regulated River Alluvial Water Source	21
18177	Hunter Regulated River Alluvial Water Source	5
23935	Muswellbrook Water Source	41
41437	Sydney Basin – North Coast Groundwater Source	640
40298	Sydney Basin – North Coast Groundwater Source	90
18336	Krui River Water Source	12

MACH Energy will obtain and hold volumetric licenses to account for maximum predicted groundwater inflows and surface water take associated with the development and operation of the MPO in accordance with the legislative requirements of the *Water Management Act, 2000*.

Relevant volumetric licences would remain to be held by MACH Energy (or retired to Dol Water) to account for predicted post-mining water take at the MPO.

Table 5
Water Access Licences – Surface Water Sources

Water Access Licence	Water Source	Share (units)
879	Hunter Regulated River Water Source	224
880	Hunter Regulated River Water Source	124

10775	Hunter Regulated River Water Source	243
1074	Hunter Regulated River Water Source	5
8445	8445 Hunter Regulated River Water Source 12.	
8406	Hunter Regulated River Water Source	168

2.4 OTHER LEGISLATION AND REQUIREMENTS

2.4.1 Water Management Act, 2000

The Water Management Act, 2000 incorporates the provisions of various prior Acts relating to the management of surface and groundwater in NSW and provides a single statute for regulation of water access, use and works (e.g. pumps or bores) that affect the licensing of surface water and alluvial and non-alluvial (i.e. porous rock) groundwater in the vicinity of the MPO.

Under the Water Management Act, 2000, the MPO is regulated under the Water Sharing Plan for the Hunter Unregulated and Alluvial Water Sources, 2009 and the Water Sharing Plan for the North Coast Fractured and Porous Rock Groundwater Sources, 2016.

A list of the water sources contained in these Water Sharing Plans, which are relevant to the MPO, is included in the GWMP (Appendix 4).

2.4.2 Water Act, 1912

As water sharing plans have been commenced under the *Water Management Act, 2000* for all groundwater and surface water systems that the MPO is predicted to extract water from, the *Water Act, 1912* is not relevant to licensing considerations for the MPO.

2.4.3 National Water Quality Management Strategy/ANZECC (2000) Guidelines

The National Water Quality Management Strategy is a joint national approach to improving water quality in Australian and New Zealand waterways. The Australian and New Zealand Environment and Conservation Council (ANZECC) water quality guidelines (ANZECC, 2000) have been considered where applicable in the SWMP (Appendix 3), GWMP (Appendix 4) and SGWRP (Appendix 5) for the MPO.

2.4.4 Aquifer Interference Policy

The Aquifer Interference Policy has been developed by the NSW Government as a component of the NSW Government's Strategic Regional Land Use Policy.

The Aquifer Interference Policy applies statewide and details water licence and impact assessment requirements. The Aquifer Interference Policy has been developed to ensure equitable water sharing between various water users and proper licensing of water taken by aquifer interference activities such that the take is accounted for in the water budget and water sharing arrangements. The Aquifer Interference Policy also enhances existing regulation, contributing to a comprehensive framework to protect the rights of all water users and the environment in NSW.

2.4.5 Hunter-Central Rivers Catchment Action Plan 2013–2023

The *Hunter-Central Rivers Catchment Action Plan 2013–2023* has been developed by the Hunter-Central Rivers Catchment Management Authority (2013) to set strategic goals, targets and outcomes maintaining and improving the health and productivity of the Hunter-Central Rivers Catchment.

The 2013–2023 plan is a further development on the goals and targets of the previous (and first) catchment action plan. The plan provides direction for actions at all levels of government, industry and community to maintain or improve the long-term viability of healthy and productive natural systems within the catchment region.

The goals, targets and outcomes of the *Hunter-Central Rivers Catchment Action Plan 2013–2023* have been considered where relevant in the preparation of this WMP.

3 WATER MANAGEMENT OVERVIEW

3.1 WATER MANAGEMENT SYSTEM AND SITE WATER BALANCE

Key water demands at the MPO include:

- water used in the CHPP, including water retained in coal products and rejects and water for dust suppression (including stockpiles);
- · haul road dust suppression; and
- miscellaneous water usage, such as vehicle wash down and stockpile water usage.

These water demands are met through a combination of the following water sources:

- groundwater inflows to the open cut;
- runoff captured from the footprint of the mining disturbance area by the water management system;
- fine rejects bleed water captured from the Fines Emplacement Area; and
- water pumped from the Hunter River.

A detailed description of the MPO water management system and an overview of the supporting site water balance modelling is provided in the SWB (Appendix 1).

3.2 EROSION AND SEDIMENT CONTROL OVERVIEW

Key activities that have the potential to cause or increase soil erosion at the MPO are disturbance of land and soils in relation to clearing, stripping and stockpiling activities.

Erosion and sediment controls will be implemented at the MPO to mitigate the impacts of the proposed development on nearby watercourses and the surrounding environment.

Specific erosion and sediment controls to be implemented at the MPO include, but are not limited to, the following:

- clean water diversion drains and banks;
- silt fences (or equivalent control);
- vegetated buffer strips; and
- sediment dams/basins.

These erosion and sediment controls will be designed and operated in accordance with the requirements of *Managing Urban Stormwater: Soils and Construction Volume 1* (Landcom, 2004) and *Volume 2E - Mines and Quarries* (DECC, 2008).

Other *Blue Book* (Landcom, 2004) erosion and sediment control measures may be implemented at the MPO as required.

More detailed information regarding the erosion and sediment control scheme proposed at the site is provided in the ESCP (Appendix 2).

3.3 SURFACE WATER OVERVIEW

The MPO is located within the Hunter Catchment, which has an overall size of 21,500 square km, encapsulating the major towns of Newcastle, Singleton and Muswellbrook (DPI Water, 2016). The Hunter River is the main drainage feature within the catchment. It begins in the Mount Royal Range and flows adjacent to Muswellbrook and Singleton, before draining to the ocean at Newcastle. The Hunter River contains a number of significant tributaries, including the Goulburn, Pages and Isis Rivers, as well as the Middle, Dart, Stewart, Moonan and Ormadale Brooks. Alluvial floodplains ranging in width from 1.5–2 km border the river over the majority of its length. The eastern extent of the MPO ML boundary is located directly adjacent to these floodplains.

The drainage network in the vicinity of the MPO is generally characterised by steep gullies which drain from the surrounding hills into the flat alluvial plains adjacent the Hunter River.

The main drainage feature is the Hunter River which flows in a southerly direction approximately 1 km to the east of the MPO ML boundary. There are a number of ephemeral drainage lines which traverse the MPO area and drain into the Hunter River. The eastern portion of the MPO area drains via Rosebrook Creek, as well as other unnamed drainages. Areas in the south and west of the MPO boundary drain to Dry Creek and Sandy Creek, respectively, both of which are tributaries of the Hunter River. All other areas drain into unnamed drainage lines, which flow directly into the Hunter River.

A detailed description of the surface water management and monitoring at the MPO is provided in the SWMP (Appendix 3).

3.4 GROUNDWATER OVERVIEW

The MPO is located in the vicinity of two predominant groundwater schemes:

- the Alluvial groundwater system associated with the alluvial plains of the Hunter River and its tributaries; and
- the Hard (fractured and porous) rock groundwater system including the Permian aged Wittingham Coal measures.

The MPO coal resource is located in the Permian Wittingham Coal measures of the Singleton Supergroup. Lithologies comprise mostly sandstones, siltstones and coal measures with minor conglomerates and tuffs. Coal seams amenable to open cut mining occur in eight correlated seams and include the Upper Piercefield (Warkworth) Seam to the lowermost Edderton Seam.

Alluvial sediments associated with the Hunter River are located to the east of the MPO. The alluvial sediments offer increased groundwater storage when compared to the hard (fractured and porous) rock groundwater system due to their higher porosity. Gravel zones within the alluvium are capable of providing the highest storage and permeability when compared to clay, sand and silt zones.

A detailed description of groundwater management and monitoring at the MPO is provided in the GWMP (Appendix 4).

3.5 SURFACE AND GROUND WATER RESPONSE OVERVIEW

The SGWRP (Appendix 5) includes response protocols for exceedances of the surface water and groundwater trigger levels established in the SWMP and GWMP. It also includes measures to:

- offset the loss of any baseflow to watercourses caused by the MPO;
- minimise groundwater leakage from alluvial aquifers as a result of the MPO;
- compensate landowners of privately-owned land whose water supply is adversely affected by the MPO; and
- mitigate any adverse impacts on groundwater dependent ecosystems or riparian vegetation.

3.6 ROLES AND RESPONSIBILITIES

The Environmental Superintendent is primarily responsible for implementing the suite of environmental management plans across the MPO, with assistance provided by the Managing Director and Department Managers/Supervisors.

4 REVIEW AND IMPROVEMENT OF ENVIRONMENTAL PERFORMANCE

4.1 ANNUAL REVIEW

In accordance with Condition 3, Schedule 5 of Development Consent DA 92/97, MACH Energy will review and evaluate the environmental performance of the MPO by the end of March each year (for the preceding calendar year) or other such timing as agreed by the Secretary of the DPIE.

In relation to water, the Annual Review will:

- include a review of the water monitoring results and complaints records relating to the MPO over the past year, which includes a comparison of these results to evaluate compliance against the:
 - relevant statutory requirements, limits or performance measures/criteria (refer Section 2.1.1);
 - monitoring results of the previous years; and
 - relevant predictions in the EIS and MOD 1, MOD 2, MOD 3 and MOD 4 EAs;
- identify any water-related non-compliance over the past year, and describe what actions were (or are being) taken to ensure compliance;
- identify any trends in the water monitoring data over the life of the MPO;
- identify any discrepancies between the predicted and actual water impacts of the MPO, and analyse the potential cause of any significant discrepancies; and
- describe what water-related measures will be implemented over the next year to improve the environmental performance of the MPO.

The Annual Review will be made publicly available on the MACH Energy website (https://machenergyaustralia.com.au/) in accordance with Condition 11, Schedule 5 of Development Consent DA 92/97.

4.2 WMP REVISION

In accordance with Condition 4, Schedule 5 of Development Consent DA 92/97, this WMP will be reviewed, and if necessary revised (to the satisfaction of the Secretary of the DPIE), within three months of the submission of:

- an Annual Review (Condition 3, Schedule 5);
- an incident report (Condition 7, Schedule 5);
- an Independent Environmental Audit (Condition 9, Schedule 5); and
- any modification to the conditions of Development Consent DA 92/97.

Within 4 weeks of conducting any such review, the Secretary of the DPIE will be advised of the outcomes of the review and any revised documents submitted to the Secretary for approval.

In accordance with Condition 4A, Schedule 5 of Development Consent DA 92/97, MACH Energy may submit a revised WMP for the approval of the Secretary at any time, and may also submit any revision to this WMP required under Development Consent DA 92/97 on a staged basis.

If agreed with the Secretary of the DPIE, a revision to this WMP required under Development Consent DA 92/97 may be prepared without undertaking consultation with all parties nominated under the relevant Condition of Development Consent DA 92/97.

This WMP will be made publicly available on the MACH Energy website (https://machenergyaustralia.com.au/), in accordance with Condition 11, Schedule 5 of Development Consent DA 92/97.

5 REPORTING SYSTEMS

In accordance with Condition 2, Schedule 5 of Development Consent DA 92/97, MACH Energy has developed protocols for managing and reporting the following:

- incidents;
- complaints;
- non-compliances with statutory requirements; and
- exceedances of the impact assessment criteria and/or performance criteria.

These protocols are described in detail in the MPO Environmental Management Strategy (MACH Energy, 2019).

In accordance with Condition 8, Schedule 5 of Development Consent DA 92/97, MACH Energy will provide regular reporting on the environmental performance of the MPO on the MACH Energy website (https://machenergyaustralia.com.au/).

Protocols for managing and reporting exceedances of the impact assessment criteria specific to water management are described in the SGWRP (Appendix 5).

Water monitoring and management will be reported as part of the Annual Review described in Section 4.1 and in accordance with the reporting requirements of EPL 20850.

WATER-RELATED DEVELOPMENT CONSENT DA 92/97 CONDITIONS

Table 2-1 Water-Related Development Consent DA 92/97 Conditions

Development Consent DA 92/97	WMP Section
Schedule 3	
Water Management Plan	
28. The Applicant must prepare a Water Management Plan for the development to the satisfaction of the Secretary. This plan must be prepared in consultation with Dol Water and EPA, and be submitted to the Secretary for approval by 30 June 2019, unless otherwise agreed by the Secretary. The plan must include:	This document (and Section 1.3.1)
(a) a Site Water Balance, which must:	Appendix 1
include details of:	
 sources and security of water supply; 	
- water use on site	
 water management on site; 	
 any off-site water transfers; and 	
 investigate and implement all reasonable and feasible measures to minimise water use by the development; 	
(b) an Erosion and Sediment Control Plan, which must:	Appendix 2
 identify activities that could cause soil erosion, generate sediment or affect flooding; 	
 describe measures to minimise soil erosion and the potential for the transport of sediment to downstream waters, and manage any flood risk; 	
 describe the location, function, and capacity of erosion and sediment control structures; 	
 describe what measures would be implemented to maintain the structures over time; 	
(c) a Surface Water Management Plan, which must include:	Appendix 3
 detailed baseline data on surface water flows and quality in creeks and other waterbodies that could potentially be affected by the development; 	
 surface water and stream health impact assessment criteria including trigger levels for investigating any potentially adverse surface water impacts; 	
 a program to monitor and maintain the bridge openings and culverts associated with the MOD 4 rail infrastructure and ensure that they remain clear of blockages; 	
 a program to monitor surface water flows and quality in the watercourses that could be affected by the project; and 	
reporting procedures for the results of the monitoring program;	
(d) a Groundwater Management Plan, which must include:	Appendix 4
 detailed plans, including design objectives and performance criteria, for the design and management of the proposed final voids; 	
 detailed baseline data of groundwater levels, yield and quality in the region, and privately-owned groundwater bores, that could be affected by the development; 	
 groundwater impact assessment criteria including trigger levels for investigating any potentially adverse groundwater impacts; 	
a program to monitor and assess:	
 groundwater inflows to the mining operations; 	
 impacts on regional and local (including alluvial) aquifers; 	
 impacts on the groundwater supply of potentially affected landowners; 	
 impacts on groundwater dependent ecosystems and riparian vegetation; 	

Table 2-1 (Continued) Water Related Development Consent DA 92/97 Conditions

Development Consent DA 92/97	WMP Section
Schedule 3	
(e) a Surface and Ground Water Response Plan, which must include:	Appendix 5
 a response protocol for any exceedances of the surface water and groundwater assessment criteria; 	
 measures to offset the loss of any baseflow to watercourses caused by the development; 	
 measures to prevent, minimise or offset groundwater leakage from alluvial aquifers caused by the development; 	
 measures to compensate landowners of privately-owned land whose water supply is adversely affected by the development; and 	
 measures to mitigate and/or offset any adverse impacts on groundwater dependent ecosystems or riparian vegetation. 	
The Applicant must implement the approved management plan as approved by the Secretary.	
SOIL & WATER	
Note: Under the <i>Water Act 1912</i> and/or the <i>Water Management Act 2000</i> , the Applicant is required to obtain water licences for the development.	Section 2.3.1
Water Supply	
25. The Applicant must ensure that it has sufficient water for all stages of development, and if necessary, adjust the scale of mining operations on site, to match its available water supply to the satisfaction of the Secretary.	Appendix 1
Water Discharges	
26. The Applicant must ensure that any surface water discharges from the site comply with the:	Appendices 1, 2 and 3
(a) discharge limits (both volume and quality) set for the development in any EPL; or	
(b) relevant provisions of the POEO Act or Protection of the Environment Operations (Hunter River Salinity Trading Scheme) Regulation 2002.	
Compensatory Water Supply	
27. The Applicant must provide compensatory water supply to any landowner of privately-owned land whose water entitlements are adversely and directly impacted (other than an impact that is negligible) as a result of the development, in consultation with Dol Water, and to the satisfaction of the Secretary.	Appendix 5
The compensatory water supply measures must provide an alternative long-term supply of water that is equivalent, in quality and volume, to the loss attributed to the development. Equivalent water supply should be provided (at least on an interim basis) as soon as practicable after the loss is identified, unless otherwise agreed with the landowner.	
If the Applicant and the landowner cannot agree on the measures to be implemented, or there is a dispute about the implementation of these measures, then either party may refer the matter to the Secretary for resolution.	
If the Applicant is unable to provide an alternative long-term supply of water, then the Applicant must provide alternative compensation to the satisfaction of the Secretary.	

APPENDIX 1

SITE WATER BALANCE

Department of Planning and Environment

Our ref: DA92/97-PA-28

Chris Masters Environmental Advisor Mach Energy Australia Pty Ltd Suite 1, Level 3 426 King Street Newcastle West, NSW, 2302

6 June 2022

Subject: Site Water Balance for Mt Pleasant Coal (DA92/97-PA-28)

Dear Mr. Masters.

I refer to the Site Water Balance which was submitted in accordance with Condition 28 (a) of Schedule 3 of the consent for the Mt Pleasant Coal project (DA92/97-PA-28).

The Department acknowledges that the plan was submitted following an Independent Environmental Audit (IEA) conducted in June 2020 in accordance with Condition 4 (c) of Schedule 5 of the consent. The Department has carefully reviewed the document and is satisfied that it addresses the recommendations of the IEA.

Accordingly, the Secretary has approved the Site Water Balance (Revision 01). Please ensure that the approved plan is placed on the project website at the earliest convenience.

If you wish to discuss the matter further, please contact Jess Watson on 02 9373 2845.

Yours sincerely,

Steve O'Donoghue

Director, Resource Assessments

As nominee of the Planning Secretary

1 INTRODUCTION

The Mount Pleasant Operation (MPO) is located in the Upper Hunter Valley of New South Wales (NSW), approximately 3 kilometres (km) north-west of Muswellbrook and approximately 50 km north-west of Singleton (Figure 1). The village of Aberdeen and locality of Kayuga are also located approximately 5 km north-northeast and 1 km north of the MPO boundary, respectively (Figure 1). MACH Energy purchased the MPO from Coal & Allied Operations Pty Ltd (Coal & Allied) in 2016.

MACH Mount Pleasant Operations Pty Ltd is the manager of the MPO as agent for, and on behalf of, the unincorporated Mount Pleasant Joint Venture between MACH Energy Australia Pty Ltd (MACH Energy) (95 per cent [%] owner) and J.C.D. Australia Pty Ltd (5% owner). This Site Water Balance (SWB) is implemented at the MPO by MACH Energy.

The initial development application for the MPO was made in 1997. This was supported by an Environmental Impact Statement (EIS) prepared by Environmental Resources Management (ERM) Mitchell McCotter (ERM Mitchell McCotter, 1997). On 22 December 1999, the then Minister for Urban Affairs and Planning granted Development Consent DA 92/97 to Coal & Allied. This allowed for the "Construction and operation of an open cut coal mine, coal preparation plant, transport and rail loading facilities and associated facilities" at the MPO. The consent allowed for operations 24 hours per day seven days per week and the extraction of 197 million tonnes (Mt) of run-of-mine (ROM) coal over a 21 year period, at a rate of up to 10.5 Mt of ROM coal per year.

The Mount Pleasant Project Modification (MOD 1) was submitted on 19 May 2010 with a supporting Environmental Assessment (EA) prepared by EMGA Mitchell McLennan (EMGA Mitchell McLennan, 2010). MOD 1 included the provision of an infrastructure envelope for siting the mine infrastructure, the provision of an optional conveyor/service corridor linking the MPO facilities with the Muswellbrook-Ulan Rail Line and modification of the existing Development Consent DA 92/97 boundaries to accommodate the optional conveyor/service corridor and minor administrative changes. MOD 1 was approved on 19 September 2011.

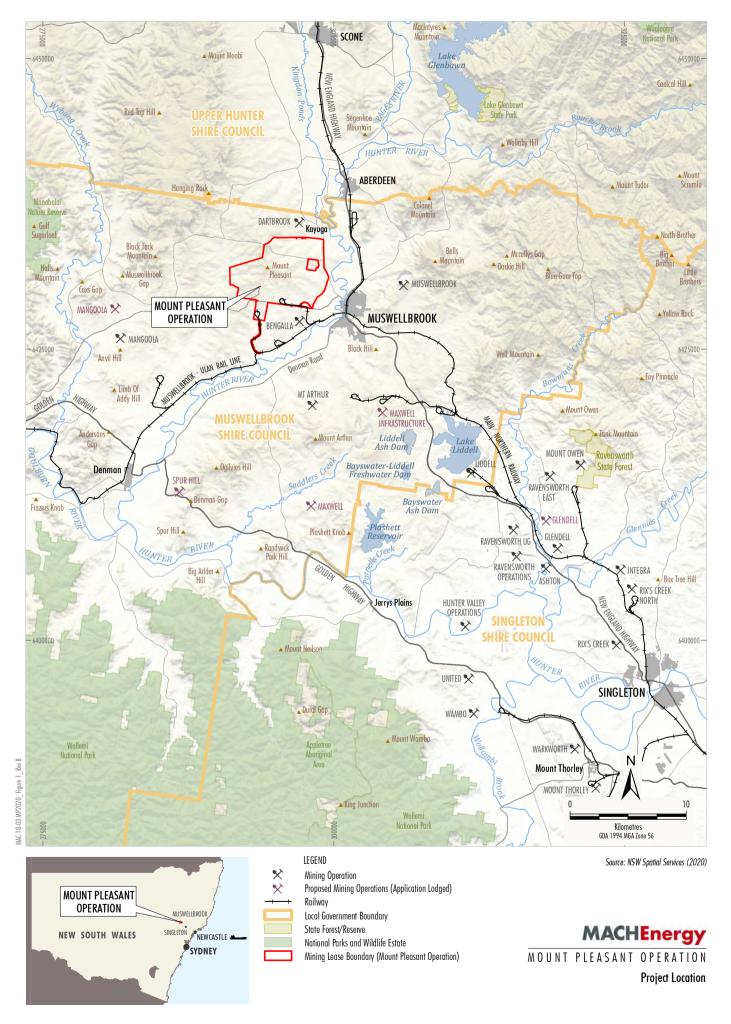

The MPO South Pit Haul Road Modification (MOD 2) was submitted on 30 January 2017 with a supporting EA prepared by MACH Energy (MACH Energy, 2017a). MOD 2 proposed to realign an internal haul road to enable more efficient access to the South Pit open cut, with no other material changes to the approved MPO. MOD 2 was approved on 29 March 2017.

The MPO Mine Optimisation Modification (MOD 3) was submitted on 31 May 2017 with a supporting EA prepared by MACH Energy (MACH Energy, 2017b). MOD 3 comprised an extension to the time limit on mining operations (to 22 December 2026) and extensions to the South Pit Eastern Out of Pit Emplacement to facilitate development of an improved final landform. MOD 3 was approved on 24 August 2018.

The MPO Rail Modification (MOD 4) was submitted on 18 December 2017 with a supporting EA prepared by MACH Energy (MACH Energy, 2017c). MOD 4 proposed the following changes:

- duplication of the approved rail spur, rail loop, conveyor and rail load-out facility and associated services;
- duplication of the Hunter River water supply pump station, water pipeline and associated electricity supply that followed the original rail spur alignment; and
- demolition and removal of the redundant approved infrastructure within the extent of the Bengalla Mine, once the new rail, product loading and water supply infrastructure has been commissioned and is fully operational.

00938536-008 1 **MACHEnergy**

MOD 4 was approved on 16 November 2018 by the Secretary of the Department of Planning and Environment (under Delegation). Appendix 2 of the modified Development Consent DA 92/97 illustrates the Conceptual Project Layout Plan of the approved MPO at 2021 and 2025, Approved Surface Disturbance Plan and Conceptual Final Landform (Attachment 1) incorporating the MOD 4 infrastructure relocations.

1.1 PURPOSE AND SCOPE

This Site Water Balance (SWB) has been prepared by MACH Energy to satisfy the requirements under Development Consent DA 92/97 (as modified) and specifically Condition 28(a), Schedule 3.

This SWB has been prepared to predict the water demand/supply associated with construction and operation of the MPO, including for example, initial establishment and development works, open cut mining, operation of the coal handling and preparation plant (CHPP), rail spur/loop and Fines Emplacement Area, and the supply of water to the MPO.

The SWB applies to all employees and contractors at the MPO and covers all areas within the MPO boundary. The SWB applies to the life of the MPO, including (but not limited to) the period of mining operations specified in Development Consent DA 92/97, which currently permits mining until 22 December 2026. As required by Condition 5, Schedule 2 of Development Consent DA 92/97, the SWB will continue to apply (excluding mining operations) beyond 22 December 2026, as required, until the rehabilitation and any additional undertakings (required by the Secretary of the Department of Planning, Industry and the Environment [DPIE], or the Division of Mining, Exploration and Geoscience [MEG] within the Department of Regional NSW) have been carried out satisfactorily.

1.2 STRUCTURE OF THE SWB

Consistent with the requirements of Condition 28(a), Schedule 3 of Development Consent DA 92/97, the remainder of the SWB is structured as follows:

- Section 2: Outlines the statutory obligations relevant to this SWB.
- Section 3: Outlines the available data used in the modelling of the SWB.
- Section 4: Describes the water management system implemented at the MPO.
- Section 5: Outlines the predicted water demands present at the site.
- Section 6: Describes the controlled water releases proposed.
- Section 7: Outlines the site water sources.
- Section 8: Describes the water balance modelling undertaken as part of this SWB.
- Section 9: Outlines the review process for MPO documentation and in particular for this SWB.
- Section 10: Describes the reporting procedures relevant for this SWB.
- Section 11: Lists the references cited in this report.

2 STATUTORY OBLIGATIONS

MACH Energy's statutory obligations are contained in:

- the conditions of Development Consent DA 92/97 (as modified);
- the condition of the Commonwealth Approval EPBC 2011/5795;
- relevant licences (including Environment Protection Licence [EPL] 20850), permits and mining leases (mining leases 1645, 1708, 1709,1713, 1750 and 1808); and
- other relevant legislation.

Obligations relevant to this SWB are described below.

2.1 DEVELOPMENT CONSENT DA 92/97

The conditions of Development Consent DA 92/97 relevant to the content and structure of this SWB are described below. A comprehensive list of all conditions in Development Consent DA 92/97 relevant to water is provided in the Water Management Plan (WMP).

2.1.1 SWB Requirements

Condition 28(a), Schedule 3 of Development Consent DA 92/97 requires the preparation of a SWB, as part of the WMP for the MPO (refer Table 1).

Table 1
SWB Development Consent DA 92/97 Conditions

MPO Development Consent DA 92/97 Schedule 3	Section where addressed in this SWB document
28. The Applicant must prepare a Water Management Plan for the development to the satisfaction of the Secretary. This plan must be prepared in consultation with Dol Water and EPA, and be submitted to the Secretary for approval by 30 June 2019, unless otherwise agreed by the Secretary.	
The plan must include:	
(a) a Site Water Balance, which must:	
include details of:	
- sources and security of water supply;	Sections 4.3, 4.4, 7, 8.3 and 8.6
- water use on site;	Section 5
 water management on site; 	Section 4
 any off-site water transfers; and 	Section 6
 investigate and implement all reasonable and feasible measures to minimise water use by the development; 	Section 4.3

2.1.2 Management Plan (General) Requirements

Condition 2, Schedule 5 of Development Consent DA 92/97 outlines the general management plan requirements that are applicable to the preparation of this SWB.

Table 2 presents these requirements and indicates where each is addressed within this SWB, or within the overarching WMP for the MPO.

Table 2 General Development Consent DA 92/97 Conditions

	MPO Development Consent DA 92/97 Schedule 5	Section where addressed in this SWB document
2.	The Applicant must ensure that the management plans required under this consent are prepared in accordance with any relevant guidelines, and include:	
	(a) detailed baseline data;	Section 3
	(b) a description of:	Section 2
	 the relevant statutory requirements (including any relevant consent, licence or lease conditions); 	
	any relevant limits or performance measures/criteria;	Surface Water Management Plan (SWMP) and Groundwater Management Plan (GWMP)
	 the specific performance indicators that are proposed to be used to judge the performance of, or guide the implementation of, the development or any management measures; 	SWMP and GWMP
	 (c) a description of the measures that would be implemented to comply with the relevant statutory requirements, limits, or performance measures/criteria; 	SWMP and GWMP
	(d) a program to monitor and report on the:	Section 9
	 impacts and environmental performance of the development; 	
	 effectiveness of any management measures (see c above); 	
	(e) a contingency plan to manage any unpredicted impacts and their consequences;	Refer to Surface and Groundwater Response Plan (SGWRP)
	 (f) a program to investigate and implement ways to improve the environmental performance of the development over time; 	Section 9 and Section 10
	(g) a protocol for managing and reporting any:	Section 10
	• incidents;	
	• complaints;	
	 non-compliances with statutory requirements; and 	
	 exceedances of the impact assessment criteria and/or performance criteria; and 	
	(h) a protocol for periodic review of the plan.	Section 9
	Note: The Secretary may waive some of these requirements if they are unnecessary for particular management plans.	

2.2 LICENCES, PERMITS AND LEASES

Water management at the MPO is conducted in accordance with a number of licences, permits and leases. Key licences, permits and leases relating to water at the MPO include:

- Water Access Licences (WALs) issued under the Water Management Act, 2000 (Table 3).
- Discharge credits (46) held under the NSW *Protection of the Environment Operations (Hunter River Salinity Trading Scheme) Regulation, 2002* (HRSTS).
- Mining leases 1645, 1708, 1709, 1713, 1750 and 1808 issued under Part 5 of the NSW *Mining Act,* 1992 and approved by the Minister for Mineral Resources.
- EPL 20850 issued under Part 3 of the NSW *Protection of the Environment Operations Act, 1997* by the NSW Environment Protection Authority (EPA).
- The Mining Operations Plan, as required by mining lease conditions issued under the *Mining Act, 1992* and approved by the DRG.

2.3 OTHER LEGISLATION

A description of other legislation relevant to water resources at the MPO is provided in the WMP, SWMP and GWMP.

Table 3

		Other Subtotal	198.9

3 AVAILABLE DATA

The SWB model has been developed using historical climate data representative of the MPO area, as described below.

3.1 CLIMATE DATA

Climate data for the SWB model was sourced from the Queensland Government's Data Drill service (Queensland Government, 2017). This service provides synthetic data sets for a specified point by interpolation between surrounding point records held by the Bureau of Meteorology. Daily evaporation and rainfall data from 1892 to 2012 was obtained for the mine site and used in the SWB model (Section 8).

3.2 HUNTER RIVER FLOW DATA

To calculate periods where licensed discharge could be simulated for the SWB, a relationship between the Hunter River flow rate and river registers for declared 'high' flow events was developed. This relationship was formulated using historical river registers sourced from Department of Industry – Water records, correlated against recorded Hunter River daily flows. This correlation extended to 'flood' flow events in the Hunter River (during which no daily discharge restriction applies). Hunter River flow rates at Muswellbrook were simulated by the Integrated Quantity and Quality Model for the same period of historical climate data as used in the water balance model and these flows used with the above correlation relationship to simulate river registers.

4 WATER MANAGEMENT SYSTEM

The MPO water management system is comprised of a number of dams, the open cut and the Fines Emplacement Area, together with a system of pumped transfers and drains. The Water Management System is shown in Schematic form in Figure 2 and described in detail below. General arrangement of the water management system at the MPO is shown on Figure 3.

Conceptual Project Layout Plans for the MPO, showing the proposed location of key water management system infrastructure, are shown in Attachment 1.

4.1 WATER MANAGEMENT SCHEME

4.1.1 Storage Dams

The Mine Water Dam (MWD) is the main water storage on-site and will supply makeup water to the CHPP. Fine rejects slurry produced by the CHPP will be pumped to the Fines Emplacement Area and water recovered from the Fines Emplacement Area is pumped back to the MWD. Any seepage from the Fines Emplacement Area is captured in a subsurface seepage collection system located at the toe of the Fines Emplacement Area embankment and pumped back to the storage area.

Environmental Dam 2 (ED2) is located downstream of the Fines Emplacement Area and will serve as a sediment dam for the construction of the Fines Emplacement Area.

Other site water storages include:

- Environment Dam Mine Infrastructure Area (EDMIA);
- Environmental Dam 3 (ED3);
- Environmental Farm Dam (EFD6)¹;
- Sediment Dam 1 (SD1);
- Sediment Dam 3 (SD3);
- Sediment Dam 4 (SD4);
- High Wall Dam 1 (HWD1);
- High Wall Dam 2 (HWD2);
- Rail Loop Dam 1 (RLD1);
- Rail Loop Dam 2 (RLD2); and
- CHPP Dam (CHPPD).

Other small farm dams are used periodically as available and required.

Each of these storages are pumped back to the water management system.

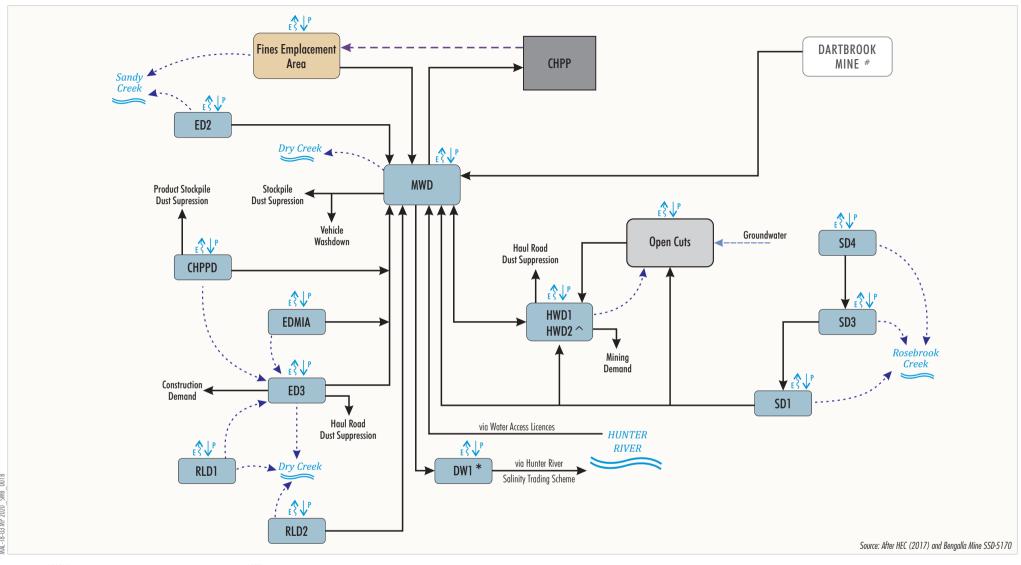

The MWD is able to receive water from the Hunter River via WALs. A discharge dam (DW1) and associated pipeline will also be constructed in the south-southwest of the MPO to receive excess water from the MWD (Attachment 1). DW1 and its associated pipeline were originally approved for construction under the development consent for the Bengalla Continuation Project (SSD-5170) with the intention that the MPO would seek any necessary secondary approvals required to facilitate its use.

00938536-008

9

EFD6 is a small farm dam with a small external catchment area, and as such, has been included in the catchment of ED3.

MOUNT PLEASANT OPERATION

Water Management System **General Arrangement** MACH Energy will seek approval for a licensed discharge point at the outflow from DW1 to the Hunter River, in accordance with the HRSTS as a variation of EPL 20850.

