# **Executive Summary**

#### Background

Deicorp Projects Showground Pty Ltd ('the client') engaged EI Australia (EI) to undertake a Detailed Site Investigation (DSI) for the property located at Doran Drive Precinct, 2 Mandala Parade, Castle Hill NSW ('the site') to allow redevelopment of the site.

It was understood that redevelopment of the site is a State Significant Development (SSD). The site (Doran Drive Precinct) is situated in the central portion of the Hills Showground Station Precinct development area, covering a total area of 7,969 m<sup>2</sup>. At the time of this investigation the site was a vacant lot, cleared of all structures. The development includes construction of multi-storey, mixed use commercial and residential apartment buildings, overlying a common podium structure with six-levels of basement.

#### Objectives

The main objective of this investigation was to:

 Investigate the degree of any potential contamination by means of intrusive sampling and laboratory analysis, for relevant contaminants of concern.

A further objective, should site contamination be confirmed, was to make recommendations for the appropriate management of any contaminated soils and/or groundwater.

#### **Key Findings**

- The site was found to be a rectangular vacant block, secured by construction hoarding and security fencing. It was elevated above the surrounding land, which displayed a moderate downslope towards the southwest. The ground surface was covered by exposed fill materials, with limited vegetation present onsite. No visual evidence of gross contamination, UPSS or UST was observed on the site during the site inspection.
- A review of historical information indicated the site was used as rural residential, agricultural, vacant pastoral and public open space (playing fields) until the late 1980s. Since 2013, significant ground disturbance works (bulk earthworks and material storage) have been completed as a result of the Sydney Metro North West (SMNW) Project activities ('Metro Northwest Link'). The site was used for a holding and processing yard during that period, which included excavated water treatment basins, material/equipment storage and site sheds. During 2019, the current site configuration was established and cleared of all previous structures. The site surface was significantly filled and raised above the surrounding land.
- The site and surrounding lands were not listed on any of the EPA records reviewed.
- Soil sampling and analysis were conducted at 19 locations across the site.
  - The sub-surface layers observed comprised of fill materials (up to 4.0m depth) overlying natural clay and sandstone bedrock;
  - Laboratory results for all the soil samples collected reported concentrations below the most conservative human health and ecological based SILs;

- Laboratory results indicated that natural soils on site were non-saline. Soils were found to be slightly acidic (pH ranged from 4.6 to 6.1), with the exception of soil sample at BH3M reported pH at 9.4
- Four groundwater monitoring wells were installed on the site.
  - Standing Water Levels (SWL) were observed between 2.58 and 4.48 mBGL;
  - Groundwater was likely to flow hydraulically south-westerly towards Cattai Creek;
  - Concentrations of PAHs, BTEX, TRHs and VOCs were reported below the adopted criteria;
  - Concentrations of heavy metals were reported below the adopted freshwater criteria, with the exception of chromium, copper, lead, nickel and zinc. However, the detected concentrations are considered to be indicative of background conditions, rather than site specific impacts.
  - Therefore the identified groundwater concentrations are not considered to present a cause for human health and environmental concern.
- Based on the analytical results, the following preliminary classifications were provided (with reference to the EPA (2014) Waste Classification Guidelines):
  - The fill materials on the site were classified as *General Solid Waste (Non-Putrescible)*; and
  - The underlying natural soils on the site were classified as Virgin Excavated Natural Material (VENM).

Based on the findings of this investigation, EI conclude that the site is suitable for the proposed mixed commercial and residential development provided the recommendations detailed in **Section 11** are implemented.

# 1. Introduction

# 1.1 Background and Purpose

Deicorp Projects Showground Pty Ltd ('the client') engaged EI Australia (EI) to undertake a Detailed Site Investigation (DSI) of the land parcel located at Doran Drive Precinct, 2 Mandala Parade, Castle Hill NSW ('the site') to allow redevelopment of the site.

The site is located within the Local Government Area (LGA) of The Hills Shire Council, as shown in **Figure 1** (**Appendix A**), and covers a total area of 7,969  $m^2$ , as shown on the survey plan attached in **Appendix C**. The site can be further identified as Lot 55 in Deposited Plan (DP) 1253217.

El understands that redevelopment of the site is a State Significant Development (SSD). The site (Doran Drive Precinct) is situated in the central portion of the Hills Showground Station Precinct development area, with Hills Showground Metro Station to the south, Hills Showground Precinct East and Hills Showground Precinct West to the east and west, respectively. At the time of this investigation the site was a vacant rectangular block, cleared of all structures.

# 1.2 Proposed Development

Based on the supplied plans (**Appendix C**), the proposed development would include construction of multi-storey, mixed use commercial and residential apartment buildings, overlying a common podium structure with six-levels of basement car park.

The basements were to be constructed to the site boundaries, with the lowest basement level (B06) will require a Finished Floor Level (FFL) of 70.20m Australian Height Datum (AHD). It is understood that a Bulk Excavation Level (BEL) of RL 69.10mAHD will be required for the lowest basement level, which includes allowance for the construction of the basement slab. To achieve the BEL, excavation depths of 19 m Below Existing Ground Level (mBGL) at the Doran Drive end of the site to 26.6 mBGL at the Andalusian Way end of the site have been estimated. Locally deeper excavations may be required for footings, services trenches, crane pads and lift overrun pits.

## 1.3 Regulatory Framework

The following regulatory framework and guidelines were considered during the preparation of this report:

- Contaminated Land Management Act 1997 (the CLM Act);
- Protection of the Environment Operations Act 1997 (the POEO Act);
- State Environmental Planning Policy 55 (SEPP 55) Remediation of Land;
- State Environmental Planning Policy (State and Regional Development) 2011;

- The Hills Development Control Plan (DCP) 2012.

### 1.4 Project Objectives

The main objective of this investigation was therefore to:

 Investigate the degree of any potential contamination by means of intrusive sampling and laboratory analysis, for relevant contaminants of concern.

A further objective, should site contamination be confirmed, was to make recommendations for the appropriate management of any contaminated soils and/or groundwater.

### 1.5 Scope of Works

In order to achieve the above objectives, the following scope of works was completed:

- Preparation of a Work, Health, Safety & Environment Plan;
- A review of existing underground services on site ('Dial-before-you-dig' DBYD) and carry out an underground search for buried services using elector-magnetic equipment;
- A review of relevant geological, hydrogeological and soil landscape maps for the project area;
- A search of groundwater bore records within close vicinity to the site;
- A review of previous environmental reports;
- A site inspection;
- Excavation of test pits and drilling of boreholes at 19 locations distributed in a triangular grid pattern across accessible areas of the site;
  - Drilling of boreholes to assess salinity at 3 locations to approximately 1m below the proposed bulk excavation (or prior refusal on bedrock);
- Installation of four groundwater monitoring wells, both up-gradient and down-gradient of the proposed development area. Groundwater monitoring wells would be constructed to standard environmental protocols to investigate potential groundwater contamination;
- Multiple level soil sampling within fill and natural soils and one round of groundwater sampling from the constructed groundwater monitoring wells;
- Laboratory analysis of selected soil and groundwater samples for relevant analytical parameters as determined from the site history survey and field observations during the investigation programme; and
- Data interpretation and reporting.

This DSI report has been prepared in accordance with the EPA (2020) to document desk study findings, the conceptual site model, data quality objectives, investigation methodologies and results. The report also provides a record of observations made during the detailed site walkover inspection, borehole and test pit logs, and a discussion of laboratory analytical results in regards to potential risks to human health, the environment and the aesthetic uses of the land.

# 2. Site Description

# 2.1 Property Identification, Location, and Physical Setting

The site identification details and associated information are presented in **Table 2-1**, while the site locality is shown in **Figure 1 (Appendix A)**.

**Attribute Description** Street Address Doran Drive Precinct, 2 Mandala Parade, Castle Hill NSW Location Description 10 km north-west of Parramatta CBD, bound by De Clambe Drive to the north, Andalusian Way to the east, Mandala Parade to the south and Doran Drive to the west. Coordinates Northeast corner of site: GDA2020-MGA56 Easting: 313544.048; Northing: 6266325.101.  Table 2-1
 Site Identification

## 2.2 Surrounding Land Use

The site is situated within the Hills Showground Station Precinct development area as described in **Table 2-2**. The sensitive receptors within close proximity of the site (approximately 250m) are also identified.

| Direction | Land Use Description                                                                                                                                                                            | Sensitive Receptors<br>(& distance from site)                                                               |

#### Table 2-2 Surrounding Land Uses

# 2.3 Regional Setting

The local topography, regional hydrogeology, geology and soil landscape information are summarised in **Table 2-3**.

| Attribute        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |  |  |
|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|--|
| Topography       | The site displays a moderate downslope towards the southwest, with site levels varying from 98.13m AHD in the north-eastern site corner to 90.63m AHD in the south-western site corner ( <b>Appendix C</b> ). The batters along the site boundaries have an average 1-1.5m drop towards the surrounding roads. Regionally, the area slopes south-westerly towards Cattai Creek.                                                                                                                            |  |  |
| Site Drainage    | Site drainage is likely to be consistent with the general slope of the site. Any run off would be expected to flow into the new constructed stormwater pits on the site, which flows into the municipal stormwater system and then into Cattai Creek approximately 130m southwest of the site.                                                                                                                                                                                                             |  |  |
| Regional Geology | The Department of Mineral Resources <i>Penrith 1:100,000 Geological Series Sheet 9030</i> indicates the site is underlain by Hawkesbury Sandstone ( <i>Rh</i> ), consisting of medium to very coarse-grained quartz sandstone, minor laminated mudstone and siltstone lenses.                                                                                                                                                                                                                              |  |  |
|                  | However, the eastern end of the site is close to a boundary with Ashfield<br>Shale (Rwa), consisting of dark-grey to black claystone-siltstone and fine<br>sandstone-siltstone laminite. The thin Mittagong Formation may or may not be<br>present between the Ashfield Sahel and Hawkesbury Sandstone.                                                                                                                                                                                                    |  |  |
| Soil Landscapes  | The Soil Conservation Service of NSW <i>Soil Landscapes of the Penrith</i> 1:100,000 Sheet (Bannerman SM and Hazelton PA, 1990) indicates that the eastern portion of the site overlies an erosional Glenorie ( <i>gn</i> ) soil landscape, characterised by undulating to rolling low hills on Wianamatta Group shales, while the western portion of the site overlies a colluvial Hawkesbury ( <i>ha</i> ) soil landscape, characterised by rugged, rolling to very steep hills on Hawkesbury Sandstone. |  |  |

Table 2-3 Regional Setting

| Attribute                        | Description                                                                                                                                                                                                                                                                                             |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Acid Sulfate Soil Risk           | With reference to the <i>Prospect/Parramatta River Acid Sulfate Soil Risk Map</i> (1:25,000 scale; Murphy, 1997) and <i>The Hills Local Environmental Plan 2019</i> , the site is not situated in an ASS classed area. As such, ASS is unlikely to be encountered during development works at the site. |
|                                  | The contamination report previously prepared for the site (JBS&G, 2019) also concluded that no further management for the potential presence of ASS is required during future ground disturbance works.                                                                                                 |
| Salinity Potential               | Based on the DIPNR (2003) <i>Salinity Potential in Western Sydney Map 2002</i> , the site is situated within an area of very low to moderate salinity potential. EI conducted a salinity assessment during this investigation, as discussed in <b>Section 8</b> .                                       |
| Nearest Surface Water<br>Feature | Cattai Creek, located approximately 130m southwest of the site.                                                                                                                                                                                                                                         |
| Groundwater Flow<br>Direction    | Interred to flow south-westerly towards Cattai Creek.                                                                                                                                                                                                                                                   |

### 2.4 Groundwater Bore Records and Groundwater Use

An online search of groundwater bores registered with WaterNSW was conducted by EI on 31 July 2020 (Ref. <u>https://realtimedata.waternsw.com.au/water.stm</u>). There was one registered bore within a 500 m radius of the site, as summarised in **Table 2-4**. A groundwater bore location plan and detailed information are presented in **Appendix D**.

| Table 2-4 | Summary of | f Proximate     | Registered | Groundwater Bores |
|-----------|------------|-----------------|------------|-------------------|
|           | Summary O  | I I I UXIIIIate | Negistereu | Groundwater Dores |

| Bore No. | Distance &<br>Direction | Date Drilled | Drilled Depth<br>(m) | SWL(m BGL) /<br>Salinity | Bore Purpose    |
|----------|-------------------------|--------------|----------------------|--------------------------|-----------------|
| GW107601 | 150m northwest          | 24.10.2002   | 35.34                | -/-                      | Monitoring bore |

Contamination report prepared by JBS&G (2019) also identified one groundwater bore (GW100981) approximately 550m northeast from the site, which was authorized for domestic use. The water table (as indicated by standing water levels, SWL) was recorded at 8.0m BGL.

Therefore it is anticipated that groundwater is present at a shallow to moderate depth below the site.

#### 2.5 Site Inspection

Site observations were recorded during an inspection of the site on 8 July 2020. These are summarised below. Site photographs taken during the inspection are presented in **Appendix E**.

- The site was a rectangular vacant block, secured by construction hoarding and security fencing (**Photograph 6**). It was situated at the north side of the Hills Showground Metro Station.
- The site was found to be elevated above the surrounding land, which displayed a moderate downslope towards the southwest. Constructed batters were present along the site boundaries, which elevated the site at up to approximately 1-1.5m above the surrounding roads (**Photographs 3** and **5**).
- The whole site was vacant, cleared of all structures. The ground surface was covered by exposed fill materials (**Photographs 1, 2** and **4**).
- Limited vegetation was present on the site. The vegetation did not appear stressed.

- Constructed stormwater pits were present along the site boundaries (**Photograph 5**), collecting surface runoff to the municipal stormwater system.
- No unusual odours were detected during the inspection. No visual signs of contamination (i.e. cement sheet fragments) were identified on site surfaces.
- No evidence of an underground petroleum storage system (UPSS), or an underground storage tank (UST), was observed on the site.
- Surrounding areas consisted of Castle Hill Showground to the north, Hills Showground Precinct East and Hills Showground Precinct West to the east and west, and Hills Showground Metro Station to the south. Residential properties were mainly present to the south, east and north of the site, while commercial properties were mainly to the west of the site.
- There was no NSW Fire and Rescue Station (or Training College) in the vicinity (<100m) of the site.

# 3. Previous Investigations

EI was provided with previous investigation reports carried out within portions of the Hills Showground Station Precinct development area, including:

- JBS&G (2009) Phase 1 and 2 Environmental Site Assessment,
- JBS&G (2013) Contamination Due Diligence Advice, Former Hills Shire Depot, Carrington Road, Castle Hill, NSW, Report Ref. 42829/54994 (Rev1), dated 26 August 2013;
- Arup (2015) *Showground Precinct Desktop Contamination Review*, dated 1 September 2015;
- Douglas Partners (2016) Report on UST Validation Sydney Metro Northwest, Showground Station, Carrington Road, Castle Hill NSW, Ref. 73315.03.R.001.Rev0.UST Validation, dated 6 May 2016; and
- JBS&G (2019) Soil and Contamination Report, Ref. 54813/125497 (Rev1), dated 29 October 2019.

The JBS&G (2009 and 2013), Arup (2015) and DP (2016) investigations referenced above were conducted at the former Hills Council Depot (now Hills Showground Precinct West and the newly constructed commuter car park to the west of the site).

