Executive Summary

YPI2B Ownership Trust No 6 ('the client') engaged EI Australia to conduct a Detailed Site Investigation (DSI) for the property located at 6-8 Woodburn Street, Redfern NSW ('the site').

During completion of this investigation, the site was occupied by a three-storey brick rendered building with a parking level which has been excavated along the western site boundary. Hardstand surfaces were present across the majority of the site.

This DSI was conducted to appraise the site's environmental condition in support of a development application to City of Sydney Council. The proposed development will include a mixed commercial and residential building overlying a single level basement car park.

Objectives

The objectives of this investigation were to:

- Evaluate the potential for site contamination on the basis of historical land uses, anecdotal and documentary evidence of possible pollutant sources; and
- To investigate the degree of any potential contamination by means of intrusive sampling and laboratory analysis, for relevant contaminants of potential concern (COPCs).

Findings

- The site has been predominantly used for commercial purposes since at least 1929. Building demolitions were not evident and building structures remained unchanged from 1930s. Historical site uses between 1950 and 1991 included a variety of manufacturing and sales of cardboard box, cartons, tailors, clothing, handbags.
- Surrounding lands also appeared to be fully developed from the 1930s and building structures and uses has generally remained commercial. A number of manufacturing activities existed surrounding the site between 1950 and 1991. Also, potential contaminating activities within the surrounding lands that were hydraulically upgradient consisted of dry cleaners, motor garage, battery and acid manufactures and a service station.
- The site slopes down towards the west. A retaining wall was observed along the central portion of the site, being the eastern end of the retaining wall filled to a level of approximately reduced level (RL) 20.4 metres Australian Height Datum (mAHD). On the western side of the wall a RL17.4 mAHD was recorded.
- The site walkover outlined the following:
 - › No fragments of potential asbestos containing material (ACM) were observed at the surface across the site.
 - › Potential lead based paints were observed on external walls paint.
 - › No unusual odours were noted.
 - › No underground storage tanks (UST) or aboveground storage tanks (AST) were present.
- The site lithology was generalised as a layer of gravelly sand/sand and silty clay fill to maximum depth of 1.0 metres below ground level (mBGL), overlying residual silty clay (down to 9.3 mBGL). Shale and sandstone were also encountered at depths from 2.9 mBGL.

- Based on results from this investigation, soils were not impacted by any of the COPCs. For all tested samples, soil concentrations did not exceed the human-health and ecological criteria. Asbestos fragments were not detected.
- Groundwater depth at the south-eastern corner of the site (BH2M) was recorded at 3.94 mBGL (RL 16.46 mAHD).
- Groundwater flow direction was inferred to be north-west, based on site topography.
- No visual or olfactory signs of contamination were observed during groundwater sampling (i.e. no hydrocarbon odours, no sheen). The field data indicated that the local groundwater was slightly acidic (pH 6.46) and fresh (electro-conductivity (EC) 415 $\mu\text{S}/\text{cm}$).
- For tested groundwater samples, the concentrations of the potential contaminants were below the adopted groundwater investigation levels (GILs) for the tested sample. It was noted that although total recoverable hydrocarbons (TRH) (fraction F3) were detected at samples collected from well BH2M, they are likely due to the presence of natural organic matter in groundwater (based on non-detect results reported by the same sample after silica gel clean-up).
- Portions of the site that could not be accessed due to existing site structures remained as a data gap, which can be closed following demolition works.

Based on the findings of this DSI, and with consideration of EI's Statement of Limitations (**Section 11**), EI concluded that the site can be made suitable for the proposed mixed use development (that includes a mixed commercial and residential building overlying a single level basement car park) subject to the implementation of the following recommendations.

Recommendations

- Before commencement of any demolition works, a Hazardous Materials Survey (HMS) should be completed by a suitably qualified consultant, to identify any hazardous materials present within the existing building fabrics.
 - If present, all identified hazardous materials must be appropriately managed, to maintain worker health and safety during demolition works and prevent the spread of hazardous substances.
 - An asbestos clearance inspection and certificate should be completed by a suitably qualified professional (SafeWork NSW Licensed Asbestos Assessor) following the removal of all ACM from the site.
 - Where clearance inspection indicates the presence of hazardous materials remaining on the site, further removal and validation works must be undertaken.
- Preparation of a waste management plan to classify all waste material and surplus material including potential virgin excavated natural material (VENM) to be removed from the site, in accordance with the NSW EPA (2014) Waste Classification Guidelines, Protection of the Environment Operations Act 1997, and Work Health and Safety Regulation 2017;
 - An unexpected finds protocol for implementation following pavement removal and during site excavation to ensure any potential contamination sources (e.g. soil staining and odour, or buried asbestos) are identified and managed in accordance with the NSW EPA legislation and guidelines.
 - The unexpected finds protocol should also include a section for acid sulfate soil management, should any signs encountered during basement excavation.