A Clean Water Diversion Drain has been constructed to direct rainfall runoff from upslope undisturbed areas off-site. Groundwater inflow to the open cut is dewatered to HWD1.

RLD1 has been located adjacent to the approved rail loop south of the CHPP, to capture potentially mine affected runoff from this area which would be pumped back to ED3. RLD2 will be commissioned to the east of the CHPP to capture runoff from the approved MOD 4 rail loop.

Temporary sediment dams will also be commissioned to the south of Wybong Road for the construction of the approved MOD 4 rail infrastructure.

The existing storage dams at the MPO are shown on Figure 3.

4.1.2 Drains

A number of drains have been developed and/or are planned as part of the water management system, these include:

- a series of downslope (toe) drains at the perimeter of the Eastern Out of Pit Emplacement, directing runoff to SD1, SD3 and SD4;
- a drain downslope of the CHPP area directing runoff to ED3;
- a short clean water diversion drain upslope of the RLD;
- clean water diversion drains around the perimeter of the Fines Emplacement Area and ED2;
- drains around the out of pit emplacement areas to the north and west of the open cut areas; and
- additional clean water diversion drains upslope of the MWD.

4.2 DAM AND DRAIN DESIGN

The storage dams and their associated design capacities are outlined in Table 4 below.

Actual water storage and sediment dam design capacities may vary from those described in Table 4 based on progressive water balance modelling reviews.

The open cut was excluded from Table 4 because its capacity was not based on design criteria. For modelling purposes, the open cut storage was assumed to comprise a rectangular sump throughout the MPO life and the volume of water stored was tracked within the model and reported to assess potential risk of disruption to mining.

The Fines Emplacement Area was also excluded from Table 4 because its capacity varies with time. The storage was assumed to comprise a sloping fine rejects beach and the water storage level-volume-area relationships were derived for the period where fine rejects are present and estimated from existing topographic contours for the initial storage (at commissioning). A minimum capacity of 400 ML was simulated in early 2023 (just before a planned dam wall raise). The Fines Emplacement Area reclaim pumping rate was set so that no spills were simulated.

The catchment area of sediment dams SD1, SD3 and SD4 was assumed to be the maximum from the Conceptual Project Layout Plans (i.e. as at 2025 [Attachment 1]). The maximum catchment area reporting to ED2 was assumed to be from 2023 onwards from stage plans and Fines Emplacement Area embankment designs.

Table 4
Water Storage and Sediment Dam Design Capacities

Name of Dam	Type of Dam	Design Criterion	Capacity (ML)
ED2	Sediment Dam	Landcom (2004) & DECC (2008)	25.5#
ED3^	Sediment Dam	1% AEP spill risk*	331.7#
RLD1	Sediment Dam	1% AEP spill risk	16.3#
RLD2	Sediment Dam	1% AEP spill risk	9.5
EDMIA	Sediment Dam	Nominal size - spills allowed internally to ED3	17.1#
CHPPD	Mine Water Dam	Nominal size - spills allowed internally to ED3	8.2#
HWD1	Mine Water Dam	Spills (to open cut) once a year on average	117.3#
HWD2	Mine Water Dam	Spills (to open cut) once every two years on average	30.9
CWD1	Clean Water Dam	Spills (to open cut) once every five years on average	6.7
CWD2	Clean Water Dam	Spills (to open cut) once every five years on average	35.2
MWD	Mine Water Dam	Allow for buffer to supply site demands	2,077#
SD1	Sediment Dam	Landcom (2004) & DECC (2008)	51.6#
SD3	Sediment Dam	Landcom (2004) & DECC (2008)	40.2#
SD4	Sediment Dam	Landcom (2004) & DECC (2008)	36.6
DW1	Discharge/Storage Dam	1% AEP spill risk	363

Note:

- ML = Megalitres, AEP = Annual Exceedance Probability and DECC = NSW Department of Environment and Climate Change.
- * MACH Energy has installed a pump and pipeline system at ED3 to dewater the storage to MWD to reduce the potential for overtopping. This would provide additional capacity above the design criterion listed above and further reduce spill risks.
- * Based on as-built survey.
- ^ Includes EFD6.

MACH Energy notes the EPA's advice to Department of Planning and Environment on the Hunter Valley Operations South MOD 5 proposal, which provided guidance regarding sediment dam design in the context of the HRSTS (EPA letter dated 17 March 2017). In accordance with the EPA's recommendations, MACH Energy is monitoring the quality of water in sediment dams in order to regularly evaluate whether the salinity of controlled discharges/managed overflows from the sediment basins complied with the provisions of the HRSTS.

Longer term (2000 to 2020) monitoring results indicate an average EC at all site monitoring points are typically less than the limit for 'saline water' of 400 µS/cm described in the HRSTS Regulation.

Recent (2020) data for SD1 and SD3 have indicated EC values greater than 400 μ S/cm, however this data has been collected during a dry period at the MPO and a correspondingly low water levels in SD1 and SD3 (i.e. due to evapoconcentration of salts). MACH Energy therefore considers that these results would not be indicative of a managed overflow event at SD1 (e.g. in the event of rainfall in excess of design criteria).

MACH Energy will continue to monitor the MPO sediment dams to ensure any controlled discharges are in accordance with the HRSTS.

To date, there have been no licensed discharges from the MPO sediment dams.

Notwithstanding, in the event that monitoring of the water quality in sediment dams after a significant rainfall event indicates that water would not meet the HRSTS maximum for non-regulated discharge, MACH Energy would identify and implement additional management measures in consultation with EPA. These may include:

- Licensing of sediment dams in an EPL and acquisition of additional salinity credits under the HRSTS.
- Increasing the capacity of relevant sediment dams.
- Implementing additional pumping arrangements to return water from the sediment dams to the mine water management system.

The capacities and storage operating levels of the MPO storages were developed based on as-built surveys or iterative simulations to achieve specific design criteria (as summarised in Table 4). For the MWD, ED3 and the RLD1 and 2, which spill externally, a spill risk assessment identified an AEP for each dam and iterative simulations were carried out to identify the required capacity for a given AEP. As noted in Table 4, MACH Energy has installed a pump and pipeline system at ED3 to dewater the storage to MWD. This would provide additional capacity above the design criterion and further reduce spill risks.

Drains are sized in accordance with Landcom (2004) and NSW DECC (2008) guidelines and would either be grassed or rip-rap lined or similar to control erosion.

4.3 MINIMISATION OF WATER USE

MACH Energy's water management strategy includes preferential use of on-site derived mine water, thereby reducing the need to import raw water from external sources for operational purposes. As described in Section 4.1.1, the water management system has been designed to recycle runoff, fine rejects bleed water and groundwater inflow wherever practicable. This water is reused for haul road and stockpile dust suppression, vehicle wash down, and in the CHPP.

Notwithstanding, general water management measures undertaken include, but are not limited to:

- finalising construction of proposed water storages as early as possible to increase site yield;
- limiting the extent of disturbance to reduce dust suppression requirements;
- all surface and groundwater will be taken in accordance with WALs; and
- regularly reviewing water use to identify areas for reduction and identify best practice technologies. This will be reviewed every year as part of the Annual Review process (Section 9.1).

During construction activities, water may be sourced externally, e.g. taken from commercial water fill points in the light industrial area.

MACH Energy would also seek opportunities to source excess mine water from the adjoining mines (i.e. Dartbrook and Bengalla Mines) should it be available, to minimise extraction from the Hunter River. The frequency, quality and quantity of water to be sourced from the Dartbrook or Bengalla Mines would depend on:

- Availability of surplus water on the other mine sites coinciding with a water deficit at the MPO.
- Suitability of Dartbrook/Bengalla water quality for the intended use at the MPO.
- MACH Energy and the other mining operator obtaining all necessary approvals.

MACH Energy would also consider the feasibility of other potential alternative water supply sources over the life of the mine in consultation with DPIE and EPA.

MACH Energy has obtained in-principle agreement with Australian Pacific Coal for Dartbrook Mine to supply some excess mine water to the MPO for its beneficial reuse (Figure 2).

4.4 POTABLE WATER

Treated potable water for all facilities is trucked to site and stored in on-site storage tanks with sufficient capacity to store a 7 day supply. All potable water supplied on-site will meet the requirements of the *Australian Drinking Water Guidelines* (National Health and Medical Research Council, 2011).

5 WATER DEMANDS

5.1 OVERVIEW

Key water demands on-site include the following:

- water used in the CHPP, including water retained in coal products and rejects;
- haul road dust suppression; and
- miscellaneous water usage such as vehicle wash down and stockpile water usage.

A description of these water demands and the assumptions adopted in development of the SWB model is provided in the sections below.

5.2 CHPP

The CHPP accounts for the largest use of water at the MPO. Water lost from the coal handling and preparation process is either entrained within product coal or reject materials. CHPP demand was calculated by simulating the moisture balance² across the CHPP. The resulting forecast CHPP make-up demand rate equates to approximately 270 ML/Mt.

The CHPP water demand was assumed to increase over time, corresponding with the increase of ROM coal production over the mine life. CHPP demand is initially predicted to be at its lowest at the start of production at 2.73 ML/day (ML/d). At maximum production, the MPO is licensed to mine up to 10.5 million tonnes per annum, which yields an assumed water requirement of up to 8 ML/d.

5.3 DUST SUPPRESSION

MPO haul road dust suppression demand was calculated based on haul road lengths derived using mine stage plans. Calculated haul road dust suppression demand averaged approximately 1.2ML/d.

5.4 MISCELLANEOUS (VEHICLE WASHDOWN AND STOCKPILE USAGE)

Vehicle wash down demand was assumed to be 37 ML/year (ML/yr) while dust suppression of stockpiles was assumed to be 115 ML/yr for all modelled years.

5.5 OTHER LOSSES

For the purposes of calculating evaporation losses, storage volume surface areas were derived using storage level-volume-area relationships. Where storage specific information was unavailable, contour data was used to derive storage information.

Evaporation losses were calculated using the following pan factors over the various water storages at the site:

- the Fines Emplacement Area = 1.1 due to the darker fine rejects surface;
- the open cut = 0.8 due to shading effects and lower wind speed at depth; and
- all other storages monthly values varying from 0.84 to 0.95 on the basis of values in McMahon *et al.* (2013) for Scone.

00938536-008 16 **MACHEnergy**

The amount of external water required to process coal through the CHPP (i.e. the difference between the moisture content in the ROM coal [input] and the moisture content in the product coal, coarse rejects and tailings [output]).

6 CONTROLLED WATER RELEASE

6.1 TREATED EFFLUENT DISPOSAL

Wastewater from offices, workshop and bath houses is collected and treated in on-site effluent treatment systems located within the Mine Infrastructure Area and the CHPP. Effluent is treated to meet the *Australian Guidelines for Water Recycling* (Environment Protection and Heritage Council, 2006), as well as NSW Health Department and local council requirements. Any additional effluent sites installed for expanded operations will be appropriately licensed. Effluent is removed from site by a suitably qualified contractor. Additionally, on-site treated effluent may be pumped to the MWD to supplement CHPP usage, vehicle wash down and stockpile dust suppression.

Any treated effluent released from the MWD to the Hunter River via the HRSTS will comply with the discharge conditions specified in EPL 20850.

6.2 LICENSED DISCHARGE

Licensed discharge will occur between MWD and the Hunter River via DW1 when appropriate secondary approvals are obtained. At the appropriate time, MACH Energy will seek these approvals in accordance with the HRSTS as a variation of EPL 20850 (Section 4.1.1).

The HRSTS regulates the amount and salinity of water which can be discharged into the Hunter River.

7 WATER SOURCES

Sources of water supply to the MPO are summarised below:

- groundwater inflows to the open cut;
- runoff captured from the footprint of the mining disturbance area by the water management system;
- fine rejects bleed water captured from the Fines Emplacement Area; and
- water pumped from the Hunter River and/or groundwater supply bores.

Operational water supply is reviewed regularly, collating all groundwater extractions, in-pit rainfall accumulation and runoff, as well as imported water to inform on-site water management.

MACH Energy will manage the available water sources and, if necessary, adjust the scale of operations to match the available water supply (in accordance with Condition 25, Schedule 3 of Development Consent DA 92/97).

MACH Energy would also seek opportunities to source excess mine water from the adjoining mines (i.e. Dartbrook and Bengalla Mines) should it be available (Section 4.3). However, potential access to excess water from other mining operations has not been currently assumed for this SWB model.

7.1 GROUNDWATER INFLOWS

Groundwater inflows were assumed to progressively increase over time, corresponding to the size of the open cut increasing over the mine life. The assumed pit inflow rate was lowest in 2018 at 0.11 ML/d, and peaking in 2026 at 0.69 ML/d. These inflow rates were reduced before use in the SWB model, to allow for evaporation from the exposed coal seams. Evaporation rates were calculated based upon coal seam thickness and strike length, using a pan factor of 0.8.

The median net inflow rate (incorporating evaporation) increased progressively, peaking yearly in the winter months. The inflow rate increased from a negligible daily rate, to approximately 0.2 ML/d for the final year of the initial five year operating period (during winter 2024).

7.2 CATCHMENT RUNOFF

As far as practical, clean water runoff from up catchment areas is diverted around active mining and other disturbance areas. Diversion design will consider catchment extent, required disturbance and safety. Water that accumulates within mining pits is pumped to surface storages for reuse in the mining operations and CHPP, as described in Section 4.1.

Catchment areas were derived using mine stage plans and converting mine areas into different sub-catchment types based upon their function and expected runoff behaviour. This is described in detail in Section 8.2.

7.3 FINE REJECTS BLEED WATER

As described in Section 4.1.1, fine rejects slurry will be pumped from the CHPP to the Fines Emplacement Area. Fine rejects bleed water is water liberated from fine rejects slurry as it settles. This water ponds at the fine rejects surface and is available for reclamation. Fine rejects bleed water recovered from the Fines Emplacement Area is pumped to the MWD.

The fine rejects bleed rate was assumed to increase progressively over the mine life due to the increased rate of ROM coal being handled in the CHPP (See Section 5.2). The bleed rate was assumed to be negligible in the first year of operations, approximately 2.5 ML/d during 2019 and approximately 5.5 ML/d for the rest of the simulation (2020 to end 2024).

7.4 PUMPING FROM THE HUNTER RIVER/GROUNDWATER SUPPLY BORES

714 ML/yr of Hunter River High Security Entitlment WALs and 829 ML/yr of MACH Energy's Hunter River General Security WALs are assumed to be available for the MPO currenlty. Up to 842 ML/yr of Hunter River High Security Entitlment WALs and 2,785 ML/yr of River General Security WALs could be made available in future if required.

The Integrated Quantity and Quality Model (IQQM) is the model used by the Department of Planning, Industry and Environment – Water (DPIE – Water) to set licence allocation levels in the Hunter Valley, in accordance and in conjunction with the *Water Sharing Plan for the Hunter Regulated River Water Source 2016.*

IQQM simulations have previously been undertaken using climatic data from 1892 to 2012 (the same period of data as used in the water balance model) to generate predictions of General Security WALs available water determinations, periods of off-allocation flow and volume of water stored in Glenbawn Dam and Glennies Creek Dam (the two Hunter River major regulating storages), used to estimate available water determinations for WALs.

MACH Energy may also obtain make-up water from groundwater supply bores. Any water taken from groundwater bores would be in accordance with WALs issued under the relevant water sharing plan (i.e. depending on the relevant groundwater source).

8 WATER BALANCE MODELLING

8.1 OVERVIEW

The water balance model for the life of mine (ten year period) has been developed for the MPO, beginning on 1 March 2017 and simulating until the end of 2026 (HEC, 2018).

A short-term operational water balance model has also been developed for the initial operating period, beginning on 1 August 2019 and simulating until the end of 2024 (HEC, 2020). The initial five year operating period model has been informed by as-built survey of the water management system and mine plans for the first five years of operations (including surface disturbance/rehabilitation plans and a production schedule).

Both models have been developed using the GoldSim simulation package. The model simulates the behaviour of water held in and pumped between all simulated water storages shown in Figure 2. For each storage, the model simulates:

Change in Storage = Inflow – Outflow Where:

- *Inflow* includes rainfall runoff, groundwater inflow (to the open cut), fine rejects bleed water, water pumped from the Hunter River and all pumped inflows from other storages.
- Outflow includes evaporation, spill, licensed discharge to the Hunter River via the HRSTS and all pumped outflows to other storages or to a demand sink (e.g. the CHPP).

The models operate on an 8-hourly time step. The models simulate 121 'realisations', derived using ten and five year time steps of the historical daily climatic record from 1892 to 2012, respectively³. The results from all realisations were used to generate estimates of supply reliability, spill and open cut water inventory. This method effectively includes all recorded historical climatic events in the water balance model, including high, low and median rainfall periods.

The sections below present the information derived from the initial five year water balance model (HEC, 2020) with the exception of Sections 8.3 and 8.4, which present the results derived from the life of mine water balance model (HEC, 2018).

8.2 SIMULATION OF CATCHMENT RUNOFF

Rainfall runoff in the water balance model was simulated using the Australian Water Balance Model (AWBM) (Boughton, 2004). The AWBM is a nationally-recognised catchment-scale water balance model that estimates catchment yield (flow) from rainfall and evaporation.

00938536-008 20 MA

Realisation 1 for the life of mine model (ten year simulation period) uses climate data from 1892 to 1902, realisation 2 uses data from 1893 to 1903 etc. Realisation 1 for the five year water balance model uses climate data from 1892 to 1897, realisation 2 uses data from 1893 to 1998 etc.

The MPO site was split into six different sub-catchment types for AWBM simulation, these were:

- undisturbed (natural) areas;
- hardstand (for example, roads and infrastructure areas);
- open cut pit;
- active waste rock emplacements;
- · rehabilitated waste rock emplacements; and
- fine rejects.

AWBM simulation of flow from each of the sub-catchment types was undertaken. Evaporation pan factors were set to 1 for fine rejects and hardstand areas and 0.85 for all other sub-catchment types. The fine rejects sub-catchment was split into two classifications: wet beach (20% of the area), and dry beach (80% of the area), to allow for the different runoff properties expected.

For water surface areas, rainfall was assumed to add directly to the storage volume with no losses.

Catchment areas for the above sub-catchment types changed progressively over the life of the mine, due to changes in surface topography and water storage size. Catchment sizes were calculated for years 2019, 2021, 2023 and 2025. These areas were derived using mine stage plans, which showed the variance of surface contours and mining areas over the initial operating period. Catchment areas for in-between years were calculated by linearly interpolating between the catchment values for these four years.

The total catchment area peaks at approximately 1580 ha at the start of the simulation period, with a reduction due to the construction of a clean water diversion upslope of the open cut pit and SD4.

8.3 OVERALL WATER BALANCE

Water balance results, averaged over all 121 model realisations during the life of mine simulation period are presented in Table 5 below. The results for this single realisation show inflows and outflows for a representative climate sequence.

It should be recognised that the following items are subject to climatic variability:

- rainfall runoff;
- evaporation; and
- licensed site releases (including licensed sediment dam spills).

The results presented in Table 5 are an average of all realisations, and will include wet and dry periods distributed throughout the mine life. Rainfall yield for each phase is affected by the variation in climatic conditions within the adopted climate sequence.

Table 5
Average Annual Water Balance

Water Inflows			
Inflow	Volume (ML/Yr)	Approximate Percentage of Total Inflow (%)	
Runoff	1746	53	
Groundwater	13	0	
Fine Rejects Bleed Water	887	27	
Hunter River Pumping (via WALs)	656	20	
	Water Outflows		
Outflow	Volume (ML/Yr)	Approximate Percentage of Total Outflow (%)	
Evaporation	393	12	
CHPP Demand	1876	58	
Haul Road Demand	510	16	
Stockpile Demand	112	3	
Vehicle Wash Demand	36	1	
Discharge to Hunter River (via HRSTS)	217	7	
Non Sediment Dam Spillage	0.7	0	
Sediment Dam Spillage	18	0.6	
Off-site Clean Water Discharge	60	2	

Rainfall runoff provides the greatest average modelled system inflow, accounting for 53% of total inflows, followed by water liberated from fine rejects bleed water (27%). Licensed extraction via WALs accounts for approximately 20% of inflows on average. Average outflows are dominated by supply to the CHPP (58%), followed by supply for haul road dust suppression (16%) and evaporation (12%).

8.4 SIMULATED HUNTER RIVER INTERACTION

As part of the water balance output, graphs of modelled outputs for the simulated extraction and release of water to/from the Hunter River were produced. These graphs showed the 5th, 10th, 90th and 95th percentile, as well as the median extraction/discharge values over the life of mine simulation period, and are presented in the sections below.

8.4.1 Hunter River Extraction

Figure 4 below presents the predicted extraction from the Hunter River simulated over the life of mine period.

8.4.2 Hunter River Discharge

Figure 5 below presents the predicted discharge to the Hunter River simulated over the life of mine period.

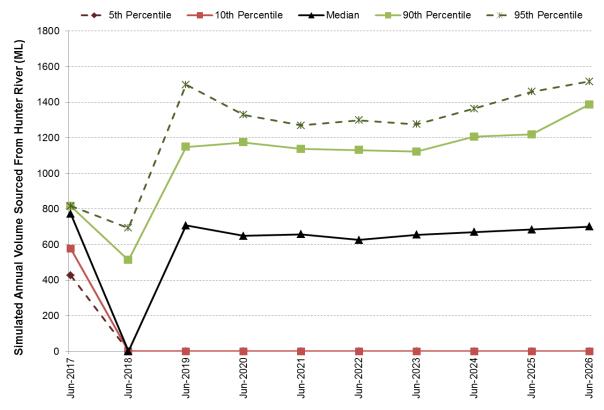

Figure 4: Simulated Hunter River Extraction

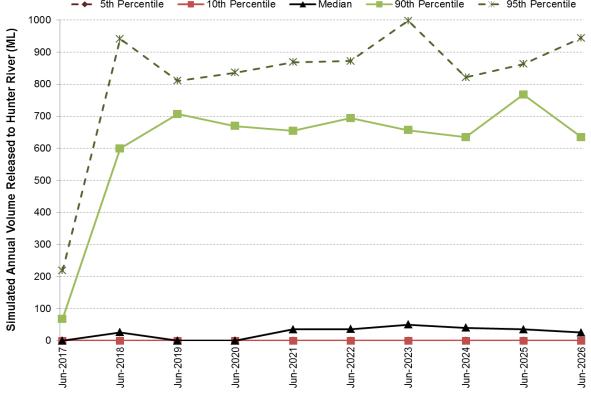

Figure 5: Simulated Hunter River Release

8.5 EXTERNAL OVERFLOWS

Sediment dams were designed to operate in accordance with the criteria listed in Table 4. The sediment dams overflowed when rainfall exceeded the design rainfall event. No overflows occurred from the MWD or Fines Emplacement Area.

8.6 WATER SUPPLY RELIABILITY

Predicted average supply reliability is expressed as total water supplied divided by total demand (i.e. a volumetric reliability) over the simulation period. Average supply reliability for the initial operating period over all climatic realisations for CHPP supply, haul road dust suppression and stockpile dust suppression are summarised in Table 6.

Table 6
Summary of Average Modelled Water Supply Reliability

CHPP Supply	Haul Road Dust Suppression	Stockpile Dust Suppression
96.8%	81.1%	98.5%

An average 96.8% supply reliability is equivalent to 68 days lost operation over the initial operating simulation period.

The water balance modelling indicates that the average haul road dust suppression water supply reliability across the simulated climatic sequences would be 81.1%. During operations, MACH Energy would undertake periodic updates to the site water balance modelling. This would allow MACH Energy to maintain the continuity of water supply for dust suppression by identifying and implementing additional management measures as required.

These may include:

- acquiring additional WALs;
- adding or relocating pumps to provide additional supply to truckfill points and/or installing additional truckfill points on the MWD or other available water storages;
- increasing the available water storage capacity on-site (e.g. providing additional in pit storage capacity) to provide additional buffer capacity; and/or
- adjusting coal washing rates in the CHPP (and potentially producing additional bypass coal) as necessary in particularly dry periods to maintain continuity of dust suppression activities.

As discussed in Section 4.3, MACH Energy may also pursue opportunities to source water from adjoining mine operations (e.g. Dartbrook and Bengalla mines), should it be mutually advantageous and subject to obtaining any necessary approvals.

9 REVIEW AND IMPROVEMENT OF ENVIRONMENTAL PERFORMANCE

9.1 ANNUAL REVIEW

In accordance with Condition 3, Schedule 5 of Development Consent DA 92/97 MACH Energy will review and evaluate the environmental performance of the MPO by the end of March each year (for the preceding calendar year) (or other such timing as agreed by the Secretary).

In relation to water, the Annual Review will:

- include a review of the SWB relating to the MPO over the past year, which includes a comparison of these results to evaluate compliance against the:
 - relevant statutory requirements, limits or performance measures/criteria (refer Section 2.1);
 - monitoring results of the previous years; and
 - relevant predictions in the EIS and MOD 1, MOD 2, MOD 3 and MOD 4 EAs;
- identify any water-related non-compliance over the past year, and describe what actions were (or are being) taken to ensure compliance;
- identify any trends in the water monitoring data over the life of the MPO;
- identify any discrepancies between the predicted and actual water impacts of the MPO, and analyse
 the potential cause of any significant discrepancies; and
- describe what water-related measures will be implemented over the next year to improve the environmental performance of the MPO.

The Annual Review will be made publicly available on the MACH Energy website (https://machenergyaustralia.com.au/) in accordance with Condition 11, Schedule 5 of Development Consent DA 92/97.

9.2 SWB REVISION

In accordance with Condition 4, Schedule 5 of Development Consent DA 92/97, this SWB will be reviewed, and if necessary revised to the satisfaction of the Secretary of the DPIE, within three months of the submission of:

- an Annual Review (Condition 3, Schedule 5);
- an incident report (Condition 7, Schedule 5);
- an Independent Environmental Audit (Condition 9, Schedule 5); and
- any modification to the conditions of Development Consent DA 92/97⁴.

Within 4 weeks of conducting any such review, the Secretary of the DPIE will be advised of the outcomes of the review and any revised documents submitted to the Secretary for approval.

In accordance with Condition 4A, Schedule 5 of Development Consent DA 92/97, MACH Energy may submit a revised SWB for the approval of the Secretary at any time, and may also submit any revision to this SWB required under Development Consent DA 92/97 on a staged basis.

00938536-008 25 **MACHEnergy**

⁴ Note that in the event of an inconsistency between Condition 4(d), Schedule 5 of Development Consent DA 92/97 and any Condition in Schedule 3 of Development Consent DA 92/97, the latter prevails.

If agreed with the Secretary of the DPIE, a revision to this SWB required under Development Consent DA 92/97 may be prepared without undertaking consultation with all parties nominated under the relevant Condition of Development Consent DA 92/97.

This SWB will be made publicly available on the MACH Energy website (https://machenergyaustralia.com.au/), in accordance with Condition 11, Schedule 5 of Development Consent DA 92/97.

10 REPORTING PROCEDURES

In accordance with Condition 2, Schedule 5 of Development Consent DA 92/97, MACH Energy has developed protocols for managing and reporting the following:

- incidents;
- complaints;
- non-compliances with statutory requirements; and
- exceedances of the impact assessment criteria and/or performance criteria.

These protocols are described in Section 5 of the WMP.

In accordance with Condition 8, Schedule 5 of Development Consent DA 92/97, MACH Energy will provide regular reporting on the environmental performance of the MPO on the MACH Energy website (https://machenergyaustralia.com.au/).

EROSION AND SEDIMENT CONTROL PLAN

Department of Planning and Environment

Mr Chris Lauritzen General Manager – Resource Development MACH Energy Australia Pty Ltd Suite 1, Level 3, 426 King Street Newcastle West, NSW, 2302

21/09/2022

Subject: Mt Pleasant Coal (DA92/97) Erosion and Sediment Control Plan

Dear Mr Lauritzen

I refer to the Erosion and Sediment Control Plan submitted to the Department for review following the completion of the Independent Environmental Audit, in accordance with Condition 9, Schedule 5 of the Mt Pleasant Coal development consent (DA 92/97). I also acknowledge your response to the Department's review comments and request for additional information.

The Department has carefully reviewed the Erosion and Sediment Control Plan and is satisfied that it meets the requirements of the relevant conditions in (DA 92/97).

Accordingly, as nominee of the Secretary, I approve the Erosion and Sediment Control Plan (revision 01, dated 28 July 2022).

You are reminded that if there are any inconsistencies between the Erosion and Sediment Control Plan and the conditions of approval, the conditions prevail.

Please ensure you make the document publicly available on the project website at the earliest convenience.

If you wish to discuss this matter further, please contact Tegan Cole on 02 9895 6457 or via email at tegan.cole@planning.nsw.gov.au.

Yours sincerely

Stephen O'Donoghue

Director

1 INTRODUCTION

The Mount Pleasant Operation (MPO) is located in the Upper Hunter Valley of New South Wales (NSW), approximately 3 kilometres (km) north-west of Muswellbrook and approximately 50 km north-west of Singleton (Figure 1). The village of Aberdeen and locality of Kayuga are also located approximately 5 km north-northeast and 1 km north of the MPO boundary, respectively (Figure 1). MACH Energy purchased the MPO from Coal & Allied Operations Pty Ltd (Coal & Allied) in 2016.

MACH Mount Pleasant Operations Pty Ltd is the manager of the MPO as agent for, and on behalf of, the unincorporated Mount Pleasant Joint Venture between MACH Energy Australia Pty Ltd (MACH Energy) (95 per cent [%] owner) and J.C.D. Australia Pty Ltd (5% owner). This Erosion and Sediment Control Plan (ESCP) is implemented at the MPO by MACH Energy.

The initial development application for the MPO was made in 1997. This was supported by an Environmental Impact Statement (EIS) prepared by Environmental Resources Management (ERM) Mitchell McCotter (ERM Mitchell McCotter, 1997). On 22 December 1999, the then Minister for Urban Affairs and Planning granted Development Consent DA 92/97 to Coal & Allied. This allowed for the "Construction and operation of an open cut coal mine, coal preparation plant, transport and rail loading facilities and associated facilities" at the MPO. The consent allowed for operations 24 hours per day seven days per week and the extraction of 197 million tonnes (Mt) of run-of-mine (ROM) coal over a 21 year period, at a rate of up to 10.5 Mt of ROM coal per year.

The Mount Pleasant Project Modification (MOD 1) was submitted on 19 May 2010 with a supporting Environmental Assessment (EA) prepared by EMGA Mitchell McLennan (EMGA Mitchell McLennan, 2010). MOD 1 included the provision of an infrastructure envelope for siting the mine infrastructure, the provision of an optional conveyor/service corridor linking the MPO facilities with the Muswellbrook-Ulan Rail Line and modification of the existing Development Consent DA 92/97 boundaries to accommodate the optional conveyor/service corridor and minor administrative changes. MOD 1 was approved on 19 September 2011.

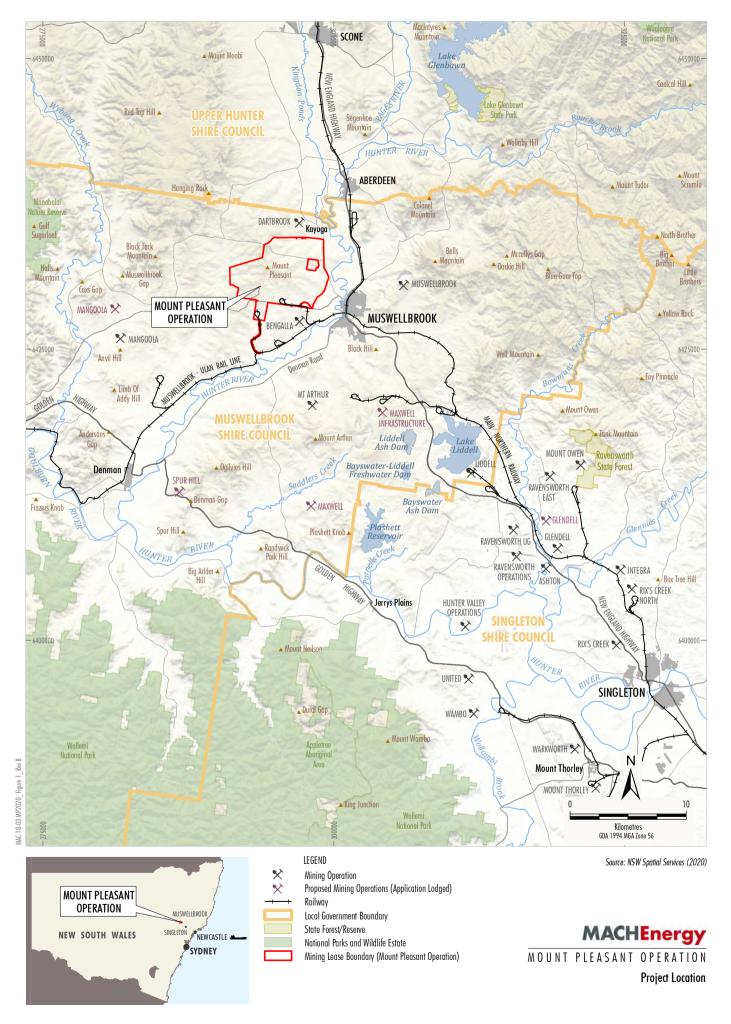

The MPO South Pit Haul Road Modification (MOD 2) was submitted on 30 January 2017 with a supporting EA prepared by MACH Energy (MACH Energy, 2017a). MOD 2 proposed to realign an internal haul road to enable more efficient access to the South Pit open cut, with no other material changes to the approved MPO. MOD 2 was approved on 29 March 2017.

The MPO Mine Optimisation Modification (MOD 3) was submitted on 31 May 2017 with a supporting EA prepared by MACH Energy (MACH Energy, 2017b). MOD 3 comprised an extension to the time limit on mining operations (to 22 December 2026) and extensions to the South Pit Eastern Out of Pit Emplacement to facilitate development of an improved final landform. MOD 3 was approved on 24 August 2018.

The MPO Rail Modification (MOD 4) was submitted on 18 December 2017 with a supporting EA prepared by MACH Energy (MACH Energy, 2017c). MOD 4 proposed the following changes:

- duplication of the approved rail spur, rail loop, conveyor and rail load-out facility and associated services;
- duplication of the Hunter River water supply pump station, water pipeline and associated electricity supply that followed the original rail spur alignment; and
- demolition and removal of the redundant approved infrastructure within the extent of the Bengalla Mine, once the new rail, product loading and water supply infrastructure has been commissioned and is fully operational.

00945630-007 1 **MACHEnergy**

MOD 4 was approved on 16 November 2018 by the Secretary of the Department of Planning and Environment (under Delegation). Appendix 2 of the modified Development Consent DA 92/97 illustrates the Conceptual Project Layout Plan of the approved MPO at 2021 and 2025, Approved Surface Disturbance Plan and Conceptual Final Landform (Attachment 1) incorporating the MOD 4 infrastructure relocations.

1.1 PURPOSE AND SCOPE

This Erosion and Sediment Control Plan (ESCP) has been prepared by MACH Energy to satisfy the requirements under Development Consent DA 92/97 (as modified) and specifically Condition 28(b), Schedule 3.

This ESCP describes the management measures proposed to control potential erosion impacts associated with construction and operation of the MPO, including for example, initial establishment and development works, open cut mining, operation of the coal handling and preparation plant, rail spur/loop and Fines Emplacement Area, and the supply of water to the MPO.