The JBS&G (2019) report identified that significant ground disturbance occurred at the site (Doran Drive Precinct) as a results of Sydney Metro North West (SMNW) Project activities ('Metro Northwest Link') and concluded that further contamination assessment was required. A summary of works and key findings from this report is outlined in **Table 3-1**.

| Table 3-1 | Summary of    | Provinue | Investigation | Worke | and Findings |

|                                    | <ul> <li>Preparation of a preliminary environmental site assessment report in general<br/>accordance with relevant EPA Guidelines.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Site History                       | Review of available site history indicated the majority of the site was historically<br>utilised as rural residential and agricultural (orchards) land prior to being acquired by<br>the Baulkham Hills Shire Council between the 1960s and 1970s. Until approximately<br>2013, the site was used for a combination of public open space (playing fields) prior<br>use for commercial (office spaces and performing arts centre) and industrial (use as<br>Council Depot) activities. The site was transferred Transport for NSW in 2013<br>following which the central and western portions have undergone redevelopment<br>works associated with the construction of the SMNW Project train tunnels and statio<br>infrastructure.                                                                                                                      |
| Conclusions and<br>Recommendations | <ul> <li>Prior to the commencement of the SMNW Project activities, the site comprised<br/>three main areas: the Hills Shire Council Chambers and Administration building ar<br/>surrounds (Hills Showground Precinct East); the former performing arts centre and<br/>associated car parking area (central portion including Showground Station and<br/>Doran Drive Precinct); and the Council Works Depot (Hills Showground Precinct<br/>West and constructed carpark infrastructure).</li> </ul>                                                                                                                                                                                                                                                                                                                                                       |
|                                    | Historical site investigation reports available for assessment were limited to the former Council Works Depot footprint. These investigations identified the presence of small scale soil and groundwater contamination and underground fuel infrastructure (considered significant point sources of potential contamination), prior to the commencement of the SMNW Project activities. Records obtained from SafeWork NSW and validation documentation have indicated removal of the majority of the identified fuel infrastructure. Notwithstanding, in the absence of further validation documentation and/or a RAP as may have been prepared as required by Project Approval consent conditions, there remains uncertainty on the fate of previously identified asbestos impacts and the current contamination status of this portion of this site. |
|                                    | <ul> <li>In addition, significant ground disturbance works have been completed within the<br/>central portion of the site (Doran Drive Precinct) during the SMNW Project activitie<br/>This site portion is currently surfaced with exposed fill material. Subject to the<br/>availability of validation documentation confirming the status of ground conditions<br/>this portion of the site, there is also a remaining data gap as to the current<br/>characterisation of this site portion given the potentially contaminating activities the<br/>have occurred within this area.</li> </ul>                                                                                                                                                                                                                                                         |
|                                    | <ul> <li>Within the eastern portion of the site, occupied by the former Council Chambers<br/>and Administration building, the potential for site contamination has been identified<br/>as relatively low, being associated with historical agricultural/open space<br/>management, the historical use of hazardous building materials (asbestos and lea<br/>paint) and the potential presence of limited profile of fill material of unknown origin<br/>However, the absence of existing characterisation data, again remains an open<br/>data gap with regard to drawing conclusions on the suitability of the site for the<br/>proposed landuses.</li> </ul>                                                                                                                                                                                           |

| Assessment<br>Details | Project Tasks and Findings                                                                                                                                                                                                                                                                                                                                                                           |  |  |  |  |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|--|--|--|
|                       | for the proposed land uses, subject to implementation of an appropriate staged<br>data gap contamination assessment (that may include verification reviews of<br>SMNW stage validation reports) and appropriate management of any small scale<br>remaining contamination issues in accordance with NSW EPA guidance as<br>appropriate prior to commencement of future final construction activities. |  |  |  |  |
|                       | <ul> <li>Review of acid sulfate soil (ASS) conditions identified there is no appreciable risk of<br/>ASS presence within natural residual soils at the site given the formation<br/>environment, and therefore no future management for the potential presence of<br/>ASS is required during future ground disturbance works.</li> </ul>                                                             |  |  |  |  |

# 4. Site History and Searches

# 4.1 Land Titles Information / Historical Aerial Photography Review

A historical title and aerial photography review of the Hills Showground Station Precinct development area was carried out by JBS&G (2019) as summarised in **Section 3**. A summary of the information obtained from the historical aerial photographs in relation to the history of the site is presented in **Table 4-1** below.

| Table 4-1            | Summary of Aerial Photograph                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                           |

| Aerial<br>Photograph | Site Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Land Use                                  |
| 1930                 | The site appeared to consist of densely timbered vegetation, rural residential properties and agricultural land.<br>Surrounding areas appeared to be used for similar rural residential / agricultural purposes, with orchard groves noted to the east, south and west of the site. The Castle Hill Showground was located to the north of the site.                                                                                                                                                                                                                                                                                                                                                                                                 | Rural residential<br>/ agricultural       |
| 1950                 | The site was largely cleared of timbered vegetation. The majority of the site appeared to be covered by grass. Previous rural residential structures remained unchanged.<br>Surrounding areas were also largely cleared of vegetation and orchards. A series of sheds were constructed to the west of the site.                                                                                                                                                                                                                                                                                                                                                                                                                                      | Rural residential<br>/ vacant             |
| 1961                 | The site appeared to be unchanged (consistent with the 1950 image).<br>Surrounding areas were largely unchanged, with the exception of some<br>scattered timber and/or waste materials noted to the east of the site.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Rural residentia<br>/ vacant              |
| 1970                 | Previous rural residential properties had been demolished. The land<br>appeared to be largely vacant with a turfed football field constructed in the<br>eastern portion of the site.<br>Surrounding areas to the east was also part of the new playing field. More<br>stockpiled timber/waste materials were noted to the east of the site. More<br>sheds were constructed within the Castle Hill Showground (north of the site).                                                                                                                                                                                                                                                                                                                    | Vacant / part of<br>the playing field     |
| 1986                 | The site was largely vacant. The playing field had been removed from the site and replaced by an oval sports track. The south-western corner of the site appeared to be used for car parking.<br>Surrounding areas appeared to be undergoing redevelopment. Doran Drive had been constructed to the west of the site (forming the western site boundary). Beyond was the Council Depot, comprising two warehouse structures and associated car parking at grade. The Council Chambers had been constructed to the east of the site (consistent with the current structures). More residential properties were constructed to the south, east and north of the site, while commercial/industrial warehouses were constructed to the west of the site. | Vacant / car<br>parking                   |
| 1994                 | A large square-shaped building was constructed in the eastern portion of the site and a L-shaped building was present in the north-western site corner. The reminder of the site consisted of handstand pavements and landscaping areas.<br>Surrounding areas were largely unchanged. The current metro station area (south of the site) appeared to be part of the car parking and landscaping area.                                                                                                                                                                                                                                                                                                                                                | Commercial<br>(performing arts<br>centre) |

Table 4-1 Summary of Aerial Photograph

| Aerial<br>Photograph | Site Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Land Use                                  |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------|
| 2002, 2009,<br>2012  | The site appeared to be unchanged.<br>Surrounding areas were largely unchanged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Commercial<br>(performing arts<br>centre) |
| 2014                 | Previous site structures had been demolished. The site appeared to be<br>redeveloped, as associated with initial SMNW Project works. Two large<br>warehouse buildings were constructed in the western portion and eastern<br>corner of the site and two constructed water treatment basins were present<br>in the central portion of the site. An above ground storage tank (AST)<br>(potentially water/concrete batching) was constructed in the north-eastern<br>site corner.                                                                    | Construction<br>storage yard              |
|                      | An elongated excavation had been formed adjacent to the southern site<br>boundary (Carrington Road), as associated with the construction of<br>underground railway infrastructure. The Council Depot area to the west of<br>the site appeared to be utilised as a storage compound for adjacent SMNW<br>redevelopment activities. Two water retention ponds were noted to the<br>southwest and northwest of the site. The Council Chambers to the east of<br>the site appeared to be unchanged.                                                    |                                           |
| 2015                 | A network of shafts was observed onsite which led to a storage yard/load<br>out area where presumably excess spoil was being transported off-site. A<br>series of cylindrical black plastic storage tanks and several tall sheet metal<br>ASTs had been installed adjacent to the AST and water treatment basins,<br>indicative of a water treatment plant.                                                                                                                                                                                        | Construction<br>storage yard              |
|                      | Further material/equipment storage was present within the Council Depot area.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                           |
| 2016                 | The network of shafts and the large warehouse (western portion) had been removed from the site, indicating bulk subsurface excavation of the Hills Showground Station had likely been completed. The series of plastic and sheet metal ASTs (water treatment plant) had also been removed. The single large AST and two water treatment basins remained onsite. The site appeared to be utilised as material/equipment storage yard. The shadowing in this image indicated that several ground levels occurred within the site during this period. | Construction<br>storage yard              |
|                      | Surrounding areas were largely unchanged, with the exception of former site structures had been demolished within the Council Depot area.                                                                                                                                                                                                                                                                                                                                                                                                          |                                           |
| 2017                 | A significant increase in material storage had occurred onsite, with several large stockpiles of soil observed within the central portion of the site.<br>The former Council Depot area was also utilised as an equipment holding and storage yard.                                                                                                                                                                                                                                                                                                | Construction storage yard                 |
| 2018                 | Significant materials storage activities were in progress within the site.<br>The commuter car park to the west of the site was undergoing construction.<br>Construction of the Hills Showground Metro Station (built form) had begun,<br>with the placement of concrete slab panels across the majority of the open<br>excavation.                                                                                                                                                                                                                | Construction<br>storage yard              |
| 2019                 | The current site configuration had been established. The streets around the site had been constructed, sealed with hardstand pavement and lined with landscaped garden beds and vegetation. The site was cleared of all structures and filled to raise the level, with constructed batters noted along the site boundaries. Several minor stockpiles of soil/waste were noted on the ground surface.                                                                                                                                               | Vacant                                    |

| Aerial<br>Photograph | Site Description                                                         | Land Use |
|----------------------|--------------------------------------------------------------------------|----------|
|                      | The construction of the Showground Metro Station (south of the site) and |          |

The construction of the Showground Metro Station (south of the site) and commuter carpark (west of the site) had been completed.

In summary, key findings related to the site indicated that the site was historically used as rural residential, agricultural, vacant pastoral and public open space (playing fields) until the late 1980s. The site was then developed into a commercial property (the former performing arts centre) between the 1990s and 2010s. Since 2013, significant ground disturbance works (bulk earthworks and material storage) have been completed as a result of the SMNW Project activities. The site was used for a holding and processing yard, which included excavated water treatment basins, material/equipment storage and site sheds (shown in **Photograph 4-1** below). During 2019, the current site configuration was established. The water treatment basins were removed and the site surface was significantly filled and raised above the surrounding land, as shown in **Photograph 4-2** below.

Photograph 4-1: Aerial photograph of the site showing previous site structures during the SMNW Project works (central portion of the development area) (dated 24/12/2014, Google Earth)

Photograph 4-2: Aerial photograph of the site showing established site configuration and levelled surface (dated 07/04/2019, Nearmap)

## 4.2 EPA Online Records

Searches of public registers maintained by the EPA for statutory notices and licensing agreements issued under the *Contaminated Land Management Act 1997* and *Protection of the Environment Operations Act 1997* were conducted by EI for this DSI.

#### 4.2.1 Record of Notices Under Section 58 of CLM Act 1997

An on-line search of the contaminated land public record was conducted on 31 July 2020. The contaminated land public record is a searchable database of:

- Orders made under Part 3 of the CLM Act 1997;
- Notices available to the public under Section 58 of the CLM Act 1997;
- Approved voluntary management proposals under the CLM Act 1997 that have not been fully carried out and where the approval of the EPA has not been revoked;
- Site audit statements provided to the EPA under Section 53B of the CLM Act 1997 that relate to significantly contaminated land;
- Where practicable, copies of anything formerly required to be part of the public record; and
- Actions taken by the EPA under Section 35 or 36 of the Environmentally Hazardous Chemicals Act 1985 (the EHC Act 1985).

The search confirmed that the site and surrounding lands within close proximity (≤250m) were not subject to any regulatory notices relevant to the above legislations.

#### 4.2.2 List of NSW Contaminated Sites Notified to EPA

A search through the *List of NSW Contaminated Sites Notified to the EPA* under Section 60 of the CLM Act 1997 was conducted on 31 July 2020. This list is maintained by the EPA and

includes properties on which contamination has been identified, but not deemed to be impacted significantly enough to warrant regulation. The site and surrounding lands within close proximity (≤250m) had not been notified as contaminated to the EPA (i.e. were not included in the list).

#### 4.2.3 POEO Public Register

A search of the *Protection of the Environment Operations Act 1997* public register was conducted on 31 July 2020. This public register contains records related to environmental protection licences, applications, notices, audits, pollution studies and reduction programs. The search confirmed that the site and surrounding lands within close proximity (<250m) were not subject to any licensing agreements / notices / programs etc. relevant to this legislation.

# 5. Conceptual Site Model

### 5.1 Overview

In accordance with NEPC (2013) Schedule B2 – Guideline on Site Characterisation and to aid in the assessment of data collected for the site, EI developed a conceptual site model (CSM) that assessed plausible linkages between potential contamination sources, migration pathways, and receptors. The CSM provides a framework for the review of the reliability and useability of the data collected and to identify gaps in the existing site characterisation.

## 5.2 Subsurface Conditions

The sub-surface conditions across the site were expected to be a layer of fill, overlying natural clay and shale / sandstone bedrock. Groundwater was likely to be at a shallow to moderate depth below the site, flowing in a south-westerly direction towards Cattai Creek.

## 5.3 Potential Contamination Sources

On the basis of the DSI findings, potential contamination sources were as follows:

- Unknown type and concentration of contaminants within imported fill soils across the site;
- Hazardous building materials (including potential asbestos) present in the site soils as a result of historic demolitions;
- Historical pesticide use;
- Spills or leaks associated with former onsite storage of material/equipment;
- Former AST in the north-eastern site corner; and
- Former water treatment basins in the central portion of the site.

#### 5.3.1 **PFAS** Assessment

EPA (2017) requires that PFAS are considered in assessing land contamination. A desktop survey of the probability for PFAS occurrence is provided in **Table 5-1**. This survey is based on guidelines from the *PFAS National Environmental Management Plan* (NEMP 2020). From this survey a decision can be made as to whether PFAS sampling of soil and groundwater is required. In this instance, the potential for PFAS to be present on-site was low and subsequently PFAS sampling / analysis of soil and water was unwarranted.

| Preliminary Screening                                                                                                                                                                             | Probability of Occurrence <sup>1</sup> |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------|
| Is the past or present site activity listed in the NEMP $(2020)^2$ as being an activity associated with PFAS contamination. If so list activity: N/A                                              | L                                      |
| Is the past or present off-site activity up-gradient or adjacent to the site listed in the NEMP (2020) <sup>2</sup> as being an activity associated with PFAS contamination. If so list activity: | L                                      |
| Did fire training involving the use of suppressants occur on-site between 1970 and 2010?                                                                                                          | L                                      |
| Did fire training occur up-gradient of or adjacent to the site between 1970 and 2010? <sup>3</sup>                                                                                                | L                                      |

Table 5-1 PFAS Decision Tree

| Preliminary Screening                                                                                                                                                                                      | Probability of<br>Occurrence <sup>1</sup> |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------|
| Have "fuel" fires ever occurred on-site between 1970 and 2010? e.g. ignition of fuel (solvent, petrol, diesel, kero) tanks?                                                                                | L                                         |
| Have PFAS been used in manufacturing or stored on-site ?4                                                                                                                                                  | L                                         |
| Could PFAS have been imported to the site in fill materials from a site with activity listed in NEMP (2020)?                                                                                               | L                                         |
| Could PFAS-contaminated groundwater or run-off have migrated on to the site?                                                                                                                               | L                                         |
| Is the site or adjacent sites listed in the NSW EPA PFAS Investigation Program? $^5$                                                                                                                       | L                                         |
| If the probability is medium or high in any of the rows, does the site analytical suite need to be optimised to include preliminary sampling and testing for PFAS in soil (incl. ASLP testing) and waters? | No                                        |

Note 1 Probability: L – low (all necessary documentation has been reviewed and there is no recorded instance or compelling rationale), M – medium/moderate (all necessary documentation has been reviewed and there is potential evidence of a recorded instance with compelling rationale); H – high (all necessary documentation has been reviewed and there is evidence of a recorded instance with compelling rationale); risk, N/A – not applicable (or "-")].