1. Introduction

1.1 Background

EI Australia (EI) was engaged by YPI2B Ownership Trust No 6 ('the client') to conduct a Detailed Site Investigation (DSI) for the property located at 6-8 Woodburn Street, Redfern NSW ('the site').

The site is located 2 km southwest of the Sydney central business district, within the local government area (LGA) of the City of Sydney Council, as shown in **Figure 1, Appendix A**. The site is legally identified as Lot 1 in DP 121029 and Lot 1 in DP 780307 and covers a total area of approximately 954.8 m², as shown in **Figure 2, Appendix A**. At the time of this investigation, a residential building occupied the entire site footprint.

This DSI was conducted to appraise the site's environmental condition in support of a development application to City of Sydney Council.

A geotechnical investigation (Project Ref. E25342.G03_Rev0) was completed concurrently with this report and relevant information were used for subsurface description.

1.2 Proposed Development

Based on the proposed development plans by Mark Shapiro Architects (Project No. 21022, Drawing Numbers SK00 to SK14, latest revision P2, dated 4 November 2021), the development involves the demolition of all existing structures and construction of a multi-storey boarding house overlying a single-level basement car park. The ground floor is proposed for commercial uses and the above levels for residential units. A copy of these plans is attached in **Appendix C**.

The finished floor of the basement level is anticipated to be 3.0 m below the existent ground level, i.e. at approximately RL 15.95 mAHD. A Bulk Excavation Level (BEL) of 15.65 mAHD was assumed, which includes an allowance for the construction of the basement slab. It is noted that the basement footprint will not cover the whole western portion of the site. Excavation depths from 3.8 to 5.8 mBGL are estimated to be required.

Retention of soils for landscaping within the western portion of the site was proposed, which will potentially remain exposed to the end users of the site and will be developed for landscaping. The position of these areas is presented in **Figure 2, Appendix A**.

1.3 Project Objectives

The primary objectives of this DSI were to:

- Provide a qualitative assessment of the environmental condition of the site, by appraising the potential for site contamination on the basis of field observations, historical land uses and anecdotal and documentary evidence.
- Investigate the degree of any potential contamination by means of limited intrusive sampling and laboratory analysis for the COPCs.
- Provide a conclusion regarding suitability of the subject site for the proposed development.
- Provide recommendations for further action, if required.

1.4 Scope of Works

To achieve the above objectives, the following scope of works was completed:

Desktop Investigation:

- Review of relevant (hydro)geological and soil landscape maps for the project area;
- A search of groundwater bore records within close vicinity to the site;
- Search of historical aerial photographs, in order to review previous site use and the historical sequence of land development in the neighbouring area;
- A land titles search;
- Search of SafeWork NSW records, for information relating to the storage of dangerous goods, in particular underground tank approvals and locations;
- Search through the OEH Land Information records to confirm that there are no statutory notices current on the site under the Contaminated Land Management Act (1997);
- Review of existing underground services on site;
- Detailed site walkover inspection.

Intrusive Investigation:

- Construction of three borehole locations, two of which were converted to groundwater monitoring wells;
- Construction of four test pits;
- Multiple level soil sampling within fill and natural soils and one round of groundwater sampling from the five newly constructed groundwater monitoring bores; and
- Laboratory analysis of selected soil samples for relevant analytical parameters as determined from the site history survey and field observations during the investigation program.
- Data interpretation and reporting.

1.5 Legislative Framework

The following regulatory framework and guidelines were considered during this DSI:

- *Contaminated Land Management Act 1997* (CLM Act 1997);
- *Protection of the Environment Operations Act 1997* (POEO Act 1997);
- *NSW Environmental Planning and Assessment Act 1979* (the EP&A Act 1997); in particular
- *State Environmental Planning Policy 55 (SEPP 55) - Remediation of Land*;
- City of Sydney Local Environmental Plan (LEP) 2012 ('S-LEP')
- NEPC (2013) *Schedule B(2) Guideline on Site Characterisation*;
- NSW EPA (2017) *Guidelines for the NSW Site Auditor Scheme*; and
- NSW EPA (2020) *Consultants Reporting on Contaminated Land: Contaminated Land Guidelines*.