The ESCP applies to all employees and contractors at the MPO and covers all areas within the MPO boundary. The ESCP applies to the life of the MPO, including (but not limited to) the period of mining operations specified in Development Consent DA 92/97, which currently permits mining until 22 December 2026. As required by Condition 5, Schedule 2 of Development Consent DA 92/97, the ESCP will continue to apply (excluding mining operations) beyond 22 December 2026, as required, until the rehabilitation and any additional undertakings (required by the Secretary of the NSW Department of Planning, Industry, and Environment [DPIE], or the Division of Mining, Exploration and Geoscience [MEG] within the Department of Regional NSW) have been carried out satisfactorily.

This ESCP has been developed in-line with best practice erosion and sediment control measures listed in *Managing Urban Stormwater Soils and Construction Volume 1* (Landcom, 2004), *Managing Urban Stormwater Soils and Construction Volume 2E – Mines and quarries* (NSW Department of Environment and Climate Change [DECC], 2008), and the International Erosion Control Association (IECA) Australasian document, *Best Practice Erosion and Sediment Control* (IECA, 2008).

1.2 STRUCTURE OF THE ESCP

This ESCP is a component of the Water Management Plan (WMP) for the MPO.

The remainder of the ESCP is structured as follows:

- Section 2: Outlines the statutory obligations relevant to this ESCP.
- Section 3: Provides a description of the baseline data available for the MPO which relates to this ESCP.
- Section 4: Outlines the potential causes of soil erosion, sedimentation and flooding, relevant to the MPO.
- Section 5: Describes the MPO erosion and sediment control strategy.
- Section 6: Outlines the review process for MPO documentation, including in particular for this ESCP.
- Section 7: Outlines the reporting procedures proposed for the MPO.
- Section 8: Provides a list of references cited in this report.

2 STATUTORY OBLIGATIONS

The statutory obligations relevant to the MPO are contained in:

- the conditions of Development Consent DA 92/97 (as modified);
- the condition of the Commonwealth Approval EPBC 2011/5795;
- relevant licences (including Environment Protection Licence [EPL] 20850), permits and mining leases (MLs) (ML 1645, ML 1708, ML 1709, ML 1713, ML 1750 and ML 1808); and
- other relevant legislation.

Obligations relevant to this ESCP are described below.

2.1 DEVELOPMENT CONSENT DA 92/97

The conditions of Development Consent DA 92/97 relevant to the content and structure of this ESCP are described below. A comprehensive list of all conditions in Development Consent DA 92/97 relevant to water is provided in the WMP.

2.1.1 ESCP Requirements

Condition 28(b), Schedule 3 of Development Consent DA 92/97 requires the preparation of an ESCP as part of the WMP for the MPO (refer Table 1).

Table 1
ESCP Development Consent DA 92/97 Conditions

MPO Development Consent DA 92/97 Schedule 3	Section where addressed in this ESCP document
28. The Applicant must prepare a Water Management Plan for the development to the satisfaction of the SecretaryThe plan must include:	
(b) an Erosion and Sediment Control Plan, which must:	
identify activities that could cause soil erosion, generate sediment or affect flooding;	Section 4
 describe measures to minimise soil erosion and the potential for the transport of sediment to downstream waters, and manage any flood risk; 	Section 5
 describe the location, function, and capacity of erosion and sediment control structures; 	Section 5
 describe what measures would be implemented to maintain the structures over time; 	Section 5

2.1.2 Management Plan (General) Requirements

Condition 2, Schedule 5 of Development Consent DA 92/97 outlines the general management plan requirements that are applicable to the preparation of the ESCP.

Table 2 presents these requirements and indicates where each is addressed within this ESCP.

Table 2 General Development Consent DA 92/97 Conditions

	MPO Development Consent DA 92/97 Schedule 5	Section where addressed in this ESCP Document
2.	The Applicant must ensure that the management plans required under this consent are prepared in accordance with any relevant guidelines, and include:	
	(a) detailed baseline data;	Section 3
	(b) a description of:	
	 the relevant statutory requirements (including any relevant consent, licence or lease conditions); 	Section 2
	any relevant limits or performance measures/criteria;	Surface Water Management Plan (SWMP) and Groundwater Management Plan (GWMP)
	 the specific performance indicators that are proposed to be used to judge the performance of, or guide the implementation of, the development or any management measures; 	SWMP and GWMP
	 (c) a description of the measures that would be implemented to comply with the relevant statutory requirements, limits, or performance measures/criteria; 	Section 5
	(d) a program to monitor and report on the:	Section 6
	 impacts and environmental performance of the development; 	
	 effectiveness of any management measures (see c above); 	
	(e) a contingency plan to manage any unpredicted impacts and their consequences;	Surface and Ground Water Response Plan
	 (f) a program to investigate and implement ways to improve the environmental performance of the development over time; 	Section 6
	(g) a protocol for managing and reporting any:	Section 7
	• incidents;	
	• complaints;	
	 non-compliances with statutory requirements; and 	
	 exceedances of the impact assessment criteria and/or performance criteria; and 	
	(h) a protocol for periodic review of the plan.	Section 6
	Note: The Secretary may waive some of these requirements if they are unnecessary or unwarranted for particular management plans.	

2.2 LICENCES, PERMITS AND LEASES

Water management at the MPO is conducted in accordance with a number of licences, permits and leases. Key licences, permits and leases relating to water at the MPO include:

- Water Access Licences (WALs) issued under the Water Management Act, 2000.
- Discharge credits (46) held under the NSW Protection of the Environment Operations (Hunter River Salinity Trading Scheme) Regulation, 2002.
- ML 1645, ML 1708, ML 1709, ML 1713, ML 1750 and ML 1808 issued under Part 5 of the NSW *Mining Act, 1992* and approved by the Minister for Mineral Resources.
- Environment Protection Licence 20850 issued under Part 3 of the NSW *Protection of the Environment Operations Act, 1997* by the NSW Environment Protection Authority (EPA).
- The Mining Operations Plan, as required by ML conditions issued under the *Mining Act 1992* and approved by the MEG.

2.3 OTHER LEGISLATION

A description of other legislation relevant to MPO water management is provided in the WMP, SWMP and GWMP.

3 BASELINE DATA

3.1 SOIL TYPES

Soil type data derived across the MPO area from the 1997 EIS is summarised in Table 3 below.

Table 3
Summary of Soil Types

Soil Types	Characteristics	
Alluvial – Floodplain Soils	Uniform medium or fine textured clay profile, consisting of clay loams, silty clay loam or light clay topsoils.	
	Slightly to highly dispersive.	
Drainage Flat / Drainage	Brown solonised soils and brown and yellow solidic soils.	
Line Soils	Slightly dispersible topsoils and highly dispersible subsoils.	
Hillslope Soils	Dominate the study area.	
	Topsoils are stable though occasionally highly dispersible.	
	Subsoils are highly dispersible.	
Sandy Hillslope Soils	Sandy parent material.	
	Topsoil in two layers:	
	Light sandy clay loam, loam fine sandy or fine sandy clay loam.	
	Clayey sand, sandy loam or light – fine sandy clay loam.	
	Subsoil is sandy – light medium clay – slightly – highly dispersible.	
Volcanic Hillslope Soils	Uniform structured clay soils.	
	Topsoil is fine sandy clay loam or light clay.	
	Subsoils consist of silty – light medium clays.	
	Slight – moderate dispersibility.	

Source: ERM Mitchell McCotter (1997).

More recently, Golder Associates (2016) compiled a Geotechnical Investigation Report on the MPO area. This investigation described the typical soil conditions found at the site as follows:

- 1. Vegetation cover throughout the site varies with grass cover in lower areas including gullies and flood plains.
- 2. Topsoil depth generally ranges from 0.2 metres (m) to 0.4 m depth. Topsoils generally comprise of sandy and/or silty clays.
- 3. Alluvial soils underlying the topsoil generally comprise cohesive soils and granular soils.
 - i. Alluvial soils are predominately cohesive, comprising clay with varying quantities of silt and sand.
 - ii. Granular soils were only encountered on the lower slopes, towards the south-eastern portion of the site. Granular soils comprise a mixture of sand and gravel with up to 30% silts and clays.
- 4. Residual soils generally comprise clays derived from the weathering of the underlying sandstone and siltstone materials. Residual soils are generally less than 1 m in depth.
- 5. Bedrock encountered in the shallow excavations generally comprised sandstone or siltstone.

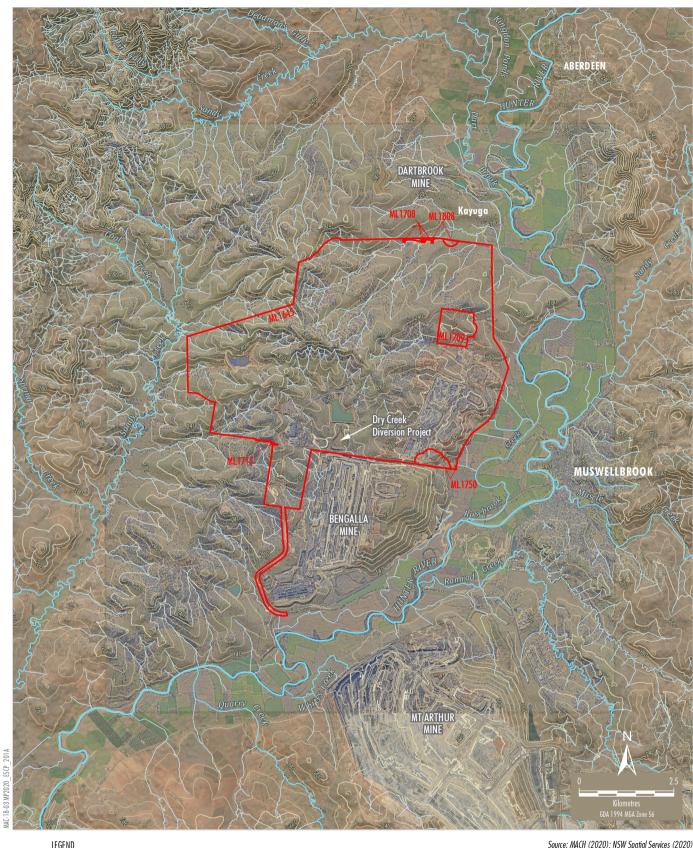

In the southern portion of the MPO area, deep alluvial soil deposits associated with the Hunter River system exist.

3.2 FLOOD EVENTS

The main drainage feature within the vicinity of the MPO is the Hunter River which flows in a southerly direction approximately 1 km to the east of the MPO ML boundary. There are a number of ephemeral drainage lines which traverse the MPO area and drain into the Hunter River. The eastern portion of the MPO area drains via Rosebrook Creek, as well as other unnamed drainages. Areas in the south and west of the MPO area drain via an unnamed drainage line (sometimes referred to as Dry Creek) and Sandy Creek respectively, both of which are tributaries of the Hunter River. All other areas drain into unnamed drainage lines, which flow directly into the Hunter River. Figure 2 shows the drainage network and topography in the vicinity of the MPO.

In 2018, Royal HaskoningDHV completed a Muswellbrook Floodplain Risk Management Study on behalf of the Muswellbrook Shire Council (Royal HaskoningDHV, 2018). Royal HaskoningDHV (2018) determined the 1% Annual Exceedance Probability (AEP) flood extent for the Hunter River.

The 1% AEP flood extent, in conjunction with the Approximate Eastern Extent of Approved Surface Development of the MPO, and the approved MOD 4 rail spur, are shown on Figure 3.

Hunter River -1% AEP Flood Extent

4 POTENTIAL CAUSES OF SOIL EROSION, SEDIMENTATION AND FLOODING EFFECTS

Key activities that have the potential to cause or increase soil erosion and sedimentation at the MPO are disturbance of land and soils in relation to mining activities involving clearing, stripping and stockpiling activities. Specifically, these include:

- clearing and stripping of land prior to mining, or for other mining related activities;
- clearing of land for some Aboriginal archaeological surveys (i.e. scrapes);
- open cut mining activities including the placement of overburden and topsoil stockpiling;
- · exploration activities;
- installation of services and infrastructure, including mine water dams, sumps and drains;
- changes to drainage lines and/or catchments, including upslope diversions;
- excavation of borrow areas and quarries for obtaining material for construction;
- management and rehabilitation of the Fines Emplacement Area;
- use of coal stockpiles and coal handling equipment including mobile equipment, coal crushing equipment, train loading infrastructure and conveyors;
- runoff from haul roads and access roads;
- · vehicle and equipment movements; and
- earthworks associated with mine site rehabilitation.

4.1 FLOODING EFFECTS

As shown on Figure 3, the Eastern Extent of Approved Surface Development (incorporating the MPO major landforms) are located outside the 1% AEP flood extent for the Hunter River. Accordingly, the potential for the MPO major landforms to result in changes to flood depth, extent or velocity in the vicinity of the MPO is considered to be negligible.

Notwithstanding, the approved MPO MOD 4 rail spur would cross the Hunter River floodplain, as defined by the 1% AEP flood extent (Figure 3). MACH Energy's proposed management of flood risks associated with the MOD 4 rail infrastructure (including the rail spur) is outlined in Section 5.5.

5 EROSION AND SEDIMENT CONTROL STRATEGY

Erosion and sediment controls are implemented at the MPO to mitigate the impacts of the proposed development on nearby watercourses and the surrounding environment. Standard erosion and sediment control techniques are designed and operated in accordance with the requirements of *Managing Urban Stormwater: Soils and Construction Volume 1* (Landcom, 2004) and *Volume 2E – Mines and Quarries* (DECC, 2008).

A summary of the general erosion and sediment control principles employed by MACH Energy to limit erosion on site are outlined in Section 5.1. In addition, site specific erosion and sediment control strategies are described in Section 5.2, and design criteria associated with the ESCP are described in Section 5.3.

5.1 GENERAL PRINCIPLES

The following general principles underpin MACH Energy's approach to erosion and sediment control at the site:

- Minimising surface disturbance and restricting access to undisturbed areas.
- Progressive rehabilitation/stabilisation of mining and infrastructure areas.
- Separation of runoff from disturbed and undisturbed areas, where practicable.
- Management of runoff from mining and infrastructure areas through the mine water management system.
- Construction of suitable erosion and sediment controls such as drains and sediment dams to control, contain and manage sediment laden surface runoff.

Development activities will generally occur in the following order:

- 1. Installation of a stabilised site access route.
- 2. Selective stripping and stockpiling of available topsoil.
- 3. Construction of diversion drains (typically upslope of disturbance areas) these are only constructed where they significantly reduce the catchment reporting to disturbance areas.
- 4. Construction of appropriately sized sediment dams/sumps where required to provide for temporary retention of runoff from disturbance areas. Where practicable, existing farm dams, mine water dams and open cut pits will be preferentially utilised for this purpose.
- 5. Construction of collection drains (downslope of or within disturbance areas) where required, to convey runoff to sediment dams or other mine water storages.
- 6. Construction of sediment controls (e.g. sediment fences) downslope of disturbance and stockpile areas, where required.

Construction/development works and mining activities will only take place once appropriate erosion and sediment control measures are in place.

5.2 EROSION AND SEDIMENT CONTROL MEASURES

Typical erosion and sedimentation control strategies that will be implemented for construction, operation and rehabilitation activities at the MPO are described in the sections below. Specific erosion and sediment controls will be designed in conjunction with the design of water management systems.

The function and capacity of key erosion and sediment control structures (e.g. environmental and sediment dams) are described in Sections 4.1 and 4.2 of the Site Water Balance. The location of these features is shown on the Conceptual Project Layout Plans in Attachment 1.

5.2.1 Erosion and Sediment Control

The following erosion and sediment control measures will be implemented in all areas of the site where disturbance from construction/development and mining activities occurs:

- relevant internal approvals and permits will be obtained before commencement of surface disturbance in the construction stage and mining phase (e.g. Ground Disturbance Permits [GDPs]);
- the extent of disturbance (including trafficable areas) will be minimised and identified using appropriate pegging, barriers or signage;
- appropriate erosion and sediment controls will be approved and established prior to land disturbance and will remain in place until exposed areas are stabilised;
- runoff from undisturbed catchments will be diverted around the disturbance areas via diversion drains and banks to discharge into natural watercourses, where practical;
- runoff from disturbed areas will be diverted into sediment dams;
- drains, diversion banks and channels will be stabilised and scour protection will be provided as necessary;
- temporary erosion and sediment control measures will be used on-site and may include silt fences, hay bales, stacked timber with geotextile, jute mesh, check dams, cross banks, contour banks, armouring and straw mulching; and
- topsoil will be stockpiled for reuse and all stockpiles will be managed as described in Section 5.2.2.

Drainage considerations will be incorporated into the landform design plan to slow and direct water flow and minimise erosion. Diversion drains will be constructed as per MACH Energy design plans.

5.2.2 Soil Management

Topsoil management strategies are described in the approved Mining Operations Plan and Rehabilitation Management Plan (MOP/RMP) for the MPO and summarised below.

Topsoil Stripping

Topsoil stripping activities will be undertaken in a manner that minimises impacts to air quality, flora and fauna, and water quality due to erosion. Measures to reduce potential impacts of topsoil stripping on air quality, flora and fauna are described in the <u>Air Quality and Greenhouse Gas Management Plan and Biodiversity Management Plan</u>, respectively.

Examples of these measures include:

- Minimising the re-handling of topsoil material.
- Avoiding or postponing stripping activities if excessive dust lift off occurs.

- Spraying material with a low moisture content with water prior to and/or during handling if necessary and practicable to control visible dust.
- Minimising vegetation clearance where practical.

Erosion and sediment controls that would be implemented to minimise potential impacts to downstream water quality are described in Section 5.2.1.

Topsoil will be stripped and salvaged to maximise its value for re-use in rehabilitation and will be guided by soil mapping and the suitable soil stripping depths as described in the MOP/RMP.

Topsoil Management

Where possible, topsoil will be transported directly to rehabilitation areas. Where this is not possible, topsoil stockpiles will be established away from active transport corridors and on level or gently sloping areas, where available, to minimise erosion and potential soil loss. Topsoil and subsoil (including alluvial soil) will be stockpiled separately where practical.

Topsoil stockpiles will be limited to a height of 3 m (except for two trial stockpiles, described in the MOP/RMP, which will be limited to a height of 5 m). Subsoil stockpiles (including alluvial soil stockpiles) will be limited to 5 m in height. Indicative locations of existing and proposed topsoil and subsoil stockpiles are shown in the MOP/RMP. Both short-term and long-term topsoil and subsoil stockpiles will be managed to maintain seed reserves and microbial soil associations as described in the MOP/RMP.

Topsoil stockpiles will be established with sediment control measures such as those listed in Section 5.2.1, including installation of silt fences around stockpiles to control potential loss of stockpiled soil through erosion prior to vegetative stabilisation and construction of stockpiles with a "rough" surface condition to reduce erosion hazard.

5.2.3 Specific ESCPs

Specific erosion and sediment control plans (Specific ESCPs) may be required to be developed to accompany a GDP. A GDP is required for all proposed land disturbance works at the MPO. The GDP application process requires the person/s seeking the disturbance 'the applicant', provide a plan which adequately illustrates the location and type of all proposed erosion and sediment controls.

The preparation of specific ESCPs must be developed in accordance with this ESCP and in consultation with the MPO Environmental Superintendent.

5.3 DESIGN CRITERIA

Specific erosion and sediment controls to be implemented at the MPO include, but are not limited to:

- clean water diversion drains and banks;
- silt fences (or equivalent control);
- vegetated buffer strips; and
- sediment dams/basins.

Other *Blue Book* (Landcom, 2004) erosion and sediment control measures may be implemented at the MPO as required.

5.3.1 Clean Water Diversion Drains and Banks

Clean water runoff from undisturbed areas will be preferentially diverted around disturbed areas, where practical. Appropriate protection will be established at the down slope end of diversion drains, including level spreaders and other energy dissipation devices.

Additional planting of grass, small shrubs and riparian species will be implemented as necessary to maintain channel stability.

5.3.2 Silt Fences

Where necessary, silt fences will be constructed immediately down slope of areas to be disturbed to minimise the potential for sediment transport into receiving catchments and waterways. Silt fences will be constructed along site contours where practicable. The catchment areas of silt fences are to be limited by constructing the fences with small returns at 20 m intervals to create smaller contributing sub catchments (refer Figure SD 6 – 8 [Landcom, 2004] [Attachment 2]), unless otherwise approved in the GDP.

The requirement and location for silt fences will be assessed by the applicant of the GDP, in consultation with the MACH Environment Superintendent as part of the GDP process.

Silt fences are considered a temporary control measure and would only be utilised until they are no longer required or a more permanent control measure is installed.

5.3.3 Vegetated Buffer Strips

A vegetated buffer strip is a vegetated area (generally grass covered), provided around the perimeter of an earthworks footprint. The primary purpose of a vegetated buffer strip is to reduce sediment transportation by acting as a 'sediment trap'.

A vegetated buffer strip shall generally be located adjacent to the earthworks clearance footprint. A visible structure, such as a fence, markers, or road, will generally be constructed around the buffer zone to clearly identify the area and prevent vehicle disturbance.

The vegetation within a vegetated buffer strip shall be maintained such that it remains effective in controlling bed load sediment runoff.

The requirement and utilisation of any proposed vegetative buffer strip will be assessed by the applicant of the GDP, in consultation with the MACH Environment Superintendent as part of the GDP process.

5.3.4 Sediment Dams

Sediment dams would be installed as required in order to capture and treat sediment laden runoff from disturbed areas prior to release off-site. The use of flocculants or other ameliorants to reduce suspended sediment content will be considered on a case-by-case basis.

Sediment dams will be designed with consideration given to soil and overburden characteristics and the planned contributing area of disturbance. The sediment dams will be sized in accordance with current recommended design standards in the following guidelines:

- Managing Urban Stormwater, Soils and Construction Volume 1 (Landcom, 2004); and
- Managing Urban Stormwater, Soils and Construction, Volume 2E Mines and Quarries (DECC, 2008).

The sediment dam volumes will be designed to comply with Table 6.1 of *Managing Urban Stormwater, Soils and Construction, Volume 2E – Mines and Quarries* (DECC, 2008) based on the following design standards and methodology:

- "Type D and F" sediment basins consistent with SD 6 4 from Landcom (2004) (Attachment 3).
- Embankment and spillway design standard will vary based on the duration of the disturbance of the sediment dam catchment, however, it is anticipated that most sediment dam catchments will be disturbed for greater than three years (including time for rehabilitation to adequately establish). Therefore, assuming a 'standard' receiving environment, the dam capacity must be designed to capture a 90th percentile 5-day duration rainfall event (39.35 mm for the MPO), with a spillway that is structurally sound for a 1 in 50 AEP rainfall event.
- Total sediment basin volume = settling zone volume + sediment storage volume. The sediment storage volume is the portion of the basin storage volume that progressively fills with sediment until the basin is de-silted. The settling zone is the minimum required free storage capacity that must be restored within 5 days after a runoff event.
- Sediment storage volume = 50% of settling zone volume.

The adopted design standard does not provide 100% containment for runoff from disturbed areas. Hence, it is possible and expected that overflows will occur from sediment dams if rainfall exceeds the design standard. The final design, type, location, function and capacity of all proposed sediment dams will be assessed by the applicant of the GDP, in consultation with the MACH Environment Superintendent, as part of the GDP process.

Sediment dams will be constructed prior to any land disturbance activities occurring, in accordance with the GDP and will be maintained during the duration of catchment disturbance. Sediment dams will be maintained in a drawn down state as far as practicable by transferring water to the mine water dams, with water to be used for dust suppression or other mine related purposes.

Level markers will be installed in sediment dams that are in place for longer durations (i.e. three years or more) to identify the required storage volumes. Dams will be dewatered as required, and in some cases, capacities may be increased to provide additional storage capacity if catchment areas or catchment disturbance changes.

Runoff from rehabilitated areas will be diverted to sediment dams for treatment until the water quality of surface runoff is suitable for release from the site, at which time the sediment dams may be decommissioned or active management (by dewatering and periodic de-silting) ceased. In the latter case, the sediment dams would remain in place in the longer term and become an asset for future land use.

5.4 MANAGEMENT OF EROSION AND SEDIMENT DAMS

MACH Energy will implement the following management measures in relation to environmental and sediment dams:

- Within 5 days following a rainfall event, sediment dams will be dewatered to the mine water system
 or to well-grassed areas where sufficient grassed buffer exists to prevent the migration of sediments
 to watercourses.
- Environmental and sediment dams will be maintained in between rainfall events to ensure sufficient capacity is available to manage the required rainfall intensity.
- Environmental and sediment dam batters will be appropriately stabilised to assist with minimising the potential for erosion of dam batters.

Environmental and sediment dams that have the potential to spill to the environment will be
inspected monthly and immediately after rainfall events with more than 20 mm in 24 hours. Dams
will be inspected for capacity, structural integrity and effectiveness. Where inspections indicate
substantial accumulation of sediment in a sediment dam, clean-out will be undertaken as soon as
practicable so as to reinstate the minimum required volumes.

Each inspection will be documented with a summary of the identified maintenance requirements for each inspected dam.

5.5 MANAGEMENT OF FLOOD RISK

As described in Section 4.1, the MPO major landforms are not located within the Hunter River 1% AEP flood extent and are therefore predicted to have a negligible impact on flood depth, extent and velocity in the vicinity of the MPO.

Notwithstanding, the approved MPO MOD 4 rail spur crosses the Hunter River floodplain. A conceptual design for the MOD 4 rail spur was modelled by WRM Water and Environment as part of the MOD 4 EA (WRM Water and Environment, 2017).

In accordance with Condition 44C, Schedule 3 of Development Consent DA 92/97, MACH Energy has designed the final MOD 4 rail infrastructure to meet the following performance criteria during a 1% AEP flood event (WRM Water and Environment, 2020):

- a) no more than 0.1 m increase in flood levels on any privately-owned land;
- b) no more than 0.01 m increase in flood levels at any privately-owned residence or commercial spaces;
- c) no more than 0.01 m increase in flood levels at any public roads servicing privately-owned properties; and
- d) no more than 0.1 m per second increase in flood velocities at privately-owned residences or commercial spaces.

An independent review of the proposed final design of the MOD 4 rail infrastructure was undertaken by Royal HaskoningDHV (2020) in accordance with Condition 44D, Schedule 3 of Development Consent DA 92/97. The final design of the MOD 4 rail infrastructure meets the performance criteria specified in Condition 44C, Schedule 3 of Development Consent DA 92/97 (Royal HaskoningDHV, 2020) and was approved by the DPIE on 5 August 2020.

Construction of the approved MOD 4 rail infrastructure will be carried out in accordance with the Construction Environmental Management Plan.

5.6 MANAGEMENT OF EXISTING RAIL LOOP AND INFRASTRUCTURE CORRIDOR

In accordance with Condition 37, Schedule 3 of Development Consent DA 92/97, MACH Energy will remove all infrastructure associated with the development within ML 1645 south of Wybong Road, including infrastructure associated with the existing rail spur and loop (shown as 'Indicative Existing Coal Transport Infrastructure' in Figure 3). This is with the exception of infrastructure which the operator of the Bengalla Mine agrees, in writing, can remain in situ.

MACH Energy will stabilise redundant rail infrastructure areas within the footprint of the Bengalla Mine such that they do not pose an ongoing material source of dust emissions (i.e. seeding to establish a cover crop and/or application of a dust suppressant) prior to management of these areas being transferred to the Bengalla Mine.

Existing MPO rail spur erosion and sediment control water management structures (e.g. sediment fences) within the footprint of the Bengalla Mine will also be left in place, subject to agreement of the Bengalla Mine.

5.7 MONITORING OF EROSION AND SEDIMENT CONTROL STRUCTURES

Erosion and sediment control structures will be inspected at regular intervals (monthly) and also following significant rainfall events (i.e. more than 20 mm in a 24 hour period), using both drone surveys and on the ground visual inspections. These inspections provide for early detection of potential issues and monitor the effectiveness of the controls installed. These inspections will then inform any maintenance works to be carried out. Inspections will be carried out by Environmental Staff, Mining or Processing Staff, or the suitably qualified dam inspector at the site,

MACH Energy will also undertake periodic internal erosion and sediment control audits at the MPO via an independent / third-party specialist with the appropriate qualifications / experience (i.e. Certified Professional in Erosion & Sediment Control (CPESC)).

6 REVIEW AND IMPROVEMENT OF ENVIRONMENTAL PERFORMANCE

6.1 ANNUAL REVIEW

In accordance with Condition 3, Schedule 5 of Development Consent DA 92/97 MACH Energy will review and evaluate the environmental performance of the MPO by the end of March each year (for the preceding calendar year) (or other such timing as agreed by the Secretary of the DPIE).

In relation to water, the Annual Review will:

- include a review of the performance of erosion and sediment controls relating to the MPO over the past year, which includes a comparison of these results to evaluate compliance against the:
 - relevant statutory requirements, limits or performance measures/criteria (refer Section 2);
 - monitoring results of the previous years; and
 - relevant predictions in the EIS and MOD1, MOD2, MOD3 and MOD4 EAs;
- identify any water-related non-compliance over the past year, and describe what actions were (or are being) taken to ensure compliance;
- identify any trends in the water monitoring data over the life of the MPO;
- identify any discrepancies between the predicted and actual water impacts of the MPO, and analyse the potential cause of any significant discrepancies; and
- describe what water-related measures will be implemented over the next year to improve the environmental performance of the MPO.

The Annual Review will be made publicly available on the MACH Energy website (https://machenergyaustralia.com.au/) in accordance with Condition 11, Schedule 5 of Development Consent DA 92/97.

6.2 ESCP REVISION

In accordance with Condition 4, Schedule 5 of Development Consent DA 92/97, this ESCP will be reviewed, and if necessary revised (to the satisfaction of the Secretary of the DPIE), within three months of the submission of:

- an Annual Review (Condition 3, Schedule 5);
- an incident report (Condition 7, Schedule 5);
- an Independent Environmental Audit (Condition 9, Schedule 5); and
- any modification to the conditions of Development Consent DA 92/97¹.

Within 4 weeks of conducting a review of this ESCP, MACH Energy will advise the Secretary of the DPIE of the outcomes of the review, and submit any revised documents for the approval of the Secretary.

In accordance with Condition 4A, Schedule 5 of Development Consent DA 92/97, MACH Energy may submit a revised ESCP for the approval of the Secretary at any time, and may also submit any revision to this ESCP required under Development Consent DA 92/97 on a staged basis.

Note that in the event of an inconsistency between Condition 4(d), Schedule 5 of Development Consent DA 92/97 and any Condition in Schedule 3, the latter prevails.

If agreed with the Secretary of the DPIE, a revision to this ESCP required under Development Consent DA 92/97 may be prepared without undertaking consultation with all parties nominated under the relevant Condition of Development Consent DA 92/97.

This ESCP will be made publicly available on the MACH Energy website (https://machenergyaustralia.com.au/), in accordance with Condition 11, Schedule 5 of Development Consent DA 92/97.

7 REPORTING PROCEDURES

In accordance with Condition 2, Schedule 5 of Development Consent DA 92/97, MACH Energy has developed protocols for managing and reporting the following:

- incidents;
- complaints;
- non-compliances with statutory requirements; and
- exceedances of the impact assessment criteria and/or performance criteria.

These protocols are described in Section 5 of the WMP.

In accordance with Condition 8, Schedule 5 of Development Consent DA 92/97, MACH Energy will provide regular reporting on the environmental performance of the MPO on the MACH Energy website (https://machenergyaustralia.com.au/).

Revised Approved Surface Disturbance Plan

FIGURE 4 - CONCEPTUAL FINAL LANDFORM

ATTACHMENT 2

LANDCOM BLUE BOOK FIGURE SD6 - 8 (LANDCOM, 2004)

Construction Notes

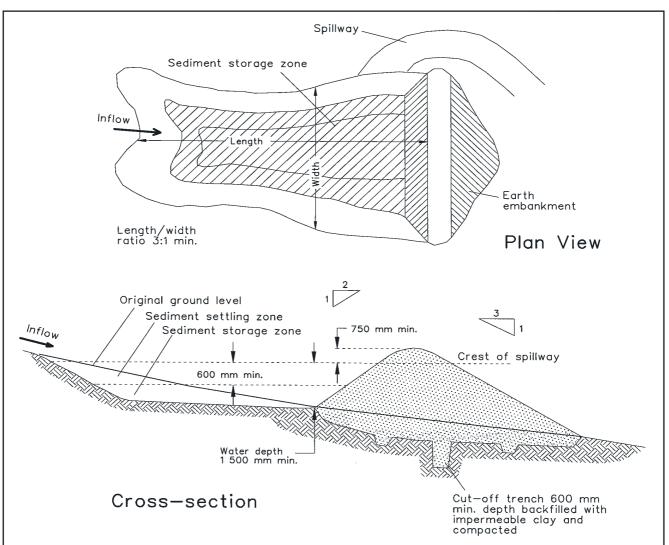

- Construct sediment fences as close as possible to being parallel to the contours of the site, but with small returns as shown in the drawing to limit the catchment area of any one section. The catchment area should be small enough to limit water flow if concentrated at one point to 50 litres per second in the design storm event, usually the 10-year event.
- 2. Cut a 150-mm deep trench along the upslope line of the fence for the bottom of the fabric to be entrenched.
- Drive 1.5 metre long star pickets into ground at 2.5 metre intervals (max) at the downslope edge of the trench. Ensure any star pickets are fitted with safety caps.
- 4. Fix self-supporting geotextile to the upslope side of the posts ensuring it goes to the base of the trench. Fix the geotextile with wire ties or as recommended by the manufacturer. Only use geotextile specifically produced for sediment fencing. The use of shade cloth for this purpose is not satisfactory.
- 5. Join sections of fabric at a support post with a 150-mm overlap.
- 6. Backfill the trench over the base of the fabric and compact it thoroughly over the geotextile.

SEDIMENT FENCE

SD 6-8

ATTACHMENT 3

LANDCOM BLUE BOOK FIGURE SD6 – 4 (LANDCOM, 2004)

Construction Notes

- 1. Remove all vegetation and topsoil from under the dam wall and from within the storage area.
- 2. Construct a cut-off trench 500 mm deep and 1,200 mm wide along the centreline of the embankment extending to a point on the gully wall level with the riser crest.
- Maintain the trench free of water and recompact the materials with equipment as specified in the SWMP to 95 per cent Standard Proctor Density.
- 4. Select fill following the SWMP that is free of roots, wood, rock, large stone or foreign material.
- 5. Prepare the site under the embankment by ripping to at least 100 mm to help bond compacted fill to the existing substrate.
- 6. Spread the fill in 100 mm to 150 mm layers and compact it at optimum moisture content following the SWMP.
- 7. Construct the emergency spillway.
- 8. Rehabilitate the structure following the SWMP.

SURFACE WATER MANAGEMENT PLAN

Department of Planning and Environment

Mr Chris Lauritzen
General Manager – Resource Development
MACH Energy Australia Pty Ltd
Suite 1, Level 3, 426 King Street
Newcastle West, NSW, 2302

7/09/2022

Subject: Mt Pleasant Coal (DA92/97) Surface Water Management Plan

Dear Mr Lauritzen

I refer to the Surface Water Management Plan submitted to the Department for review following the completion of the Independent Environmental Audit, in accordance with Condition 9, Schedule 5 of the Mt Pleasant Coal development consent (DA 92/97). I also acknowledge your response to the Department's review comments and request for additional information.