Note 2 Activities listed in Appendix B of the NEMP (2020). Further information, refer to

https://www.oecd.org/env/ehs/risk-management/PFC\_FINAL-Web.pd

Note 3 Runoff from up-gradient PFAS use may impact surface water, soil, sediment and groundwater.

Note 4 PFAS is used wide range of industrial processes and consumer products, including in the manufacture of nonstick cookware, specialised garments and textiles, Scotchguard<sup>™</sup> and similar products (used to protect fabric, furniture, leather and carpets from oils and stains), metal plating and in some types of fire-fighting foam (<u>https://www.nicnas.gov.au/chemical-information/factsheets/chemical-name/perfluorinated-chemicals-pfas</u>).

Note 5 https://www.epa.nsw.gov.au/your-environment/contaminated-land/pfas-investigation-program

#### 5.3.2 Emerging Chemicals

The EPA uses Chemical Control Orders (CCOs) as a primary legislative tool under the EHC Act 1985 to control chemicals of concern and limit their potential impact on the environment. Considerations for chemicals controlled by CCOs, and other potential emerging chemicals, are outlined in **Table 5-2**. In this instance, the potential for an emerging chemical of concern to be present on-site was low and subsequently corresponding sampling / analysis of soil and water was unwarranted.

 Table 5-2
 Emerging or Controlled Chemicals

| Chemicals of Concern (CCO or emerging)                                                                                                             | Decision                                                               |
|----------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------|
| Were aluminium smelter wastes used or stored on site (CCO, 1986)?                                                                                  | No                                                                     |
| Do dioxin contaminated wastes (CCO, 1986) have the potential to impact the site? <sup>1</sup>                                                      | No                                                                     |
| Were organotin products (CCO, 1989) used or stored on site? <sup>2</sup>                                                                           | No                                                                     |
| Were polychlorinated biphenyls (PCBs) used or PCB wastes (CCO, 1997) stored on-site? <sup>3</sup>                                                  | No                                                                     |
| Were scheduled chemical or wastes (CCO, 2004) used or stored <sup>4</sup>                                                                          | Potential for small quantity pesticides to have been used on the land. |
| Are other emerging chemicals suspected? 5                                                                                                          | No                                                                     |
| If Yes to any questions, has site sampling suite been optimised to include specific sampling for other chemicals of concern in soil, air and water | -                                                                      |

Note 1 From burning of certain chemicals, smelting or chemical manufacturing or fire on or near the site.

Note 2 From anti-fouling paints used or removed at boat and ship yards and marinas.

Note 3 From older transformer oils and electrical capacitors

Note 4 Twenty-four mostly organochlorine pesticides and industrial by-products

Note 5 Other chemicals considered as emerging e.g. 1,4 dioxane (associated with some chlorinated VOCs).

# 5.4 Potential Contaminants

The potential contaminants at the site resulting from the site filling and previous site use were considered to be:

- Metals (M) arsenic, cadmium, chromium, copper, lead, mercury, nickel, zinc;
- Total Recoverable Hydrocarbons (TRH);
- Volatile Organic Compounds (VOC);
- Benzene, Toluene, Ethylbenzene and Xylenes (BTEX);
- Polycyclic Aromatic Hydrocarbons (PAH);
- Organochlorine and Organophosphorus Pesticides (OCP/OPP);
- Polychlorinated Biphenyls (PCB); and
- Asbestos.

# 5.5 Potential Contamination in the Context of the Site

An assessment of the potential contamination risks for the site is outlined in Table 5-3.

| qualityPCB and asbestos(see logs, Appendix F).Hazardous buildingBuildingMetals (lead inLow                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                         |              |                       |                                                                                                                                                                                       |

# 5.6 Potential Receptors

The following potential receptors of contamination from the site were identified as:

- Construction and maintenance workers;
- Users of the adjacent land during construction works;
- Future site users; and
- Ecological receptors in areas of exposed soil / landscaping.

#### 5.7 Preliminary Conceptual Site Model

A summary of EI's CSM, identifying the potential contamination sources, exposure pathways and human and environmental receptors is presented in **Table 5-4**.

#### 5.8 Data Gaps

Based on the CSM derived for the site and the qualitative assessment of risks, the degree of any contamination associated with the potential contamination sources identified in **Section 5.3** constitute current investigation data gaps. These data gaps will require further assessment by intrusive investigation to quantify possible risks to further site receptors.

| Potential Sources                                                                                                                                                              | Impacted<br>Media                                | Contaminants of<br>Potential Concern                                                                  | Transport mechanism                                                              | Exposure pathway                                                                                         | Potential receptor                                                                                                                                                                                                           |

|                                                                                                                                                                                |                                                  |                                                                                                       | Potential seepage into deep basement intercepting water table (on and offsite)   | _                                                                                                        |                                                                                                                                                                                                                              |

### Table 5-4 Preliminary Conceptual Site Model

Page | 19

# 6. Methodology

# 6.1 Sampling, Analysis and Quality Plan (SAQP)

The SAQP ensures that the data collected as part of this DSI, and ongoing environmental works carried out at the site are representative, and provide a robust basis for site assessment decisions. This SAQP includes the following:

- Data quality objectives, including a summary of the objectives of the DSI;
- Investigation methodology including media to be sampled, details of analytes and parameters to be monitored, and a description of intended sampling points;
- Sampling methods and procedures;
- Field screening methods;
- Laboratory analysis methods;
- Sample handling, preservation and storage; and
- Analytical QA/QC.

## 6.2 Data Quality Objectives (DQO)

In accordance with the US EPA (2006) *Data Quality Assessment* and the EPA (2017) *Guidelines for the NSW Site Auditor Scheme*, Data Quality Objectives (DQO) were established by the EI team to determine the appropriate level of data quality needed for the specific data requirements of the project. The DQO process that was applied for this assessment is documented in **Table 6-1**.

### Table 6-1 Summary of Project Data Quality Objectives

| DQO Steps                                                                                                                                                                                                      | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Comments (changes during investigation)                                                                                                            |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| 1. State the Problem<br>Summarise the contamination problem that<br>will require new environmental data, and<br>identify the resources available to resolve<br>the problem; develop a conceptual site<br>model | <ul> <li>The site is to be redeveloped into multi-storey, mixed use commercial and residential apartment buildings with six-levels of basement, as outlined in Section 1.2.</li> <li>Historical information and site inspection observations identified the potential for soil and/or groundwater contamination due to various possible sources, as listed in Section 5.2. In light of the available historical information, a conceptual site model has been developed (Table 5-4) for the site.</li> <li>The findings of the investigation must provide supportive information on the environmental conditions of the site to determine the site's suitability for the proposed redevelopment.</li> </ul>                                                                                                                                                                                                                                                                                                 | -                                                                                                                                                  |
| 2. Identify the Goal of the Study (Identify<br>the decisions)<br>Identify the decisions that need to be made<br>on the contamination problem and the new<br>environmental data required to make them           | <ul> <li>Based on the objectives outlined in Section 1.4, the following decisions are identified:</li> <li>Has the site been adequately characterised with sufficient and appropriate sampling coverage (vertical and lateral) to assess for the presence of potential contamination sources?</li> <li>Has the nature, source and extent of any onsite impacts (soil, groundwater, and/or vapour) been defined?</li> <li>What influence do site-specific, geologic conditions have on the fate and transport of any impacts that may be identified?</li> <li>Does the degree of impact coupled with the fate and transport of identified contaminants represent an unacceptable risk to identified human and/or environmental receptors on or offsite?</li> <li>Does the collected data provide sufficient information to allow the selection and design of an appropriate remedial strategy, assuming remedial action is necessary? If not, what are the remaining data gaps requiring closure?</li> </ul> | Given the site area (7,969 m <sup>2</sup> )<br>a minimum of 19 sampling<br>points is required (based on<br>NSW EPA Sampling Design<br>Guidelines). |
| 3. Identify Information Inputs (Identify<br>inputs to decision)<br>Identify the information needed to support<br>any decision and specify which inputs<br>require new environmental measurements               | <ul> <li>Inputs to the decision making process include:</li> <li>Proposed development and land use;</li> <li>Aerial photographs and historical information;</li> <li>Previous investigations;</li> <li>Areas of concern identified during the site inspection, prior to intrusive investigations;</li> <li>National and NSW EPA guidelines endorsed under the NSW Contaminated Land Management Act 1997;</li> <li>Investigation sampling (soils and/or groundwater) and laboratory analysis for potential contaminants to verify the presence of onsite contamination and to evaluate the potential risks to sensitive receptors; and</li> <li>At the end of the investigation, a decision must be made regarding whether the soils and/or groundwater are suitable for the proposed development, or if additional investigation or remedial works are required to make the site suitable for the proposed use.</li> </ul>                                                                                  | -                                                                                                                                                  |

| DQO Steps                                                                                                                                                                                                                                                                   | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Comments (changes during investigation) |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------|
| <b>4. Define the Boundaries of the Study</b><br>Specify the spatial and temporal aspects of<br>the environmental media that the data must<br>represent to support decision                                                                                                  | <ul> <li>Lateral – the investigation will be conducted within the cadastral boundaries of the site (Figure 2).</li> <li>Vertical – Investigations will be advanced to the depth of natural soils or rock.</li> <li>Temporal – Results are valid on the day of data / sample collection and remain valid as long as no changes occur on site or contamination (if present) does not migrate on site or on to the site from off-site sources.</li> </ul>                                                                                                                                                                                                                                                                                                      | -                                       |
| 5. Develop the Analytic Approach<br>(Develop a decision rule)<br>To define the parameter of interest, specify<br>the action level, and integrate previous<br>DQO outputs into a single statement that<br>describes a logical basis for choosing from<br>alternative actions | <ul> <li>The decision rules for the investigation were:</li> <li>If the concentrations of contaminants in the soil and/or groundwater data exceed the adopted criteria; then assess the need to further investigate the extent of impacts onsite.</li> <li>Decision criteria for QA/QC measures are defined by the Data Quality Indicators (DQI) in Table 5-2.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                   | -                                       |
| 6. Specify Performance or Acceptance<br>Criteria (Specify limits on decision<br>errors)<br>Specify the decision-maker's acceptable<br>limits on decision errors, which are used to<br>establish performance goals for limiting<br>uncertainties in the data                 | <ul> <li>Based on the qualitative data gathered via site history review and site walkover observations, a non-<br/>statistical judgemental sampling design was selected for performing soil and groundwater sampling. The<br/>sampling will target identified as areas of environmental concern (AEC) based identified contamination<br/>sources, known contaminants of concern, and professional judgement.</li> </ul>                                                                                                                                                                                                                                                                                                                                     | -                                       |
| 7. Develop the Detailed Plan for<br>Obtaining Data (Optimise the design for<br>obtaining data)<br>Identify the most resource-effective<br>sampling and analysis design for general<br>data that are expected to satisfy the DQOs                                            | <ul> <li>Conduct 19 soil sampling locations, distributed in a triangular grid pattern across the site.</li> <li>One round of groundwater sampling from the constructed four groundwater monitoring wells.</li> <li>An upper soil profile sample will be collected at each location and tested for chemicals of concern, to assess the environmental condition of the fill layer, and for potential impacts from historical, above-ground activities. Further sampling was also performed in deeper soil layers. Samples were selected for analytical testing based on field observations (including visual and olfactory evidence).</li> <li>Representative groundwater samples will be collected and analysed for groundwater characterisation.</li> </ul> | -                                       |

# 6.3 Data Quality Indicators

To ensure that the investigation data collected was of an acceptable quality, the investigation data set was assessed against the data quality indicators (DQI) outlined in **Table 6-2**, which related to both field and laboratory-based procedures. The assessment of data quality is discussed in **Section 7**.

Table 6-2 Data Quality Indicators

| QA/QC Measure                                                                                                                               | Data Quality Indicator                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Precision</b> – A quantitative<br>measure of the variability<br>(or reproducibility) of data                                             | <ul> <li>Data precision would be assessed by reviewing the performance of blind field duplicate sample sets, through calculation of relative percentage differences (RPD). Data precision would be deemed acceptable if RPDs are found to be less than 30%. RPDs that exceed this range may be considered acceptable where:</li> <li>Results are less than 10 times the limits of reporting (LOR).</li> <li>Results are less than 20 times the LOR and the RPD is less than 50%.</li> <li>Heterogeneous materials or volatile compounds are encountered.</li> <li>In cases where RPD values were considered unacceptable, the analytical results of primary and duplicate samples were both reviewed against the adopted assessment criteria. If the review indicates the variations in data between the primary and duplicate samples would result in a different conclusion (e.g. the higher concentration is failing the assessment criteria), the need for re-sampling / validation would be considered.</li> <li>Duplicate samples are to be collected at a rate of 5% (1 duplicate sample per 20 samples collected).</li> </ul> |
| Accuracy – A quantitative<br>measure of the closeness<br>of reported data to the<br>"true" value                                            | <ul> <li>Data accuracy would be assessed through the analysis of:</li> <li>Method blanks, which are analysed for the analytes targeted in the primary samples.</li> <li>Matrix spike and matrix spike duplicate sample sets.</li> <li>Laboratory control samples.</li> <li>Calibration of instruments against known standards.</li> <li>Variation in results reported by the primary and secondary laboratories for primary and duplicate samples.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Representativeness</b> – The<br>confidence (expressed<br>qualitatively) that data are<br>representative of each<br>medium present onsite | <ul> <li>To ensure the data produced by the laboratory is representative of conditions encountered in the field, the laboratory would carry out the following:</li> <li>Collect samples that are representative of the material being sampled and biased to any suspect locations based on physical evidence.</li> <li>Blank samples will be run in parallel with field samples to confirm there are no unacceptable instances of laboratory artefacts.</li> <li>Review of relative percentage differences (RPD) values for field and laboratory duplicates to provide an indication that the samples are generally homogeneous, with no unacceptable instances of significant sample matrix heterogeneities.</li> <li>The appropriateness of collection methodologies, handling, storage and preservation techniques will be assessed to ensure/confirm there was minimal opportunity for sample interference or degradation (i.e. volatile loss during transport due to incorrect preservation / transport methods).</li> <li>Consistency between field vapour screening information and laboratory results.</li> </ul>             |

| QA/QC Measure Data Quality Indicator                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                              |  |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Completeness</b> – A measure of the amount of                                                                                                             | Analytical data sets acquired during the assessment will be evaluated as complete, upon confirmation that:                                                                                                                                                                                                                                                                                                                                   |  |
| useable data from a data collection activity                                                                                                                 | <ul> <li>Standard operating procedures for sampling protocols were adhered to.</li> </ul>                                                                                                                                                                                                                                                                                                                                                    |  |
|                                                                                                                                                              | <ul> <li>Copies of all COC documentation are presented, reviewed and found to be<br/>properly completed.</li> </ul>                                                                                                                                                                                                                                                                                                                          |  |
|                                                                                                                                                              | <ul> <li>It can therefore be considered whether the proportion of "useable data"<br/>generated in the data collection activities is sufficient for the purposes of the<br/>land use assessment.</li> </ul>                                                                                                                                                                                                                                   |  |
| <b>Comparability</b> – The<br>confidence (expressed<br>qualitatively) that data may<br>be considered to be<br>equivalent for each<br>sampling and analytical | Given that a reported data set can comprise several data sets from separate sampling episodes, issues of comparability between data sets are reduced through adherence to standard operation procedure and regulator-endorsed or published guidelines and standards on each data gathering activity. Sampling was conducted by the same sampler where possible to enhance project continuity and minimise variability in sampling technique. |  |
| event                                                                                                                                                        | Sampling under inclement weather conditions were avoided to minimise variability contributed by weather conditions.                                                                                                                                                                                                                                                                                                                          |  |
|                                                                                                                                                              | Samples to be collected using procedures meeting NSW EPA endorsed guidelines.                                                                                                                                                                                                                                                                                                                                                                |  |
|                                                                                                                                                              | In addition the data will be collected by experienced samplers and NATA-<br>accredited laboratory methodologies will be employed in all laboratory testing<br>programs.                                                                                                                                                                                                                                                                      |  |

#### 6.4 Sampling Rationale

With reference to the CSM described in **Section 5.7**, soil and groundwater investigations were planned in accordance with the following rationale:

- Sampling of the widespread fill and underlying natural soils from 19 locations, distributed in a triangular grid pattern across the site;
- Installation of four groundwater monitoring wells in targeted locations and a single groundwater monitoring event (GME) to assess the impacts (if any) to groundwater; and
- Laboratory analysis of representative soil and groundwater samples for the identified potential contaminants.