2. Site Description

2.1 Property Identification, Location and Physical Setting

The site identification details and associated information are presented in **Table 2-1**, while the site locality and layout are illustrated in **Figures 1 and 2, Appendix A**.

Table 2-1 Site Identification

Attribute	Description
Street Address	6-8 Woodburn Street, Redfern NSW
Location Description	Located within a mixed commercial and residential area of Redfern, the site is bound by Woodburn Street to the east and Eveleigh Street to the west. Commercial properties to the north and residential dwellings to the south.
Site Coordinates	North-east corner of site (GDA2020-MGA56): <ul style="list-style-type: none"> ▪ Easting: 333597.391; ▪ Northing: 6248642.659. (Source: http://maps.six.nsw.gov.au)
Site Area	954.8 m ²
Lot and DP	Lot 1 in DP 121029 and Lot 1 in DP 780307
State Survey Marks	Two state survey marks and one permanent mark are situated within close proximity (<100m) to the site: <ul style="list-style-type: none"> ▪ SS176731 and SS25335: on the southern side of Cleveland Street Street (approximately 80m north-east); and ▪ PM5376D: on the eastern side of the rail corridor (approximately 86m south-east). (Source: http://maps.six.nsw.gov.au)
Local Government Authority	City of Sydney Council
Parish	Alexandria
County	Cumberland
Current Zoning	D:Business Zone - Mixed Use (Source: State Environmental Planning Policy (State Significant Precincts) 2005)
Site Setting	During completion of this DSI, the site was occupied by a three-storey brick rendered building with a parking level which has been excavated into excavated along the western site boundary. Hardstand surfaces were present across the majority of the site.

2.2 Surrounding Land Use

The site is situated within an area of mixed use. Surrounding land uses are described in **Table 2-2**. The local sensitive receptors within close proximity to the site (approximately 250m) are also identified.

Table 2-2 Surrounding Land Uses

Direction	Land Use Description	Sensitive Receptors
North	Commercial properties (an art gallery and a makerspace rental), car parking area, followed by Cleveland Street.	-
South	Mixed residential and commercial properties, as well as rail corridor.	Local residents
East	Rail corridor, followed by Regent Street, then commercial and residential properties. Prince Alfred Park is located in the north east	Local residents
West	Mixed residential and commercial properties.	Local residents

2.3 Regional Setting

Details of the regional setting of the site are summarised in **Table 2-3**.

Table 2-3 Regional Setting

Attribute	Description
Topography	The site generally slopes north-west. The relative level of the ground ranged from approximately RL 20.40 mAHD (south-eastern portion) to 17.43 mAHD (south-western portion) – Reference: <i>E25342.G03_Rev0, Geotechnical Investigation</i> .
Site Drainage	Site drainage is likely to be captured via onsite drainage, however overland flow would likely migrate to the west, following the topography. Stormwater is discharged to the municipal collection system, which is expected to ultimately drain into the Sydney Harbour. It was noted that a dyke is located approximately 50m to the south of the site.
Regional Geology	Information on regional sub-surface conditions, referenced from the Department of Mineral Resources Geological Map Sydney 1:100,000 Geological Series Sheet 9130 (DMR 1983) indicates the site to be underlain by Ashfield Shale (Rwa), which consists of black to dark grey shale and laminite. To the east of the site lies a geological boundary with Cainozoic Holocene material (Qhd), which comprises medium to fine grained “marine” sands with podsols.
Soil Landscape	The Soil Conservation Service of NSW <i>Soil Landscapes of the Sydney 1:100,000 Sheet</i> (Chapman and Murphy, 1989) indicates that the site overlies a Blacktown (bt) residual landscape. The Blacktown landscape is characterised by gently undulating rises on Wianamatta Group shales and Hawkesbury shale. Soils are shallow to moderately deep (<100cm). Limitations include soils moderately reactive highly plastic subsoil, low soil fertility, poor soil drainage.
Acid Sulfate Soil (ASS) Risk	The <i>Botany Bay Acid Sulfate Soil Risk Map</i> (1:25,000 scale; Murphy, 1997) indicates the subject land lies within the map class description of ‘ <i>No Known Occurrence</i> ’. In such cases, ASS are not known or expected to occur and “land management activities are not likely to be affected by ASS materials. In view that excavation may require dewatering resulting in lowering of the water table, further assessment of potential for ASS is recommended.
Groundwater	Groundwater was recorded at depths of approximately 3.9 mBGL, inferred to be migrating northwest towards the Sydney Harbour.