The Department has carefully reviewed the Surface Water Management Plan and is satisfied that it meets the requirements of the relevant conditions in DA 92/97.

Accordingly, as nominee of the Secretary, I approve the Surface Water Management Plan (revision 01, dated 28 July 2022).

You are reminded that if there are any inconsistencies between the Surface Water Management Plan and the conditions of approval, the conditions prevail.

Please ensure you make the document publicly available on the project website at the earliest convenience.

If you wish to discuss this matter further, please contact Tegan Cole on 02 9895 6457 or via email at tegan.cole@planning.nsw.gov.au.

Yours sincerely

Joe Fittell Team Leader

1 INTRODUCTION

The Mount Pleasant Operation (MPO) is located in the Upper Hunter Valley of New South Wales (NSW), approximately 3 kilometres (km) north-west of Muswellbrook and approximately 50 km north-west of Singleton (Figure 1). The village of Aberdeen and locality of Kayuga are also located approximately 5 km north-northeast and 1 km north of the MPO boundary, respectively (Figure 1). MACH Energy purchased the MPO from Coal & Allied Operations Pty Ltd (Coal & Allied) in 2016.

MACH Mount Pleasant Operations Pty Ltd is the manager of the MPO as agent for, and on behalf of, the unincorporated Mount Pleasant Joint Venture between MACH Energy Australia Pty Ltd (MACH Energy) (95 per cent [%] owner) and J.C.D. Australia Pty Ltd (5% owner). This Surface Water Management Plan (SWMP) is implemented at the MPO by MACH Energy.

The initial development application for the MPO was made in 1997. This was supported by an Environmental Impact Statement (EIS) prepared by Environmental Resources Management (ERM) Mitchell McCotter (ERM Mitchell McCotter, 1997). On 22 December 1999, the then Minister for Urban Affairs and Planning granted Development Consent DA 92/97 to Coal & Allied. This allowed for the "Construction and operation of an open cut coal mine, coal preparation plant, transport and rail loading facilities and associated facilities" at the MPO. The consent allowed for operations 24 hours per day seven days per week and the extraction of 197 million tonnes (Mt) of run-of-mine (ROM) coal over a 21 year period, at a rate of up to 10.5 Mt of ROM coal per year.

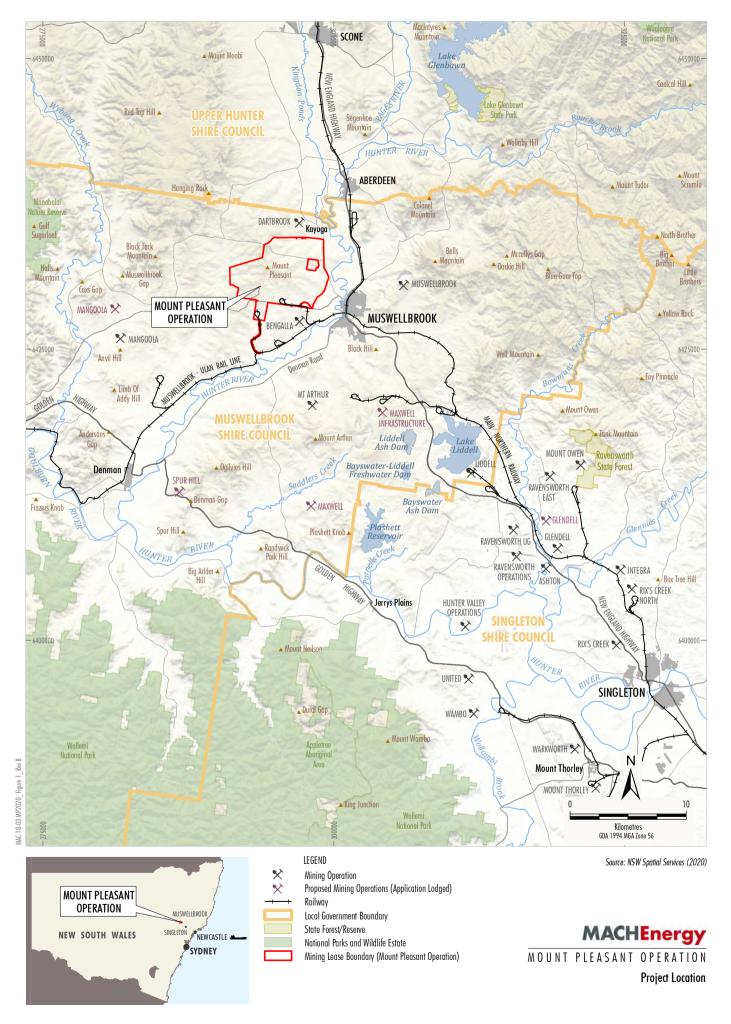

The Mount Pleasant Project Modification (MOD 1) was submitted on 19 May 2010 with a supporting Environmental Assessment (EA) prepared by EMGA Mitchell McLennan (EMGA Mitchell McLennan, 2010). MOD 1 included the provision of an infrastructure envelope for siting the mine infrastructure, the provision of an optional conveyor/service corridor linking the MPO facilities with the Muswellbrook-Ulan Rail Line and modification of the existing Development Consent DA 92/97 boundaries to accommodate the optional conveyor/service corridor and minor administrative changes. MOD 1 was approved on 19 September 2011.

The MPO South Pit Haul Road Modification (MOD 2) was submitted on 30 January 2017 with a supporting EA prepared by MACH Energy (MACH Energy, 2017a). MOD 2 proposed to realign an internal haul road to enable more efficient access to the South Pit open cut, with no other material changes to the approved MPO. MOD 2 was approved on 29 March 2017.

The MPO Mine Optimisation Modification (MOD 3) was submitted on 31 May 2017 with a supporting EA prepared by MACH Energy (MACH Energy, 2017b). MOD 3 comprised an extension to the time limit on mining operations (to 22 December 2026) and extensions to the South Pit Eastern Out of Pit Emplacement to facilitate development of an improved final landform. MOD 3 was approved on 24 August 2018.

The MPO Rail Modification (MOD 4) was submitted on 18 December 2017 with a supporting EA prepared by MACH Energy (MACH Energy, 2017c). MOD 4 proposed the following changes:

- duplication of the approved rail spur, rail loop, conveyor and rail load-out facility and associated services;
- duplication of the Hunter River water supply pump station, water pipeline and associated electricity supply that followed the original rail spur alignment; and
- demolition and removal of the redundant approved infrastructure within the extent of the Bengalla Mine, once the new rail, product loading and water supply infrastructure has been commissioned and is fully operational.

MOD 4 was approved on 16 November 2018 by the Secretary of the Department of Planning and Environment (DPE) (under Delegation). Appendix 2 of the modified Development Consent DA 92/97 illustrates the Conceptual Project Layout Plan of the approved MPO at 2021 and 2025, Approved Surface Disturbance Plan and Conceptual Final Landform (Attachment 1) incorporating the MOD 4 infrastructure relocations.

1.1 PURPOSE AND SCOPE

This SWMP has been prepared by MACH Energy to satisfy the requirements under Development Consent DA 92/97 (as modified) and specifically Condition 28(c), Schedule 3.

The SWMP applies to all employees and contractors at the MPO and covers all areas within the MPO boundary. The SMP applies to the life of the MPO, including (but not limited to) the period of mining operations specified in Development Consent DA 92/97, which currently permits mining until 22 December 2026. As required by Condition 5, Schedule 2 of Development Consent DA 92/97, the SWMP will continue to apply (excluding mining operations) beyond 22 December 2026, as required, until the rehabilitation and any additional undertakings (required by the Secretary of the NSW Department of Planning, Industry, and Environment [DPIE], or the Division of Mining, Exploration and Geoscience [MEG] within the Department of Regional NSW) have been carried out satisfactorily.

This SWMP has been prepared to manage surface water related impacts associated with construction and operation of the MPO, including for example, initial establishment and development works, open cut mining, operation of the coal handling and preparation plant (CHPP), rail spur/loop, and Fines Emplacement Area, and the supply of water to the MPO.

1.2 STRUCTURE OF THE SWMP

This SWMP is a component of the Water Management Plan (WMP) for the MPO.

The remainder of the SWMP is structured as follows:

- Section 2: Outlines the statutory obligations relevant to this SWMP.
- Section 3: Describes the existing environment including regional and local drainage network.
- Section 4: Provides a description of the baseline data available for the MPO which relates to this SWMP.
- Section 5: Describes the surface water management measures implemented at the MPO.
- Section 6: Outlines the surface water impact trigger levels proposed for the MPO.
- Section 7: Describes the surface water monitoring program proposed for the MPO.
- Section 8: Describes the review process for MPO documentation, including in particular for this SWMP.
- Section 9: Outlines the reporting procedures proposed for the MPO.
- Section 10: Provides a list of the references cited in this report.

2 STATUTORY OBLIGATIONS

MACH Energy's statutory obligations are contained in:

- the conditions of Development Consent DA 92/97 (as modified);
- the condition of the Commonwealth Approval EPBC 2011/5795;
- relevant licences (including Environment Protection Licence [EPL] 20850), permits and mining leases (mining leases 1645, 1708, 1709, 1713, 1750 and 1808); and
- other relevant legislation.

Obligations relevant to this SWMP are described below.

2.1 DEVELOPMENT CONSENT DA 92/97

The conditions of Development Consent DA 92/97 relevant to the content and structure of this SWMP are described below. A comprehensive list of all conditions in Development Consent DA 92/97 relevant to the water is provided in the WMP.

2.1.1 SWMP Requirements

Condition 28(c), Schedule 3 of Development Consent DA 92/97 requires the preparation of a SWMP as part of the WMP for the Project (refer Table 1).

Table 1
SWMP Development Consent DA 92/97 Conditions

MPO Development Consent DA 92/97 Schedule 3	Section where addressed in this SWMP Document
28. The Applicant must prepare a Water Management Plan for the development to the satisfaction of the Secretary. This plan must be prepared in consultation with Dol Water and EPA, and be submitted to the Secretary for approval by 30 June 2019, unless otherwise agreed by the Secretary.	
The plan must include:	
(c) a Surface Water Management Plan, which must include:	
 detailed baseline data on surface water flows and quality in creeks and other waterbodies that could potentially be affected by the development; 	Section 4
 surface water and stream health impact assessment criteria including trigger levels for investigating any potentially adverse surface water impacts; 	Section 6
 a program to monitor and maintain the bridge openings and culverts associated with the MOD 4 rail infrastructure and ensure that they remain clear of blockages; 	Section 7.6
 a program to monitor surface water flows and quality in the watercourses that could be affected by the project; and 	Section 7
 reporting procedures for the results of the monitoring program; 	Sections 8 and 9

2.1.2 Management Plan (General) Requirements

Condition 2, Schedule 5 of Development Consent DA 92/97 outlines the general management plan requirements that are applicable to the preparation of the SWMP.

Table 2 presents these requirements and indicates where each is addressed within this SWMP.

Table 2
General Development Consent DA 92/97 Conditions

MPO Development Consent DA 92/97 Schedule 5	Section where addressed in this SWMP Document
The Applicant must ensure that the management plans required under this consent are prepared in accordance with any relevant guidelines, and include:	
(a) detailed baseline data;	Section 4
(b) a description of:	
 the relevant statutory requirements (including any relevant consent, licence or lease conditions); 	Section 2
any relevant limits or performance measures/criteria;	Section 6
 the specific performance indicators that are proposed to be used to judge the performance of, or guide the implementation of, the development or any management measures; 	Section 6
(c) a description of the measures that would be implemented to comply with the relevant statutory requirements, limits, or performance measures/criteria;	Section 5
(d) a program to monitor and report on the:	Sections 7 and 8
 impacts and environmental performance of the development; 	
 effectiveness of any management measures (see c above); 	
(e) a contingency plan to manage any unpredicted impacts and their consequences;	Surface and Ground Water Response Plan (SGWRP)
 (f) a program to investigate and implement ways to improve the environmental performance of the development over time; 	Section 8
(g) a protocol for managing and reporting any:	Section 9
• incidents;	
complaints;	
 non-compliances with statutory requirements; and 	
 exceedances of the impact assessment criteria and/or performance criteria; and 	
(h) a protocol for periodic review of the plan.	Section 8
Note: The Secretary may waive some of these requirements if they are unnecessary or unwarranted for particular management plans.	

2.2 LICENCES, PERMITS AND LEASES

Water management at the MPO is conducted in accordance with a number of licences, permits and leases. Key licences, permits and leases relating to water at the MPO include:

- Water Access Licences (WALs) issued under the Water Management Act, 2000.
- Discharge credits (46) held under the NSW *Protection of the Environment Operations (Hunter River Salinity Trading Scheme) Regulation, 2002* (HRSTS).
- Mining leases 1645, 1708, 1709, 1713, 1750 and 1808 issued under Part 5 of the NSW *Mining Act,* 1992 and approved by the Minister for Mineral Resources.
- Environment Protection Licence (EPL) 20850 issued under Part 3 of the NSW *Protection of the Environment Operations Act, 1997* by the NSW Environment Protection Authority (EPA).
- The Mining Operations Plan, as required by mining lease conditions issued under the *Mining Act*, 1992 and approved by the MEG.

2.3 OTHER LEGISLATION / GUIDELINES / POLICY / PLANS

Other NSW Acts, Regulations and policies that may be applicable to the SWMP for the MPO are summarised in the following sub-sections.

2.3.1 Water Management Act, 2000

The Water Management Act, 2000 aims to provide sustainable and integrated management of the water sources of NSW for the benefit of both present and future generations.

The MPO is located in the Hunter Catchment, and is regulated under the *Water Sharing Plan for the Hunter Unregulated and Alluvial Water Sources 2009* and the *Water Sharing Plan for the Hunter Regulated River Water Source 2016*.

The water sharing plans contain various rules applying to surface water sources in the MPO, such as access licence dealing rules, water supply works approval rules, water allocation account rules and access rules for rivers and creeks.

2.3.2 ANZECC/ARMCANZ (2000) Guidelines

The Australian and New Zealand Environment and Conservation Council (ANZECC) and Agriculture and Resource Management Council of Australia and New Zealand (ARMCANZ) *Australian and New Zealand Guidelines for Fresh and Marine Water Quality* (ANZECC & ARMCANZ, 2000) provide a national benchmark for assessing water quality in systems throughout Australia and New Zealand. The ANZECC & ARMCANZ (2000) guidelines provide guidance for developing local guidelines or strategies such as catchment water quality and river flow objectives (Section 2.3.3).

The ANZECC & ARMCANZ (2000) guidelines have been superseded by the Australian New Zealand Guidelines 2018 (ANZG 2018). However, site specific and default trigger levels or guideline values remain unchanged for the Southeast Coast water drainage division (in which the MPO is located)¹.

¹ As of 28 July 2022

2.3.3 NSW Water Quality and River Flow Objectives

The NSW Water Quality and River Flow Objectives (NSW Office of Environment and Heritage [OEH], 2006) have been developed to guide plans and actions to achieve healthy waterways in NSW. Each objective is based on providing the right water quality for the environment and the different beneficial uses of the water. They are based on measurable environmental values, which are those values or uses of water that the community believes are important for a healthy ecosystem for public benefit, welfare, safety or health. The target concentrations for each water quality objective are based on ANZG (2018) / ANZECC & ARMCANZ (2000).

2.3.4 Hunter River Salinity Trading Scheme

The HRSTS was originally established by the then Department of Land and Water Conservation and Hunter River Trust in 1995 as a pilot trial to manage salinity discharges to the Hunter River, such that salt concentrations would be held below irrigation and environmental standards.

The scheme is now managed by the NSW EPA under a statutory regulation attached to the *Protection of Environmental Operations Act*, 1997. The regulation came into effect on 1 December 2002. The stated objectives of the HRSTS are:

- a) to minimise the impact of discharges of saline water on irrigation, other water uses and on aquatic ecosystems in the Hunter River catchment:
 - i. at the lowest overall cost to the community, and
 - ii. in a way that provides ongoing financial incentives to reduce pollution, and
- b) to facilitate sustainable water management by industry in the Hunter River catchment.

The HRSTS achieves these objectives by prohibiting the release of saline water during periods of low flow in the Hunter River and controlling releases of saline water during periods of high flow in the Hunter River such that specific salinity targets at various points in the river are not exceeded.

Participants in the HRSTS are issued with tradeable discharge credits. Each credit entitles the holder to a share of the available salt discharge capacity announced by WaterNSW during high flow periods.

Discharges at the MPO would be undertaken in accordance with the HRSTS and EPL 20850. MACH Energy currently holds 46 discharge credits.

2.3.5 Local Policy and Plans

Local land service plans and policies for the Hunter region have been considered in the development of this SWMP. The key plan is the *Hunter-Central Rivers Catchment Action Plan 2013 – 2023* (Hunter Central Rivers Catchment Management Authority, 2013). This plan provides a direction for all government, industry and community actions in the region to maintain the health of natural systems in the region. The goals, targets and outcomes of the *Hunter-Central Rivers Catchment Action Plan 2013 – 2023* have been considered where relevant in the preparation of this SWMP.

3 EXISTING ENVIRONMENT

3.1 REGIONAL DRAINAGE NETWORK

The MPO is located within the Hunter Catchment. The Hunter Catchment has an overall size of 21,500 square kilometres (km²), and includes the city of Newcastle and the major towns of Singleton and Muswellbrook. The Hunter River is the main drainage feature within the catchment, rising on the northern side of the Barrington Tops (Mount Royal Range) and flowing south and then east through Muswellbrook and Singleton, before draining to the Pacific Ocean at Newcastle.

The Hunter River contains a number of significant tributaries upstream of Muswellbrook, including the Pages and Isis Rivers, as well as the Middle, Dart, Stewarts, Moonan and Rouchel Brooks. Alluvial floodplains ranging in width from 1.5 to 2 km border the river over the majority of its length. The eastern extent of the MPO mining lease boundary is located directly adjacent to these floodplains.

The Hunter River is regulated by two major storages, the Glenbawn and the Glennies Creek Dams. The Glenbawn Dam is located approximately 16 km north-east of the MPO mining lease boundary. The dam mainly serves as a flood mitigation measure for the surrounding area, as well as for supplying water to surrounding agriculture and industries. The dam has a current capacity of 750,000 megalitres (ML), with potential for an additional 120,000 ML during flood events (WaterNSW, 2018a). Glennies Creek Dam is approximately 37 km south-east of the MPO mining lease boundary and has a capacity of 283,000 ML (WaterNSW, 2018b).

3.2 LOCAL DRAINAGE NETWORK

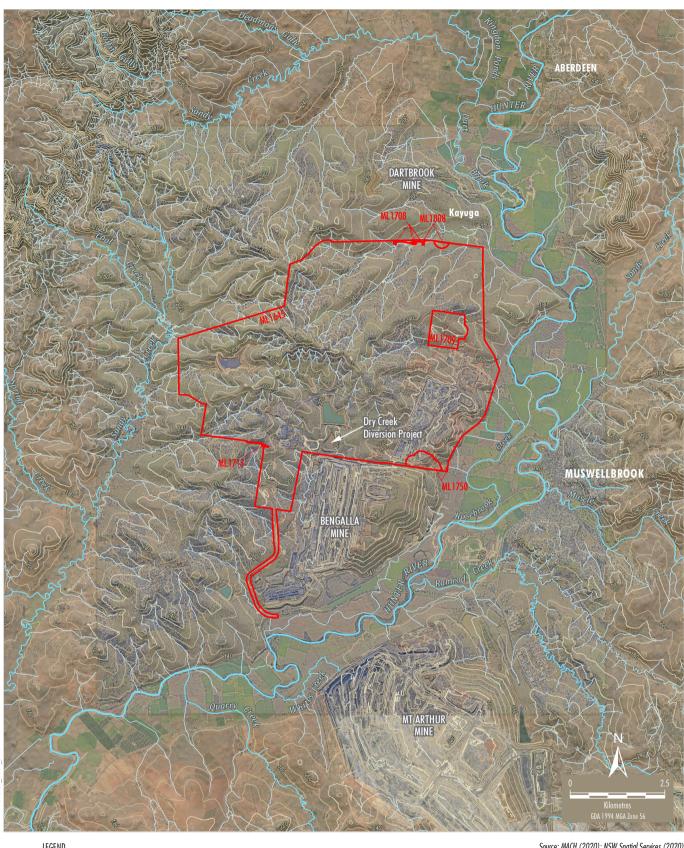

The local drainage network in the vicinity of the MPO is shown on Figure 2.

The drainage network is generally characterised by steep gullies which drain from the surrounding hills into the flat alluvial plains adjacent the Hunter River.

The main drainage feature within the vicinity of the MPO is the Hunter River which flows in a southerly direction approximately 1 km to the east of the MPO mining lease boundary. There are a number of ephemeral drainage lines which traverse the MPO area and drain into the Hunter River. The eastern portion of the MPO area drains via Rosebrook Creek, as well as other unnamed drainages. Areas in the south and west of the MPO area drain via an unnamed drainage line (sometimes referred to as Dry Creek) and Sandy Creek respectively, both of which are tributaries of the Hunter River. All other areas drain into unnamed drainage lines, which also flow to the Hunter River.

The Bengalla Mine's Dry Creek Diversion Project diverts the unnamed drainage line that drains the south of the MPO area (Figure 2). The Dry Creek Diversion Project includes a clean water dam north of Wybong Road, a pump station and pipeline used to direct water around the Bengalla Mine and a protective contour levee to release water from the pipeline into an unnamed tributary of the Hunter River. The Bengalla Mining Company (BMC) monitors a number of unnamed drainage lines and the Hunter River, downstream of the MPO. Relevant monitoring information from the Bengalla Mine has been considered in this SWMP.

Part of Mangoola Coal is located within the Sandy Creek catchment. Accordingly, Mangoola Coal Operations Pty Limited (MCO) undertake surface water and stream health monitoring in Sandy Creek. Relevant monitoring information has been considered in this SWMP.

Local Drainage Network and Topography

4 BASELINE DATA

Surface water monitoring was undertaken from January 1993 to December 1995 to inform the EIS Water Management Study. The results of this monitoring are presented in PPK Environment & Infrastructure (1997) and included creeks and other waterbodies in the vicinity of the MPO.

The collection of surface water monitoring data at the MPO resumed in 2000 at ten monitoring locations. For the purposes of this plan, baseline monitoring is taken as the period up to and including July 2016. Construction at the MPO commenced in November 2016. Surface water monitoring at sites W12 and W15 commenced in October 2017, and baseline monitoring at these sites was undertaken between October 2017 and May 2020. Sampling locations used to establish baseline data in the MPO surface water monitoring network are summarised in Table 3 and shown on Figure 3.

Table 3
Baseline Surface Water Monitoring Locations

Site	Watercourse	Baseline Period of Record
W1	Hunter River	July 2000 – October 2011
W2	Hunter River	July 2000 – July 2016
W3	Hunter River	July 2000 – July 2016*
W4	Muscle Creek	July 2000 – July 2016
W5	Unnamed Drainage Line	July 2000 – July 2016
W6#	Hunter River	July 2000 – April 2015
W7	Unnamed Drainage Line	July 2000 – July 2016
W8^	Unnamed Drainage Line	July 2000 – July 2016
W9	Unnamed Drainage Line	July 2000 – July 2016
W10^	Unnamed Drainage Line (Dry Creek)	July 2000 – July 2016
W12	Sandy Creek	October 2017 – May 2020
W15	Hunter River	October 2017 – May 2020

Located adjacent to Department of Primary Industry – Water (DPI – Water) gauging station. Only monitored intermittently for laboratory analysis.

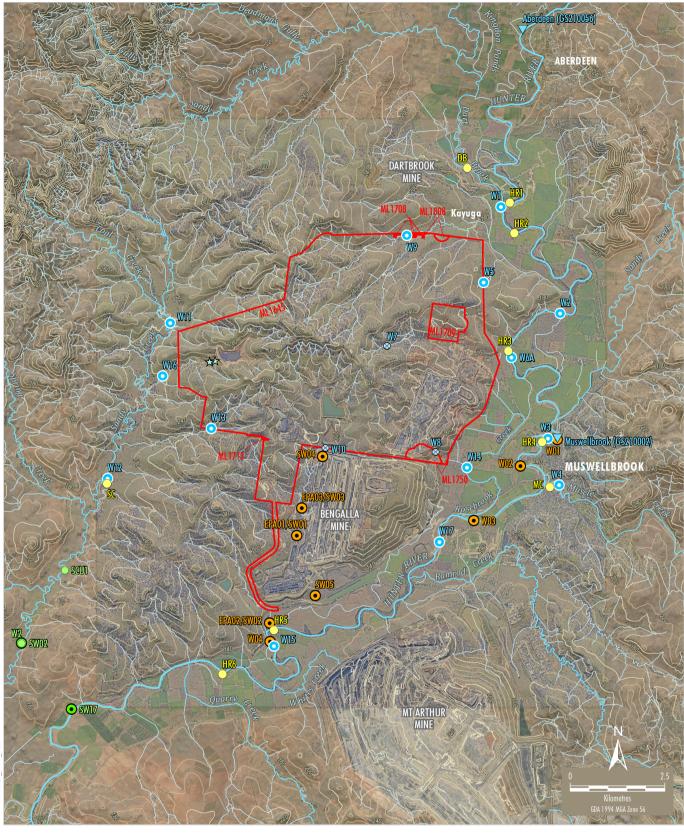

Other baseline monitoring data and assessments undertaken for creeks and other waterbodies by surrounding mining operations have also been utilised where available including (Figure 3):

- downstream water quality monitoring undertaken by the BMC;
- water quality monitoring on Sandy Creek undertaken by MCO; and
- stream health monitoring on Sandy Creek undertaken by MCO.

In addition to the above, Department of Planning, Industry and Environment – Water (DPIE – Water) streamflow and electrical conductivity (EC) gauging stations are located on the Hunter River at Aberdeen (GS210056), Muswellbrook (GS210002) and Denman (GS210055) (Figure 3).

[^] Note these monitoring locations have since been disturbed by mining activities and are therefore no longer monitored (Figure 3).

[#] Note this monitoring site has been replaced by Site W6A, as outlined in Section 7.3.

MOUNT PLEASANT OPERATION

Surface Water and Stream Health Monitoring Sites

4.1 STREAMFLOW

4.1.1 Hunter River

DPIE – Water monitor flow in the Hunter River at three gauging stations in the vicinity of the MPO (Figure 3). Data from these gauging stations is summarised in Table 4. All three gauging stations monitor flow continuously.

Table 4
Hunter River Streamflow

Monitoring Monitoring		Percentage	Catchment	Daily Flow (ML/day)*			
Site	Commenced	of Days with Data*	Area (km²)	Minimum	Median	Maximum	
Aberdeen (GS210056)	1959	65.3%	3,090	13.7	372	91,556	
Muswellbrook (GS210002)	1906	67.6%	4,220	0.0	348.5	167,292	
Denman (GS210055)	1908	80.9%	4,530	0.0	346.1	108,560	

Note: ML/day = Megalitres per day.

Under current catchment conditions (since the construction of Glenbawn Dam was completed in 1958), the Hunter River is perennial, with a minimum flow rate at Aberdeen of approximately 14 ML/day (Table 4). Flow duration curves since 1988 for each gauge are shown on Figure 4. These flow duration curves indicate that flow in the Hunter River is fairly consistent immediately upstream and downstream of the MPO, with some variation primarily due to missing data.

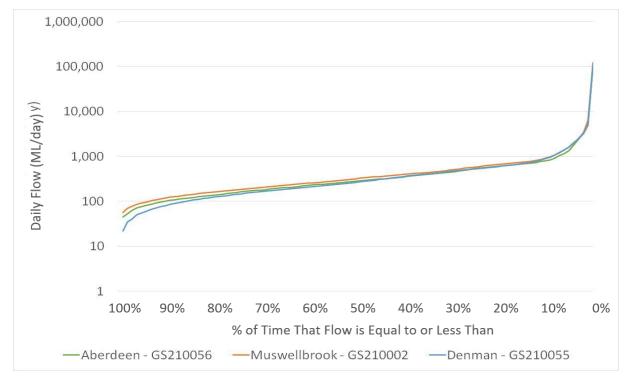

Figure 4: Flow Duration Curves

^{*} Data Source: http://realtimedata.water.nsw.gov.au/water.stm?ppbm=SURFACE_WATER&rs&3&rskm_url; accessed 15 Dec 2016

4.1.2 Sandy Creek

MCO monitor Sandy Creek at SW01 (downstream of Mangoola Coal) and SW02 (upstream of Mangoola Coal). Both monitoring sites are located downstream of the MPO, where Sandy Creek has a larger catchment than adjacent to the MPO.

The Mangoola Coal Water Management Plan (MCO, 2014) includes monitoring data for SW01 and SW02 from 2002 to 2014 (reproduced in Attachment 3). During this period, both monitoring sites were frequently dry with SW01 reporting dry/no flow approximately 50% of the time and SW02 reporting dry/no flow approximately 42% of the time.

4.1.3 Other Local Drainages

A summary of samples collected from local drainages in the MPO area is provided in Table 5. This indicates that the drainages are highly ephemeral, with dry samples representing more than 85% of the total samples obtained at each site.

Table 5
Flow Frequency of Local Drainages

Site	Number of Samples	Number of Dry Samples	Flow Frequency
W5	186	183	1.6%
W7	188	186	1.1%
W8	188	161	14.4%
W9	188	178	5.3%
W10	187	186	0.5%

BMC has historically monitored the unnamed drainage line that drains the south of the MPO area (referred to as Dry Creek in the Bengalla Mine Water Management Plan). From 2008 to 2013, there were only 14 occasions that the unnamed drainage line had sufficient flow (not including controlled discharges from Bengalla Mine's Staged Discharge Dam in accordance with the HRSTS) for water quality sampling to be undertaken (BMC, 2015). As described in Section 3.2, Bengalla Mine's Dry Creek Diversion Project involves the diversion of flow in this unnamed drainage line.

4.2 SURFACE WATER QUALITY

Baseline surface water quality data is presented in Attachment 2 and a summary is provided in Tables 6 and 7 below.

Median pH values at creek sites show that surface water in the vicinity of the site is relatively neutral. Sites located along the Hunter River (i.e. W1, W2 and W6), have a median pH value and overall pH range which is slightly alkaline.

Median electrical conductivity (EC) values for the surface water sites were generally below 400 μ S/cm. Given the frequency in which the unnamed drainage lines were dry, the monitoring results for these drainage lines likely reflect flows occurring during or immediately after rainfall events, which is why the local median EC is lower than the Hunter River. This is with the exception of sites W4 and W12, located at Muscle Creek and Sandy Creek, which had a median EC value of 2,030 μ S/cm and 4,970 μ S/cm, respectively.

Table 6
Surface Water Quality Summary – pH and Electrical Conductivity

Site	Number of Samples with Flow	Median pH	Median Electrical Conductivity (μS/cm)
W1	131	8.00	400
W2	184	8.10	410
W3*	-	-	-
W4	186	7.60	2,030
W5	3	6.30	120
W6	123	8.10	400
W7	2	7.30	228
W8	27	7.30	238
W9	10	7.05	255
W10	1	6.20	30
W12**	36	8.00	4,970
W15**	36	7.90	414

Note: μ S/cm = micro Siemens per centimetre,

- * Located adjacent to DPI Water gauging station. Only monitored intermittently for laboratory analysis.
- ** Monitoring at sites W12 and W15 commenced in October 2017, and baseline monitoring at these sites was undertaken between October 2017 and May 2020.

Table 7
Surface Water Quality Summary – Total Suspended Solids and Total Dissolved Solids

Site	Number of TSS Samples	Median TSS (mg/L)	Number of TDS Samples	Median TDS (mg/L)
W1	129	8	1	<5
W2	182	8	5	251
W3*	-	-	-	-
W4	185	6	4	1,620
W5	3	15	0	-
W6	119	8	0	-
W7	2	46	0	-
W8	26	292	1	1,560
W9	10	159	0	-
W10	1	139	0	-
W12**	36	8.5	36	2,905
W15**	36	16	36	263

Note: TSS = Total Suspended Solids, TDS = Total Dissolved Solids.

- * Located adjacent to DPI Water gauging station. Only monitored intermittently for laboratory analysis.
- ** Monitoring at sites W12 and W15 commenced in October 2017 and baseline monitoring at these sites was undertaken between October 2017 and May 2020.

4.3 STREAM HEALTH

Stream health surveying at a number of surface water sites in the Hunter Catchment was undertaken from 1994 – 1999 and included as part of the EPA's *River Health in the New South Wales Lower North Coast, Hunter and Central Coast Catchments* report (Hose and Turak, 2004). This report identified a number of parameters using the Australian River Assessment System (AusRivAS), averaged over two monitoring periods (Autumn and Spring) during a single year. AusRivAS is a rapid river health assessment system which uses the presence or absence of macro invertebrate taxa to assess the biological health of Australian rivers. Observed (O) numbers of macro invertebrates at the site are compared with the Expected (E) number of macro invertebrates which could be found at the site, if the site was in a natural state (i.e. had not been disturbed). This informs an overall 'band of impairment' score ranging from X (more biologically diverse than expected) to D (extremely impaired).

The measured average parameters and the resulting 'band of impairment' score for four sites in the vicinity of the MPO are outlined in Table 8 below.

Table 8
Historical Stream Health in the Vicinity of the MPO

100.4	11 - 1 - 2 - 1			Edge			Riffle	
Historical Site ID	Updated Site ID	Site Location	O/E Taxa	Band	O/E Signal	O/E Taxa	Band	O/E Signal
Hunt 585	DB	Dart Brook at MacIntyre Bridge	0.79	В	0.88	0.75	В	0.93
Hunt 506	MC	Muscle Creek at Muswellbrook	0.77	В	0.83	1	1	-
Hunt 571	HR4	Hunter River at Muswellbrook	0.56	В	0.88	0.73	В	1.06
Hunt 854	HR3	Hunter River downstream of Aberdeen	1.02	А	1	-	-	-

Source: Hose and Turak, 2004.

As shown, three of the four monitoring sites fell within band 'B'. This indicates that ecological condition of macro invertebrates at the sites has been 'significantly impaired', meaning that a potential impact on water quality and/or habitat quality has resulted in a loss of taxa. The monitoring location on the Hunter River downstream of Aberdeen however, fell within band 'A'. This indicates that impacts on water and habitat condition at the site have not resulted in a loss of macro invertebrate diversity.

Stream health monitoring has been undertaken at three points along Sandy Creek by Glencore for Mangoola Coal. This monitoring has involved assessing macro invertebrate community structures, water quality, and overall riparian health using AusRivAS, SIGNAL2 sampling, HABSCORE assessments, and physicochemical water quality testing. Stream health results published as part of the 2015 *Mangoola Annual Review* indicates that Sandy Creek has remained in a poor but stable condition since monitoring began in 2009 (SLR Consulting Australia Pty Ltd, 2015).

Extensive historical surveying of river health in the Hunter River has been undertaken due to its regional ecological and agricultural significance. This surveying has indicated that the river has been historically degraded due to agricultural and industrial use, however surveys in recent years suggest river health has improved.