#### 6.5 Assessment Criteria

The assessment criteria proposed for this project are outlined in **Table 6-3**. These were selected from available published guidelines that are endorsed by national or state regulatory authorities, with due consideration of the exposure scenarios that are expected for various parts of the site, the likely exposure pathways, and the identified potential receptors.

|                        |                                                                   | <ul> <li>0.001% w/w for friable asbestos in soil.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|                        |                                                                   | Ecological Investigation Levels (EILs) / Ecological<br>Screening Levels (ESLs)                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|                        |                                                                   | All soil samples would also be assessed against the NEPM (2013) EILs for urban residential and public open space land us as a conservative approach. EILs / ESLs only apply to the top 2 m (root zone). The derived EIL criteria presented by EI are calculated based on the average results of pH (6.1) and CEC (7.8 meq/100g). The adopted ESL criteria presented by EI are based on fine grained criteria.                                                                                                                      |
|                        |                                                                   | Management Limits for Petroleum Hydrocarbons                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|                        |                                                                   | Should the ESLs and HSLs be exceeded for petroleum hydrocarbons, soil samples would also assessed against the NEPM 2013 <i>Management Limits</i> for the TRH fractions F1 – F4 to assess propensity for phase-separated hydrocarbons (PSH) fire and explosive hazards & adverse effects on buried infrastructure.                                                                                                                                                                                                                  |
|                        |                                                                   | Soil Salinity                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|                        |                                                                   | Soil salinity classes were calculated from the Indicators of Urba Salinity (DLWC).                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Groundwater            | NEPM (2013)<br>GILs for Fresh<br>Waters                           | <b>Groundwater Investigation Levels (GILs) for Fresh Water</b><br>NEPM 2013 provides GILs for typical, slightly-moderately<br>disturbed aquatic ecosystems, which are based on the ANZEC<br>& ARMCANZ 2000 Trigger Values (TVs) for the 95% level of<br>protection of aquatic ecosystems; however, the 99% TVs were<br>applied for the bio-accumulative metals <i>cadmium</i> and <i>mercury</i> .<br>The fresh water criteria were considered relevant as the Cattai<br>Creek was the closest surface water receptor to the site. |
|                        | NEPM (2013)<br>Groundwater HSLs<br>for Vapour Intrusion           | Groundwater Health-Based Screening Levels (HSLs)<br>As a conservative approach, HSL-A&B thresholds for vapour<br>intrusion in sand at low to high density residential sites were<br>applied for groundwater to assess potential human health<br>impacts from residual vapours resulting from petroleum, BTEX,<br>and naphthalene.                                                                                                                                                                                                  |

# 6.6 Soil Investigation

The soil investigation works conducted at the site are described in **Table 6-4**. Test bore locations are illustrated in **Figure 2**.

 Table 6-4
 Summary of Soil Investigation Methodology

| Activity/Item                            | Details                                                                                                                                                                                                                                                                                                                |
|------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Fieldwork                                | Field works were conducted from 8 July to 22 July 2020 and comprised 19 soil sampling locations.                                                                                                                                                                                                                       |
| Investigation Method                     | Test bores BH1 to BH6 were drilled using a solid flight auger drilling rig, while test pits TP7 to TP19 were completed using an excavator.                                                                                                                                                                             |
| Soil Logging                             | Collected soils were classified in the field with respect to lithological characteristics and evaluated on a qualitative basis for odour and visual signs of contamination. Soil classifications and descriptions were based on Australian Standard (AS) 1726-2017. Logs are presented in <b>Appendix F</b> .          |
| Field Observations                       | A summary of field observations compiled during intrusive investigations is provided on the logs in <b>Appendix F</b> . Field observations are summarised in <b>Section 8.1.2</b> .                                                                                                                                    |
| Soil Sampling                            | <ul> <li>Soil samples were collected using a dry grab method (unused, dedicated nitrile<br/>gloves) &amp; placed into laboratory-supplied, acid-washed, solvent-rinsed glass<br/>jars.</li> </ul>                                                                                                                      |
|                                          | <ul> <li>Blind field duplicates were separated from the primary samples and placed into<br/>glass jars.</li> </ul>                                                                                                                                                                                                     |
|                                          | <ul> <li>A small amount of sample was separated from all fill samples and placed into a<br/>zip-lock bag for asbestos analysis.</li> </ul>                                                                                                                                                                             |
|                                          | <ul> <li>A small amount of duplicate was collected from each soil samples and placed<br/>into zip-lock bag for Photo-ionisation Detector (PID) screening.</li> </ul>                                                                                                                                                   |
| Decontamination<br>Procedures            | Nitrile sampling gloves were replaced between each sampling location.<br>Samples were collected from a different part of the solid flight auger and the auger<br>was cleaned from all residual soil waste between each location.                                                                                       |
| Sample Preservation                      | Samples were stored in a chilled chest (with frozen ice packs), whilst on-site and in transit to the laboratory. All samples were submitted and analysed within the required holding period, as documented in laboratory reports discussed in a later section.                                                         |
| Management of Soil<br>Cuttings           | Soil cuttings were used as backfill for completed boreholes and test pits.                                                                                                                                                                                                                                             |
| Quality Control &<br>Laboratory Analysis | A number of soil samples were submitted for analysis of previously-identified chemicals of concern by SGS Laboratories (SGS). QA/QC testing comprised intra-<br>laboratory duplicates ('field duplicates') tested blind by SGS and an inter-laboratory field duplicate tested blind by Envirolab Services (Envirolab). |
|                                          | All samples were transported under strict COC conditions and COC certificates and laboratory sample receipt documentation were provided to EI for confirmation purposes, as discussed in <b>Section 7</b> .                                                                                                            |
| Soil Vapour Screening                    | Screening for potential VOCs in collected soil samples was conducted using a pre-<br>calibrated Photoionisation Detector (PID) with a 10.6 mV ionisation lamp.                                                                                                                                                         |

# 6.7 Groundwater Investigation

The groundwater investigation works conducted at the site are described in **Table 6-5**. Monitoring well locations are illustrated in **Figure 2**.

| Table 6-5 | Summary of | Groundwater | Investigation | Methodology |
|-----------|------------|-------------|---------------|-------------|
|-----------|------------|-------------|---------------|-------------|

| Activity/Item                        | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |  |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| Fieldwork                            | Groundwater monitoring wells were installed on 17, 21 & 22 July 2020.<br>Groundwater sampling for all the monitoring wells was conducted on 29 July 2020.<br>Additional sampling was conducted on 18 August 2020 for BH4M-a (after fulling<br>developing the well).                                                                                                                                                                                                                                                                 |  |
| Well Construction                    | Well construction details are summarised as follows:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |  |
|                                      | <ul> <li>BH3M-a (located hydraulically down-gradient) installed to a total depth of 6.1<br/>mBGL (screened from 3.1-6.1 mBGL).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                           |  |
|                                      | <ul> <li>BH4M-a (located hydraulically up-gradient) installed to a total depth of 7.7<br/>mBGL (screened from 4.7-7.7 mBGL).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                             |  |
|                                      | <ul> <li>BH5M (located hydraulically down-gradient) installed to a total depth of 6.5<br/>mBGL (screened from 2.5-6.5 mBGL).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                             |  |
|                                      | <ul> <li>BH7M (located hydraulically down-gradient) installed to a total depth of 4.9<br/>mBGL (screened from 1.9-4.9 mBGL).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                             |  |
|                                      | Well construction was in general accordance with the standards described in NUDLC (2012) and involved the following:                                                                                                                                                                                                                                                                                                                                                                                                                |  |
|                                      | <ul> <li>50 mm, Class 18 uPVC, threaded, machine-slotted screen and casing;</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                              |  |

|                                      | <ul> <li>Annular, graded sand filter was used to approximately 300 mm above top of<br/>screen interval;</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                  |  |
|                                      | <ul> <li>Granular bentonite was applied above annular filter to seal the screened interval;</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                              |  |
|                                      | <ul> <li>Cuttings backfill just below ground level; and</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |  |
|                                      | Surface completion comprised a PVC stick-up pipe, with plastic cap.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |  |
| Well Development                     | Well development was conducted for each well directly following installation. This involved agitation within the full length of the water column using a dedicated, HDPE, disposable bailer, followed by removal of water and accumulated sediment using a 12V, HDPE submersible bore pump (Proactive Environmental, model Super Twister). Pumping was continued until no further reduction in suspended sediment was observed (i.e. after removal of several well volumes).                                                        |  |
| Well Survey                          | No well survey having been completed at the site. The monitoring well locations were compared to the reduced levels (mAHD) given on the survey plan (see <b>Appendix C</b> ).                                                                                                                                                                                                                                                                                                                                                       |  |
| Well Gauging and<br>Groundwater Flow | Monitoring wells were gauged for standing water level (SWL) prior to sampling at the commencement of the GME on 29 July 2020.                                                                                                                                                                                                                                                                                                                                                                                                       |  |
| Direction                            | Based on the water level measured at each monitoring well ( <b>Table 8-3</b> ), groundwater was inferred to flow south-westerly.                                                                                                                                                                                                                                                                                                                                                                                                    |  |
| Well Purging and Field<br>Testing    | No volatile or organic odours were detected during any stage of well purging or sampling. The measurement of water quality parameters was conducted repeatedly during purging and the details were recorded onto field data sheets, once water quality parameters stabilised. Field measurements for Dissolved Oxygen (DO), Electrical Conductivity (EC) and pH of the purged water were also recorded during well purging. Purged water volumes removed from each well and field test results are summarised in <b>Table 8-3</b> . |  |

| Activity/Item                              | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |  |  |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|--|
| Groundwater sampling                       | Groundwater was sampled using a micro-purge system (with the exception of the additional round of sampling for BH4M-a, which was sampled using a HDPE base for heavy metal testing only). Water was continuously measured for four parameters (Temperature, EC, Redox, DO, pH). Once three consecutive field measurements were recorded for the purged waters to within $\pm$ 10% for DO, $\pm$ 3 for EC, $\pm$ 0.2 for pH, $\pm$ 0.2° for temperature and $\pm$ 20 for redox, this was considered to indicate that representative groundwater quality had been achieve and final physio-chemical measurements were recorded. Groundwater samples were then collected from the micro-purge sampling pump discharge point. |  |  |
| Decontamination<br>Procedure               | <ul> <li>The micro-purge pump is decontaminated in a solution of potable water and Decon 90 and then rinsed with potable water between each location.</li> <li>The micro-purge system employs a disposable bladder and tubing system to further minimise potential cross contamination.</li> <li>All sample containers were supplied by the laboratory and were only opened once, immediately prior to sampling.</li> <li>Ice packs kept in an insulated chest were used to keep the samples cool; and</li> <li>The water level probe and sampling kit were washed in a solution of potable water and Decon 90 and then rinsed with potable water between uses.</li> </ul>                                                |  |  |
| Sample Preservation                        | <ul> <li>Sample containers were supplied by the laboratory with the following preservatives:</li> <li>One, 1 litre amber glass, acid-washed and solvent-rinsed bottle;</li> <li>Two, 40ml glass vials, pre-preserved with dilute hydrochloric acid, Teflon-sealed; and</li> <li>One, 250mL, HDPE bottle, pre-preserved with dilute nitric acid (1 mL).</li> <li>Samples for metals analysis were field-filtered using 0.45 µm pore-size filters. All containers were filled with sample to the brim then capped and stored in ice-filled chests, until completion of the fieldwork and during sample transit to the laboratory.</li> </ul>                                                                                |  |  |
| Sample Transport                           | After sampling, the ice brick filled coolers were transported to SGS Australia Pty Ltd using Chain-of-Custody (COC) procedures. Inter-laboratory duplicate (ILD) samples were forwarded to Envirolab Services Pty Ltd (Envirolab) for QA/QC analysis. A Sample Receipt Advice (SRA) was provided by each laboratory to document sample condition upon receipt. Copies of SRA and COC certificates are presented in <b>Appendix H</b> .                                                                                                                                                                                                                                                                                    |  |  |
| Quality Control and<br>Laboratory Analysis | All groundwater samples were submitted for analysis of previously-identified chemicals of concern by SGS Laboratories (SGS). QA/QC testing comprised intra-<br>laboratory duplicates ('field duplicates') tested blind by SGS and an inter-laboratory field duplicate tested blind by Envirolab Services (Envirolab). All samples were transported under strict Chain-of-Custody (COC) conditions and COC certificates and laboratory sample receipt documentation were provided to EI for confirmation purposes.                                                                                                                                                                                                         |  |  |

# 7. Data Quality Assessment

### 7.1 Quality Control Process

The assessment of data quality is defined as the scientific and statistical evaluation of environmental data to determine if the data meets the objectives for the project (USEPA 2006). Data quality assessment included an evaluation of the compliance of the field sampling, field and laboratory duplicates and laboratory analytical procedures and an assessment of the accuracy and precision of these data from the laboratory quality control measurements. The findings of the data quality assessment in relation to the current investigation at the site are discussed in detail in **Appendix J**.

The QC measures generated from the field sampling and laboratory analytical program are summarised in **Table 7-1**.

| Data Quality     | Control                                                                                                      | Conformance<br>[Yes, Part, No] | Report<br>Sections                                                          |
|------------------|--------------------------------------------------------------------------------------------------------------|--------------------------------|-----------------------------------------------------------------------------|
| Preliminaries    | Data Quality Objectives established                                                                          | Yes                            | See DQO/DQI,<br>Section 6.2,6.3                                             |
| Field work       | Suitable documentation of fieldwork<br>observations including borehole logs,<br>sample register, field notes | Yes                            | See Appendix F & G                                                          |
| Sampling<br>Plan | Use of relevant and appropriate sampling plan (density, type, and location)                                  | Yes                            | See sample rationale,<br>Section 6.4                                        |
|                  | All media sampled and duplicates collected                                                                   | Part                           | See Appendix G and H,<br>BH7M did not have<br>enough water for<br>sampling. |
|                  | Use of approved and appropriate sampling methods (soil, groundwater, air quality)                            | Yes                            | See methodology,<br>Section 6.6 and 6.7                                     |
|                  | Preservation and storage of samples upon collection and during transport to the laboratory                   | Yes                            | See methodology,<br>Section 6.6 and 6.7                                     |
|                  | Appropriate Rinsate, Field and Trip Blanks taken                                                             | Yes                            | See Appendix H                                                              |
|                  | Completed field and analytical laboratory sample COC procedures and documentation                            | Yes                            | See Appendix H                                                              |
| Laboratory       | Sample holding times within acceptable limits                                                                | Yes                            | See laboratory QA,<br>Appendix J.3                                          |
|                  | Use of appropriate analytical procedures and NATA-accredited laboratories                                    | Yes                            | See laboratory report,<br>Appendix I                                        |

Table 7-1 Quality Control Process

| Data Quality | Control                                                                                                                                                                            | Conformance<br>[Yes, Part, No] | Report<br>Sections                   |

|              | Laboratory duplicates                                                                                                                                                              | Yes                            | See laboratory QA,<br>Appendix J.3   |
|              | Matrix spike/matrix spike duplicates (MS/MSDs)                                                                                                                                     | Yes                            | See laboratory QA,<br>Appendix J.3   |
|              | Surrogates (or System Monitoring Compounds)                                                                                                                                        | Yes                            | See laboratory QA,<br>Appendix J.3   |
|              | Analytical results for replicated samples,<br>including field and laboratory duplicates and<br>inter-laboratory duplicates, expressed as<br>Relative Percentage Difference (RPD)   | Yes                            | See laboratory QA,<br>Appendix J.3   |
|              | Checking for the occurrence of apparently<br>unusual or anomalous results, e.g.<br>laboratory results that appear to be<br>inconsistent with field observations or<br>measurements | Yes                            | See Appendices B and F               |
| Reporting    | Report reviewed by senior staff to assess<br>project meets desired quality, EPA<br>guidelines and project outcomes.                                                                | Yes                            | See document control                 |

#### 7.2 Quality Overview

On the basis of the field and analytical data validation procedure employed, the overall quality of the analytical data produced for the site was considered to be of an acceptable standard for interpretive use and preparation of a conceptual site model (CSM).