2.4 Site Walkover Inspection

Observations were recorded during a walkover inspection on 5 October 2021. These are summarised below and photographs taken during site visit are presented in **Appendix D**.

- The site was occupied by a three-storey brick building with a parking level which has been excavated along the western site boundary. Cleveland Street was observed to 1.5m higher than the western portion of the car park. The building covered the majority of the site footprint.
- The site was located in an area of mixed use, with commercial and residential properties in all directions. The eastern side of Woodburn Street, adjacent to the rail corridor, is approximately 1.5m high than the site. The rail corridor adjoins Redfern and Central Station.
- The surrounding commercial buildings were generally characterised as office units, retail shops, cafes and hotels. Heavy (chemical) industries were not present in the immediate surroundings (radius of <500 m).
- The site slope towards the west. A retaining wall was observed along the central portion of the site, parallel with Eveleigh and Woodburn Street. The eastern half of the site sits at an RL20.4 mAHD and the western half at RL17.4 mAHD. Fill was noted to be present to the east of the retaining wall.
- Accessibility on the inside was only provided within the ground floor. The structure was noted to be in fair condition, although cracks were observed in the concrete floor, concrete entry/exit ramp and the walls.
- No fragments of potential asbestos containing material (ACM) were observed at the surface across the site. However, potential ACM may exist in site structures.
- Potential lead based paints were observed on external walls paint.
- No landscaping / exposed soil was present at the site.
- No unusual odours were noted.
- No underground store tanks (UST) and above-ground storage tanks (AST) were present.

3. Site History

3.1 Groundwater Bore Records and Groundwater Use

An online search for groundwater bores registered with WaterNSW was conducted by EI on 12 November 2021 (Ref. <https://realtimedata.waternsw.com.au/water.stm>). The search identified 42 registered wells within a 500m radius of the site. The archived data for the five closest of these is summarised in **Table 3-1**. A bore location plan and additional information are attached in **Appendix E**.

Table 3-1 Summary of Groundwater Bore Information

Bore No.	Date	Approx. Distance & Direction	Drilled Depth (m BGL)	SWL/Salinity/ Yield	Bore Purpose
GW113881	20/08/2004	350m north	6.1	-	Monitoring
GW113882	20/08/2004	350m north	6.1	-	Monitoring
GW113885	20/08/2004	350m north	7.0	-	Monitoring
GW113890	09/10/2005	350m north	6.0	-	Monitoring
GW113891	09/10/2005	350m north	6.8	-	Monitoring

Although the nearest bores are potentially downgradient, located north of the site, the bores are used only for monitoring purposes. Bores used for domestic, irrigation or industrial purposes were not observed downgradient of the site.

3.2 Land Titles and Aerial Photograph Reviews

A summary of the previous and current registered proprietors (i.e. land titles records) is presented in **Table 3-2**. Detailed information is attached in **Appendix F**.

Table 3-2 Summary of Property Ownership

Date of Acquisition and Term Held	Registered Proprietor(s) and Occupations
Lot 1 in DP780307 and Lot 1 in DP121029	
27.08.1929 (1929 to 1962)	Paper Products Limited
26.04.1962 (1962 to 1987)	Nebroc Properties Pty Limited
01.01.1987 (1987 to 1992)	Totex Investments Pty Limited Ellenwood Productions Pty Limited
19.05.1992 (1992 to 1996)	Business Proprietor
10.09.1996 (1996 to 1998)	Business Proprietor
23.10.1998 (1998 to 1999)	Bruno Scalercio (Business Proprietor) Gina Scalercio (Business Proprietor) Phillip Kagan (Business Proprietor) (50/200 Share)

Date of Acquisition and Term Held	Registered Proprietor(s) and Occupations
	Jeannette Kagan (Business Proprietor) (50/200 Share) Harbour City Building Services Pty Limited (76/200 Share) Toonnavy Pty Limited (14/200 Share) Peter John Hart (10/200 Share)
11.11.1999 (1999 to 2000)	Bruno Scalercio (Business Proprietor) Gina Scalercio (Business Proprietor) Phillip Kagan (Business Proprietor) (50/200 Share) Jeannette Kagan (Business Proprietor) (50/200 Share) Harbour City Building Services Pty Limited (71.5/200 Share) Toonnavy Pty Limited (19.5/200 Share) Peter John Hart (10/200 Share)
02.05.2000 (2000 to 2012)	Leduva Pty Limited
06.09.2012 (2012 to 2021)	Grand Baie Pty Ltd
07.08.2021 (2021 to Date)	# Perpetual Corporate Trust Limited