The 2002 Healthy Rivers Commission investigation of the Hunter River determined that the river was not ecologically sustainable in its current capacity (Healthy Rivers Commission, 2002). The commission found that the overall water quality of the river was variable, and that nearly two thirds of streams were considered to be in a degraded condition. Approximately 30% of native fish species were estimated to have been lost from the Hunter River, and between 40 and 70% of sampled macro invertebrate sites were found to be in poor condition.

A suite of more contemporary surveys undertaken between 2004 – 2006 have shown the overall health of the Hunter River has been improving (Cumberland Ecology, 2013). These surveys showed suitable habitat for a variety of macro invertebrates and amphibians, with the presence of a diverse variety of macro invertebrate species.

A 2010 State of the Catchment Report (NSW Government) determined that although the health of the overall Hunter Catchment was poor, the health of the Hunter River was considered 'moderate'.

Macro invertebrate condition (a measure of the remaining proportion of macro invertebrate assemblages which have been retained in the river system) of the Hunter River and surface water drainages in the vicinity of the MPO, was found to be 'moderate'. This means that less than half, but more than a quarter, of macro invertebrate were estimated to have been lost in the river system.

Although overall fish condition for the Hunter Catchment was determined to be very poor, fish condition along the Hunter River in the vicinity of the MPO was rated as 'moderate'. Fish condition scores are based upon both the proportion of fish species which are native to the region, as well as the proportion of fish species that have been retained relative to pre-disturbance conditions (NSW Government, 2010).

Historical surveys of the Hunter River have not indicated the presence of any threatened species and the overall habitat of the Hunter River Catchment has been considered unsuitable for threatened species and communities listed under both the *Fisheries Management Act, 1994* and the *Environmental Protection and Biodiversity Conservation Act, 1999* (Cumberland Ecology, 2013).

A contemporary stream health monitoring program commenced at the MPO in Spring 2017 (November 2017) in accordance with the SWMP. The Spring 2017 monitoring round is the only contemporary survey undertaken at the stream health monitoring sites prior to commencement of operations at the MPO. The Spring 2017 monitoring round results are outlined in Table 9 below and were reported in the MPO 2017 Annual Review (MACH Energy, 2018).

Table 9
Spring 2017 Stream Health Monitoring Round Results

Historical Site ID	Updated Site ID	Number of Taxa	SIGNAL 2*	Baseline Band of Impairment Score	O/E Taxa
W1	HR1	8	3.31	С	0.41
W1	HR2	11	3.38	В	0.59
Hunt 854	HR3	13	3.19	В	0.64
Hunt 571	HR4	12	2.88	С	0.51
W15	HR5	10	3.04	В	0.61
SW17	HR6	13	3.38	В	0.73
Sandy 1	SC	11	3.28	В	0.61
Hunt 585	DB	18	3.41	В	0.66
Hunt 506	МС	13	3.24	В	0.55

Source: BIO-ANALYSIS Pty Ltd (2018).

^{*} The SIGNAL score for a macroinvertebrate sample is calculated by averaging the pollution sensitivity grade numbers of the families present, which may range from 10 (most sensitive) to 1 (most tolerant).

The Spring 2017 monitoring results indicated that the band of impairment score measured at sites HR3 and HR4 were lower than the previously assigned stream health performance criteria, which were determined by combining edge and riffle habitat scores of the samples collected in mid-1990s as discussed above. Contributions from agriculture, mining, urban run-off, drought and flow regulation, among others, since the mid-1990s are likely to have had a considerable influence on aquatic biota within the area. Accordingly, the contemporary data collected in 2017 is considered to provide a more appropriate representation of the baseline conditions of the Hunter River prior to commencement of operations at the MPO.

Further discussion regarding the stream health trigger levels is presented in Section 6.2.

5 SURFACE WATER MANAGEMENT MEASURES

5.1 MINIMISATION OF WATER USE

MACH Energy's water management strategy includes preferential use of on-site derived mine-affected water (i.e. water that has come into contact with mining or processing operations), thereby reducing the need to import raw water from external sources for operational purposes. As described in the Site Water Balance (SWB), the water management system involves recycling site runoff, fine rejects reclaim water and groundwater inflow wherever practicable, for reuse in the CHPP and/or for dust suppression.

General water management measures proposed at the site include, but are not limited to:

- Finalising construction of proposed water storages as early as possible to increase site yield.
- Limiting the extent of disturbance to reduce dust suppression requirements.
- All surface and groundwater will be taken in accordance with WALs.
- Regularly reviewing water use to identify areas for reduction and identify best practice technologies. This will be reviewed every year as part of the Annual Review process (Section 8.1).

During construction and/or prior to commissioning of the Hunter River water supply pipeline, water may be sourced externally (e.g. taken from commercial water fill points in the light industrial area).

In addition, in order to reduce make-up water demand from the Hunter River over the life of the MPO, MACH Energy may also source excess mine water from the adjoining mines (i.e. Dartbrook and Bengalla Mines) for use on-site. Should this water sharing be undertaken, it would be subject to MACH Energy and the other mining operator obtaining all necessary approvals.

5.2 INFRASTRUCTURE DESIGN

Sediment dams will be designed with consideration given to topsoil and overburden characteristics and the contributing area of disturbance. The sediment dams will be sized in accordance with current recommended design standards in the following guidelines:

- Managing Urban Stormwater, Volume 1 Soils and Construction (Landcom, 2004).
- Managing Urban Stormwater, Soils and Construction, Volume 2E Mines and Quarries (DECC, 2008).

Discussion on the design of specific sediment and mine water dams is provided in the SWB.

5.3 MANAGEMENT OF POTENTIALLY ACID FORMING MATERIALS

Geochemical testing of overburden material undertaken at the site has revealed that the only acid forming leachate occurs in the Wynn Seam (Mountford and Wall, 1995). Material balance calculations undertaken for the 1997 EIS indicated that dilution and neutralisation will negate any acid forming potential that may occur in this leachate.

Due to the predicted small proportion of potentially acid forming material, it is expected that operational blending during ROM dumping will produce a non-acid forming material within the overburden emplacement and back-filled open cut. The management strategy for the MPO will provide that no zones of poorly blended, potentially acid forming material are exposed in the final surface of the overburden emplacement and back-filled open cut. This will be achieved by excluding the material identified as potentially being acid forming (i.e. non-economic coal and identified coal seam roof and floor rock from the Wynn Seam) from the final face of the overburden emplacement.

Using this strategy, it is anticipated that no surface water will come into contact with potentially acid forming materials at the site.

5.4 CHEMICAL AND HYDROCARBON STORAGE

Chemicals and hydrocarbons will be managed through the MPO procedures for site contamination prevention and control. These procedures will minimise the potential for land and water contamination from the handling, storage and disposal of these substances.

Chemicals and hydrocarbons will be transported and stored on-site in accordance with the NSW *Work Health and Safety Act 2011* and *Work Health and Safety (Mines and Petroleum Sites) Act 2013*. Additionally, MACH Energy will register all chemicals used on site within a central database. The central database will contain all information in the Safety Data Sheets (SDS) and an inventory of chemicals held on-site. The information will be accessible at any computer terminal within the MPO and provide guidance on storage, use and disposal.

On-site controls will include storage within properly sealed containers and controlled areas, bunded for medium to long-term storage requirements. These storage and waste receival areas will be isolated from clean water catchments to minimise the risk of land or water pollution should an unplanned spill occur.

The response to any accidental spills or ground contamination will be assessed on a case-by-case basis and remediated using biodegradable spill absorbent. Emergency response procedures will also be enacted as required in accordance with the relevant environmental procedures. Hydrocarbon or chemical spills will be reported in the mine site incident reporting and management system with corrective and preventative measures undertaken as appropriate.

6 SURFACE WATER IMPACT TRIGGER LEVELS

6.1 SURFACE WATER QUALITY

Surface water quality triggers have been developed using the ANZG (2018) / ANZECC & ARMCANZ (2000) guidelines in conjunction with baseline data collected at the site.

The ANZG (2018) / ANZECC & ARMCANZ (2000) guidelines recommend that wherever possible, site-specific data is used to define trigger values for physical and chemical factors which can adversely impact the environment. Trigger values are not regarded as assessment criteria; rather they are used as an indicator of potential impacts and to initiate investigations into the surface water quality as reported by the monitoring program.

The ANZG (2018) / ANZECC & ARMCANZ (2000) guidelines have been superseded by the Australian New Zealand Guidelines 2018 (ANZG 2018). However, site specific and default trigger levels or guideline values remain unchanged for the Southeast Coast water drainage division (in which the MPO is located)²

The approach recommended by ANZG (2018) / ANZECC & ARMCANZ (2000) for developing site-specific trigger values for slightly to moderately disturbed ecosystems, is to formulate trigger values based on the 20th and 80th percentile of the site-specific monitoring data. These values should be calculated from a minimum of 2 years of monthly data (i.e. 24 data points). The objective of this approach is to develop conservative, site-specific trigger values for use as a means to improve water quality in highly disturbed ecosystems.

Trigger levels have not been established for sites upstream of the MPO (i.e. W1, W4 and W11) because these cannot be affected by the MPO. Site specific trigger levels have been developed for sites W2 and W6 as indicator sites. Site W6 contains sufficient data to develop trigger levels although there was insufficient data to develop TDS trigger levels for this site. Sites W5, W9, W13 and W16 are located on ephemeral drainage lines which are frequently dry and do not have sufficient data to develop site-specific trigger levels. There was insufficient data to develop trigger levels for site W14 due to dry conditions. ANZG (2018) / ANZECC & ARMCANZ (2000) default trigger levels for these sites have been adopted, until such time as sufficient data is available to develop site-specific triggers.

Preliminary trigger values from the *Bengalla Water Management Plan* (BMC, 2017) have been assigned for site W17. MACH Energy has established preliminary triggers at this site as it is the only site downstream of MPO's footprint on the Hunter River which is not also downstream of the Bengalla Mine footprint. MACH Energy therefore considers this site particularly important for assessing surface water impacts prior to site specific triggers becoming available to establish.

MCO has established triggers on Sandy Creek, downstream of the MPO. A description of these triggers and how they were derived is contained in the *Mangoola Coal Surface Water Monitoring Plan* (MCO, 2018).

Proposed water quality trigger levels for the surface water sites and the corresponding ANZG (2018) / ANZECC & ARMCANZ (2000) guidelines are presented in Table 10 below. Where the 80th percentile value for EC is lower than the ANZG (2018) / ANZECC & ARMCANZ (2000) guidelines, the guidelines have been adopted as the trigger value for that specific parameter.

² As of 28 July 2022

An investigation is triggered when:

- a water quality indicator at a downstream receiving water monitoring location is above (or outside the range) of trigger investigation level for three consecutive sampling events; and
- a water quality indicator at a downstream water monitoring location is above (or below in event of a trigger of the lower pH limit) the corresponding upstream monitoring location (where such a monitoring location exists) sampled on the same day.

Table 10
Surface Water Quality Trigger Levels

	рН	EC (µS/cm)	TSS (mg/L)	
Site	20 th – 80 th Percentile Trigger Values	80 th Percentile Trigger Value	80 th Percentile Trigger Value	
Site Specific 1	Trigger Levels			
W2	6.5 - 8.3**	539	18	
W6*	6.5 – 8.4**	496	19	
W12	6.5 – 8.1**	6420	30	
W15	6.5 – 8**	460	23	
Default Trigge	er Levels^			
W5	6.5 – 7.5	350	-	
W9	6.5 – 7.5	350	-	
W13	6.5 – 7.5	350		
W14	6.5 – 7.5	350		
W16	6.5 – 7.5	350		
Bengalla Mine	Trigger Levels#			
W17	6.5 – 8.1	650	40	

^{*} Due to safe access no longer being available at site W6, triggers developed for this site will now be used at the new monitoring location W6A approximately 500 metres (m) downstream of W6, as described in Section 7.3.

^{**} Where the 20th - 80th percentile trigger values were within the default trigger levels, the default trigger levels were adopted.

[^] Default triggers are based on ANZECC & ARMCANZ (2000) guideline values for upland rivers in south-east Australia. ANZECC & ARMCANZ (2000) does not provide guideline values for TSS.

^{**} Preliminary trigger values have been sourced from the Bengalla Water Management Plan (BMC, 2017), which have been established from baseline data for monitoring sites adjacent to W17 (e.g. Bengalla sites W01, W02 and W03 [Figure 3]), as well as the ANZECC & ARMCANZ (2000) guideline.

6.2 STREAM HEALTH

Baseline data for the stream health of surface water in the vicinity of the MPO has been collected using the AusRivAS system, which is described in Section 4.3. Using the AusRivAS system, observed (O) numbers of macro invertebrate taxa were compared with the expected (E) numbers of macro invertebrate taxa found at each site. Using this information, an O/E proportion was calculated, and this informed an overall 'band of impairment' score for each site.

Band of impairment scores are based upon where the O/E values fall within a specified range, as shown in Table 11 below.

Contributions from agriculture, mining, urban run-off, drought and flow regulation, among others, since the mid-1990s are likely to have had a considerable influence on aquatic biota within the area and the previously assigned baseline band of impairment scores, which were determined by combining edge and riffle habitat scores of the samples collected in mid-1990s.

Revised baseline band of impairment scores have been determined based on the Spring 2017 monitoring round results, which is the only contemporary survey undertaken at the stream health monitoring sites (Table 8) prior to commencement of operations at the MPO. The band of impairment scores derived from the Spring 2017 monitoring round were generally lower than the previously assigned baseline band of impairment scores (likely due to the activities described above). Accordingly, the contemporary data collected in 2017 is considered to provide a more appropriate representation of the baseline conditions of the Hunter River prior to commencement of operations at the MPO.

Should a measured band of impairment score at a particular downstream monitoring site degrade below the baseline band level outlined in Table 12, and the band level at a corresponding upstream monitoring site remain the same for two successive monitoring rounds, the stream health investigation protocol (refer to the SGWRP) would be initiated³.

The stream health triggers for each downstream site are presented in Table 12.

Table 11
Stream Health Band of Impairment Scores

Band Label	O/E Taxa Range	Band Name	Band Description
Band X	>1.12	More biologically diverse than reference sites.	More taxa found than expected. Potential biodiversity hot-spot. Possible mild organic enrichment.
Band A	0.85 – 1.15	Reference condition.	Most/all of the expected families found. Water quality and/or habitat condition roughly equivalent to reference sites. Impact on water quality and habitat condition does not result in a loss of macro invertebrate diversity.
Band B	0.55 – 0.84	Significantly impaired.	Fewer families than expected. Potential impact either on water quality or habitat quality or both resulting in loss of taxa.
Band C	0.25 – 0.54 Severely impaired.		Many fewer families than expected. Loss of macro invertebrate biodiversity due to substantial impacts on water and/or habitat quality.
Band D	0 – 0.24	Extremely impaired.	Few of the expected families remain. Extremely poor water and/or habitat quality. Highly degraded.

Source: Gray B. (2004); Hose, G. and Turak, E. (2004).

00938921-008 22 **MACHEnergy**

There is no corresponding upstream site for site SC. The stream health investigation protocol would be initiated if the band of impairment score at site SC degrades below the baseline band level outlined in Table 12 for two successive monitoring rounds.

Table 12 Stream Health Trigger Values

Historical Site ID	Updated Site ID	Baseline Band of Impairment Score	O/E Taxa^
W1	HR1	С	0.41
W1	HR2	B*	0.59
Hunt 854	HR3	В	0.64
Hunt 571	HR4	С	0.51
W15	HR5	В	0.61
SW17	HR6	В	0.73
Sandy 1	SC	В	0.61
Hunt 585	DB	В	0.66
Hunt 506	MC	В	0.55

Derived from the Spring 2017 monitoring round (refer Table 9).

MACH Energy commenced stream health monitoring at three additional downstream sites in Spring 2017, including one on Sandy Creek and two on the Hunter River. MCO has established stream health trigger levels for monitoring sites on Sandy Creek (Figure 3). In the event a deterioration in stream health is observed at these locations, MACH Energy would consult with MCO during the implementation of their response mechanisms.

6.3 LICENSED DISCHARGE

Licensed discharges from the MPO will be undertaken in accordance with the HRSTS and criteria described in EPL 20850.

^{*} Previously recorded as Band A, which is considered unrealistic due to the disturbances that the site is regularly exposed to (e.g. stream bank erosion, water regulation and agricultural activities).

7 SURFACE WATER MONITORING PROGRAM

7.1 STANDARDS

Surface water monitoring at the MPO will be undertaken in accordance with relevant Australian Standards, legislation and NSW Guidelines, including (but not limited to):

- Approved Methods for the Sampling and Analysis of Water pollutants in NSW (DEC, 2004);
- AS/NZS 5667.1:1998 Water Quality Sampling Guidance on the Design of Sampling Programs, Sampling Techniques and the Preservation and Handling of Samples; and
- AS/NZS 5667.10:1998 Water Quality Sampling Guidance on Sampling of Waste Waters.

7.2 STREAMFLOW

MACH Energy would continue to review data from DPI-Water's gauging stations in the vicinity of the MPO (e.g. to inform groundwater modelling reviews). All three of these gauges continuously monitor:

- level (m);
- discharge/flow (ML/day);
- EC (μS/cm); and
- water temperature (degrees Celsius).

A qualitative measure of flow would also be recorded at all surface water quality sites at the time of sampling (e.g. dry, stagnant pool, low flow or high flow).

7.3 SURFACE WATER QUALITY

Monthly water sampling is undertaken at the relevant monitoring locations listed in Table 3. This includes the seven new surface water monitoring sites that were added to the monitoring network following commencement of operations (W11 – W17). The surface water monitoring program is shown on Figure 3 and summarised in Table 13 below.

Since 2011, monitoring data has not been collected at the Hunter River site W6 due to the river bank being too steep at this location to allow safe access. As such, water monitoring at site W6 has been discontinued and monitoring is undertaken at the new monitoring site W6A. This site is located at the same point as stream health monitoring site HR3, approximately 500 m downstream of the historical W6 site (Figure 3). Given its close proximity to the original site, as well as the overall scale of the Hunter River, trigger values developed at site W6 (Table 10) are used for monitoring at site W6A.

Monitoring at sites W7 and W8 have been discontinued due to being disturbed by mining activities. Monitoring at site W10 has been discontinued as the site is located on Dry Creek directly downstream of the Bengalla Mine Dry Creek Diversion Project.

Two v-notch weirs have been installed to the west of the Fines Emplacement Area for internal monitoring purposes. The location of the installed v-notch weirs is shown on Figure 3. The established v-notch weirs may be relocated as part of any future works. Should the v-notch weirs be relocated, the revised location of the weirs will be shown in the revised SWMP. Further information regarding the SWMP revision in provided in Section 8.2 of this SWMP.

Table 13
Surface Water Monitoring Program

Feature	Location/Sites	Parameters	Frequency ¹
Hunter River#	Upstream (Aberdeen [GS210056])	Streamflow, EC	Continuous (DPIE-Water)
	Upstream (W1)	Water Quality (Suite 1)	Monthly & Event Based
	Upstream (W1)	Water Quality (Suite 2)	Special Frequency
	*Upstream / Downstream (Muswellbrook [210002])	Stream Flow	Continuous (DPIE-Water)
	*Upstream / Downstream (W2, W3 & W6A)	Water Quality (Suite 1)	Monthly (Baseline)
			Monthly & Event Based (When development within sub-catchment)
	*Upstream / Downstream (W2, W3 & W6A)	Water Quality (Suite 2)	Special Frequency

	Downstream (W15 & W17)	Water Quality (Suite 1)	Monthly & Event Based
	Downstream (W15 & W17)	Water Quality (Suite 2)	Special Frequency
	Downstream (Denman [210055])	Stream Flow	Continuous (DPIE-Water)
Dart Brook	Upstream (DB)	Stream Health%	Bi-Annual (Spring and Autumn)
Muscle Creek	Upstream (W4)	Stream Quality	Event Based
	Upstream (MC)	Stream Health%	Bi-Annual (Spring and Autumn)
Unnamed Tributaries – Draining mining lease 1645 (North-east to Hunter River)	Downstream (W5 & W9)	Water Quality (Suite 1)	Event Based (<i>Baseline</i>) Monthly & Event Based (<i>When development within</i> sub-catchment)
	Downstream (W5 & W9)	Water Quality (Suite 2)	Special Frequency
Rosebrook Creek	Downstream (W14)	Water Quality (Suite 1)	Monthly & Event Based
	Downstream (W14)	Water Quality (Suite 2)	Special Frequency
Sandy Creek^	Upstream (W11)	Water Quality (Suite 1)	Monthly & Event Based
	Upstream (W11)	Water Quality (Suite 2)	Special Frequency
	Downstream (W12)	Water Quality (Suite 1)	Event Based (Baseline)
			Monthly & Event Based (When development within sub-catchment)
	Downstream (W12)	Water Quality (Suite 2)	Special Frequency
	Downstream (SC)	Stream Health%	Bi-Annual (Spring & Autumn)

Table 13 (Continued) Surface Water Monitoring Program

Feature	Location/Sites	Parameters	Frequency ¹
Unnamed Tributaries – Draining mining lease 1645 (West to Sandy Creek)	Downstream (W13 & W16)	Water Quality (Suite 1)	Event Based (Baseline)
			Monthly & Event Based (When development within sub-catchment)
	Downstream (W13 & W16)	Water Quality (Suite 2)	Special Frequency

¹ Event based frequency would be no greater than once per month.

- # Available water monitoring results from the Mangoola Coal water monitoring program at nearby sites on Hunter River (SW14, SW15 & SW17) would also be used for comparative purposes.
- * Upstream / Downstream reflects monitoring locations that would not be potentially affected by the development until later in the Project life.
- ^ Available water monitoring results from the Mangoola Coal water monitoring program at nearby sites on Sandy Creek (SW1 & SW2) would also be used for comparative purposes.
- Stream health monitoring parameters are described in Section 7.4.

Suite 1 = pH, EC, TSS and TDS sampling.

Suite 2 = pH, EC, TSS, Cu, Pb, Zn, Ni, Fe, Mn, As, Se, Cd, Cr, Li, Ba, Sr, Turbidity, Dissolved Oxygen, Total P and Total N. Special Frequency = Quarterly until the end of 2018 and annually thereafter.

Note: During the construction phase of the MOD 4 rail loop and associated infrastructure, a Construction Environmental Management Plan (CEMP) will be implemented. The CEMP includes project-specific surface water quality monitoring to monitor potential impacts to water quality from the construction activities.

7.4 STREAM HEALTH

The stream health monitoring program is based on the AusRivAS aquatic invertebrate monitoring protocol, as used for the baseline stream health study.

AusRivAS is a rapid biological assessment protocol with twice yearly (spring and autumn) aquatic macro invertebrate sampling. Monitoring would continue to be undertaken at the nine sites shown on Figure 3. Stream health monitoring is also undertaken by MCO on Sandy Creek, to the south of site SC, and to the south-west of the MPO (Figure 3) and published in the Mangoola Coal Annual Reviews.

In addition to the aquatic macro invertebrate sampling, monitoring at the MPO stream health sites will also include:

- fish observations;
- site water quality;
- stream condition; and
- aquatic and riparian edge plants.

Due to the highly ephemeral nature of drainage lines within the MPO boundary, it is unlikely that these drainage lines support significant ecosystems. Therefore, all stream health monitoring locations are located on significant watercourses outside the MPO boundary.

The outcomes of the annual stream health monitoring (i.e. two rounds of monitoring) will be described in the Annual Review.

7.5 ON-SITE (MINE) WATER MANAGEMENT

A description of the on-site water management system is provided in the SWB.

Regular on-site water management monitoring will be undertaken to minimise potential environmental harm, ensure relevant statutory requirements are being met and to improve the water management system implemented at the site.

Regular monitoring of water levels in all mine water management storage dams will be undertaken. The integrity of clean water diversion and runoff collection structures will be monitored after rainfall events causing flow and on scheduled inspections. Visual and olfactory checks will occur following any contamination incidents, to monitor for any remnant contamination (this may involve laboratory assessment). All mine water storages (including open cut pits and sediment dams) will be sampled for Suite 1 water quality parameters monthly. An automated system for water diversion is used on-site to reduce human error.

The Secretary of the DPIE and the Chief Executive Officer of the EPA will be notified as soon as practicable after monitoring has identified a discharge incident causing material environmental harm. A detailed report on the incident will be made available within seven calendar days after the incident was identified.

To further reduce the risk of a discharge incident causing material harm, MACH Energy has developed a Surface Water Management Procedure which provides a set of recommended work practices for use by MPO employees and contractors to manage construction dams within the MPO. The Surface Water Management Procedure is an internal MACH Energy document, which expands on the procedures outlined in this SWMP⁴.

MACH Energy has also prepared the CEMP in accordance with Condition 44I, Schedule 3 of Development Consent DA 92/97, which provides measures to minimise potential environmental impacts from MOD 4 construction works, including surface water management. The CEMP was approved on 10 March 2020.

7.6 BRIDGE OPENINGS AND CULVERTS

Condition 28(c), Schedule 3 of Development Consent DA 92/97 requires MACH Energy to implement a program to monitor and maintain the bridge openings and culverts associated with the MOD 4 rail infrastructure and ensure that they remain clear of blockages.

An assessment of the potential for blockages to occur in the proposed final design of bridge openings and culverts was undertaken by WRM Water and Environment (2020).

Assessment of the design blockage for the conceptual rail spur bridge openings was undertaken in accordance with Australian Rainfall and Runoff 2019, which included consideration of key design criteria including debris availability, mobility and transportability. The blockage assessment for the conceptual rail spur bridge openings indicated a low blockage potential and resulted in a 0% blockage for the most likely inlet blockage level (WRM Water and Environment, 2020).

MACH Energy has also designed the final MOD 4 rail infrastructure to meet specific flooding criteria in accordance with Conditions 44C and 44D, Schedule 3 of Development Consent DA 92/97 (WRM Water and Environment, 2020).

Note that the Surface Water Management Procedure has not been reviewed or endorsed by the DPIE. MACH Energy takes responsibility for ensuring the procedures in the Surface Water Management Procedure are in accordance with provisions in this SWMP and provisions in Development Consent DA 92/97.

An independent review of the proposed final design of the MOD 4 rail infrastructure was undertaken by Royal HaskoningDHV (2020) in accordance with Condition 44D, Schedule 3 of Development Consent DA 92/97. The final design of the MOD 4 rail infrastructure meets the performance criteria specified in Condition 44C, Schedule 3 of Development Consent DA 92/97 (Royal HaskoningDHV, 2020) and was approved by the DPIE on 5 August 2020.

Notwithstanding the limited potential for blockages to occur, MACH Energy would undertake visual inspections annually and following flooding events⁵ of the existing culvert crossings, culvert crossing extension and rail bridges to identify any blockages or potential blockage risks.

Any blockages that are identified would be removed by MACH Energy personnel and disposed of in accordance with the Waste Management Plan.

MACH Energy would also implement the management measures outlined in the CEMP to minimise the potential for blockage at culvert and bridge crossings during the construction of the approved MOD 4 rail infrastructure.

⁵ Defined as a flood event equal to or exceeding the 'minor flooding' classification in the Muswellbrook Shire Local Flood Plan (NSW State Emergency Service, 2013).

8 REVIEW AND IMPROVEMENT OF ENVIRONMENTAL PERFORMANCE

8.1 ANNUAL REVIEW

In accordance with Condition 3, Schedule 5 of Development Consent DA 92/97 MACH Energy will review and evaluate the environmental performance of the MPO by the end of March each year (for the preceding calendar year) or other such timing as agreed by the Secretary of the DPIE.

In relation to water, the Annual Review will:

- include a review of the surface water monitoring data and site water balance relating to the MPO over the past year, which includes a comparison of these results to evaluate compliance against the:
 - relevant statutory requirements, limits or performance measures/criteria (refer Section 2.1.1);
 - monitoring results of the previous years; and
 - relevant predictions in the EIS and MOD 1, MOD 2, MOD 3 and MOD 4 EAs;
- identify any surface water-related non-compliance over the past year, and describe what actions were (or are being) taken to ensure compliance;
- identify any trends in the surface water monitoring data over the life of the MPO;
- identify any discrepancies between the predicted and actual surface water impacts of the MPO, and analyse the potential cause of any significant discrepancies; and
- describe what surface water-related measures will be implemented over the next year to improve the environmental performance of the MPO.

The Annual Review will be made publicly available on the MACH Energy website (https://machenergyaustralia.com.au/) in accordance with Condition 11, Schedule 5 of Development Consent DA 92/97.

8.2 SWMP REVISION

In accordance with Condition 4, Schedule 5 of Development Consent DA 92/97, this SWMP will be reviewed, and if necessary revised (to the satisfaction of the Secretary of the DPIE), within three months of the submission of:

- an Annual Review (Condition 3, Schedule 5);
- an incident report (Condition 7, Schedule 5);
- an Independent Environmental Audit (Condition 9, Schedule 5); and
- any modification to the conditions of Development Consent DA 92/97.

Within 4 weeks of conducting a review of this SWMP, MACH Energy will advise the Secretary of the DPIE of the outcomes of the review, and submit any revised documents for the approval of the Secretary.

In accordance with Condition 4A, Schedule 5 of Development Consent DA 92/97, MACH Energy may submit a revised SWMP for the approval of the Secretary at any time, and may also submit any revision to this SWMP required under Development Consent DA 92/97 on a staged basis.

If agreed with the Secretary of the DPIE, a revision to this SWMP required under Development Consent DA 92/97 may be prepared without undertaking consultation with all parties nominated under the relevant Condition of Development Consent DA 92/97.

The approved SWMP will be made publicly available on the MACH Energy website (https://machenergyaustralia.com.au/), in accordance with Condition 11, Schedule 5 of Development Consent DA 92/97.

9 REPORTING PROCEDURES

In accordance with Condition 2, Schedule 5 of Development Consent DA 92/97, MACH Energy has developed protocols for managing and reporting the following:

- incidents;
- complaints;
- non-compliances with statutory requirements; and
- exceedances of the impact assessment criteria and/or performance criteria.

These protocols are described in Section 5 of the WMP.

In accordance with Condition 8, Schedule 5 of Development Consent DA 92/97, MACH Energy will provide regular reporting on the environmental performance of the MPO on the MACH Energy website (https://machenergyaustralia.com.au/).

APPENDIX 4

GROUNDWATER MANAGEMENT PLAN

Department of Planning and Environment

Chris Masters Environmental Advisor Mach Energy Australia Pty Ltd Suite 1, Level 3 426 King Street Newcastle West, NSW, 2302 06/06/2022

Subject: Groundwater Management Plan for Mt Pleasant Coal (DA92/97-PA-31)

Dear Mr. Masters,

I refer to the Groundwater Management Plan which was submitted in accordance with Condition 28 (d) of Schedule 3 of the consent for the Mt Pleasant Coal project (DA92/97-PA-31).

The Department acknowledges that the plan was submitted following an Independent Environmental Audit (IEA) conducted in June 2020 in accordance with Condition 4 (c) of Schedule 5 of the consent. The Department has carefully reviewed the document and is satisfied that it addresses the recommendations of the IEA.

Accordingly, the Secretary has approved the Groundwater Management Plan (Revision 00). Please ensure that the approved plan is placed on the project website at the earliest convenience. You are reminded that if there is any inconsistency between the approved document and the conditions of approval, then the requirements of the conditions of approval prevail.

If you wish to discuss the matter further, please contact Jess Watson on 02 9373 2845.

Yours sincerely

Stephen O'Donoghue

Director

Resource Assessments

As nominee of the Planning Secretary

1 INTRODUCTION

The Mount Pleasant Operation (MPO) is located in the Upper Hunter Valley of New South Wales (NSW), approximately 3 kilometres (km) north-west of Muswellbrook and approximately 50 km north-west of Singleton (Figure 1). The village of Aberdeen and locality of Kayuga are also located approximately 5 km north-northeast and 1 km north of the MPO boundary, respectively (Figure 1). MACH Energy purchased the MPO from Coal & Allied Operations Pty Ltd (Coal & Allied) in 2016.

MACH Mount Pleasant Operations Pty Ltd is the manager of the MPO as agent for, and on behalf of, the unincorporated Mount Pleasant Joint Venture between MACH Energy Australia Pty Ltd (MACH Energy) (95 per cent [%] owner) and J.C.D. Australia Pty Ltd (5% owner). This Groundwater Management Plan (GWMP) is implemented at the MPO by MACH Energy.

The initial development application for the MPO was made in 1997. This was supported by an Environmental Impact Statement (EIS) prepared by Environmental Resources Management (ERM) Mitchell McCotter (ERM Mitchell McCotter, 1997). On 22 December 1999, the then Minister for Urban Affairs and Planning granted Development Consent DA 92/97 to Coal & Allied. This allowed for the "Construction and operation of an open cut coal mine, coal preparation plant, transport and rail loading facilities and associated facilities" at the MPO. The consent allowed for operations 24 hours per day seven days per week and the extraction of 197 million tonnes (Mt) of run-of-mine (ROM) coal over a 21 year period, at a rate of up to 10.5 Mt of ROM coal per year.

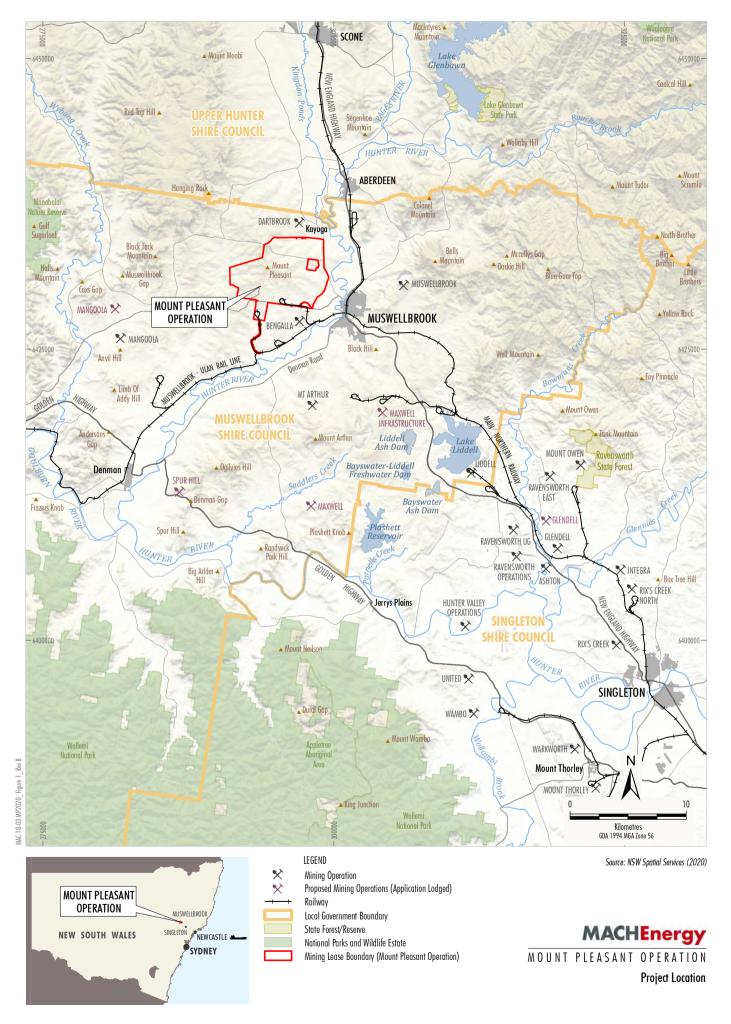

The Mount Pleasant Project Modification (MOD 1) was submitted on 19 May 2010 with a supporting Environmental Assessment (EA) prepared by EMGA Mitchell McLennan (EMGA Mitchell McLennan, 2010). MOD 1 included the provision of an infrastructure envelope for siting the mine infrastructure, the provision of an optional conveyor/service corridor linking the MPO facilities with the Muswellbrook-Ulan Rail Line and modification of the existing Development Consent DA 92/97 boundaries to accommodate the optional conveyor/service corridor and minor administrative changes. MOD 1 was approved on 19 September 2011.