### 8. Results

#### 8.1 Soil Investigation Results

#### 8.1.1 Subsurface Conditions

The general site lithology encountered during the soil investigations may be described as a layer of anthropogenic filling, overlying residual clay and sandstone bedrock. More detailed description is summarised in **Table 8-1** and the logs from these works are presented in **Appendix F**.

| Table 8-1 | Generalised | Subsurface | Profile | (mBGL) |
|-----------|-------------|------------|---------|--------|
|-----------|-------------|------------|---------|--------|

| Layer    | Description                                                                                                                                                    | Average depth to top and bottom of layer (mBGL) |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------|
|          | Silty CLAY; low plasticity, pale grey to red brown/dark brown, with sandstone, gravels and sand, no odour.                                                     | 0.0-4.0                                         |
| Fill     | Gravelly SAND; fine to medium grained, brown, with gravels, clay, sandstone and foreign materials (brick, metal, concrete, plastic and steel wires), no odour. | 0.0-1.8                                         |
|          | Silty SAND; fine to medium grained, brown, with low plasticity clay and concrete fragments, no odour.                                                          | 0.0-2.0                                         |
| Residual | Silty CLAY; low to medium plasticity, light brown mottled orange, no odour.                                                                                    | 1.0-1.4                                         |
|          | Silty CLAY; medium plasticity, pale grey, with gravels and sand, grading to extremely weathered sandstone, no odour.                                           | 0.6-4.6                                         |
|          | Sandy CLAY; low to medium plasticity, pale grey and orange-brown, grading to extremely weathered sandstone, no odour.                                          | 2.6-5.0+                                        |
| Bedrock  | SANDSTONE; fine to medium grained, pale grey and orange-brown, low to medium strength, slightly to distinctly weathered, no odour.                             | 2.1-3.95+                                       |

+ Termination depth of test pit and borehole.

#### 8.1.2 Field Observations and PID Results

Soil samples were obtained from the test bores and test pits at various depths ranging between 0.1 to 5.0 mBGL. All examined soil samples were evaluated on a qualitative basis for odour and visual signs of contamination (e.g. hydrocarbon odours, oil staining, petrochemical filming, asbestos fragments, ash, charcoal) and the following observations were noted:

- Hydrocarbon odour was noted in fill at test pits: TP12 (from depth at 1.7m) and TP13 (from depth at 1.8m);
- Weak odour was noted in fill and natural soils at BH2 (from depth 1.0m to 2.0m);
- Steel wires were noted in fill at test pits: TP10, TP13 and TP15;
- Concrete footing was noted at the bottom of the test pit at TP 16; and
- VOC concentrations from collected soil samples were low, ranging between 0.3 and 1.6 parts per million (ppm). VOC concentrations were field-screened using a portable Photo-ionisation Detector (PID). The PID results are shown in the logs (Appendix F).

### 8.2 Groundwater Investigation Results

#### 8.2.1 Monitoring Well Construction

A total of four groundwater monitoring wells were installed on the site on 17, 21 &22 July 2020. Well construction details for the installed groundwater monitoring wells are summarised in **Table 8-2**.

| Well ID | Well Depth (mBGL) | Well Stick up (m) | Screen Interval (mBGL) | Lithology Screened |
|---------|-------------------|-------------------|------------------------|--------------------|
| BH3M-a  | 6.1               | +1.0              | 3.1-6.1                | Sandstone          |
| BH4M-a  | 7.7               | +0.96             | 4.7-7.7                | Sandstone          |
| BH5M    | 6.5               | +0.6              | 2.5-6.5                | Sandstone          |
| BH7M    | 4.9               | +1.0              | 1.9-4.9                | Sandstone          |

Table 8-2 Monitoring Well Construction Details

mBGL- Metres Below Ground Level.

#### 8.2.2 Field Observations

A groundwater monitoring event (GME) was conducted on 29 July 2020 for all the monitoring wells installed. In addition, another round of sampling for BH4M-a was conducted on 18 August to confirm the heavy metal results. Field data was recorded before sampling, as presented in **Table 8-3**. Field data sheets are attached in **Appendix G**. Samples were then evaluated on the basis of odour and visual signs of contamination, with the following observations noted:

- Groundwater in monitoring well BH3M-a and BH5M was noted to be light brown, with low to medium turbidity, while in BH4M-a, groundwater was noted to be brown, with medium to high turbidity;
- No sufficient water was in monitoring well BH7M for sampling and field observation;
- No olfactory or visual evidence of contamination was noted in the monitoring wells;
- No sheens were noted within the groundwater of any monitoring well sampled; and
- Additional round of sampling of BH4M-a recorded the groundwater in this well was noted to be light brown, with low to medium turbidity on 18 August 2020.

| Well ID | SWL<br>(mBTOC) | SWL<br>(mBGL) | SWL<br>(mAHD) | DO<br>(mg/L) | Field<br>pH | Field EC<br>(μS/cm) | Temp<br>(°C) | Redox<br>(mV) |
|---------|----------------|---------------|---------------|--------------|-------------|---------------------|--------------|---------------|

### 8.3 Laboratory Analytical Results

#### 8.3.1 Soil Analytical Results

A summary of the laboratory results showing number of tested samples, minimum/maximum analyte concentrations for primary samples and samples found to exceed the SILs, is presented in **Table 8-4**. More detailed tabulations of results showing the tested concentrations for individual samples alongside the adopted soil criteria are presented in **Table T1** in **Appendix B**.

Completed documentation used to track soil sample movements and laboratory receipt (i.e. COC and SRA forms) are copied in **Appendix H** and all laboratory analytical reports for tested soil samples are presented in **Appendix I**.

#### 8.3.2 Soil salinity

Laboratory results indicated that natural soils on site were non-saline. Soils were found to be slightly acidic (pH ranged from 4.6 to 6.1), with the exception of soil sample at BH3M reported pH at 9.4.

#### 8.3.3 Groundwater Analytical Results

Laboratory analytical results for groundwater samples are summarised in **Table 8-5**, which also include the test sample quantities, minimum/maximum analyte concentrations for primary samples and samples found to exceed the GILs. More detailed tabulations of results showing the tested concentrations for individual samples alongside the adopted groundwater criteria are presented in **Table T2** in **Appendix B**.

Completed documentation used to track groundwater sample movements and laboratory receipt (COC and SRA forms) are copied in **Appendix H**. Copies of the laboratory analytical reports are attached in **Appendix I**.

| 3                            | Dibromochloromethane<br>(THM) | <0.5                              | 1.6                               | None                     |
| 3                            | Total VOC                     | <10                               | 48                                | None                     |

Note 1 Reported minimum and maximum concentrations shows results after resampling of BH4M-a.

## 9. Site Characterisation

#### 9.1 Subsurface Conditions

The general site lithology encountered during this investigation can be described as a layer of anthropogenic filling overlying residual clay and sandstone bedrock. The depth of fill soils at the site ranged from 0.6 mBGL in the south-eastern corner at BH1 to 4.0 mBGL in the north-eastern corner at BH4M. The fill soils at the central portion of the site (TP15 and TP18) and south-western corner of the site (BH3M, TP12 and TP13) were also noted to be of moderate depths (ranged between 2.1m and 3.0m BGL).

#### 9.2 Soil Impacts

No visual signs of contamination (e.g. oil staining, petrochemical filming, asbestos fragments) were noted during the soil investigation.

Contaminant concentrations in soils, sampled across the site, were all found to be below the most conservative human health (HIL A / HSL A&B) and ecological criteria.

#### 9.3 Salinity

Laboratory results indicated that natural soils on site were non-saline. Soils were found to be slightly acidic (pH ranged from 4.6 to 6.1), with the exception of soil sample at BH3M reported pH at 9.4.

#### 9.4 Groundwater Impacts

With reference to **Table 8-5** and **Table T2**, concentrations of PAHs, BTEX, TRHs and VOCs were reported below the adopted criteria.

For heavy metals, chromium, copper, lead, nickel and zinc were detected in groundwater at levels above the adopted GILs. However, as the elevation of metal concentrations are common in urban groundwater environments, the detected concentrations are considered to be indicative of background conditions, rather than site specific impacts. In addition, no on-site sources in relation to heavy metals were identified in site soils.

Tested TRH concentrations were below the PQL, with the exception of TRH-F1 fraction was detected in BH4M-a ( $52\mu g/L$ ) and TRH-F2 fraction was detected in BH5M ( $76\mu g/L$ ), which slightly exceeded the laboratory PQL ( $50\mu g/L$  for TRH-F1 and  $60\mu g/L$  for TRH-F2).

For the proposed mixed use, residential and commercial land use, the TRH-F1 and TRH-F2 results can be compared to the HSL-A&B (low to high density residential) and HSL-D (commercial/industrial) criteria. In such a comparison, the TRH-F1 HSL-A&B and HSL-D criteria are 1,000µg/L and 6,000µg/L, and the TRH-F2 HSL-A&B and HSL-D criteria are 1,000µg/L and Not-Limiting, so the results are below these criteria and thus the TRH in groundwater is not considered to pose human health risk to the current land use.

Total VOC concentrations were detected in BH3M-a  $(13\mu g/L)$  and BH4M-a  $(48\mu g/L)$  for Trihalomethanes (THMs). As the detected THMs concentrations were low, it is not considered to pose human health risk at the site.

### 9.5 Review of Conceptual Site Model

Preliminary CSM discussed in **Sections 5.7** generally identified a low to moderate contamination risk on the site, relating to the widespread fill across the site, hazardous materials from demolition of historic structures, historical pesticide use, former onsite storage of material/equipment, former AST and water treatment basins in the north-eastern site corner and central portion of the site. On the basis of investigation findings, the preliminary CSM was considered to appropriately identify contamination sources, migration mechanisms and exposure pathways, as well as potential receptors. Previously known data gaps, as discussed in **Section 5.8** have largely been addressed, with the exception of the following:

- Groundwater quality in monitoring well BH7M is not known due to insufficient water for sampling;
- No well survey having been completed at the site. Based on the limited survey data and depth to water the groundwater appears to be flowing to the south west toward Cattai Creek in a similar direction to the overall topography.

#### 9.6 Preliminary Waste Classification

Preliminary waste classification was conducted during this investigation. This information is for the purpose of development planning and does not constitute a formal waste classification certificate, as required by the *NSW Waste Regulations 2014*. A table with tabulated data can be found in **Appendix B**.

It is recommended that the fill soils on the site classified as General Soil Waste (GSW). The analytical results were below CT1 criteria and depending on the receiving facility might be classified as GSW-recyclable. The results also met the Excavated Natural Material (ENM) criteria but testing is needed for pH, EC and foreign material. The underlying natural soils on the site can be classified as Virgin Excavated Natural Material (VENM).

# 10. Conclusions

The property located at Doran Drive Precinct, 2 Mandala Parade, Castle Hill NSW was the subject of a Detailed Site Investigation, which was conducted in order to assess the nature and degree of on-site contamination associated with current and former uses of the property. Based on the findings of this DSI it was concluded that:

- The site was found to be a rectangular vacant block, secured by construction hoarding and security fencing. It was elevated above the surrounding land, which displayed a moderate downslope towards the southwest. The ground surface was covered by exposed fill materials, with limited vegetation present onsite. No visual evidence of gross contamination, UPSS or UST was observed on the site during the site inspection.
- A review of historical information indicated the site was used as rural residential, agricultural, vacant pastoral and public open space (playing fields) until the late 1980s. Since 2013, significant ground disturbance works (bulk earthworks and material storage) have been completed as a result of the SMNW Project activities. The site was used for a holding and processing yard during that period, which included excavated water treatment basins, material/equipment storage and site sheds. During 2019, the current site configuration was established and cleared of all previous structures. The site surface was significantly filled and raised above the surrounding land.
- The site and surrounding lands were not listed on any of the EPA records reviewed.
- Soil sampling and analysis were conducted at 19 locations across the site.
  - The sub-surface layers observed comprised of fill materials (up to 4.0m depth) overlying natural clay and sandstone bedrock;
  - Laboratory results for all the soil samples collected reported concentrations below the most conservative human health and ecological based SILs;
  - Laboratory results indicated that natural soils on site were non-saline. Soils were found to be slightly acidic (pH ranged from 4.6 to 6.1), with the exception of soil sample at BH3M reported pH at 9.4
- Four groundwater monitoring wells were installed on the site.
  - Standing Water Levels (SWL) were observed between 2.58 and 4.48 mBGL;
  - Groundwater was likely to flow south-westerly towards Cattai Creek;
  - Concentrations of PAHs, BTEX, TRHs and VOCs were reported below the adopted criteria;
  - Concentrations of heavy metals were reported below the adopted freshwater criteria, with the exception of chromium, copper, lead, nickel and zinc. However, the detected concentrations are considered to be indicative of background conditions, rather than site specific impacts.
  - Therefore the identified groundwater concentrations are not considered to present a cause for human health and environmental concern.
- Based on the analytical results, the following preliminary classifications were provided (with reference to the EPA (2014) Waste Classification Guidelines):

- The fill materials on the site were classified as *General Solid Waste (Non-Putrescible)*; and
- The underlying natural soils on the site were classified as *Virgin Excavated Natural Material* (VENM).

Based on the findings of this investigation, EI conclude that the site is suitable for the proposed mixed commercial and residential development provided the recommendations detailed in **Section 11** are implemented.

### 11. Recommendations

In view of the above findings and in accordance with the NEPM 2013 guidelines, it is considered that the site is suitable for the proposed mixed commercial and residential development on completion of the following recommendations:

- Any fill or natural soil materials that are required to be removed from site as surplus materials (including virgin excavated natural materials or VENM) as part of any excavation and foundation works are to be classified for off-site disposal in accordance the EPA (2014) *Waste Classification Guidelines* and *Protection of the Environmental Operations (Waste) Regulations* (2014);
- Any material imported to the site should be validated as suitable for the intended use in accordance with EPA guidelines.

# 12. Statement of Limitations

The findings presented in this report are the result of discrete and specific sampling methodologies used in accordance with best industry practices and standards. Due to the site-specific nature of soil sampling from point locations, it is considered likely that all variations in subsurface conditions across a site cannot be fully defined, no matter how comprehensive the field investigation program.

While normal assessments of data reliability have been made, EI assumes no responsibility or liability for errors in any data obtained from previous assessments conducted on site, regulatory agencies (e.g. Council, EPA), statements from sources outside of EI, or developments resulting from situations outside the scope of works of this project.

Despite all reasonable care and diligence, the ground conditions encountered and concentrations of contaminants measured may not be representative of conditions between the locations sampled and investigated. In addition, site characteristics may change at any time in response to variations in natural conditions, chemical reactions and other events, e.g. groundwater movement and or spillages of contaminating substances. These changes may occur subsequent to El's investigations and assessment.

EI's assessment is necessarily based upon the result of the site investigation and the restricted program of surface and subsurface sampling, screening and chemical testing which was set out in the proposal. Neither EI, nor any other reputable consultant, can provide unqualified warranties nor does EI assume any liability for site conditions not observed or accessible during the time of the investigations.

This report was prepared for the above named client and no responsibility is accepted for use of any part of this report in any other context or for any other purpose or by other third parties. This report does not purport to provide legal advice.

This report and associated documents remain the property of EI subject to payment of all fees due for this assessment. The report shall not be reproduced except in full and with prior written permission by EI.

Indicates values where a single result is found to be less than detection, with the duplicate sample found to be over the detection limit. RPD exceeds 30-50% range referenced from AS4482.1 (2005)

#### NOTE:

All soil results are reported in mg/kg . All water results are reported in  $\mu\text{g/L}.$ 

 $^{\ast}$  - to obtain F1 subtract the sum of BTEX concentrations from the  $C_{6}\text{-}C_{10}$  fraction

\*\* - to obtain F2 subtract naphthalene from the >  $\rm C_{10}\text{-}C_{16}$  fraction

### ABBREVIATIONS AND DESCRIPTIONS FOR ROCK MATERIAL AND DEFECTS

#### CLASSIFICATION AND INFERRED STRATIGRAPHY

Rock is broadly classified and described in Borehole Logs using the preferred method given in AS1726 – 1993, (Amdt1 – 1994 and Amdt2 – 1994), Appendix A. Material properties are assessed in the field by visual/ tactile methods.

The above table represents SGS' interpretation of the client-supplied Chain Of Custody document.

The numbers shown in the table indicate the number of results requested in each package. Please indicate as soon as possible should your request differ from these details .

Testing as per this table shall commence immediately unless the client intervenes with a correction .

The ' $\checkmark$ ' indicates the testing you have requested. THIS IS NOT A REPORT OF THE RESULTS.

### **Additional Info**

Sample storage - Waters are routinely disposed of approximately 1 month and soils approximately 2 months from receipt.

Requests for longer term sample storage must be received in writing.

Please contact the laboratory immediately if observed settled sediment present in water samples is to be included in the extraction and/or analysis (exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, Total Recoverable metals and PFAS analysis where solids are included by default.

TAT for Micro is dependent on incubation. This varies from 3 to 6 days.

- SUBMISSION DETAILS

This is to confirm that 14 samples were received on Friday 17/7/2020. Results are expected to be ready by COB Friday 24/7/2020. Please quote SGS reference SE208846 when making enquiries. Refer below for details relating to sample integrity upon receipt.

- Samples clearly labelled Sample container provider Samples received in correct containers Date documentation received Samples received in good order Sample temperature upon receipt Turnaround time requested
- Yes SGS Yes 17/7/2020 Yes 14°C Standard

Complete documentation received Sample cooling method Sample counts by matrix Type of documentation received Samples received without headspace Sufficient sample for analysis Yes Ice Bricks 14 Soil COC Yes Yes

Unless otherwise instructed, water and bulk samples will be held for one month from date of report, and soil samples will be held for two months.

COMMENTS -

16 soil samples have been placed on hold as no tests have been assigned for them by the client. These samples will not be processed.

The above table represents SGS' interpretation of the client-supplied Chain Of Custody document. The numbers shown in the table indicate the number of results requested in each package. Please indicate as soon as possible should your request differ from these details . Testing as per this table shall commence immediately unless the client intervenes with a correction .

\_ SUBMISSION DETAILS

This is to confirm that 4 samples were received on Thursday 23/7/2020. Results are expected to be ready by COB Thursday 30/7/2020. Please quote SGS reference SE209082 when making enquiries. Refer below for details relating to sample integrity upon receipt.

- Samples clearly labelled Sample container provider Samples received in correct containers Date documentation received Samples received in good order Sample temperature upon receipt Turnaround time requested
- Yes SGS Yes 23/7/2020 Yes 8.1°C Standard

Complete documentation received Sample cooling method Sample counts by matrix Type of documentation received Samples received without headspace Sufficient sample for analysis Yes Ice Bricks 2 Soil COC Yes Yes

Unless otherwise instructed, water and bulk samples will be held for one month from date of report, and soil samples will be held for two months.

COMMENTS -

2 soil samples have been placed on hold as no tests have been assigned for them by the client. These samples will not be processed.

SUBMISSION DETAILS

This is to confirm that 17 samples were received on Tuesday 21/7/2020. Results are expected to be ready by COB Tuesday 28/7/2020. Please quote SGS reference SE208846A when making enquiries. Refer below for details relating to sample integrity upon receipt.

Samples clearly labelled Sample container provider Samples received in correct containers Date documentation received Samples received in good order Sample temperature upon receipt Turnaround time requested Yes SGS Yes 21/7/2020@8:16am Yes 14°C Standard Complete documentation received Sample cooling method Sample counts by matrix Type of documentation received Samples received without headspace Sufficient sample for analysis Yes Ice Bricks 5 Soil COC Yes Yes

Unless otherwise instructed, water and bulk samples will be held for one month from date of report, and soil samples will be held for two months.

The above table represents SGS' interpretation of the client-supplied Chain Of Custody document. The numbers shown in the table indicate the number of results requested in each package. Please indicate as soon as possible should your request differ from these details . Testing as per this table shall commence immediately unless the client intervenes with a correction . source: Sydney.pdf page: 9 SGS Ref. SE209379\_COC

- SUBMISSION DETAILS

This is to confirm that 7 samples were received on Thursday 30/7/2020. Results are expected to be ready by COB Thursday 6/8/2020. Please quote SGS reference SE209379 when making enquiries. Refer below for details relating to sample integrity upon receipt.

- Samples clearly labelled Sample container provider Samples received in correct containers Date documentation received Samples received in good order Sample temperature upon receipt Turnaround time requested
- Yes SGS Yes 30/7/2020 Yes 5.4°C Standard

Complete documentation received Sample cooling method Sample counts by matrix Type of documentation received Samples received without headspace Sufficient sample for analysis Yes Ice Bricks 7 Water COC Yes Yes

Unless otherwise instructed, water and bulk samples will be held for one month from date of report, and soil samples will be held for two months.

COMMENTS -

This document is issued by the Company under its General Conditions of Service accessible at <u>www.sqs.com/en/Terms-and-Conditions.aspx</u>. Attention is drawn to the limitation of liability, indemnification and jurisdiction issues defined therein.

Analysis Underway, details on the following page:

Envirolab Services Pty Ltd ABN 37 112 535 645 12 Ashley St Chatswood NSW 2067 ph 02 9910 6200 fax 02 9910 6201 customerservice@envirolab.com.au www.envirolab.com.au

The '\s' indicates the testing you have requested. THIS IS NOT A REPORT OF THE RESULTS.

## **Additional Info**

Sample storage - Waters are routinely disposed of approximately 1 month and soils approximately 2 months from receipt.

Requests for longer term sample storage must be received in writing.

Please contact the laboratory immediately if observed settled sediment present in water samples is to be included in the extraction and/or analysis (exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, Total Recoverable metals and PFAS analysis where solids are included by default.

TAT for Micro is dependent on incubation. This varies from 3 to 6 days.

Appendix I - Laboratory Analytical Reports

COMMENTS

Accredited for compliance with ISO/IEC 17025 - Testing. NATA accredited laboratory 2562(4354).

No respirable fibres detected in all soil samples using trace analysis technique.

Asbestos analysed by Approved Identifier Yusuf Kuthpudin.

| _ METHOD           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| AN002              | The test is carried out by drying (at either 40°C or 105°C) a known mass of sample in a weighed evaporating basin. After fully dry the sample is re-weighed. Samples such as sludge and sediment having high percentages of moisture will take some time in a drying oven for complete removal of water.                                                                                                                                                                                                                                                                                                                                                |
| AN020              | Unpreserved water sample is filtered through a 0.45µm membrane filter and acidified with nitric acid similar to<br>APHA3030B.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| AN040/AN320        | A portion of sample is digested with nitric acid to decompose organic matter and hydrochloric acid to complete the digestion of metals. The digest is then analysed by ICP OES with metals results reported on the dried sample basis. Based on USEPA method 200.8 and 6010C.                                                                                                                                                                                                                                                                                                                                                                           |
| AN040              | A portion of sample is digested with Nitric acid to decompose organic matter and Hydrochloric acid to complete the digestion of metals and then filtered for analysis by ASS or ICP as per USEPA Method 200.8.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| AN311(Perth)/AN312 | Mercury by Cold Vapour AAS in Waters: Mercury ions are reduced by stannous chloride reagent in acidic solution<br>to elemental mercury. This mercury vapour is purged by nitrogen into a cold cell in an atomic absorption<br>spectrometer or mercury analyser. Quantification is made by comparing absorbances to those of the calibration<br>standards. Reference APHA 3112/3500.                                                                                                                                                                                                                                                                     |
| AN312              | Mercury by Cold Vapour AAS in Soils: After digestion with nitric acid, hydrogen peroxide and hydrochloric acid, mercury ions are reduced by stannous chloride reagent in acidic solution to elemental mercury. This mercury vapour is purged by nitrogen into a cold cell in an atomic absorption spectrometer or mercury analyser. Quantification is made by comparing absorbances to those of the calibration standards. Reference APHA 3112/3500                                                                                                                                                                                                     |
| AN318              | Determination of elements at trace level in waters by ICP-MS technique,, referenced to USEPA 6020B and USEPA 200.8 (5.4).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| AN403              | Total Recoverable Hydrocarbons: Determination of Hydrocarbons by gas chromatography after a solvent extraction. Detection is by flame ionisation detector (FID) that produces an electronic signal in proportion to the combustible matter passing through it. Total Recoverable Hydrocarbons (TRH) are routinely reported as four alkane groupings based on the carbon chain length of the compounds: C6-C9, C10-C14, C15-C28 and C29-C36 and in recognition of the NEPM 1999 (2013), >C10-C16 (F2), >C16-C34 (F3) and >C34-C40 (F4). F2 is reported directly and also corrected by subtracting Naphthalene (from VOC method AN433) where available.   |
| AN403              | Additionally, the volatile C6-C9 fraction may be determined by a purge and trap technique and GC/MS because of the potential for volatiles loss. Total Recoverable Hydrocarbons - Silica (TRH-Si) follows the same method of analysis after silica gel cleanup of the solvent extract. Aliphatic/Aromatic Speciation follows the same method of analysis after fractionation of the solvent extract over silica with differential polarity of the eluent solvents.                                                                                                                                                                                      |
| AN403              | The GC/FID method is not well suited to the analysis of refined high boiling point materials (ie lubricating oils or greases) but is particularly suited for measuring diesel, kerosene and petrol if care to control volatility is taken. This method will detect naturally occurring hydrocarbons, lipids, animal fats, phenols and PAHs if they are present at sufficient levels, dependent on the use of specific cleanup/fractionation techniques. Reference USEPA 3510B, 8015B.                                                                                                                                                                   |
| AN420              | (SVOCs) including OC, OP, PCB, Herbicides, PAH, Phthalates and Speciated Phenols (etc) in soils, sediments<br>and waters are determined by GCMS/ECD technique following appropriate solvent extraction process (Based on<br>USEPA 3500C and 8270D).                                                                                                                                                                                                                                                                                                                                                                                                     |
| AN420              | SVOC Compounds: Semi-Volatile Organic Compounds (SVOCs) including OC, OP, PCB, Herbicides, PAH,<br>Phthalates and Speciated Phenols in soils, sediments and waters are determined by GCMS/ECD technique<br>following appropriate solvent extraction process (Based on USEPA 3500C and 8270D).                                                                                                                                                                                                                                                                                                                                                           |
| AN433              | VOCs and C6-C9 Hydrocarbons by GC-MS P&T: VOC's are volatile organic compounds. The sample is presented to a gas chromatograph via a purge and trap (P&T) concentrator and autosampler and is detected with a Mass Spectrometer (MSD). Solid samples are initially extracted with methanol whilst liquid samples are processed directly. References: USEPA 5030B, 8020A, 8260.                                                                                                                                                                                                                                                                          |
| AN602              | Qualitative identification of chrysotile, amosite and crocidolite in bulk samples by polarised light microscopy (PLM) in conjunction with dispersion staining (DS). AS4964 provides the basis for this document. Unequivocal identification of the asbestos minerals present is made by obtaining sufficient diagnostic `clues`, which provide a reasonable degree of certainty, dispersion staining is a mandatory `clue` for positive identification. If sufficient `clues` are absent, then positive identification of asbestos is not possible. This procedure requires removal of suspect fibres/bundles from the sample which cannot be returned. |
| AN602              | Fibres/material that cannot be unequivocably identified as one of the three asbestos forms, will be reported as unknown mineral fibres (umf) The fibres detected may or may not be asbestos fibres.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| AN602              | AS4964.2004 Method for the Qualitative Identification of Asbestos in Bulk Samples, Section 8.4, Trace Analysis<br>Criteria, Note 4 states:"Depending upon sample condition and fibre type, the detection limit of this technique has<br>been found to lie generally in the range of 1 in 1,000 to 1 in 10,000 parts by weight, equivalent to 1 to 0.1 g/kg."                                                                                                                                                                                                                                                                                            |

| AN602 | The sample can be reported "no asbestos found at the reporting limit of 0.1 g/kg" (<0.01%w/w) where AN602 section 4.5 of this method has been followed, and if-                                                                                                                                |

Not analysed.
 NVL Not validated.
 IS Insufficient sample for analysis.
 LNR Sample listed, but not received.

UOM Unit of Measure. LOR Limit of Reporting. ↑↓ Raised/lowered Limit of Reporting.

Unless it is reported that sampling has been performed by SGS, the samples have been analysed as received. Solid samples expressed on a dry weight basis.

Where "Total" analyte groups are reported (for example, Total PAHs, Total OC Pesticides) the total will be calculated as the sum of the individual analytes, with those analytes that are reported as <LOR being assumed to be zero. The summed (Total) limit of reporting is calculated by summing the individual analyte LORs and dividing by two. For example, where 16 individual analytes are being summed and each has an LOR of 0.1 mg/kg, the "Totals" LOR will be 1.6 / 2 (0.8 mg/kg). Where only 2 analytes are being summed, the "Total" LOR will be the sum of those two LORs.

Some totals may not appear to add up because the total is rounded after adding up the raw values.

If reported, measurement uncertainty follow the ± sign after the analytical result and is expressed as the expanded uncertainty calculated using a coverage factor of 2, providing a level of confidence of approximately 95%, unless stated otherwise in the comments section of this report.

Results reported for samples tested under test methods with codes starting with ARS-SOP, radionuclide or gross radioactivity concentrations are expressed in becquerel (Bq) per unit of mass or volume or per wipe as stated on the report. Becquerel is the SI unit for activity and equals one nuclear transformation per second.

Note that in terms of units of radioactivity:

- a. 1 Bq is equivalent to 27 pCi
- b. 37 MBq is equivalent to 1 mCi

For results reported for samples tested under test methods with codes starting with ARS-SOP, less than (<) values indicate the detection limit for each radionuclide or parameter for the measurement system used. The respective detection limits have been calculated in accordance with ISO 11929.

The QC and MU criteria are subject to internal review according to the SGS QAQC plan and may be provided on request or alternatively can be found here: <u>www.sgs.com.au/en-gb/environment-health-and-safety</u>.

COMMENTS

Accredited for compliance with ISO/IEC 17025 - Testing. NATA accredited laboratory 2562(4354).

No respirable fibres detected in all soil samples using trace analysis technique.

Asbestos analysed by Approved Identifier Yusuf Kuthpudin.