The MPO South Pit Haul Road Modification (MOD 2) was submitted on 30 January 2017 with a supporting EA prepared by MACH Energy (MACH Energy, 2017a). MOD 2 proposed to realign an internal haul road to enable more efficient access to the South Pit open cut, with no other material changes to the approved MPO. MOD 2 was approved on 29 March 2017.

The MPO Mine Optimisation Modification (MOD 3) was submitted on 31 May 2017 with a supporting EA prepared by MACH Energy (MACH Energy, 2017b). MOD 3 comprised an extension to the time limit on mining operations (to 22 December 2026) and extensions to the South Pit Eastern Out of Pit Emplacement to facilitate development of an improved final landform. MOD 3 was approved on 24 August 2018.

The MPO Rail Modification (MOD 4) was submitted on 18 December 2017 with a supporting EA prepared by MACH Energy (MACH Energy, 2017c). MOD 4 proposed the following changes:

- duplication of the approved rail spur, rail loop, conveyor and rail load-out facility and associated services;
- duplication of the Hunter River water supply pump station, water pipeline and associated electricity supply that followed the original rail spur alignment; and
- demolition and removal of the redundant approved infrastructure within the extent of the Bengalla Mine, once the new rail, product loading and water supply infrastructure has been commissioned and is fully operational.

MOD 4 was approved on 16 November 2018 by the Secretary of the NSW Department of Planning and Environment (under Delegation). Appendix 2 of the modified Development Consent DA 92/97 illustrates the Conceptual Project Layout Plan of the approved MPO at 2021 and 2025, Approved Surface Disturbance Plan and Conceptual Final Landform (Attachment 1) incorporating the MOD 4 infrastructure relocations.

1.1 STRUCTURE OF THE GROUND WATER MANAGEMENT PLAN

Consistent with the requirements of Condition 28(d), Schedule 3 of Development Consent DA 92/97, the remainder of the GWMP is structured as follows:

- Section 2: Outlines the statutory obligations relevant to this GWMP.
- Section 3: Describes the existing groundwater environment present at the MPO.
- Section 4: Provides a description of the baseline data available for the GWMP.
- Section 5: Describes the management strategy proposed for the final voids (including development of detailed plans).
- Section 6: Describes the groundwater model predictions and validation (including contemporary groundwater modelling).
- Section 7: Outlines the groundwater impact trigger levels.
- Section 8: Describes the groundwater monitoring program proposed for the MPO.
- Section 9: Describes the review process for MPO documentation, including in particular for this GWMP.
- Section 10: Outlines the reporting procedures for MPO documentation.
- Section 11: Provides a list of the references cited in this report.

2 STATUTORY OBLIGATIONS

MACH Energy's statutory obligations are contained in:

- the conditions of Development Consent DA 92/97 (as modified);
- the conditions of the Commonwealth Approval EPBC 2011/5795;
- relevant licences (including Environment Protection Licence [EPL] 20850), permits and mining leases (MLs) (ML 1645, ML 1708, ML 1709, ML 1713, ML 1750 and ML 1808); and
- other relevant legislation.

Obligations relevant to this GWMP are described below.

2.1 PURPOSE AND SCOPE

This GWMP has been prepared by MACH Energy to satisfy the requirements under Development Consent DA 92/97 and specifically Condition 28(d), Schedule 3.

The GWMP applies to all employees and contractors at the MPO and covers all areas within the MPO boundary. The GWMP applies to the life of the MPO, including (but not limited to) the period of mining operations specified in Development Consent DA 92/97, which currently permits mining until 22 December 2026. As required by Condition 5, Schedule 2 of Development Consent DA 92/97, the GWMP will continue to apply (excluding mining operations) beyond 22 December 2026, as required, until the rehabilitation and any additional undertakings (required by the Secretary of the NSW Department of Planning, Industry and the Environment [DPIE], or the Department of Mining, Exploration and Geoscience [MEG] within the Department of Regional NSW) have been carried out satisfactorily.

This GWMP has been prepared to monitor and manage potential groundwater related impacts (through groundwater model validation and the development of trigger levels) associated with the MPO, including open cut mining.

Response protocols in the event of an exceedance of trigger levels from this GWMP and appropriate measures to prevent, minimise, mitigate, compensate and/or offset such adverse impacts are described separately in the Surface and Ground Water Response Plan.

2.2 DEVELOPMENT CONSENT DA 92/97

The conditions of Development Consent DA 92/97 relevant to the content and structure of this GWMP are described below. A comprehensive list of all conditions in Development Consent DA 92/97 relevant to water resources (in general) is provided in the Water Management Plan (WMP).

2.2.1 **GWMP** Requirements

Condition 28(d), Schedule 3 of Development Consent DA 92/97 requires the preparation of a GWMP (refer Table 1).

Table 1
Groundwater Management Plan Development Consent DA 92/97 Condition

MPO Development Consent DA 92/97 Schedule 3	Section where addressed in this GWMP Document
28. The Applicant must prepare a Water Management Plan for the development to the satisfaction of the Secretary. This plan must be prepared in consultation with Dol Water and EPA, and be submitted to the Secretary for approval by 30 June 2019, unless otherwise agreed by the Secretary.	
The plan must include:	
(d) a Groundwater Management Plan, which must include:	
 detailed plans, including design objectives and performance criteria, for the design and management of the proposed final voids; 	Section 5
 detailed baseline data of groundwater levels, yield and quality in the region, and privately-owned groundwater bores, that could be affected by the development; 	Section 4
 groundwater impact assessment criteria including trigger levels for investigating any potentially adverse groundwater impacts; 	Section 7
a program to monitor and assess:	Section 8
 groundwater inflows to the mining operations; 	
 impacts on regional and local (including alluvial) aquifers; 	
 impacts on the groundwater supply of potentially affected landowners; 	
 impacts on groundwater dependent ecosystems and riparian vegetation; 	

2.2.2 Management Plan (General) Requirements

Condition 2, Schedule 5 of Development Consent DA 92/97 outlines the general management plan requirements that are applicable to the preparation of the GWMP.

Table 2 presents these requirements and indicates where each is addressed within this GWMP.

Table 2
General Development Consent DA 92/97 Conditions

MPO Development Consent DA 92/97 Schedule 5	Section where addressed in this GWMP Document
The Applicant must ensure that the management plans required under this consent are prepared in accordance with any relevant guidelines, and include:	
(a) detailed baseline data;	Section 4
(b) a description of:	Section 2
 the relevant statutory requirements (including any relevant consent, licence or lease conditions); 	
any relevant limits or performance measures/criteria;	Section 7
 the specific performance indicators that are proposed to be used to judge the performance of, or guide the implementation of, the development or any management measures; 	Section 7
(c) a description of the measures that would be implemented to comply with the relevant statutory requirements, limits, or performance measures/criteria;	Section 5
(d) a program to monitor and report on the:	Sections 7 and 8
 impacts and environmental performance of the development; 	
 effectiveness of any management measures (see c above); 	
(e) a contingency plan to manage any unpredicted impacts and their consequences;	Surface and Ground Water Response Plan
(f) a program to investigate and implement ways to improve the environmental performance of the development over time;	Section 9
(g) a protocol for managing and reporting any:	Section 10
• incidents;	
complaints;	
non-compliances with statutory requirements; and	
 exceedances of the impact assessment criteria and/or performance criteria; and 	
(h) a protocol for periodic review of the plan.	Section 9
Note: The Secretary may waive some of these requirements if they are unnecessary or unwarranted for particular management plans.	

2.3 LICENCES, PERMITS AND LEASES

Water management at the MPO is conducted in accordance with a number of licences, permits and leases. Key licences, permits and leases relating to water at the MPO include:

- Water Access Licences (WALs) issued under the NSW Water Management Act, 2000.
- Discharge credits (46 held under the NSW Protection of the Environment Operations (Hunter River Salinity Trading Scheme) Regulation, 2002.
- ML 1645, ML 1708, ML 1709, ML 1713, ML 1750 and ML 1808 issued under Part 5 of the NSW Mining Act, 1992 and approved by the Minister for Mineral Resources in December 2010.
- EPL 20850 issued under Part 3 of the NSW *Protection of the Environment Operations Act, 1997* by the NSW Environment Protection Authority (EPA).
- Mining Operations Plan/Rehabilitation Management Plan (MOP/RMP) approved by the MEG.

2.4 OTHER LEGISLATION / POLICY / PLANS

Other NSW Acts and Regulations that may be applicable to the GWMP for the MPO are discussed in the following sub-sections.

2.4.1 Water Management Act, 2000

The NSW *Water Management Act, 2000* aims to provide sustainable and integrated management of the water sources of NSW for the benefit of both present and future generations.

Under the NSW Water Management Act, 2000, the MPO is regulated under the Water Sharing Plan for the Hunter Unregulated and Alluvial Water Sources, 2009 and the Water Sharing Plan for the North Coast Fractured and Porous Rock Groundwater Sources, 2016.

The following groundwater sources are relevant to the MPO (Figure 2):

- Water Sharing Plan for the North Coast Fractured and Porous Rock Groundwater Sources, 2016:
 - Sydney Basin North Coast;
 - New England Fold Belt Coast; and
 - Liverpool Ranges Basalt Coast.
- Water Sharing Plan for the Hunter Unregulated and Alluvial Water Sources, 2009:
 - Hunter Regulated River Alluvial Water Source;
 - Unnamed alluvium within the Muswellbrook Water Source; and
 - Unnamed alluvium within the Dart Brook Water Source.
- Water Sharing Plan for the Hunter Regulated River Water Source, 2016:
 - Hunter Regulated River Water Source.

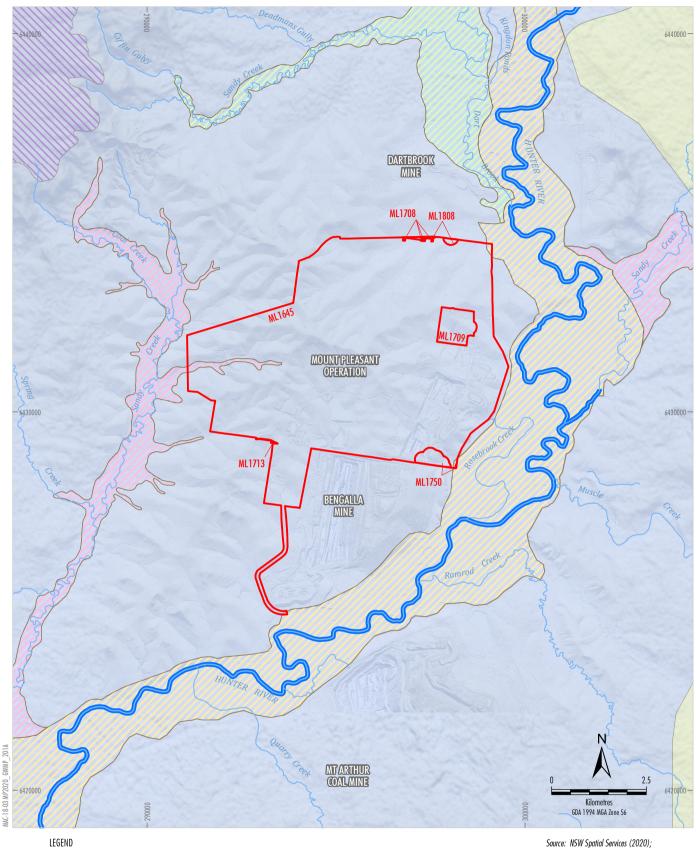

A summary of licences held by MACH Energy is provided in Tables 3 and 4.

MOUNT PLEASANT OPERATION

Relevant Groundwater Sources

In addition to licensing requirements, the NSW *Water Management Act, 2000* includes the concept of ensuring "no more than minimal harm". Minimal impact considerations have been developed in the *NSW Aquifer Interference Policy* (Department of Primary Industries [DPI], 2012) (Section 2.4.3).

2.4.2 Water Act, 1912

As water sharing plans have been commenced under the NSW *Water Management Act, 2000* for all groundwater and surface water systems that the MPO is predicted to take water from, the *Water Act, 1912* is not relevant to licensing considerations for the MPO.

2.4.3 NSW Aguifer Interference Policy

The NSW Aquifer Interference Policy has been developed by the NSW Government as a component of the NSW Government's Strategic Regional Land Use Policy.

The NSW Aquifer Interference Policy applies State-wide and details water licence and impact assessment requirements. The NSW Aquifer Interference Policy has been developed to ensure equitable water sharing between various water users and proper licensing of water taken by aquifer interference activities such that the take is accounted for in the water budget and water sharing arrangements. The NSW Aquifer Interference Policy also enhances existing regulation, contributing to a comprehensive framework to protect the rights of all water users and the environment in NSW.

The NSW Aquifer Interference Policy includes minimal impact considerations relating to water table and groundwater pressure drawdown and changes in groundwater and surface water quality. Where relevant, these minimal impact considerations have informed the groundwater impact trigger levels (i.e. more than 2 metres [m] drawdown) (Section 7). The NSW Aquifer Interference Policy establishes minimal impact considerations for groundwater categories of both 'highly productive' and 'less productive' groundwater. 'Highly productive groundwater' is defined by the NSW Aquifer Interference Policy as groundwater which (NSW Government, 2012):

...is defined in this Policy as a groundwater source that is declared in the Regulations and will be based on the following criteria:

- a) has total dissolved solids of less than 1,500 mg/L, and
- b) contains water supply works that can yield water at a rate greater than 5 L/sec.

The NSW Government's classification of the productivity of the various Groundwater Sources in this area is discussed in Section 3.

3 EXISTING GROUNDWATER ENVIRONMENT

A Water Management Study, including a regional groundwater investigation, was undertaken for the Mount Pleasant EIS by PPK Environment & Infrastructure (1997). A number of subsequent studies have been undertaken as part of mining planning and feasibility studies for the MPO as well as development applications for neighbouring mines (e.g. Bengalla Mine). A summary of the existing groundwater environment described by PPK Environment & Infrastructure (1997) is provided below.

Consistent with the relevant water sharing plans under the NSW *Water Management Act, 2000* (Section 2.4.1), the two key groundwater systems identified are the:

- **Alluvial groundwater system** associated with the alluvial plains of the Hunter River and its tributaries.
- Hard (fractured and porous) rock groundwater system including the Permian aged Wittingham Coal measures.

The regional geology of the MPO area is shown on Figure 3.

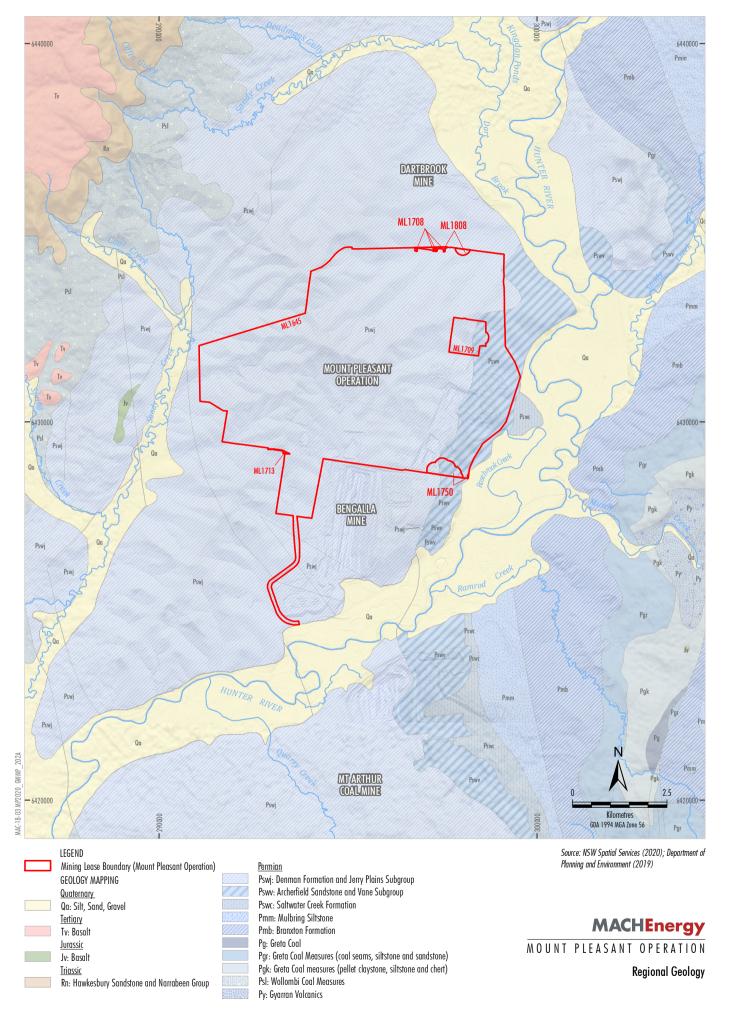

3.1 HARD (FRACTURED AND POROUS) ROCK GROUNDWATER SYSTEM

The MPO coal resource is located in the Permian Wittingham Coal measures of the Singleton Supergroup. Lithologies comprise mostly sandstones, siltstones and coal measures with minor conglomerates and tuffs. Coal seams amenable to open cut mining occur in eight correlated seams and include the Upper Piercefield (Warkworth) Seam to the lowermost Edderton Seam.

The sequence of stratigraphic units, focussing on the seams targeted at the MPO, is as follows:

Table 5
MPO Stratigraphic Units

Coal Measure	Subgroup	Coal Seam	
		Warkworth seam	
		Interburden #1	
		Mount Arthur seam	
		Interburden #2	
		Piercefield seam	
	Jerrys Plains Subgroup	Interburden #3	
		Vaux seam	
		Interburden #4	
Wittingham Coal Measures		Broonie seam	
		Interburden #5	
		Bayswater seam	
	Archerfield Sandstone		
		Interburden #6	
	Vara - Ouk mann	Wynn seam	
	Vane Subgroup	Interburden #7	
		Edderton seam	
	Saltwater Creek Formation		
Maitland Group	Mulbring Sandstone / Branxton Formation		

The coal seams are recognised as the main aquifer zones within the hard rock groundwater system, providing storage and transmission within cleats and joints.

The interburden is mainly comprised of sandstones and siltstones with very low permeabilities and porosities, which limits the rate of groundwater transmission. The interburden zones often act as aquitards, effectively impeding or constraining the vertical exchange of groundwaters.

Higher aquifer pressures within the coal measures and a regional gradient towards the alluvium result in pressure driving groundwater movement towards the Hunter River. It is likely groundwater seeps naturally from the hard (fractured and porous) rock groundwater system into the alluvial groundwater system.

The hard (fractured and porous) rock groundwater system is considered 'less productive' under the *NSW Aquifer Interference Policy* (Section 2.4.3). The exception to this is the 'highly productive' Liverpool Ranges Basalt, which is about 8 km from the MPO.

3.2 ALLUVIAL GROUNDWATER SYSTEM

Alluvial sediments associated with the Hunter River are located to the east of the MPO. Alluvial sediments associated with Sandy Creek are located to the west of the MPO (Figures 2 and 3).

The Hunter River alluvium comprises silt underlain by sands and gravels, reaching a thickness of up to 30 m. The Hunter River alluvium is classified as a highly productive groundwater source. These alluvial sediments offer increased groundwater storage when compared to the hard (fractured and porous) rock groundwater system due to their higher porosity. Gravel zones within the alluvium are capable of providing the highest storage and permeability when compared to sand, silt and clay zones.

Recharge to the Hunter Alluvium is also significantly controlled by surface water flows in the Hunter River. The Hunter River is perennial due to releases from Glenbawn Dam. Groundwater levels within the alluvium have remained relatively stable over time, despite periods of below average rainfall, indicating recharge from surface water flows. Groundwater flow within the Hunter River alluvium generally follows the direction of surface water flow, in a south to south-easterly direction (HydroSimulations, 2019).

Groundwater take from the Hunter Regulated River Alluvial Water Source will be reported as part of the Annual Review, where relevant.

4 BASELINE DATA

Groundwater monitoring was undertaken from 1994 to 1995 to inform the Mount Pleasant EIS Water Management Study. The results of this monitoring are presented in PPK Environment & Infrastructure (1997). The collection of baseline groundwater monitoring data at the MPO resumed in 2003. The baseline period of record has been taken up until August 2018. Mining activities have been undertaken prior to August 2018, however, these activities have been minor in nature and are not anticipated to have caused propagation at monitoring sites.

Bores in the MPO groundwater monitoring network are shown on Figure 4 and summarised in Table 6.

Table 6

Note:

mBG = metres below grade.

4.1 GROUNDWATER LEVELS

Baseline groundwater levels are presented as hydrographs in Attachment 2. Depending on the bore location, the baseline period may include groundwater level effects from neighbouring Bengalla and Dartbrook mines.

4.1.1 Eastern Domain

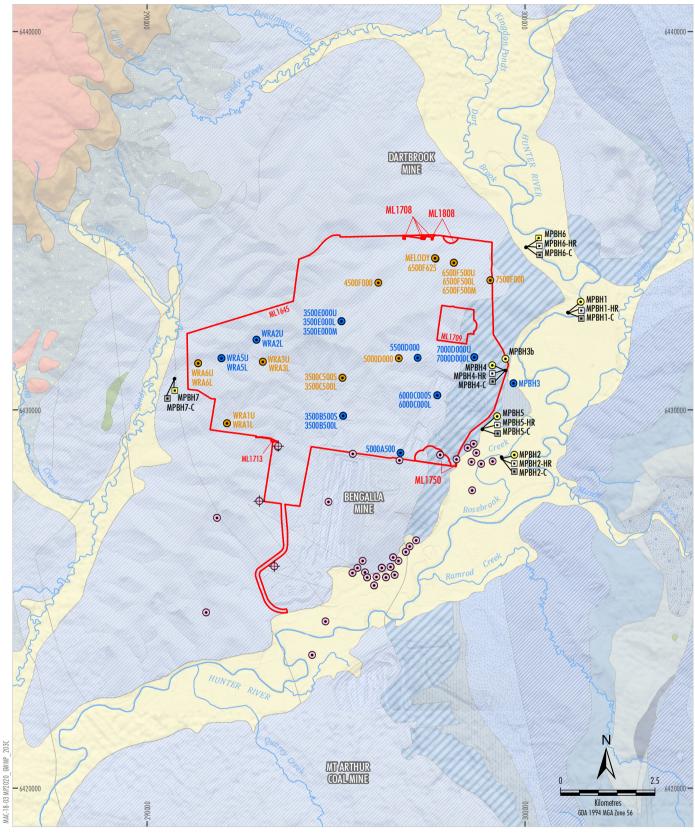

The alluvium bores MPBH1, 2, 3 and 3b show fairly static groundwater levels, varying by only 1-2 m, supporting the concept that these are controlled by nearby Hunter River stage elevation. MPBH1-2 both show a period of greater variation in 2009-10, which could have been caused by local bore pumping.

4.1.2 Central Domain

Some of the bores monitoring the hard rock units, e.g. 3500B500L and 3500B500S show a response to historical mining at Bengalla Mine. 3500B500L and 3500B500S are about 1.5 km north of Bengalla Mine and the deeper bore 3500B500L shows about 35 m of drawdown from 2002 to 2013-16, while about 25-30 m drawdown was observed at 3500C500L, which is a further 1 km north. The shallow (S) piezometers at these locations do not exhibit the same response to Bengalla Mine, indicating that there is only a weak connection (due to low permeability) between the deep and shallow units.

^{*} Bore decommissioned. MPBH3 was replaced by MPBH3B in 2011; 3500E000 was unable to be located during the 2017 Bore Census (MACH Energy, 2017d); and the remaining sites have been disturbed by mining operations.

Sites with U, M and L suffixes refer to 'upper', 'middle' and 'lower' (depths), but sites with S and L suffixes usually refers to piezometer diameter (small and large), which may be unrelated to the depth.

MOUNT PLEASANT OPERATION

Groundwater Monitoring Network

4.1.3 Western Domain

Bores in the west (e.g. WRA1U, WRA3U, WRA5U and WRA6U) show a higher degree of correlation to rainfall trends, and even some of the deeper piezometers exhibit the same (e.g. WRA3L, WRA5L and WRA6L). Generally, these bores also show consistent head separation between upper/shallow and lower piezometers, with the exception of WRA5U and WRA6U. The reason for the lack of head separation at these two bores is not yet known, but will be assessed further as part of on-going Contemporary Groundwater Modelling for the Project.

4.2 GROUNDWATER QUALITY

Baseline groundwater quality data is provided in Attachment 3 and a summary is provided in Table 7.

Table 7
Groundwater Quality Summary

Bore Group	Groundwater System Monitored	Median pH	Median Electrical Conductivity (EC) (μS/cm)
Eastern Groundwater Site (MPBH1 and MPBH2)	Alluvium	6.9	790
Eastern Groundwater Site (MPBH3)	Alluvium	6.8	1,005
Eastern Groundwater Site (MPBH3b)	Alluvium / Permian regolith	7.6	3,860
Central Groundwater Site	Hard (Porous and Fractured) Rock	6.9	5,210
Western Groundwater Site	Hard (Porous and Fractured) Rock	7.2	5,690

Note: μ S/cm = microsiemens per centimetre.

Median pH in both the alluvial and hard (porous and fractured) rock aquifer systems are neutral. The range of data shown in Attachment 3 indicate the pH is quite stable across both groundwater systems.

Groundwater within the alluvium is generally fresh to slightly brackish (median of $540-1,005~\mu\text{S/cm}$), as recorded at MPBH1, MPBH2 and MPBH3. Bore MPBH3b intersects the basal alluvium and weathered Permian coal measures, resulting in more brackish water quality. Groundwater within the Permian coal measures (Central and Western groundwater sites) is generally brackish to moderately saline.

4.3 AQUIFER PARAMETERS/GROUNDWATER YIELD

A number of investigations into aquifer parameters have been undertaken at the MPO and neighbouring Bengalla and Mt Arthur mines.

A summary of these investigations is provided in the sub-sections below.

4.3.1 MPO Investigations

As part of the Water Management Study undertaken for the Mount Pleasant EIS (PPK Environment & Infrastructure, 1997), a suite of groundwater testing, including injection, pump out and packer tests, were undertaken at the site.

Groundwater testing of the hard rock aquifers involved injection, slug and packer testing, and indicated very low rates of flow. A range of <0.0001 metres per day (m/day) to 0.84 m/day was determined for the hydraulic conductivity of the aquifer, with a global median value (omitting extreme values) of 0.015 m/day across all testing types.

In contrast to the hard rock coal measures, the alluvial aquifer regime was found to be highly transmissive, with an average hydraulic conductivity of 20.3 m/day, and an overall range of 8.8 m/day to 33.2 m/day.

Data obtained from the groundwater testing undertaken for the Mount Pleasant EIS (PPK Environment & Infrastructure, 1997) is provided in Attachment 4.

4.3.2 Investigations at Neighbouring Mines

Various groundwater tests have been undertaken in the vicinity of the MPO area, including at the Bengalla Mine directly to the south of the MPO, and the Mt Arthur Coal Mine to the south-east.

Pumping tests were undertaken as part of the Bengalla Mine EIS (Mackie Martin and Associates, 1993) on the alluvial aquifer bordering the Hunter River, to the south-east of the MPO. These tests found a transmissivity ranging from 100 square metres per day (m²/day) to 700 m²/day. Assuming a saturated thickness of 10 m (which is typical, based on nearby bore logs), this equates to a hydraulic conductivity ranging from 10 m/day to 70 m/day (AGEC, 2013).

Pumping tests were also undertaken on five bores bordering the Hunter River to the south of the MPO boundary, as part of the *Mt Arthur North Groundwater Management Studies* (Mackie Environmental Research, 2000). These tests indicated that basal gravel in the aquifer had a moderate to high hydraulic conductivity, which ranged from 5 m/day to 40 m/day, with a median value of 8.2 m/day.

Overall, available data in the area to the south of the MPO indicates a generally high but spatially variable hydraulic conductivity in the alluvial aquifer regime bordering the Hunter River (Australasian Groundwater and Environmental Consultants, 2013).

In the Wittingham Coal Measures to the south of the MPO, various tests were undertaken as part of the Bengalla Mine EIS (HLA-Envirosciences, 1993) which found a transmissivity range of 0.2 m²/day to 10 m²/day.

Australian Groundwater Consultants (AGC) (1979) and Laurie, Montgomerie and Petit Pty Ltd (LM&P) (1982) undertook groundwater testing in the Wittingham Coal Measures at the Mt Arthur Coal Mine to the south of the MPO boundary. The outcomes of these tests are summarised in Attachment 4, which indicate a large variation in the hydraulic conductivities of coal seams in the area (AGEC, 2013).

4.4 PRIVATELY-OWNED GROUNDWATER BORES

MACH Energy has conducted a census of privately-owned groundwater bores in the vicinity of the MPO (MACH Energy, 2017d).

The census involved:

- Characterisation of existing groundwater bores through collation and review of the NSW Department of Planning, Industry and Environment – Water (DPIE – Water) (former Department of Industry – Water).
- DPIE Water registered bore database and other regional information (e.g. 1:25,000 topographic maps).
- Site visits with local landholders to confirm the location and use of groundwater bores on their property.
- Opportunistic collection of baseline data where practical (e.g. water levels and basic water quality parameters).

Groundwater bores, wells and springs identified on privately-owned land during the census are shown on Figures 5a, 5b and 5c. A number of bores were also visited on mine-owned land during the census (e.g. monitoring bores). PINNEENA records are shown for properties that were not visited (e.g. due to distance from the MPO mining areas).

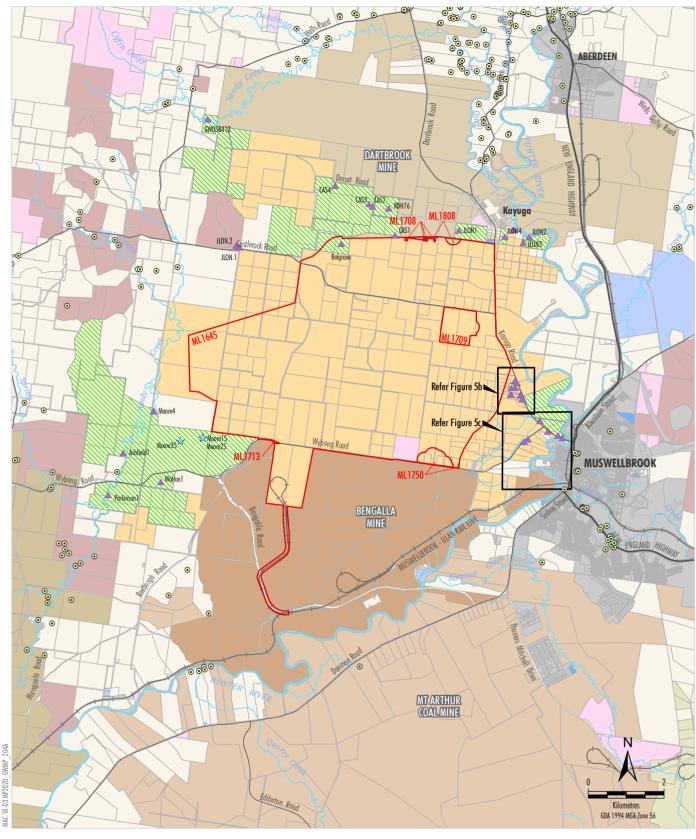

A summary of the results of the bore census is provided in Attachment 5.

MACH Energy wrote to landholders that participated in the bore census in May 2020 to confirm recorded information regarding groundwater bores, wells and known seeps across the MPO ML and neighbouring properties remained correct and contemporary.

4.5 METEOROLOGICAL DATA

Meteorological data is collected from a number of Bureau of Meteorology (BoM) stations in the vicinity of the MPO. Average monthly rainfall for each of these stations is summarised in Table 8.

Data from the Aberdeen (Main Road) (1900 – 1960) and Muswellbrook (Lindisfarne) (1961 – 2018) has been aggregated to develop a rainfall residual mass curve shown on Figure 6 and has been used on the groundwater hydrographs in Attachment 2. This curve is used as it allows easy identification of short or long periods of below average rainfall (downward gradient) or above average rainfall (upward gradient), as well as periods of roughly average rainfall (flat). Comparison of this curve with groundwater level hydrographs indicates whether groundwater levels are responding to dry or wet conditions, or potentially to some other mechanism (e.g. groundwater pumping, mining).

4.6 FLOW MONITORING DATA

Baseline flow monitoring data in the vicinity of the MPO is described in the Surface Water Management Plan (SWMP).

4.7 GEOCHEMISTRY DATA

Metal concentrations in overburden and coal reject materials was assessed by RGS Environmental Pty Ltd (2013) in the *Continuation of Bengalla Mine Geochemical Impact Assessment*. This data is considered to be representative of the overburden and coal reject materials at the MPO, which is located in the same geology as the Bengalla Mine (Figure 3). RGS Environmental Pty Ltd (2013) conclude:

- the concentration of trace metals and sulfate in run-off and seepage from overburden will be low;
- the concentration of trace metals and sulfate from most coal rejects will be low; and
- coal reject materials from the Wynn seam have the potential to generate elevated concentrations of some metals (Al, Cd, Co, Cu, As, Ni, Se and Zn) if exposed to oxidising conditions.

On this basis, the potential for elevated metals to be present in groundwater seepage is considered low.

5 FINAL VOID WATER MANAGEMENT

As part of the MOD 3 EA, MACH Energy developed revisions to the final landform to reflect a less engineered profile that is more consistent with the surrounding natural environment. Construction of the final landform would involve a range of earthworks to push down areas of the final highwalls and low walls, the outcome being a single void remaining in the south with a relatively natural looking shape (Figure 7).

Once mining operations cease, groundwater inflows to the final void would no longer be collected and pumped out. As a result, the final void would gradually fill with water. Inflows into the final void would comprise incident rainfall, runoff within the final void catchment area and groundwater.

The final void catchment would incorporate batter slope and drainage principles as described in the MOD 3 EA (MACH Energy, 2017b). The design of the final void would be refined as required to ensure that the final void would not spill to the environment and would provide a groundwater sink.