RESULTS -

Fibre Identification in soil

Method AN602

### **METHOD SUMMARY**

| METHOD | METHODOLOGY SUMMARY                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AN602  | Qualitative identification of chrysotile, amosite and crocidolite in bulk samples by polarised light microscopy (PLM) in conjunction with dispersion staining (DS). AS4964 provides the basis for this document. Unequivocal identification of the asbestos minerals present is made by obtaining sufficient diagnostic `clues`, which provide a reasonable degree of certainty, dispersion staining is a mandatory `clue` for positive identification. If sufficient `clues` are absent, then positive identification of asbestos is not possible. This procedure requires removal of suspect fibres/bundles from the sample which cannot be returned. |
| AN602  | Fibres/material that cannot be unequivocably identified as one of the three asbestos forms, will be reported as unknown mineral fibres (umf) The fibres detected may or may not be asbestos fibres.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| AN602  | AS4964.2004 Method for the Qualitative Identification of Asbestos in Bulk Samples , Section 8.4, Trace Analysis<br>Criteria, Note 4 states:"Depending upon sample condition and fibre type, the detection limit of this technique has<br>been found to lie generally in the range of 1 in 1,000 to 1 in 10,000 parts by weight, equivalent to 1 to 0.1 g/kg."                                                                                                                                                                                                                                                                                           |
| AN602  | The sample can be reported "no asbestos found at the reporting limit of 0.1 g/kg" (<0.01%w/w) where AN602 section 4.5 of this method has been followed, and if-                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|        | <ul> <li>(a) no trace asbestos fibres have been detected (i.e. no 'respirable ' fibres):</li> <li>(b) the estimated weight of non-respirable asbestos fibre bundles and/or the estimated weight of asbestos in asbestos-containing materials are found to be less than 0.1g/kg: and</li> <li>(c) these non-respirable asbestos fibre bundles and/or the asbestos containing materials are only visible under stereo-microscope viewing conditions.</li> </ul>                                                                                                                                                                                           |

FOOTNOTES -Amosite Brown Asbestos NA Not Analysed Chrysotile White Asbestos INR --Listed. Not Required Crocidolite Blue Asbestos \* -NATA accreditation does not cover the performance of this service . \*\* Amosite and/or Crocidolite Indicative data, theoretical holding time exceeded. Amphiboles

(In reference to soil samples only) This report does not comply with the analytical reporting recommendations in the Western Australian Department of Health Guidelines for the Assessment and Remediation and Management of Asbestos Contaminated sites in Western Australia - May 2009.

Unless it is reported that sampling has been performed by SGS, the samples have been analysed as received.

Where reported: 'Asbestos Detected': Asbestos detected by polarised light microscopy, including dispersion staining. Where reported: 'No Asbestos Found': No Asbestos Found by polarised light microscopy, including dispersion staining. Where reported: 'UMF Detected': Mineral fibres of unknown type detected by polarised light microscopy, including dispersion staining. Confirmation by another independent analytical technique may be necessary.

Even after disintegration it can be very difficult, or impossible, to detect the presence of asbestos in some asbestos -containing bulk materials using polarised light microscopy. This is due to the low grade or small length or diameter of asbestos fibres present in the material, or to the fact that very fine fibres have been distributed intimately throughout the materials.

The QC and MU criteria are subject to internal review according to the SGS QAQC plan and may be provided on request or alternatively can be found here: <a href="https://www.sgs.com.au/en-gb/environment-health-and-safety">www.sgs.com.au/en-gb/environment-health-and-safety</a>.

### **Analysis Details**

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Blank                              | This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.           |
| Duplicate                          | This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.                                                 |
| Matrix Spike                       | A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist. |
| LCS (Laboratory<br>Control Sample) | This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.                                |
| Surrogate Spike                    | Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.                          |

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

The recommended maximums for analytes in urine are taken from "2018 TLVs and BEIs", as published by ACGIH (where available). Limit provided for Nickel is a precautionary guideline as per Position Paper prepared by AIOH Exposure Standards Committee, 2016.

Guideline limits for Rinse Water Quality reported as per analytical requirements and specifications of AS 4187, Amdt 2 2019, Table 7.2

### Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% – see ELN-P05 QA/QC tables for details; <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals (not SPOCAS); 60-140% for organics/SPOCAS (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Measurement Uncertainty estimates are available for most tests upon request.

Analysis of aqueous samples typically involves the extraction/digestion and/or analysis of the liquid phase only (i.e. NOT any settled sediment phase but inclusive of suspended particles if present), unless stipulated on the Envirolab COC and/or by correspondence. Notable exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, total recoverable metals and PFAS where solids are included by default.

Samples for Microbiological analysis (not Amoeba forms) received outside of the 2-8°C temperature range do not meet the ideal cooling conditions as stated in AS2031-2012.

|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| AN002       | The test is carried out by drying (at either 40°C or 105°C) a known mass of sample in a weighed evaporating basin. After fully dry the sample is re-weighed. Samples such as sludge and sediment having high percentages of moisture will take some time in a drying oven for complete removal of water.                                                                                                                                                                                                                                                                                                                                                               |
| AN040/AN320 | A portion of sample is digested with nitric acid to decompose organic matter and hydrochloric acid to complete the digestion of metals. The digest is then analysed by ICP OES with metals results reported on the dried sample basis. Based on USEPA method 200.8 and 6010C.                                                                                                                                                                                                                                                                                                                                                                                          |
| AN040       | A portion of sample is digested with Nitric acid to decompose organic matter and Hydrochloric acid to complete the digestion of metals and then filtered for analysis by ASS or ICP as per USEPA Method 200.8.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| AN312       | Mercury by Cold Vapour AAS in Soils: After digestion with nitric acid, hydrogen peroxide and hydrochloric acid,<br>mercury ions are reduced by stannous chloride reagent in acidic solution to elemental mercury. This mercury<br>vapour is purged by nitrogen into a cold cell in an atomic absorption spectrometer or mercury analyser.<br>Quantification is made by comparing absorbances to those of the calibration standards. Reference APHA<br>3112/3500                                                                                                                                                                                                        |
| AN403       | Total Recoverable Hydrocarbons: Determination of Hydrocarbons by gas chromatography after a solvent extraction. Detection is by flame ionisation detector (FID) that produces an electronic signal in proportion to the combustible matter passing through it. Total Recoverable Hydrocarbons (TRH) are routinely reported as four alkane groupings based on the carbon chain length of the compounds: C6-C9, C10-C14, C15-C28 and C29-C36 and in recognition of the NEPM 1999 (2013), >C10-C16 (F2), >C16-C34 (F3) and >C34-C40 (F4). F2 is reported directly and also corrected by subtracting Naphthalene (from VOC method AN433) where available.                  |
| AN403       | Additionally, the volatile C6-C9 fraction may be determined by a purge and trap technique and GC/MS because of the potential for volatiles loss. Total Recoverable Hydrocarbons - Silica (TRH-Si) follows the same method of analysis after silica gel cleanup of the solvent extract. Aliphatic/Aromatic Speciation follows the same method of analysis after fractionation of the solvent extract over silica with differential polarity of the eluent solvents.                                                                                                                                                                                                     |
| AN403       | The GC/FID method is not well suited to the analysis of refined high boiling point materials (ie lubricating oils or greases) but is particularly suited for measuring diesel, kerosene and petrol if care to control volatility is taken. This method will detect naturally occurring hydrocarbons, lipids, animal fats, phenols and PAHs if they are present at sufficient levels, dependent on the use of specific cleanup/fractionation techniques. Reference USEPA 3510B, 8015B.                                                                                                                                                                                  |
| AN420       | (SVOCs) including OC, OP, PCB, Herbicides, PAH, Phthalates and Speciated Phenols (etc) in soils, sediments<br>and waters are determined by GCMS/ECD technique following appropriate solvent extraction process (Based on<br>USEPA 3500C and 8270D).                                                                                                                                                                                                                                                                                                                                                                                                                    |
| AN420       | SVOC Compounds: Semi-Volatile Organic Compounds (SVOCs) including OC, OP, PCB, Herbicides, PAH, Phthalates and Speciated Phenols in soils, sediments and waters are determined by GCMS/ECD technique following appropriate solvent extraction process (Based on USEPA 3500C and 8270D).                                                                                                                                                                                                                                                                                                                                                                                |
| AN433       | VOCs and C6-C9 Hydrocarbons by GC-MS P&T: VOC`s are volatile organic compounds. The sample is presented to a gas chromatograph via a purge and trap (P&T) concentrator and autosampler and is detected with a Mass Spectrometer (MSD). Solid samples are initially extracted with methanol whilst liquid samples are processed directly. References: USEPA 5030B, 8020A, 8260.                                                                                                                                                                                                                                                                                         |
| AN602       | Qualitative identification of chrysotile, amosite and crocidolite in bulk samples by polarised light microscopy (PLM)<br>in conjunction with dispersion staining (DS). AS4964 provides the basis for this document. Unequivocal<br>identification of the asbestos minerals present is made by obtaining sufficient diagnostic `clues`, which provide a<br>reasonable degree of certainty, dispersion staining is a mandatory `clue` for positive identification. If sufficient<br>`clues` are absent, then positive identification of asbestos is not possible. This procedure requires removal of<br>suspect fibres/bundles from the sample which cannot be returned. |
| AN602       | Fibres/material that cannot be unequivocably identified as one of the three asbestos forms, will be reported as unknown mineral fibres (umf) The fibres detected may or may not be asbestos fibres.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| AN602       | AS4964.2004 Method for the Qualitative Identification of Asbestos in Bulk Samples, Section 8.4, Trace Analysis<br>Criteria, Note 4 states:"Depending upon sample condition and fibre type, the detection limit of this technique has<br>been found to lie generally in the range of 1 in 1,000 to 1 in 10,000 parts by weight, equivalent to 1 to 0.1 g/kg."                                                                                                                                                                                                                                                                                                           |
| AN602       | The sample can be reported "no asbestos found at the reporting limit of 0.1 g/kg" (<0.01%w/w) where AN602 section 4.5 of this method has been followed, and if-                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|             | <ul> <li>(a) no trace asbestos fibres have been detected (i.e. no 'respirable' fibres):</li> <li>(b) the estimated weight of non-respirable asbestos fibre bundles and/or the estimated weight of asbestos in asbestos-containing materials are found to be less than 0.1g/kg: and</li> <li>(c) these non-respirable asbestos fibre bundles and/or the asbestos containing materials are only visible under stereo-microscope viewing conditions.</li> </ul>                                                                                                                                                                                                           |

#### FOOTNOTES

NATA accreditation does not cover the performance of this service. \*\*

Indicative data, theoretical holding time exceeded

Not analysed. NVL Not validated. IS I NR

Insufficient sample for analysis. Sample listed, but not received. UOM LOR î↓

Unit of Measure. Limit of Reporting. Raised/lowered Limit of Reporting.

Unless it is reported that sampling has been performed by SGS, the samples have been analysed as received. Solid samples expressed on a dry weight basis.

Where "Total" analyte groups are reported (for example, Total PAHs, Total OC Pesticides) the total will be calculated as the sum of the individual analytes, with those analytes that are reported as <LOR being assumed to be zero. The summed (Total) limit of reporting is calculated by summing the individual analyte LORs and dividing by two. For example, where 16 individual analytes are being summed and each has an LOR of 0.1 mg/kg, the "Totals" LOR will be 1.6 / 2 (0.8 mg/kg). Where only 2 analytes are being summed, the "Total" LOR will be the sum of those two LORs.

Some totals may not appear to add up because the total is rounded after adding up the raw values.

If reported, measurement uncertainty follow the ± sign after the analytical result and is expressed as the expanded uncertainty calculated using a coverage factor of 2, providing a level of confidence of approximately 95%, unless stated otherwise in the comments section of this report.

Results reported for samples tested under test methods with codes starting with ARS-SOP, radionuclide or gross radioactivity concentrations are expressed in becquerel (Bq) per unit of mass or volume or per wipe as stated on the report. Becquerel is the SI unit for activity and equals one nuclear transformation per second.

Note that in terms of units of radioactivity:

- a. 1 Bq is equivalent to 27 pCi
- b. 37 MBq is equivalent to 1 mCi

For results reported for samples tested under test methods with codes starting with ARS-SOP, less than (<) values indicate the detection limit for each radionuclide or parameter for the measurement system used. The respective detection limits have been calculated in accordance with ISO 11929.

The QC and MU criteria are subject to internal review according to the SGS QAQC plan and may be provided on request or alternatively can be found here: www.sqs.com.au/en-gb/environment-health-and-safety

Unequivocal<br>identification of the asbestos minerals present is made by obtaining sufficient diagnostic `clues`, which provide a<br>reasonable degree of certainty, dispersion staining is a mandatory `clue` for positive identification. If sufficient<br>`clues` are absent, then positive identification of asbestos is not possible. This procedure requires removal of<br>suspect fibres/bundles from the sample which cannot be returned. |
| AN602  | Fibres/material that cannot be unequivocably identified as one of the three asbestos forms, will be reported as unknown mineral fibres (umf) The fibres detected may or may not be asbestos fibres.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| AN602  | AS4964.2004 Method for the Qualitative Identification of Asbestos in Bulk Samples , Section 8.4, Trace Analysis<br>Criteria, Note 4 states:"Depending upon sample condition and fibre type, the detection limit of this technique has<br>been found to lie generally in the range of 1 in 1,000 to 1 in 10,000 parts by weight, equivalent to 1 to 0.1 g/kg."                                                                                                                                                                                                                                                                                                          |
| AN602  | The sample can be reported "no asbestos found at the reporting limit of 0.1 g/kg"(<0.01%w/w)where AN602 section 4.5 of this method has been followed, and if-                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|        | <ul> <li>(a) no trace asbestos fibres have been detected (i.e. no 'respirable ' fibres):</li> <li>(b) the estimated weight of non-respirable asbestos fibre bundles and/or the estimated weight of asbestos in asbestos-containing materials are found to be less than 0.1g/kg: and</li> <li>(c) these non-respirable asbestos fibre bundles and/or the asbestos containing materials are only visible under stereo-microscope viewing conditions.</li> </ul>                                                                                                                                                                                                          |

(In reference to soil samples only) This report does not comply with the analytical reporting recommendations in the Western Australian Department of Health Guidelines for the Assessment and Remediation and Management of Asbestos Contaminated sites in Western Australia - May 2009.

Unless it is reported that sampling has been performed by SGS, the samples have been analysed as received.

Where reported: 'Asbestos Detected': Asbestos detected by polarised light microscopy, including dispersion staining. Where reported: 'No Asbestos Found': No Asbestos Found by polarised light microscopy, including dispersion staining. Where reported: 'UMF Detected': Mineral fibres of unknown type detected by polarised light microscopy, including dispersion staining. Confirmation by another independent analytical technique may be necessary.

Even after disintegration it can be very difficult, or impossible, to detect the presence of asbestos in some asbestos -containing bulk materials using polarised light microscopy. This is due to the low grade or small length or diameter of asbestos fibres present in the material, or to the fact that very fine fibres have been distributed intimately throughout the materials.