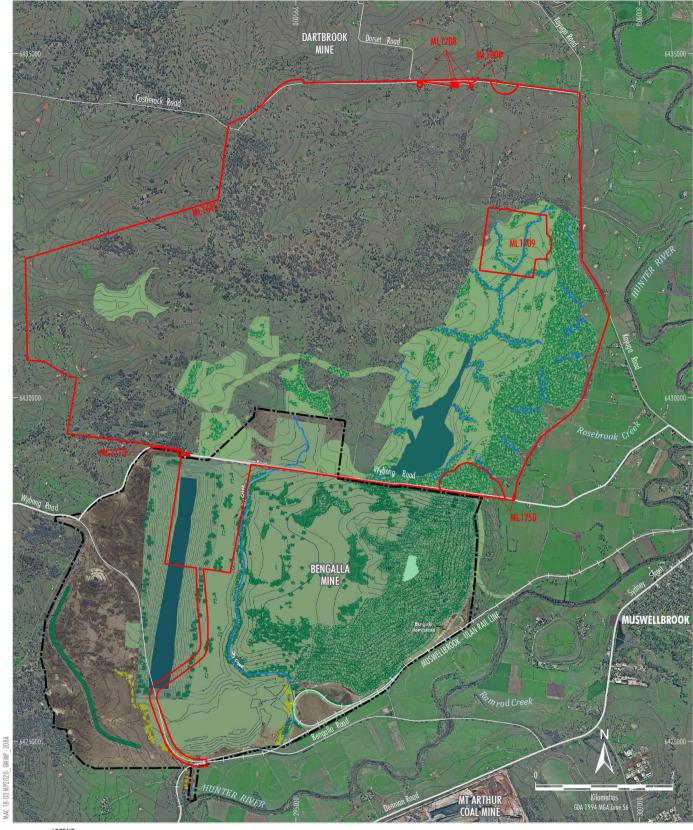

In consultation with the Division of Resources and Geoscience (now MEG) and the Muswellbrook Shire Council, MACH Energy has developed the following Provisional Post-Mining design objectives for the final void:

- The residual final void will form a waterbody.
- The final void (and associated drainage network) will be shaped to reflect a less engineered profile that is more consistent with the surrounding natural environment.
- The final void will typically act as a groundwater sink.
- The final void could provide long-term use for recreational or industrial activities.

The final void landform will be rehabilitated with vegetation species appropriate for the complex landform. The highwall will be rehabilitated using the best reasonable and feasible rehabilitation technologies available and revegetated with species that are appropriate for its steepness and aspect. Design alternatives for the final void will be continually evaluated and prepared as part of the closure planning process at the MPO and will be subject to ongoing regulatory consultation.

Relevant geotechnical studies will be undertaken to assess the stability and provide guidance on measures to minimise instability. Appropriate measures will be used to limit access to steep areas around the final void to restrict cattle, pedestrian and vehicle access. These measures may include large rock placement, landform shaping, or fencing, as agreed with relevant government authorities prior to closure.

MACH Energy will refine the design objectives of the final void over the life of the MPO in the relevant MOP/RMP. In addition, MACH Energy will develop performance criteria relevant to the design and management of the final void in the next MOP/RMP.

6 GROUNDWATER PREDICTIONS AND VALIDATION

6.1 PREDICTED GROUNDWATER IMPACTS

Groundwater modelling was undertaken for the Mount Pleasant EIS by PPK Environment & Infrastructure (1997).

A number of subsequent groundwater modelling exercises have been undertaken as part of mine planning and feasibility studies for the MPO as well as development applications for neighbouring mines (e.g. Bengalla Mine).

6.1.1 Groundwater Inflows

HydroSimulations (2016) has undertaken a desktop review of these studies in order to conservatively estimate the MPO groundwater pit inflows and associated licensing requirements. As described in Section 6.2, contemporary groundwater modelling is being undertaken for the MPO to validate that the groundwater inflow estimates are conservative.

The maximum predicted inflow rate for the MPO was derived by averaging the maximum predicted inflow rates in each of the studies that were reviewed. This results in a maximum inflow rate of 400 megalitres per annum (ML/a) (HydroSimulations, 2016).

The maximum inflow rate of 400 ML/a was then pro-rated according to pit inflows for the various mine development stages described in the Mount Pleasant Water Management Studies (PPK Environment & Infrastructure, 1997). The pro-rated progressive pit inflow rates are shown in Table 9.

Table 9
Predicted Pit Inflows

Mine Development Stage	Pit Inflow Rate (ML/a)		
Year 2	40		
Year 5	125		
Year 10	250		
Year 15	320		
Year 20	380		
Year 21	400		

Source: HydroSimulations (2016).

6.1.2 Groundwater Quality

Depressurisation of the coal seams is expected to have little impact on groundwater quality. In some cases, a slight improvement in water quality may occur due to increased rainfall infiltration (PPK Environment & Infrastructure, 1997).

On cessation of mining, groundwater seepage to the final void is expected to result in a recovery of groundwater levels. Ultimately, if void water levels recover to levels above the elevation of groundwater levels in the alluvium, the pre-mining upward leakage of water from the hard rock groundwater system to the alluvial groundwater system will resume. While the quality of water in the backfilled material may be poorer than the pre-mining quality of the hard rock groundwater system, the reduced rate of leakage relative to pre-mining is expected to result in negligible changes to the rate of salt migration to the alluvium (PPK Environment & Infrastructure, 1997).

6.1.3 Licensing Requirements

The full groundwater take from the hard rock is anticipated to derive from the Sydney Basin – North Coast Groundwater Source, within *the Water Sharing Plan for the North Coast Fractured and Porous Rock Groundwater Sources, 2016.* The take from the other two hard rock groundwater sources in the region (i.e. the New England Fold Belt Coast and the Liverpool Ranges Basalt Coast Groundwater Sources) was assumed to be negligible given the large distance between these sources and the open cut (HydroSimulations, 2016).

The estimate of maximum alluvial groundwater take was derived following a similar approach for the maximum groundwater inflows, but conservatively applied to obtain a higher estimate of alluvial take. This resulted in a maximum alluvial groundwater take of 60 ML/a (HydroSimulations, 2016).

The estimated alluvial groundwater take was assigned to the sources described in Section 2.4.1 based on their distance from the active open cut. It was conservatively assumed that the maximum alluvial licensing requirement and maximum hard rock licensing requirement would occur at separate times and as a result there would be no offsetting effect of the take from the hard rock and alluvial water sources (HydroSimulations, 2016).

The estimated groundwater licensing requirements for the MPO are summarised in Table 10.

Table 10 Recommended Groundwater Licensing Requirements

Water Sharing Plan	Water Source	Distance from Open Cut	Year 1 - 2 Extraction from Water Source (ML/a)	Maximum Predicted Extraction Year 1 – 5 (ML/a)	Maximum Extraction from Water Source (ML/a)
Water Sharing	Sydney Basin – North Coast Groundwater Source	Within MPO tenements / open cut	40	125	400
Plan for the North Coast Fractured and Porous Rock Groundwater Sources, 2016	New England Fold Belt Coast Groundwater Source	5.4 km north-east	Negligible	Negligible	<5

Source: HydroSimulations (2016).

MACH Energy has acquired sufficient licences in the Sydney Basin – North Coast Groundwater Source (730 units).

6.2 CONTEMPORARY GROUNDWATER MODELLING

MACH Energy has engaged specialist hydrogeologists to undertake contemporary groundwater modelling for the MPO.

The contemporary groundwater model will be consistent with the Australian Groundwater Modelling Guidelines prepared by the National Water Commission in June 2012 (Barnett *et al.*, 2012).

MODFLOW-USG will be used for groundwater simulation with GIS, AlgoMesh and Groundwater Vistas as the interface software. MODFLOW-USG is a recent version of the popular MODFLOW code developed by the United States Geological Survey. MODFLOW-USG is able to simulate variably saturated flow and can handle desaturation and re-saturation of multiple aquifers without the "dry cell" problems of standard-MODFLOW, and has the advantage of using 'unstructured' meshes, which allows more focus on the areas where detail is warranted and coarsening of the mesh in areas where detail is not required.

The GWMP will be updated to include the outcomes of the contemporary groundwater modelling, once complete.

6.3 GROUNDWATER MODEL VALIDATION

The contemporary groundwater model described in Section 6.2 would be used as a management tool for the periodic review and calibration of predicted groundwater impacts through the life of the MPO.

This review would be undertaken at least every five years over the life of the MPO.

The results of the groundwater monitoring program would inform progressive refinement of the groundwater model as each of the open cut mining areas are developed. Revised outputs from the groundwater model would be reported in the Annual Review, as relevant over the life of the MPO and used to inform regular site water balance reviews.

7 GROUNDWATER IMPACT TRIGGER LEVELS

Groundwater trigger levels have been developed for the MPO based on the NSW Aquifer Interference Policy and Australian and New Zealand Guidelines for Fresh and Marine Water Quality (Australian and New Zealand Environment and Conservation Council [ANZECC] and Agriculture and Resource Management Council of Australia and New Zealand [ARMCANZ], 2000).

7.1 GROUNDWATER LEVELS

MACH Energy will evaluate the environmental performance of the MPO against the predictions of impacts made by the contemporary groundwater modelling, once complete (Section 6.2).

In the interim, and in accordance with the NSW Aquifer Interference Policy, groundwater trigger levels will focus on potential effects of mining on:

- the groundwater supply of potentially affected landowners;
- High Priority groundwater dependent ecosystems (GDEs); and
- · High Priority culturally significant sites.

There are no High Priority GDEs or High Priority culturally significant sites in the vicinity of the MPO described in the relevant water sharing plans.

A review of the DPIE – Water registered bore database and other regional information indicates the majority of private groundwater users are accessing the alluvial groundwater system to the east of the MPO and registered bores within the MPO tenements are sparse. This lower groundwater use reflects the relatively poorer quality and lower expected bore yield of the hard rock groundwater systems in the vicinity of the MPO (Section 4.2).

Based on the above, groundwater level triggers have been established to monitor for potential impacts on the alluvial groundwater system to the east associated with the Hunter River. Water level triggers have been developed for the alluvial monitoring bores listed in Table 11 in order to identify trends that could potentially lead to a private bore being impacted (i.e. experiencing greater than 2 m drawdown). These water level triggers have been set at 2 m below the 80th percentile water level reported during the baseline monitoring period to date.

Table 11
Groundwater Triggers – Water Level

Screened Interv		Observed Ground	Trigger Level	
Bore	(mbgl)	Minimum	80 th percentile	(mbgl)
MPBH1	12.6 – 18.6	8.8	9.7	11.7
MPBH2	11.5 – 17.5	11.6	12.2	14.2
MPBH3b	Well to 14 m	11.6	12.0	Dry (or 14.0 m)

7.2 GROUNDWATER QUALITY

The Australian and New Zealand *Guidelines for Fresh and Marine Water Quality* (ANZECC & ARMCANZ, 2000) apply to the quality of both surface waters and groundwaters since they have been developed to protect environmental values relating to above-ground uses such as irrigation and stock use.

ANZECC & ARMCANZ (2000) recommends that wherever possible site-specific data be used to define trigger values for physical and chemical factors which can adversely impact the environment, rather than using default trigger values. For pH triggers however, a single trigger range of 6 – 8.5 was applied to all bores. This decision was made as the proposed 20th to 80th percentile trigger ranges proved to be too narrow to allow inaccuracy in pH measurement. The adopted range of 6 – 8.5 pH units is consistent with the pH recommended by ANZECC & ARMCANZ (2000) to prevent corrosion of infrastructure associated with the groundwater, as well as the recommend range for drinking water as outlined in the *Australian Drinking Water Quality Guidelines* (National Health and Medical Research Council [NHMRC] & National Resource Management Ministerial Council [NRMMC], 2011).

Baseline groundwater monitoring results indicate that baseline values of EC in the vicinity of the MPO vary across a wide range and can be outside of the ANZECC & ARMCANZ (2000) guideline values for ecosystem protection. Therefore, site-specific trigger levels based on the baseline data have been developed for monitoring the effect of the MPO.

The NSW Aquifer Interference Policy sets out the minimal impact considerations for aquifer interference activities for groundwater sources, including:

Any change in the groundwater quality should not lower the beneficial use category of the groundwater source beyond 40m from the activity;

The water sharing plans that regulate groundwater use in the vicinity of the MPO do not describe beneficial use categories for the groundwater sources. However, the *National Land and Water Resources Audit* (Murray Darling Basin Commission, 2005) specified groundwater quality ranges for beneficial use categories based on salinity (Table 12).

Table 12
Groundwater Quality Categories – EC

Beneficial Use	Quality Range	Description		
Potable	Up to 800 μS/cm (500 mg/L TDS)*	Suitable for all drinking water and uses.		
Marginal Potable	800-2,350 µS/cm (500-1,500 mg/L TDS)*	At the upper level this water is at the limit of potable water, but is suitable for watering of livestock, irrigation and other general uses.		
Irrigation	2,350-7,800 µS/cm (1,500-5,000 mg/L TDS)*	At the upper level, this water requires shandying for use as irrigation water or to be suitable for selective irrigation and watering of livestock.		
Saline 7,800-22,000 μS/cm (5,000-14,000 mg/L TDS)*		Generally unsuitable for most uses. It may be suitable for a diminishing range of salt-tolerant livestock up to about 6,500mg/L [~10,150 µS/cm] and some industrial uses.		
Highly Saline > 22,000 μS/cm (14,000 mg/L TDS)*		Suitable for coarse industrial processes up to about 20,000 mg/L [~31,000 µS/cm].		

Source: National Land and Water Resources Audit (Murray Darling Basin Commission, 2005).

Notes:

mg/L = milligrams per litre; and

TDS = Total Dissolved Solids.

^{*} Approximate EC ranges derived from TDS ranges, with conversion Factor of 1.5625 applied.

Beneficial use categories have been assigned to each monitoring bore based on its 80th percentile baseline EC and the EC ranges specified in the table above, with the exception of bores 5500D000, 6500F500L and 4500F000. These bores have been experiencing sustained increases in salinity since approximately 2012, leading to data collected since 2016-2017 being greater than the beneficial use category that would be otherwise designated by their respective 80th percentile EC value. Salinity in bores 5500D000, and 4500F000 stabilised around 2017, however, data indicates that bore 6500F500L is still becoming progressively more saline. It is believed that the salinity recorded at these bores indicates a new equilibrium and EC is not expected to return to values recorded pre-2012. Therefore, the beneficial use category allocated to these three bores has been assigned to complement the more saline measurements recorded in the previous two years and do not necessarily reflect the 80th percentile baseline EC value.

Should a measured EC value exceed the upper limit of the beneficial use quality range for EC at a particular bore for three successive monitoring rounds, the groundwater investigation protocol, as detailed in the Surface and Ground Water Response Plan, would be initiated.

The water quality triggers for each bore are presented in Table 13.

Table 13

MPBH5 (formerly B1)^	-	-		-	-	-	
Melody Bore [^]	-	-		-	-	-	

Notes:

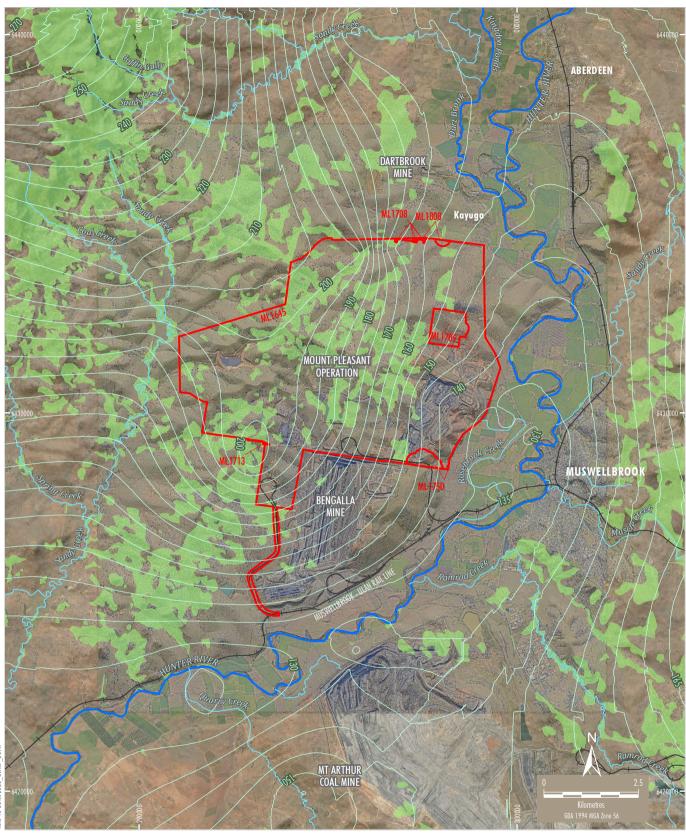

- * pH values for bore 3500B500S exceed the pH trigger range of 6 8.5 however, this bore was mined through in August 2018.
- ** Existing 80th percentile values have been adopted for these bores given the baseline water quality is close to potable and these sites are representative of the Hunter River alluvium.
- ^ Sufficient data is not yet available to develop baseline trigger ranges for new alluvial bores MPBH4 and MPBH5, or Melody Bore. This table will be revised with the appropriate values once the data becomes available. For more information on these bores refer to Section 8.6.

Sufficient data is not yet available to develop baseline trigger ranges for the new bores that have been established to the east and west of the MPO. The trigger ranges for the bores will be established once sufficient data becomes available. Further information regarding the newly established bores is presented in Section 8.6.

7.3 GROUNDWATER DEPENDENT ECOSYSTEMS

Potential GDEs mapped in the *National Atlas of Groundwater Dependent Ecosystems* (BoM, 2016) are presented on Figure 8, along with the interpreted water table based on baseline water level monitoring (Section 4.1).

Figure 8 indicates that none of the potential GDEs are likely to be groundwater dependent, due to the significant depth to groundwater in these areas. The trees that are located in the gullies running north/south through the MPO are thought to rely on ephemeral surface water flows down the gullies rather than on groundwater. On this basis, GDEs are likely restricted to the trees on the bank of the Hunter River, with the historic GDE vegetation on the main floodplain out from the river banks having been cleared for farming. Accordingly, the triggers established for alluvial groundwater levels (Section 7.1) are considered to be sufficient for monitoring potential effects on GDEs.

Potential Groundwater Dependent Ecosystems

8 GROUNDWATER MONITORING PROGRAM

Groundwater monitoring bores within the MPO monitoring network cover all major hydrogeological units and are broadly distributed across the project area (Figure 4).

The groundwater monitoring network is listed in Table 6.

8.1 WATER LEVEL

All non-historical bores listed in Table 6 will be monitored manually on a quarterly basis. Monitoring at bore locations within mine disturbance areas will be discontinued when mined by the advancing open cut.

The elevation at the additional monitoring bores to be established (refer Section 8.6) will be surveyed by a registered surveyor with water levels reported in Australian Height Datum and depth in the Annual Review. Electronic data of these monitoring results will be made available to DPIE upon request.

Data from the MPO monitoring program will be supplemented with data available from the Bengalla Mine monitoring bores in the region, as required for comparison.

Privately-owned bores (shown in Figure 5) will be monitored on a regular basis to ensure that mining related drawdown of greater than 2 m has not occurred (as described in Section 8.4).

8.2 WATER QUALITY

All non-historical bores listed in Table 6 will be sampled quarterly for pH and EC. MACH Energy will consider additional water quality bores once final landform, including voids and waste emplacements, is determined.

The potential for elevated metals to be present in groundwater seepage is considered low (Section 4.7). Notwithstanding, samples will be sent for laboratory analysis annually for the suite of parameters listed in Table 14.

Table 14
Parameters for Laboratory Analysis

Parameters						
EC	TDS	Total Hardness as CaCO ₃	Carbonate alkalinity as CaCO ₃			
Total alkalinity as CaCO ₃	рН	Calcium	Magnesium			
Sodium	Potassium	Chloride	Sulfate as SO ₄			
Aluminium	Arsenic	Boron	Nitrite as N			
Cadmium	Copper	Ionic Balance	Lead			
Zinc	Mercury	Nickel	Selenium			
Total Cations	Ammonia as N	Beryllium	Reactive Silica			
Antimony	Hydroxide Alkalinity as CaCO₃	Nitrate as N	Total Phosphorous as P			
Nitrate & Nitrite as N	Total Anions	Bicarbonate Alkalinity as CaCO3	Acidity as CaCO ₃			

8.3 GROUNDWATER INFLOWS (PIT DEWATERING / EXTRACTION)

Groundwater extraction for mining activities from all pumping bores will be monitored by means of a flow meter attached to the bore headworks or installed in the discharge pipeline as required under the conditions of the relevant water licences. The MPO Environmental Superintendent (or delegate) will be responsible for monitoring and recording of volumes extracted.

Volumes of water pumped directly from the open cut pits will be monitored by means of flow meters fitted to pipelines or recording of pumping times and rates. Water reporting to the open cut pits may include both groundwater seepage inflows and incident rainfall and runoff.

Where appropriate for comparison, estimates of seepage inflows to the open cut will be determined using the contemporary groundwater model (once complete). The rainfall runoff component estimates will also be determined where appropriate for comparison using the rainfall records and the existing site water balance model.

Operational water balance reviews will be conducted regularly as described in the Site Water Balance.

8.4 GROUNDWATER SUPPLY OF POTENTIALLY AFFECTED LANDOWNERS

MACH Energy conducted a census of privately-owned bores in the vicinity of the MPO (MACH Energy, 2017d) (Section 4.4). MACH Energy wrote to landholders that participated in the bore census in May 2020 to confirm recorded information regarding groundwater bores, wells and known seeps across the MPO ML and neighbouring properties remained correct and contemporary.

Trigger levels have been established at three alluvial bores (Table 11) to monitor the potential effects of the MPO on the groundwater resource in the Hunter Alluvium. In the event that a trigger is exceeded, the groundwater investigation protocol, as detailed in the Surface and Ground Water Response Plan, will be initiated.

The bore census (MACH Energy, 2017d) concluded that there were a number of privately-owned bores to the east, north and west of the MPO mining tenements. Bores to the east lie generally within 1-1.5 km of the proposed area of initial mining. Bores to the north and west are nominally 5-6 km from early mining, however they are also situated close to mining at the Bengalla Mine (western bores) and the Dartbrook Mine (northern bores).

In order to satisfy the requirements of the NSW Aquifer Interference Policy, groundwater monitoring at bores located between the MPO and bores owned by potentially affected landowners will occur on a regular basis to ensure that mining related drawdown of greater than 2 m has not occurred, including:

- for the monitoring bores to the east of the MPO, monitoring of the groundwater levels will occur at a higher frequency (quarterly) to ensure that a suitable baseline record is obtained and to detect whether initial mining is affecting water levels at these bores; and
- for the monitoring bores to the north and west of the mining tenements a lower frequency of monitoring will occur (6-monthly) to obtain a suitable baseline dataset, until mining at MPO progresses closer to those areas.

In order to satisfy the requirements of the NSW Aquifer Interference Policy, monitoring of groundwater levels around potentially affected landowners is necessary to ensure that drawdown greater than 2 m has not occurred. The existing network of monitoring bores will be utilised to assess drawdown extents. Monitoring of water levels at these bores is intended to occur quarterly. This frequency is considered appropriate to identify any mining related drawdown which may affect groundwater supply at landowner bores.

8.5 GROUNDWATER DEPENDENT ECOSYSTEMS AND RIPARIAN VEGETATION

As described in Section 7.3, GDEs are likely restricted to the trees on the bank of the Hunter River, with the historic GDE vegetation on the main floodplain out from the river banks having been cleared for farming.

Accordingly, the water level and quality monitoring programme for the alluvium (described in Sections 7.1 and 7.2) are considered to be adequate for monitoring potential effects on GDEs.

Specific monitoring of riparian vegetation is described in the SWMP.

8.6 AUGMENTATIONS TO THE GROUNDWATER MONITORING PROGRAM

MACH Energy reviewed the groundwater monitoring program at the MPO as a component of the contemporary groundwater modelling (Section 6.2). Following this review, MACH Energy has established the following additional groundwater monitoring bores in November 2019 and January 2020 (Figure 4):

- A new nested site to the north-east of the MPO that includes an alluvial and hard rock monitoring bore (i.e. MPBH6).
- Two additional sites to the east of the MPO as part of an alluvial investigation program. These bores, MPBH4 and MPBH5 (see Figure 4), were drilled by ENRS in February 2018 (ENRS, 2018).
- New hard rock monitoring bores at two of the existing alluvial sites to the east of the MPO (i.e. MPBH1 and MPBH2).
- A new site to the west of the MPO (i.e. MPBH7).

Details regarding the newly established bores are included in Table 6.

Trigger levels will be established for these new monitoring bores when sufficient monitoring data is available.

It was previously proposed to include two additional sites to the east of the MPO identified during the bore census (i.e. ME11 and ME22). This is no longer considered to be necessary due to the installation of nested standpipes (sampling the alluvium, interburden and coal seam) at the nearby sites MPBH4, MPBH5 and MPBH2.

9 REVIEW AND IMPROVEMENT OF ENVIRONMENTAL PERFORMANCE

9.1 ANNUAL REVIEW

In accordance with Condition 3, Schedule 5 of Development Consent DA 92/97 MACH Energy will review and evaluate the environmental performance of the MPO by the end of March each year (for the preceding calendar year) or other such timing as agreed by the Secretary of the DPIE.

In relation to water, the Annual Review will:

- include a comprehensive review of the groundwater monitoring results at the MPO over the past year, which includes a comparison of the results to evaluate compliance against:
 - relevant statutory requirements, limits or performance measures/criteria (refer Sections 2 and 7);
 - monitoring results of the previous years; and
 - relevant predictions in the EIS and MOD 1, MOD 2, MOD 3 and MOD 4 EAs;
- identify any groundwater-related non-compliance over the past year, and describe what actions were (or are being) taken to ensure compliance;
- identify any trends in the groundwater monitoring data over the life of the MPO;
- identify any discrepancies between the predicted and actual groundwater impacts of the MPO, and analyse the potential cause of any significant discrepancies; and
- describe what groundwater-related measures will be implemented over the next year to improve the environmental performance of the MPO.

The Annual Review will be made publicly available on the MACH Energy website (https://machenergyaustralia.com.au/) in accordance with Condition 11, Schedule 5 of Development Consent DA 92/97.

The Annual Review will also include reporting on elevation at each bore with water levels being presented in Australian Height Datum and depth.

9.2 GROUND WATER MAGEMENT PLAN REVISION

In accordance with Condition 4, Schedule 5 of Development Consent DA 92/97, this GWMP will be reviewed, and if necessary revised to the satisfaction of the Secretary of the DPIE, within three months of the submission of:

- an Annual Review (Condition 3, Schedule 5);
- an incident report (Condition 7, Schedule 5);
- an Independent Environmental Audit (Condition 9, Schedule 5); and
- any modification to the conditions of Development Consent DA 92/97.

Within 4 weeks of conducting any such review, the Secretary of the DPIE will be advised of the outcomes of the review and any revised documents submitted to the Secretary for approval.

In accordance with Condition 4A, Schedule 5 of Development Consent DA 92/97, MACH Energy may submit a revised GWMP for the approval of the Secretary at any time, and may also submit any revision to this GWMP required under Development Consent DA 92/97 on a staged basis.

If agreed with the Secretary of the DPIE, a revision to this GWMP required under Development Consent DA 92/97 may be prepared without undertaking consultation with all parties nominated under the relevant Condition of Development Consent DA 92/97.

This GWMP will be made publicly available on the MACH Energy website (https://machenergyaustralia.com.au/), in accordance with Condition 11, Schedule 5 of Development Consent DA 92/97.

9.3 INDEPENDENT ENVIRONMENTAL AUDIT

In accordance with Condition 9, Schedule 5 of Development Consent DA 92/97, an independent environmental audit of the MPO will be conducted by a suitably qualified, experienced and independent team of experts whose appointment has been endorsed by the Secretary of the DPIE.

The independent environmental audit will assess the environmental performance of the MPO and review the adequacy of this GWMP. If necessary, appropriate measures or actions to improve the environmental performance of the MPO or this GWMP will be recommended.

10 REPORTING PROCEDURES

In accordance with Condition 2, Schedule 5 of Development Consent DA 92/97, MACH Energy has developed protocols for managing and reporting the following:

- incidents;
- complaints;
- non-compliances with statutory requirements; and
- exceedances of the impact assessment criteria and/or performance criteria.

These protocols are described in Section 5 of the WMP.

In accordance with Condition 8, Schedule 5 of Development Consent DA 92/97, MACH Energy will provide regular reporting on the environmental performance of the MPO on the MACH Energy website (https://machenergyaustralia.com.au/).

APPENDIX 5

SURFACE AND GROUND WATER RESPONSE PLAN

Department of Planning and Environment

Chris Masters Environmental Advisor Mach Energy Australia Pty Ltd Suite 1, Level 3 426 King Street Newcastle West, NSW, 2302 06/06/2022

Subject: Surface and Groundwater Response Plan for Mt Pleasant Coal (DA92/97-PA-32)

Dear Mr. Masters,

I refer to the Surface and Groundwater Response Plan which was submitted in accordance with Condition 28 (e) of Schedule 3 of the consent for the Mt Pleasant Coal project (DA92/97-PA-32).

The Department acknowledges that the plan was submitted following an Independent Environmental Audit (IEA) conducted in June 2020 in accordance with Condition 4 (c) of Schedule 5 of the consent. The Department has carefully reviewed the document and is satisfied that it addresses the recommendations of the IEA.

Accordingly, the Secretary has approved the Surface and Groundwater Response Plan (Revision 00). Please ensure that the approved plan is placed on the project website at the earliest convenience.

If you wish to discuss the matter further, please contact Jess Watson on 02 9373 2845.

Yours sincerely

Stephen O'Donoghue

Director

Resource Assessments

As nominee of the Planning Secretary

1 INTRODUCTION

The Mount Pleasant Operation (MPO) is located in the Upper Hunter Valley of New South Wales (NSW), approximately 3 kilometres (km) north-west of Muswellbrook and approximately 50 km north-west of Singleton (Figure 1). The village of Aberdeen and locality of Kayuga are also located approximately 5 km north-northeast and 1 km north of the MPO boundary, respectively (Figure 1). MACH Energy purchased the MPO from Coal & Allied Operations Pty Ltd (Coal & Allied) in 2016.

MACH Mount Pleasant Operations Pty Ltd is the manager of the MPO as agent for, and on behalf of, the unincorporated Mount Pleasant Joint Venture between MACH Energy Australia Pty Ltd (MACH Energy) (95 per cent [%] owner) and J.C.D. Australia Pty Ltd (5% owner). This Surface and Ground Water Response Plan (SGWRP) is implemented at the MPO by MACH Energy.

The initial development application for the MPO was made in 1997. This was supported by an Environmental Impact Statement (EIS) prepared by Environmental Resources Management (ERM) Mitchell McCotter (ERM Mitchell McCotter, 1997). On 22 December 1999, the then Minister for Urban Affairs and Planning granted Development Consent DA 92/97 to Coal & Allied. This allowed for the "Construction and operation of an open cut coal mine, coal preparation plant, transport and rail loading facilities and associated facilities" at the MPO. The consent allowed for operations 24 hours per day seven days per week and the extraction of 197 million tonnes (Mt) of run-of-mine (ROM) coal over a 21 year period, at a rate of up to 10.5 Mt of ROM coal per year.

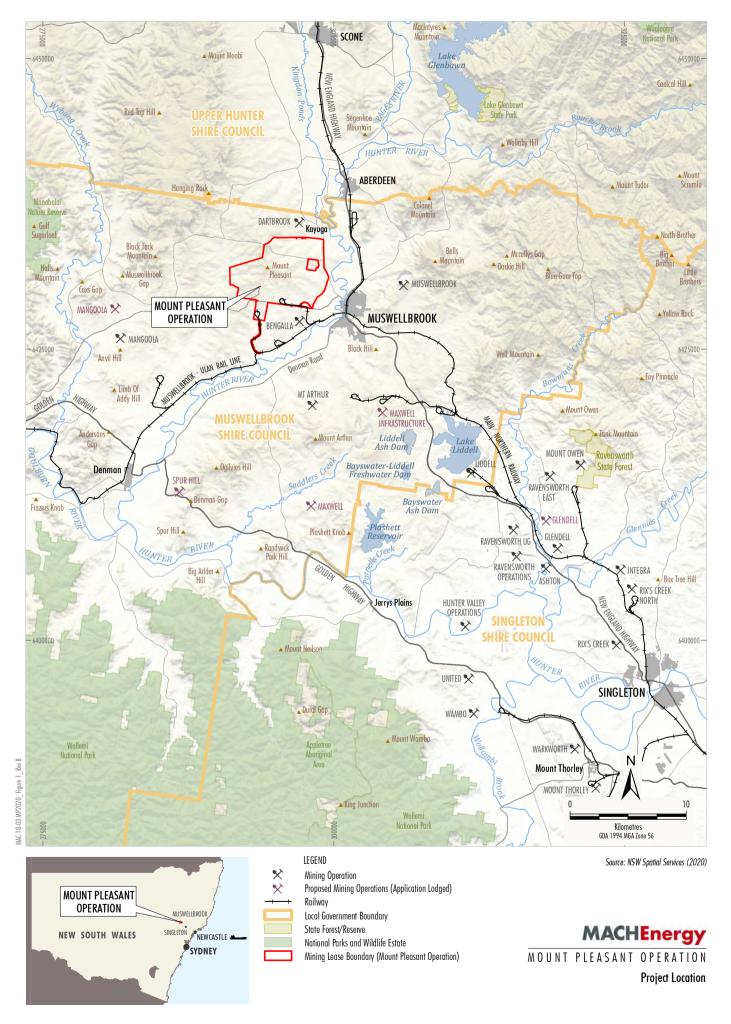

The Mount Pleasant Project Modification (MOD 1) was submitted on 19 May 2010 with a supporting Environmental Assessment (EA) prepared by EMGA Mitchell McLennan (EMGA Mitchell McLennan, 2010). MOD 1 included the provision of an infrastructure envelope for siting the mine infrastructure, the provision of an optional conveyor/service corridor linking the MPO facilities with the Muswellbrook-Ulan Rail Line and modification of the existing Development Consent DA 92/97 boundaries to accommodate the optional conveyor/service corridor and minor administrative changes. MOD 1 was approved on 19 September 2011.

The MPO South Pit Haul Road Modification (MOD 2) was submitted on 30 January 2017 with a supporting EA prepared by MACH Energy (MACH Energy, 2017a). MOD 2 proposed to realign an internal haul road to enable more efficient access to the South Pit open cut, with no other material changes to the approved MPO. MOD 2 was approved on 29 March 2017.

The MPO Mine Optimisation Modification (MOD 3) was submitted on 31 May 2017 with a supporting EA prepared by MACH Energy (MACH Energy, 2017b). MOD 3 comprised an extension to the time limit on mining operations (to 22 December 2026) and extensions to the South Pit Eastern Out of Pit Emplacement to facilitate development of an improved final landform. MOD 3 was approved on 24 August 2018.

The MPO Rail Modification (MOD 4) was submitted on 18 December 2017 with a supporting EA prepared by MACH Energy (MACH Energy, 2017c). MOD 4 proposed the following changes:

- duplication of the approved rail spur, rail loop, conveyor and rail load-out facility and associated services;
- duplication of the Hunter River water supply pump station, water pipeline and associated electricity supply that followed the original rail spur alignment; and
- demolition and removal of the redundant approved infrastructure within the extent of the Bengalla Mine, once the new rail, product loading and water supply infrastructure has been commissioned and is fully operational.

MOD 4 was approved on 16 November 2018 by the Secretary of the Department of Planning and Environment (under Delegation). Appendix 2 of the modified Development Consent DA 92/97 illustrates the Conceptual Project Layout Plan of the approved MPO at 2021 and 2025, Approved Surface Disturbance Plan and Conceptual Final Landform (Attachment 1) incorporating the MOD 4 infrastructure relocations.

1.1 PURPOSE AND SCOPE

This SGWRP has been prepared by MACH Energy to satisfy the requirements under Development Consent DA 92/97 (as modified) and specifically Condition 28(e), Schedule 3.