The QC and MU criteria are subject to internal review according to the SGS QAQC plan and may be provided on request or alternatively can be found here: <u>www.sgs.com.au/en-gb/environment-health-and-safety</u>.

| - METHOD    | METHODOLOGY SUMMARY                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| AN002       | The test is carried out by drying (at either 40°C or 105°C) a known mass of sample in a weighed evaporating<br>basin. After fully dry the sample is re-weighed. Samples such as sludge and sediment having high percentages of<br>moisture will take some time in a drying oven for complete removal of water.                                                                                                                                                                                                                                                                                                                                                         |
| AN040/AN320 | A portion of sample is digested with nitric acid to decompose organic matter and hydrochloric acid to complete the digestion of metals. The digest is then analysed by ICP OES with metals results reported on the dried sample basis. Based on USEPA method 200.8 and 6010C.                                                                                                                                                                                                                                                                                                                                                                                          |
| AN040       | A portion of sample is digested with Nitric acid to decompose organic matter and Hydrochloric acid to complete the digestion of metals and then filtered for analysis by ASS or ICP as per USEPA Method 200.8.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| AN312       | Mercury by Cold Vapour AAS in Soils: After digestion with nitric acid, hydrogen peroxide and hydrochloric acid,<br>mercury ions are reduced by stannous chloride reagent in acidic solution to elemental mercury. This mercury<br>vapour is purged by nitrogen into a cold cell in an atomic absorption spectrometer or mercury analyser.<br>Quantification is made by comparing absorbances to those of the calibration standards. Reference APHA<br>3112/3500                                                                                                                                                                                                        |
| AN403       | Total Recoverable Hydrocarbons: Determination of Hydrocarbons by gas chromatography after a solvent extraction. Detection is by flame ionisation detector (FID) that produces an electronic signal in proportion to the combustible matter passing through it. Total Recoverable Hydrocarbons (TRH) are routinely reported as four alkane groupings based on the carbon chain length of the compounds: C6-C9, C10-C14, C15-C28 and C29-C36 and in recognition of the NEPM 1999 (2013), >C10-C16 (F2), >C16-C34 (F3) and >C34-C40 (F4). F2 is reported directly and also corrected by subtracting Naphthalene (from VOC method AN433) where available.                  |
| AN403       | Additionally, the volatile C6-C9 fraction may be determined by a purge and trap technique and GC/MS because of the potential for volatiles loss. Total Recoverable Hydrocarbons - Silica (TRH-Si) follows the same method of analysis after silica gel cleanup of the solvent extract. Aliphatic/Aromatic Speciation follows the same method of analysis after fractionation of the solvent extract over silica with differential polarity of the eluent solvents.                                                                                                                                                                                                     |
| AN403       | The GC/FID method is not well suited to the analysis of refined high boiling point materials (ie lubricating oils or greases) but is particularly suited for measuring diesel, kerosene and petrol if care to control volatility is taken. This method will detect naturally occurring hydrocarbons, lipids, animal fats, phenols and PAHs if they are present at sufficient levels, dependent on the use of specific cleanup/fractionation techniques. Reference USEPA 3510B, 8015B.                                                                                                                                                                                  |
| AN420       | (SVOCs) including OC, OP, PCB, Herbicides, PAH, Phthalates and Speciated Phenols (etc) in soils, sediments and waters are determined by GCMS/ECD technique following appropriate solvent extraction process (Based on USEPA 3500C and 8270D).                                                                                                                                                                                                                                                                                                                                                                                                                          |
| AN420       | SVOC Compounds: Semi-Volatile Organic Compounds (SVOCs) including OC, OP, PCB, Herbicides, PAH, Phthalates and Speciated Phenols in soils, sediments and waters are determined by GCMS/ECD technique following appropriate solvent extraction process (Based on USEPA 3500C and 8270D).                                                                                                                                                                                                                                                                                                                                                                                |
| AN433       | VOCs and C6-C9 Hydrocarbons by GC-MS P&T: VOC's are volatile organic compounds. The sample is presented to a gas chromatograph via a purge and trap (P&T) concentrator and autosampler and is detected with a Mass Spectrometer (MSD). Solid samples are initially extracted with methanol whilst liquid samples are processed directly. References: USEPA 5030B, 8020A, 8260.                                                                                                                                                                                                                                                                                         |
| AN602       | Qualitative identification of chrysotile, amosite and crocidolite in bulk samples by polarised light microscopy (PLM)<br>in conjunction with dispersion staining (DS). AS4964 provides the basis for this document. Unequivocal<br>identification of the asbestos minerals present is made by obtaining sufficient diagnostic `clues`, which provide a<br>reasonable degree of certainty, dispersion staining is a mandatory `clue` for positive identification. If sufficient<br>`clues` are absent, then positive identification of asbestos is not possible. This procedure requires removal of<br>suspect fibres/bundles from the sample which cannot be returned. |
| AN602       | Fibres/material that cannot be unequivocably identified as one of the three asbestos forms, will be reported as unknown mineral fibres (umf) The fibres detected may or may not be asbestos fibres.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| AN602       | AS4964.2004 Method for the Qualitative Identification of Asbestos in Bulk Samples, Section 8.4, Trace Analysis<br>Criteria, Note 4 states:"Depending upon sample condition and fibre type, the detection limit of this technique has<br>been found to lie generally in the range of 1 in 1,000 to 1 in 10,000 parts by weight, equivalent to 1 to 0.1 g/kg."                                                                                                                                                                                                                                                                                                           |
| AN602       | The sample can be reported "no asbestos found at the reporting limit of 0.1 g/kg" (<0.01%w/w) where AN602 section 4.5 of this method has been followed, and if-                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|             | <ul> <li>(a) no trace asbestos fibres have been detected (i.e. no 'respirable' fibres):</li> <li>(b) the estimated weight of non-respirable asbestos fibre bundles and/or the estimated weight of asbestos in asbestos-containing materials are found to be less than 0.1g/kg: and</li> <li>(c) these non-respirable asbestos fibre bundles and/or the asbestos containing materials are only visible under stereo-microscope viewing conditions.</li> </ul>                                                                                                                                                                                                           |

#### FOOTNOTES

\* NATA accreditation does not cover the performance of this service. \*\*

Indicative data, theoretical holding time exceeded.

Not analysed. NVL Not validated. IS LNR

Insufficient sample for analysis. Sample listed, but not received. UOM LOR î↓

Unit of Measure. Limit of Reporting. Raised/lowered Limit of Reporting.

Unless it is reported that sampling has been performed by SGS, the samples have been analysed as received. Solid samples expressed on a dry weight basis.

Where "Total" analyte groups are reported (for example, Total PAHs, Total OC Pesticides) the total will be calculated as the sum of the individual analytes, with those analytes that are reported as <LOR being assumed to be zero. The summed (Total) limit of reporting is calculated by summing the individual analyte LORs and dividing by two. For example, where 16 individual analytes are being summed and each has an LOR of 0.1 mg/kg, the "Totals" LOR will be 1.6 / 2 (0.8 mg/kg). Where only 2 analytes are being summed, the "Total" LOR will be the sum of those two LORs.

Some totals may not appear to add up because the total is rounded after adding up the raw values.

If reported, measurement uncertainty follow the ± sign after the analytical result and is expressed as the expanded uncertainty calculated using a coverage factor of 2, providing a level of confidence of approximately 95%, unless stated otherwise in the comments section of this report.

Results reported for samples tested under test methods with codes starting with ARS-SOP, radionuclide or gross radioactivity concentrations are expressed in becquerel (Bq) per unit of mass or volume or per wipe as stated on the report. Becquerel is the SI unit for activity and equals one nuclear transformation per second.

Note that in terms of units of radioactivity:

- a. 1 Bq is equivalent to 27 pCi
- b. 37 MBq is equivalent to 1 mCi

For results reported for samples tested under test methods with codes starting with ARS-SOP, less than (<) values indicate the detection limit for each radionuclide or parameter for the measurement system used. The respective detection limits have been calculated in accordance with ISO 11929

The QC and MU criteria are subject to internal review according to the SGS QAQC plan and may be provided on request or alternatively can be found here: www.sgs.com.au/en-gb/environment-health-and-safety.

## **METHOD SUMMARY**

| METHOD | METHODOLOGY SUMMARY                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AN602  | Qualitative identification of chrysotile, amosite and crocidolite in bulk samples by polarised light microscopy (PLM) in conjunction with dispersion staining (DS). AS4964 provides the basis for this document. Unequivocal identification of the asbestos minerals present is made by obtaining sufficient diagnostic `clues`, which provide a reasonable degree of certainty, dispersion staining is a mandatory `clue` for positive identification. If sufficient `clues` are absent, then positive identification of asbestos is not possible. This procedure requires removal of suspect fibres/bundles from the sample which cannot be returned. |
| AN602  | Fibres/material that cannot be unequivocably identified as one of the three asbestos forms, will be reported as unknown mineral fibres (umf) The fibres detected may or may not be asbestos fibres.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| AN602  | AS4964.2004 Method for the Qualitative Identification of Asbestos in Bulk Samples , Section 8.4, Trace Analysis<br>Criteria, Note 4 states:"Depending upon sample condition and fibre type, the detection limit of this technique has<br>been found to lie generally in the range of 1 in 1,000 to 1 in 10,000 parts by weight, equivalent to 1 to 0.1 g/kg."                                                                                                                                                                                                                                                                                           |
| AN602  | The sample can be reported "no asbestos found at the reporting limit of 0.1 g/kg" (<0.01%w/w) where AN602 section 4.5 of this method has been followed, and if-                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|        | <ul> <li>(a) no trace asbestos fibres have been detected (i.e. no 'respirable ' fibres):</li> <li>(b) the estimated weight of non-respirable asbestos fibre bundles and/or the estimated weight of asbestos in asbestos-containing materials are found to be less than 0.1g/kg: and</li> <li>(c) these non-respirable asbestos fibre bundles and/or the asbestos containing materials are only visible under stereo-microscope viewing conditions.</li> </ul>                                                                                                                                                                                           |

FOOTNOTES -Amosite Brown Asbestos NA Not Analysed Chrysotile White Asbestos INR --Listed. Not Required Crocidolite Blue Asbestos \* -NATA accreditation does not cover the performance of this service . \*\* Amosite and/or Crocidolite Indicative data, theoretical holding time exceeded. Amphiboles

(In reference to soil samples only) This report does not comply with the analytical reporting recommendations in the Western Australian Department of Health Guidelines for the Assessment and Remediation and Management of Asbestos Contaminated sites in Western Australia - May 2009.

Unless it is reported that sampling has been performed by SGS, the samples have been analysed as received.

Where reported: 'Asbestos Detected': Asbestos detected by polarised light microscopy, including dispersion staining. Where reported: 'No Asbestos Found': No Asbestos Found by polarised light microscopy, including dispersion staining. Where reported: 'UMF Detected': Mineral fibres of unknown type detected by polarised light microscopy, including dispersion staining. Confirmation by another independent analytical technique may be necessary.

Even after disintegration it can be very difficult, or impossible, to detect the presence of asbestos in some asbestos -containing bulk materials using polarised light microscopy. This is due to the low grade or small length or diameter of asbestos fibres present in the material, or to the fact that very fine fibres have been distributed intimately throughout the materials.

The QC and MU criteria are subject to internal review according to the SGS QAQC plan and may be provided on request or alternatively can be found here: <u>www.sgs.com.au/en-gb/environment-health-and-safety</u>.

|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AN002/AN135 | Alkalinity (and forms of) by Titration: The sample is extracted 1to 5 in deionised water and the extract titrated with standard acid to pH 8.3 (P titre) and pH 4.5 (T titre) and permanent and/or total alkalinity calculated. The results are expressed as equivalents of calcium carbonate or recalculated as bicarbonate, carbonate and hydroxide. Reference APHA 2320. Internal Reference AN135                                                                                                                                                                                        |
| AN002       | The test is carried out by drying (at either 40°C or 105°C) a known mass of sample in a weighed evaporating basin. After fully dry the sample is re-weighed. Samples such as sludge and sediment having high percentages of moisture will take some time in a drying oven for complete removal of water.                                                                                                                                                                                                                                                                                    |
| AN040/AN320 | A portion of sample is digested with nitric acid to decompose organic matter and hydrochloric acid to complete the digestion of metals. The digest is then analysed by ICP OES with metals results reported on the dried sample basis. Based on USEPA method 200.8 and 6010C.                                                                                                                                                                                                                                                                                                               |
| AN040       | A portion of sample is digested with Nitric acid to decompose organic matter and Hydrochloric acid to complete the digestion of metals and then filtered for analysis by ASS or ICP as per USEPA Method 200.8.                                                                                                                                                                                                                                                                                                                                                                              |
| AN051       | A small sample of soil is kneaded with water and then pressed out into a ribbon. The behaviour of this ribbon is used to classify the soil into one of the texture classes in AS 4419.                                                                                                                                                                                                                                                                                                                                                                                                      |
| AN101       | pH in Soil Sludge Sediment and Water: pH is measured electrometrically using a combination electrode and is calibrated against 3 buffers purchased commercially. For soils, sediments and sludges, an extract with water (or 0.01M CaCl2) is made at a ratio of 1:5 and the pH determined and reported on the extract. Reference APHA 4500-H+.                                                                                                                                                                                                                                              |
| AN106       | Conductivity and TDS by Calculation: Conductivity is measured by meter with temperature compensation and is calibrated against a standard solution of potassium chloride. Conductivity is generally reported as $\mu$ mhos/cm or $\mu$ S/cm @ 25°C. For soils, an extract of as received sample with water is made at a ratio of 1:5 and the EC determined and reported on the extract, or calculated back to the as-received sample. Salinity can be estimated from conductivity using a conversion factor, which for natural waters, is in the range 0.55 to 0.75. Reference APHA 2510 B. |
| AN122       | Exchangeable Cations, CEC and ESP: Soil sample is extracted in 1M Ammonium Acetate at pH=7 (or 1M Ammonium Chloride at pH=7) with cations (Na, K, Ca & Mg) then determined by ICP OES/ICP MS and reported as Exchangeable Cations. For saline soils, these results can be corrected for water soluble cations and reported as Exchangeable cations in meq/100g or soil can be pre-treated (aqueous ethanol/aqueous glycerol) prior to extraction. Cation Exchange Capacity (CEC) is the sum of the exchangeable cations in meq/100g.                                                        |
| AN122       | The Exchangeable Sodium Percentage (ESP) is calculated as the exchangeable sodium divided by the CEC (all in meq/100g) times 100. ESP can be used to categorise the sodicity of the soil as below :                                                                                                                                                                                                                                                                                                                                                                                         |
|             | ESP < 6%non-sodicESP 6-15%sodicESP >15%strongly sodic                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|             | Method is referenced to Rayment and Lyons, 2011, sections 15D3 and 15N1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| AN245       | Anions by Ion Chromatography: A water sample is injected into an eluent stream that passes through the ion chromatographic system where the anions of interest ie Br, CI, NO2, NO3 and SO4 are separated on their relative affinities for the active sites on the column packing material. Changes to the conductivity and the UV-visible absorbance of the eluent enable identification and quantitation of the anions based on their retention time and peak height or area. APHA 4110 B                                                                                                  |

#### FOOTNOTES

\* NATA accreditation does not cover the performance of this service. \*\*

Indicative data, theoretical holding time exceeded.

Not analysed. NVL Not validated. IS LNR

Insufficient sample for analysis. Sample listed, but not received. UOM Unit of Measure. LOR î↓

Limit of Reporting. Raised/lowered Limit of Reporting.

Unless it is reported that sampling has been performed by SGS, the samples have been analysed as received. Solid samples expressed on a dry weight basis.

Where "Total" analyte groups are reported (for example, Total PAHs, Total OC Pesticides) the total will be calculated as the sum of the individual analytes, with those analytes that are reported as <LOR being assumed to be zero. The summed (Total) limit of reporting is calculated by summing the individual analyte LORs and dividing by two. For example, where 16 individual analytes are being summed and each has an LOR of 0.1 mg/kg, the "Totals" LOR will be 1.6 / 2 (0.8 mg/kg). Where only 2 analytes are being summed, the "Total" LOR will be the sum of those two LORs.

Some totals may not appear to add up because the total is rounded after adding up the raw values.

If reported, measurement uncertainty follow the ± sign after the analytical result and is expressed as the expanded uncertainty calculated using a coverage factor of 2, providing a level of confidence of approximately 95%, unless stated otherwise in the comments section of this report.

Results reported for samples tested under test methods with codes starting with ARS-SOP, radionuclide or gross radioactivity concentrations are expressed in becquerel (Bq) per unit of mass or volume or per wipe as stated on the report. Becquerel is the SI unit for activity and equals one nuclear transformation per second.

Note that in terms of units of radioactivity:

- a. 1 Bq is equivalent to 27 pCi
- b. 37 MBq is equivalent to 1 mCi

For results reported for samples tested under test methods with codes starting with ARS-SOP, less than (<) values indicate the detection limit for each radionuclide or parameter for the measurement system used. The respective detection limits have been calculated in accordance with ISO 11929

The QC and MU criteria are subject to internal review according to the SGS QAQC plan and may be provided on request or alternatively can be found here: www.sgs.com.au/en-gb/environment-health-and-safety.