The SGWRP applies to all employees and contractors at the MPO and covers all areas within the MPO boundary. The SGWRP applies to the life of the MPO, including (but not limited to) the period of mining operations specified in Development Consent DA 92/97, which currently permits mining until 22 December 2026. As required by Condition 5, Schedule 2 of Development Consent DA 92/97, the SGWRP will continue to apply (excluding mining operations) beyond 22 December 2026, as required, until the rehabilitation and any additional undertakings (required by the Secretary of the Department of Planning, Industry and the Environment [DPIE], or the Division of Mining, Exploration and Geoscience [MEG] within the Department for Regional NSW) have been carried out satisfactorily.

This SGWRP has been prepared to manage surface water and groundwater related impacts associated with construction and operation of the MPO, including for example, initial establishment and development works, open cut mining, operation of the coal handling and preparation plant, rail spur/loop and Fines Emplacement Area, and the supply of water to the MPO.

1.2 STRUCTURE OF THE SGWRP

This SGWRP is a component of the Water Management Plan (WMP) for the MPO.

The remainder of the SGWRP is structured as follows:

- Section 2: Outlines the statutory requirements relevant to this SGWRP.
- Section 3: Describes the response protocols for trigger events which may occur at the MPO.
- Section 4: Provides potential contingency measures for the MPO.
- Section 5: Describes the review process for MPO documentation, including in particular for this SGWRP.
- Section 6: Outlines the reporting procedures proposed for the MPO.
- Section 7: Provides a list of references cited in this report.

2 STATUTORY OBLIGATIONS

MACH Energy's statutory obligations are contained in:

- the conditions of Development Consent DA 92/97 (as modified);
- the condition of the Commonwealth Approval EPBC 2011/5795;
- relevant licences (including Environment Protection Licence [EPL] 20850), permits and mining leases (MLs) (ML 1645, ML 1708, ML 1709, ML 1713, ML 1750 and ML 1808); and
- other relevant legislation.

Obligations relevant to this SGWRP are described below.

2.1 DEVELOPMENT CONSENT DA 92/97

The conditions of Development Consent DA 92/97 relevant to the content and structure of this SGWRP are described below. A comprehensive list of all conditions in Development Consent DA 92/97 relevant to water is provided in the WMP.

2.1.1 SGWRP Requirements

Condition 28(e), Schedule 3 of Development Consent DA 92/97 requires the preparation of a SGWRP (refer Table 1).

Table 1
Surface and Groundwater Response Plan Development Consent DA 92/97 Conditions

MPO Development Consent DA 92/97 Schedule 3	Section where addressed in this SGWRP Document
28. The Applicant must prepare a Water Management Plan for the development to the satisfaction of the Secretary. This plan must be prepared in consultation with Dol Water and EPA, and be submitted to the Secretary for approval by 30 June 2019, unless otherwise agreed by the Secretary.	
The plan must include:	
(e) a Surface and Ground Water Response Plan, which must include:	
 a response protocol for any exceedances of the surface water and groundwater assessment criteria; 	Section 3
 measures to offset the loss of any baseflow to watercourses caused by the development; 	Section 4.1
 measures to prevent, minimise or offset groundwater leakage from alluvial aquifers caused by the development; 	Section 4.2
measures to compensate landowners of privately-owned land whose water supply is adversely affected by the development; and	Section 4.3
 measures to mitigate and/or offset any adverse impacts on groundwater dependent ecosystems or riparian vegetation. 	Section 4.4

2.1.2 Management Plan (General) Requirements

Condition 2, Schedule 5 of Development Consent DA 92/97 outlines the general management plan requirements that are applicable to the preparation of the SGWRP.

Table 2 presents these requirements and indicates where each is addressed within this SGWRP.

Table 2
General Development Consent DA 92/97 Conditions

	MPO Development Consent DA 92/97 Schedule 5	Section where addressed in this SGWRP Document
2.	The Applicant must ensure that the management plans required under this consent are prepared in accordance with any relevant guidelines, and include:	
	(a) detailed baseline data;	Refer to the Surface Water Management Plan (SWMP) and Groundwater Management Plan (GWMP)
	(b) a description of:	Section 2
	 the relevant statutory requirements (including any relevant consent, licence or lease conditions); 	
	any relevant limits or performance measures/criteria;	Refer to the SWMP and GWMP
	 the specific performance indicators that are proposed to be used to judge the performance of, or guide the implementation of, the development or any management measures; 	Section 3
	(c) a description of the measures that would be implemented to comply with the relevant statutory requirements, limits, or performance measures/criteria;	Sections 3 and 4 and refer to the SWMP and GWMP
	(d) a program to monitor and report on the:	Refer to the SWMP and
	 impacts and environmental performance of the development; 	GWMP
	 effectiveness of any management measures (see c above); 	
	(e) a contingency plan to manage any unpredicted impacts and their consequences;	Section 4
	 a program to investigate and implement ways to improve the environmental performance of the development over time; 	Section 5
	(g) a protocol for managing and reporting any:	Section 6
	• incidents;	
	• complaints;	
	non-compliances with statutory requirements; and	
	exceedances of the impact assessment criteria and/or performance criteria; and	
	(h) a protocol for periodic review of the plan.	Section 5
	Note: The Secretary may waive some of these requirements if they are unnecessary or unwarranted for particular management plans.	

2.2 LICENCES, PERMITS AND LEASES

A description of licences, permits and leases relevant to the MPO is provided in the WMP, SWMP and GWMP.

2.3 OTHER LEGISLATION

A description of other legislation relevant to the MPO is provided in the WMP, SWMP and GWMP.

3 RESPONSE PROTOCOLS

Trigger response protocols have been developed by MACH Energy to address potential impacts to surface water and/or groundwater that may arise from mining activities. These include surface water impact and stream health assessment criteria defined in the SWMP and groundwater impact assessment criteria defined in the GWMP.

Each response protocol outlines the trigger conditions for potential impacts and the investigation and response protocols that will be implemented if an incident or trigger exceedance has occurred or a complaint is reported. If at any time during the investigation protocol the trigger exceedance/complaint is deemed not to have occurred as a result of activities at the MPO, the response protocol can be ceased without completing the remaining steps.

3.1 SURFACE WATER INVESTIGATIONS

MACH Energy has developed a surface water response protocol to ensure all trigger exceedances and complaints related to surface water are appropriately investigated and addressed. Details are included in the individual response protocols below.

3.1.1 Surface Water Quality Response Protocol

Site specific triggers for surface water quality criteria have been set for electrical conductivity (EC), pH and total suspended solids (TSS) levels at three monitoring locations downstream of the MPO on the Hunter River.

Consistent with the Australian and New Zealand Environment and Conservation Council (ANZECC) & Agriculture and Resource Management Council of Australia and New Zealand (ARMCANZ) Guidelines (2000), these criteria have been defined in terms of persistent statistical variation from baseline data and comparison with upstream monitored values. Default trigger levels developed using the ANZECC & ARMCANZ (2000) guidelines have been established for other sites in the MPO area which did not have sufficient data to generate site specific trigger values. Details are provided in Section 6.1 of the SWMP.

In the event that one of the water quality impact assessment criteria is triggered at the monitoring locations above, the response protocol in Table 3 will be implemented.

Table 3
Surface Water Quality Response Protocol

Response Protocol		
Trigger	a water quality indicator at a downstream water monitoring location is above (or outside the range) of trigger levels (refer to Table 9 of the SWMP) for three consecutive sampling events; and	
	 a water quality indicator at a downstream water monitoring location is above (or below in event of a trigger of the lower pH limit) the corresponding upstream monitoring location (where such a monitoring location exists) sampled on the same day. 	

Table 3 (Continued) Surface Water Quality Response Protocol

		Response Protocol
Investigation	1.	Notify the MACH Energy Environmental Superintendent within 24 hours of becoming aware of the trigger event.
	2.	Check and validate the data which indicates an exceedance of the trigger conditions.
	3.	Collect and analyse supplementary samples of the exceedance parameter (as well as any other relevant parameters) upstream (where possible) and downstream of the MPO, to assess whether the exceedance is ongoing.
	4.	Assess any changes to MACH Energy activities and inspect all relevant water management structures and infrastructure, and erosion and sediment controls in the area of the trigger event.
	5.	Assess conditions (climatic, hydrological, hydrogeological and changes in land use activities in the catchment – including other mining activities and riparian revegetation works), both preceding and during the event and assess their impact.
	6.	For the Hunter River monitoring locations, investigate changes in continuously recorded salinity values over time and compare with Department of Planning, Industry and Environment– Water (DPIE Water) stream gauging stations located on the river, to assess if any trends are evident.
	7.	For the Hunter River, assess whether releases were occurring from Glenbawn Dam or other mines.
	8.	Identify plausible and possible causes of the exceedance.
	9.	Decide if the exceedance was directly caused by or predominantly as a result of activities being undertaken by or directly related to the MPO.
	10	. If required (i.e. if it is deemed that the exceedance was directly caused by or predominantly as a result of activities being undertaken by or directly related to the MPO), engage a suitably qualified aquatic ecologist or similar to determine if any material harm to the surface water ecosystems have occurred.
	11	. Provide a preliminary investigation report to the DPIE, Environment Protection Authority (EPA) and DPIE Water within seven days of identifying the trigger exceedance.
Response	•	Develop/design contingency and remedial measures based on the results of the above investigations. Contingency and remedial measures considered practical for implementation may include:
		 notifying local landholders;
		 providing an alternative water source for the duration of water quality impact caused by the incident/non-compliance;
		 reviewing and refining the Surface Water Management Plan;
		 reviewing and refining processes for inspection, maintenance and siting of water management infrastructure (e.g. dams, pipelines, pumps);
		 repairing, replacing, or constructing new water management infrastructure; and
		 developing and implementing a training package specifically related to the cause of the incident/non-compliance.
	•	Communicate results of investigation, contingency and remedial measures to government agencies as required and summarise in the Annual Review.
	•	Review and update the WMP and resubmit to the DPIE (if required).

3.1.2 Stream Health Response Protocol

Stream health assessment triggers have been developed based on the Spring 2017 monitoring round results, which is the only contemporary survey undertaken prior to commencement of operations at the MPO. Using the Spring 2017 monitoring results, baseline stream health band of impairment scores were allocated to each stream health monitoring site based upon where their O/E¹ taxa values fell within a standardised range. Details are provided in Section 6.2 of the SWMP.

In the event that the stream health assessment criteria is triggered at a downstream monitoring site, the response protocol in Table 4 will be implemented.

00939551-008 7 **MACHEnergy**

O/E taxa scores are obtained by comparing the Observed (O) numbers of macro invertebrates at the site with the Expected (E) number of macro invertebrates which could be found at the site, if the site was in a natural state (i.e. had not been disturbed).

Table 4 Stream Health Response Protocol

Response Protocol		
Trigger	A stream health indicator at a particular downstream monitoring site falls below the specified trigger levels (refer to Table 11 of the SWMP), and the stream health indicator at a corresponding upstream monitoring site remains the same for two successive monitoring rounds ² .	
Investigation	 Notify the MACH Energy Environmental Superintendent within 24 hours of becoming aware of the trigger event. 	
	2. Check and validate the data which indicates an exceedance of the trigger conditions.	
	Compare data with other stream health data available in the vicinity (e.g. Muscle Creek and Dart Brook).	
	 Undertake supplementary stream health investigations upstream (where possible) and downstream of the MPO. 	
	Assess any changes to MACH Energy activities and inspect all relevant water management structures and infrastructure, and erosion and sediment controls in the area of the trigger event.	
	 Assess conditions (climatic, hydrological, hydrogeological and changes in land use activities in the catchment – including other mining/pastoral activities and riparian revegetation works), both preceding and during the event and assess their impact. 	
	7. Check water quality data to see if any trend is evident.	
	 Identify plausible and possible causative mechanisms and assess/quantify these against all relevant data and information to identify most likely causes. 	
	9. Decide if the exceedance was directly caused by or predominantly as a result of activities being undertaken by or directly related to the MPO. If required (i.e. if it is deemed that the exceedance was directly caused by or predominantly as a result of activities being undertaken by or directly related to the MPO), engage a suitably qualified aquatic ecologist or similar to determine the cause of the stream health deterioration.	
	 Provide a preliminary investigation report to the DPIE, EPA and DPIE Water when stream health monitoring and investigation is complete. 	
Response	Develop/design contingency and remedial measures based on the results of the above investigations. Contingency and remedial measures considered practical for implementation may include:	
	 undertaking stream bank remedial works including desilting and revegetation works; 	
	 reviewing and refining the stream health and surface water monitoring programs; 	
	 reviewing and refining processes for inspection, maintenance and siting of water management infrastructure (e.g. dams, pipelines, pumps); 	
	 repairing, replacing, or constructing new or enlarged water management infrastructure; and 	
	 restricting stock access to affected areas of the stream. 	
	 Communicate results of investigation, contingency and remedial measures to government agencies as required and summarise in the Annual Review. 	
	Review and update the WMP and resubmit to the DPIE (if required).	

MACH Energy commenced stream health monitoring at three additional sites in Spring 2017, including one on Sandy Creek and one on the Hunter River. Mangoola Coal Operations has established stream health trigger levels for monitoring sites on Sandy Creek (refer to Figure 3 of the SWMP). In the event a deterioration in stream health is observed at these locations, MACH Energy would consult with Mangoola Coal Operations during the implementation of their response mechanisms.

00939551-008 8 **MACHEnergy**

There is no corresponding upstream site for site SC. The stream health investigation protocol would be initiated if the stream health indicator at site SC degrades below the specified trigger levels (refer to Table 11 of the SWMP) for two successive monitoring rounds.

3.1.3 Surface Water Supply on Privately-Owned Land Response Protocol

A number of privately-owned properties reside along unnamed drainage lines which flow out of the MPO to the east and west of the MPO boundary (Figure 2). MACH Energy has designed the surface water management system to ensure that all discharges from the site are controlled and meet acceptable water quality standards, and to avoid unlicensed discharges of contaminated water (refer Site Water Balance). Notwithstanding, in the event that a surface water-related complaint is received from a local landholder in relation to a potential MPO-related impact on their surface water supply, the response protocol in Table 5 will be initiated.

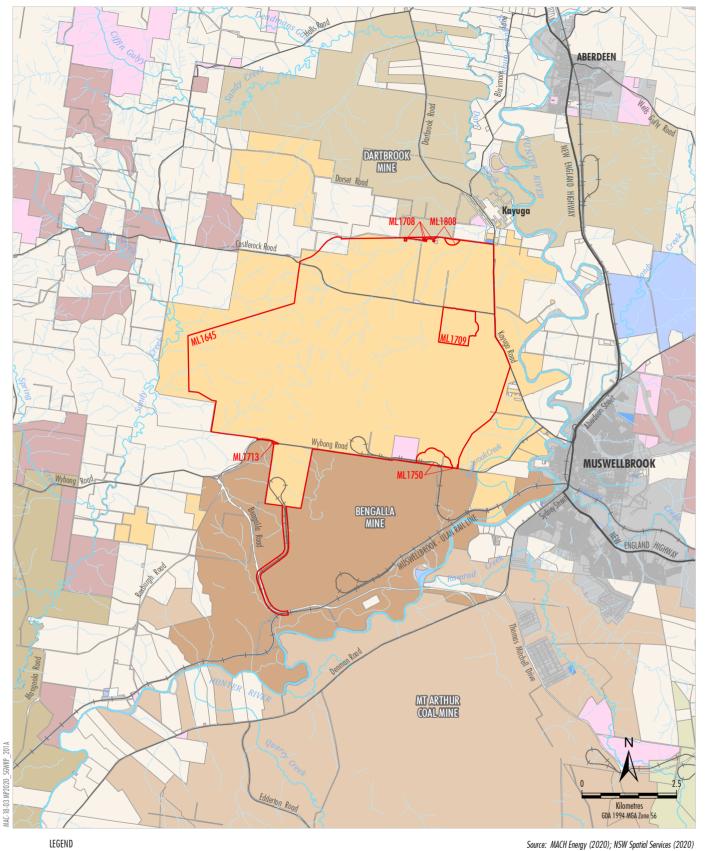

Table 5
Surface Water Supply Response Protocol

	Response Protocol
Trigger	Complaint by local landholder regarding surface water supply.
Investigation	I. Notify the MACH Energy Environmental Superintendent within 24 hours of receiving the complaint.
	2. Check and validate the information provided with the complaint.
	3. Undertake a review of monitoring data.
	 Collect and analyse supplementary samples of the exceedance parameter (as well as any other relevant parameters) upstream (where possible) and downstream of the MPO, to assess whether the exceedance is ongoing.
	5. Assess any changes to MACH Energy activities and inspect all relevant water management structures and infrastructure, and erosion and sediment controls in the area of the complaint.
	 Assess conditions (climatic, hydrological, hydrogeological and changes in land use activities in the catchment – including other mining/pastoral activities and riparian revegetation works), both prevailing and preceding the complaint and assess the potential impact.
	 Identify plausible and possible causative mechanisms and assess/quantify these against all relevant data and information to identify most likely causes.
	 Decide if the impact (i.e. impact on surface water supply) is solely attributable to activities being undertaken by or directly related to the MPO.
	Notify owner of the outcome of the investigation.
	 Provide a preliminary investigation report to the DPIE, EPA and DPIE Water within seven days of identifying the trigger exceedance.
Response	Develop/design contingency and remedial measures based on the results of the above investigations. Contingency and remedial measures considered practical for implementation may include:
	 notifying local landholders;
	 providing an alternative water source for the duration of water quality impact caused by the incident/non-compliance;
	 reviewing and refining the SWMP;
	 reviewing and refining processes for inspection, maintenance and siting of water management infrastructure (e.g. dams, pipelines, pumps);
	 repairing, replacing, or constructing new or enlarged water management infrastructure; and
	 developing and implementing a training package specifically related to the cause of the incident/non-compliance.
	Communicate results of investigation, contingency and remedial measures to government agencies as required and summarise in the Annual Review.
	Review and update the WMP and resubmit to the DPIE (if required).

All complaints will be managed in accordance with the complaints procedure outlined in Section 5 of the WMP.

3.2 GROUNDWATER INVESTIGATIONS

MACH Energy has developed a groundwater response protocol to ensure all exceedances of groundwater triggers and complaints related to groundwater are appropriately investigated and addressed. These have been incorporated in the individual response protocols provided below.

Mining Lease Boundary (Mount Pleasant Operation) Mount Pleasant-controlled Bengalla-controlled
Dartbrook-controlled Mangoola-controlled Muswellbrook Coal-controlled Mt Arthur-controlled Other Mining/Resource-controlled Crown The State of NSW $\,$ Muswellbrook Shire Council Upper Hunter Shire Council Privately-owned Land Muswellbrook and Upper Hunter LEPs Zones B2, B5, IN1, SP2, R2, R5, RE1, RE2 and W1

MACHEnergy

MOUNT PLEASANT OPERATION Land Ownership Overview (July 2020)

Figure 2

3.2.1 Groundwater Levels Response Protocol

As described in Section 7.1 of the GWMP, final groundwater level trigger values will be based upon the results of contemporary groundwater modelling yet to be completed. In the interim, groundwater level trigger values have been established to monitor for potential impacts on the alluvial groundwater system to the east of the MPO, associated with the Hunter River (this is anticipated to be where the majority of private groundwater users are accessing groundwater in the vicinity of the MPO). Trigger values have been developed in accordance with the *NSW Aquifer Interference Policy*, at three monitoring bores situated in this alluvial groundwater system. In the event that groundwater levels at these bores fall below these trigger values, the response protocol in Table 6 will be initiated.

Table 6
Groundwater Level Response Protocol

	Response Protocol		
Trigger		groundwater level measurement at a relevant alluvial monitoring bore falls below the trigger value ecified within Table 10 of the GWMP.	
Investigation	1.	Notify the MACH Energy Environmental Superintendent within 24 hours of becoming aware of the trigger event.	
	2.	Check and validate the data which indicates an exceedance of the trigger conditions.	
	3.	Undertake supplementary water level measurements to check if the exceedance is ongoing.	
	4.	Conduct a preliminary investigation, including a review of site activities being undertaken at the time, baseline groundwater monitoring results, groundwater results at nearby locations, the prevailing and preceding meteorological and streamflow conditions and changes to the land use/activities being undertaken in the area, including mining/pastoral activities. If necessary, engage a suitably qualified hydrogeologist to assist with the preliminary investigation (e.g. interpretation of monitoring results).	
	5.	Identify plausible and possible causative mechanisms and assess/quantify these against all relevant data and information to identify most likely causes.	
	6.	Determine if private groundwater supply bores in the vicinity of the monitoring bore have experienced cumulative drawdowns in excess of 2 metres (m) and an associated reduction in groundwater yield (The minimal impact consideration for privately owned groundwater bores under the <i>NSW Aquifer Interference Policy</i> is drawdowns greater than 2 m).	
	7.	Determine if there has been an effect on potential GDEs located along the Hunter River.	
	8.	Provide a preliminary investigation report to the DPIE, EPA and DPIE Water within seven days of identifying the trigger exceedance.	
Response	•	Implement appropriate contingency and remedial measures (including the privately-owned groundwater bores response protocol, if required).	
	•	Communicate results of investigation, contingency and remedial measures to government agencies as required and summarise in the Annual Review.	
	•	Review and update the WMP and resubmit to the DPIE (if required).	

3.2.2 Groundwater Quality Response Protocol

Water quality triggers for groundwater have been developed in accordance with the *Australian and New Zealand Guidelines for Fresh and Marine Water Quality* (ANZECC & ARMCANZ, 2000). These triggers are based upon exceedance of the assigned beneficial use categories for EC values, and the exceedance/deterioration of pH values outside the 20th and 80th percentile range of baseline pH data. Details regarding the trigger values are provided in Section 7.2 of the GWMP. In the event that one of the groundwater quality assessment criteria is triggered, the response protocol in Table 7 will be implemented.

Table 7 Groundwater Quality Response Protocol

	Response Protocol	
Trigger	A monitoring bore records an EC or pH value above (or outside the range of) the trigger values specified in Table 12 of the GWMP at three successive monitoring rounds.	
Investigation	Notify the MACH Energy Environmental Superintendent within 24 hours of becoming aware of the trigger event.	
	2. Check and validate the data which indicates an exceedance of the trigger conditions.	
	3. In the event of an apparently anomalous groundwater monitoring result, conduct a resample/retest.	
	4. Conduct a preliminary investigation, including a review of site activities being undertaken at the time, baseline groundwater monitoring results, groundwater results at nearby locations, the prevailing and preceding meteorological and streamflow conditions and changes to the land use/activities being undertaken in the area, including mining/pastoral activities. If necessary, engage a suitably qualified hydrogeologist to assist with the preliminary investigation (e.g. interpretation of monitoring results).	
	Provide a preliminary investigation report to the DPIE, EPA and DPIE Water within seven days of identifying the trigger exceedance.	
Response	Subject to the outcomes of the investigation, develop/design contingency and remedial measures. Contingency and remedial measures considered practical for implementation may include:	
	- notification to local groundwater users;	
	 providing an alternative water source for the duration of the water quality impact; 	
	 reviewing and refining the Ground Water Monitoring Program including undertaking additional specific monitoring of private landholder bores; 	
	 reviewing mine plan impacts on the alluvial groundwater source; and 	
	 repairing, replacing, or constructing new water management infrastructure. 	
	Communicate results of investigation, contingency and remedial measures to government agencies as required and summarise in the Annual Review.	
	Review and update the WMP and resubmit to the DPIE (if required).	

3.2.3 Privately-Owned Groundwater Bores Response Protocol

In the event that a groundwater-related complaint is received from a local landholder in relation to a potential mine-related effect on their groundwater supply, or an investigation undertaken in accordance with the response protocol in Table 6 indicates a drawdown of greater than 2 m at a privately owned bore, the response protocol in Table 8 will be initiated.

In addition, all complaints will be managed in accordance with the complaint protocols outlined in Section 5 of the WMP.

Table 8 Privately-Owned Groundwater Bores Response Protocol

Response Protocol	
Trigger	Complaint by local landholder regarding water supply from groundwater bore.
Investigation	Notify the MACH Energy Environmental Superintendent within 24 hours of receiving the complaint.
	Check and validate the information provided with the complaint.
	3. Conduct a preliminary investigation, including a review of site activities being undertaken at the time, baseline groundwater monitoring results, groundwater results at nearby locations, the prevailing and preceding meteorological and streamflow conditions and changes to the land use/activities being undertaken in the area, including mining/pastoral activities. If necessary, engage a suitably qualified hydrogeologist to assist with the preliminary investigation (e.g. interpretation of monitoring results).
	Where a preliminary investigation indicates a potential mining effect at the complainant's bore, conduct a detailed investigation to determine whether the MPO has contributed to a greater than 2 m cumulative drawdown or a detrimental water quality effect.
Response	In the event that a detailed investigation conclusively attributes greater than 2 m drawdown, or a detrimental water quality effect, for an existing groundwater supply user to the MPO (or a contribution from the MPO to a cumulative 2 m drawdown or cumulative detrimental water quality effect), investigate appropriate contingency and remedial measures which may include:
	 deepening the affected groundwater supply bore;
	 construction of a new groundwater supply bore; or
	- provision of an alternative water supply.
	Determine the exact nature of contingency/remedial measures in consultation with the affected landholder (and relevant regulatory agencies as required). Where a cumulative impact is identified, the costs associated with the contingency/remedial measures will be apportioned to the responsible parties based on their relative contribution to the identified impact.
	Communicate results of investigation, contingency and remedial measures to government agencies as required and summarise in the Annual Review.
	Review and update the WMP and resubmit to the DPIE (if required).

4 POTENTIAL CONTINGENCY MEASURES

4.1 LOSS OF BASEFLOW

Potential impacts to Hunter River baseflow were considered as part of the Mt Pleasant Water Management Studies (PPK Infrastructure and Environment, 1997).

PPK Infrastructure and Environment (1997) concluded that a minor reversal in flow, resulting in downward leakage from the alluvium to the hard rock, would be offset by natural groundwater recharge. Accordingly, the water table within the alluvial sediments was predicted to remain largely unaffected by depressurisation and the impacts on Hunter River water supply were therefore predicted to be negligible.

Notwithstanding, contemporary groundwater modelling is being undertaken for the MPO. This contemporary groundwater modelling will include updated predictions of Hunter River baseflow loss due to the approved MPO.

Any incidental water take from the Hunter River would be licensed in accordance with requirements of the *Water Management Act*, 2000. Unnamed drainage lines in the MPO vicinity are unlikely to receive any significant baseflow given their ephemeral nature. On this basis, further measures to offset the loss of any baseflow to watercourses is not considered to be warranted.

4.2 GROUNDWATER LEAKAGE FROM ALLUVIAL AQUIFERS

HydroSimulations (2016) has undertaken a desktop review of a number of groundwater studies in order to conservatively estimate the MPO groundwater pit inflows and associated alluvial groundwater licensing requirements (refer to Section 6.1.1 of the GWMP).

Groundwater leakage from alluvial aquifers will be licensed in accordance with requirements of the *Water Management Act, 2000.* On this basis, further measures to prevent, minimise or offset groundwater leakage from alluvial aquifers due to the MPO are not considered warranted.

4.3 ADVERSELY AFFECTED WATER SUPPLY ON PRIVATELY-OWNED LAND

Response protocols have been developed for potential impacts on privately-owned surface water and groundwater users (Sections 3.1.3 and 3.2.3).

The NSW Aquifer Interference Policy includes minimal impact considerations relating to water table and groundwater pressure drawdown. The minimal impact consideration for privately owned groundwater bores is cumulative drawdowns greater than 2 m. In the event the MPO contributed to a drawdown greater than 2 m at a private bore was attributed to the MPO, and this has negative impacts on the landholder's water supply, the following potential make-good provisions may be implemented:

- deepening the affected groundwater supply bore;
- construction of a new groundwater supply bore; or
- provision of an alternative water supply.

If an unapproved, adverse impact occurs on a downstream surface water user due to the MPO, MACH Energy would implement the following contingency measures:

- providing an alternative water source during the duration of the impact; and
- reviewing and refining the surface water and groundwater monitoring programs.

These contingency measures would be assessed on a case by case basis and implemented in consultation with the affected landholder.

4.4 ADVERSELY AFFECTED GROUNDWATER DEPENDENT ECOSYSTEMS AND RIPARIAN VEGETATION

Review of the relevant water sharing plans has indicated that there are no high priority groundwater dependent ecosystems (GDEs) in the vicinity of the MPO.

GDEs are likely restricted to the trees on the bank of the Hunter River, with the historic GDE vegetation on the main floodplain out from the river banks having been cleared for farming. Accordingly, the triggers established for alluvial groundwater levels are considered to be sufficient for monitoring potential effects on GDEs (refer to Section 7.3 of the GWMP).

As described in Section 4.3 of the SWMP, the Hunter River and its tributaries have been historically degraded due to agricultural and industrial use. Riparian condition at all four stream health monitoring locations was described as poor, with the majority of native flora species at the sites being replaced by exotic species (Hose and Turak, 2004).

Notwithstanding the above, a stream health monitoring program has been developed to detect any changes in macro invertebrate ecology in the vicinity of the MPO. This monitoring program includes macro invertebrate sampling at two downstream monitoring locations on the Hunter River, in the vicinity of the MPO.

In addition to aquatic macro invertebrate sampling, monitoring will also include:

- fish observations;
- site water quality;
- · stream condition; and
- aquatic and riparian edge plants.

In the event that deterioration is identified in GDEs or in riparian vegetation condition during stream health monitoring, the response protocol outlined in Table 9 will be initiated.

Table 9
Groundwater Dependent Ecosystems and Riparian Vegetation Condition Response Protocol

	Response Protocol		
Trigger	Detection of deterioration in GDEs or riparian vegetation along watercourses in the vicinity of the MPO.		
Investigation	Notify the MACH Energy Environmental Superintendent within 24 hours of becoming aware of the deterioration.		
	2. Check and validate the data/information which indicates an impact.		
	3. In the event of an apparently anomalous monitoring result, conduct a resample/retest where possible.		
	4. Review the impact, including consideration of:		
	- any relevant monitoring data; and		
	 current mine activities and land management practices in the relevant catchment, including other mining/pastoral activities. 		
	5. Commission an investigation by an appropriate specialist into the impact, if considered appropriate by the Environmental Superintendent.		
	6. Provide a preliminary investigation report to the DPIE, EPA and DPIE Water within seven days of identifying the trigger exceedance.		
Response	Develop appropriate contingency/remedial measures based on the results of the above investigations, in consultation with the relevant authorities if or as required.		

5 REVIEW AND IMPROVEMENT OF ENVIRONMENTAL PERFORMANCE

5.1 ANNUAL REVIEW

In accordance with Condition 3, Schedule 5 of Development Consent DA 92/97 MACH Energy will review and evaluate the environmental performance of the MPO by the end of March each year (for the preceding calendar year) or other such timing as agreed by the Secretary of the DPIE.

In relation to water, the Annual Review will:

- include a review of the surface and groundwater monitoring results at the MPO over the past year, which includes a comparison of the results to evaluate compliance against the:
 - relevant statutory requirements, limits or performance measures/criteria (refer Section 2.1.1);
 - monitoring results of the previous years; and
 - relevant predictions in the EIS and MOD 1, MOD 2, MOD 3 and MOD 4 EAs;
- identify any water-related non-compliance over the past year, and describe what actions were (or are being) taken to ensure compliance;
- identify any trends in the water monitoring data over the life of the MPO;
- identify any discrepancies between the predicted and actual water impacts of the MPO, and analyse
 the potential cause of any significant discrepancies; and
- describe what water-related measures will be implemented over the next year to improve the environmental performance of the MPO.

The Annual Review will be made publicly available on the MACH Energy website (http://www.machenergyaustralia.com.au) in accordance with Condition 11, Schedule 5 of Development Consent DA 92/97.

5.2 SGWRP REVISION

In accordance with Condition 4, Schedule 5 of Development Consent DA 92/97, this SGWRP will be reviewed, and if necessary revised to the satisfaction of the Secretary of the DPIE, within three months of the submission of:

- an Annual Review (Condition 3, Schedule 5);
- an incident report (Condition 7, Schedule 5);
- an Independent Environmental Audit (Condition 9, Schedule 5); and
- any modification to the conditions of Development Consent DA 92/97.

Within 4 weeks of conducting any such review, the Secretary of the DPIE will be advised of the outcomes of the review and any revised documents submitted to the Secretary for approval.

In accordance with Condition 4A, Schedule 5 of Development Consent DA 92/97, MACH Energy may submit a revised SGWRP for the approval of the Secretary at any time, and may also submit any revision to this SGWRP required under Development Consent DA 92/97 on a staged basis.

If agreed with the Secretary of the DPIE, a revision to this SGWRP required under Development Consent DA 92/97 may be prepared without undertaking consultation with all parties nominated under the relevant Condition of Development Consent DA 92/97.

The approved SGWRP will be made publicly available on the MACH Energy website (http://www.machenergyaustralia.com.au), in accordance with Condition 11, Schedule 5 of Development Consent DA 92/97.

6 REPORTING PROCEDURES

In accordance with Condition 2, Schedule 5 of Development Consent DA 92/97, MACH Energy has developed protocols for managing and reporting the following:

- incidents;
- · complaints;
- non-compliances with statutory requirements; and
- exceedances of the impact assessment criteria and/or performance criteria.

These protocols are described in Section 5 of the WMP.

In accordance with Condition 8, Schedule 5 of Development Consent DA 92/97, MACH Energy will provide regular reporting on the environmental performance of the MPO on the MACH Energy website (http://www.machenergyaustralia.com.au).

Chloe Annandale Environmental Advisor MACH Energy 1100 Wybong Road Muswellbrook NSW 2333 Our ref: OUT19/12901

email: <u>Chloe.Annandale@machenergyaustralia.com.au</u>

Dear Chloe 25 September 2019

Mount Pleasant Operation – Water Management Plans

Thank you for giving the Department of Planning, Industry and Environment – Water (DPIE-Water) formerly Dol Water the opportunity to comment on the Water Management Plans, including the Site Water Balance, Erosion and Sediment Control Plan, Surface Water Management Plan, Groundwater Management Plan and the Surface and Ground Water Response Plan. DPIE-Water has reviewed the plans and provides the following comments:

- Mount Pleasant Operation hold appropriate groundwater entitlement prior to take. A shortfall in entitlement held versus modelled mine inflow is predicted by year 6 of the mine plan for the Sydney Basin North Coast Groundwater Source.
- 2. The additional monitoring bores proposed to be constructed within the alluvial aquifers are to be amalgamated into the nominated impact bores network as soon as practical.
- 3. The elevation at each bore should be surveyed (by a registered surveyor) with water levels presented in Australian Height Datum as well as depth in the annual report and provided electronically in an excel/csv format if requested.
- 4. Reporting on Hunter Regulated River Alluvial Water Source groundwater flow direction is to be included within the annual report.
- 5. The Aquifer Interference Policy outlines that the drawdown impact consideration is a cumulative impact and not that by a sole activity. Therefore, if Mount Pleasant Operation contributes to the exceedance albeit not the full 2m or greater, Mount Pleasant Operation remains accountable. The wording of the Surface and Ground Water Response Plan protocol should reflect this intent.

Should you have any further queries in relation to this submission please do not hesitate to contact Ellie Randall on (02) 4275 9308. Please note the generic email address for correspondence is nrar.servicedesk@industry.nsw.gov.au.

Yours sincerely