The historical aerial photographs reviewed as part of this DSI were:

- 1930: Sydney, Run R4, Image CAC_04_1153, dated 1/1/1930;
- 1943: Six Map Imagery, 1943;
- 1951: Sydney, Run R14, Image CCC467_14_047, dated 1/5/1951;
- 1961: Sydney, Run R36, Image 1042_36_010, dated 25/6/1961;
- 1978: Sydney, Run R17, Image 2713_17_138, dated 6/5/1978;
- 1986: Sydney, Run R23E, Image 3527_23E_127, dated 2/8/1986;
- 1991: Sydney, Run R11, Image 4029_11_075, dated 14/8/1991;
- 2002: Sydney, Run R10, Image 4724_10_114, dated 16/03/2002; and
- 2018: Six Map Imagery, 7 April 2018

A summary of the information obtained from the available historical aerial photographs is presented in **Table 2-6**

Table 3-3 Summary of Aerial Photograph Review

Photograph	Site	Surrounding lands
1930	A building occupied the entire site	Surrounding lands were occupied with buildings, which appears predominantly commercial to the north, west and south and residential to the east. The rail corridor occupied the east.
1943 to 2018	The site remained unchanged	The surrounding lands appear to be relatively unchanged.

In summary, based on the land titles and aerial photographs, the site has predominately been used for commercial purposes, since at least 1929. It has been occupied by the same building from at least 1930 to current date. No major demolitions or changes are evident in the aerial photographs.

Surrounding lands also appeared to be fully developed from the 1930s and building structures and uses generally remained unchanged.

3.3 Council Information

An application to access records held by City of Sydney Council was initiated on 17 September 2021. However, Council response was still pending at the time of report writing. Should pertinent information be identified upon receipt of Council records, an addendum to the PSI will be prepared and issued.

3.4 SafeWork NSW Dangerous Goods Register Records

A search for SafeWork NSW records relating to on-site storage of dangerous goods, held under their stored chemical information database and microfiche, was requested by EI on 17 September 2021. The search has not located any records pertaining to the above-mentioned premises, as per correspondence attached in **Appendix G**.

3.5 EPA Online Records

Searches of public registers maintained by the NSW EPA for statutory notices and licensing agreements issued under the *Contaminated Land Management Act 1997* and *Protection of the Environment Operations Act 1997* were conducted by EI on 12 November 2021.

Record of Notices under Section 58 of CLM Act 1997

The contaminated land public record is a searchable database of:

- Orders made under Part 3 of the CLM Act 1997;
- Notices available to the public under Section 58 of the CLM Act 1997;
- Approved voluntary management proposals under the CLM Act 1997 that have not been fully carried out and where the approval of the NSW EPA has not been revoked;
- Site audit statements provided to the NSW EPA under Section 53B of the CLM Act 1997 that relate to significantly contaminated land;
- Where practicable, copies of anything formerly required to be part of the public record; and
- Actions taken by the NSW EPA under Section 35 or 36 of the *Environmentally Hazardous Chemicals Act 1985* (EHC Act 1985).

The search confirmed that the site was not subject to any regulatory notices relevant to the above legislations, however one site approximately 270m north was within the records:

- Corner Regent Street and Wellington Street, Chippendale – 3 current and 4 former notices.

List of NSW Contaminated Sites Notified to EPA

The *List of NSW Contaminated Sites Notified to the EPA* under Section 60 of the CLM Act 1997 is maintained by the NSW EPA and includes properties on which contamination has been identified, but not deemed to be impacted significantly enough to warrant regulation.

The site had not been notified as contaminated to the NSW EPA; however, two sites in close proximity have been notified:

- Australian Technology Park; Henderson Road, Eveleigh - regulation under CLM Act not required – approx. 442m south-west of the site; and
- BP Service Station; 116 Regent Street, Redfern – regulation under CLM Act not required – approx. 480m south of the site.

POEO Public Register

The *Protection of the Environment Operations Act 1997* public register contains records relating to environmental protection licences, applications, notices, audits, pollution studies and reduction programs. The search confirmed that the site and land in close proximity was not subject to any licensing agreements / notices / programs relevant to the above legislation. It was noted that the railway systems activities are licensed activities in close proximity of the site.

3.6 Historical Business Directories

A search of historical records for the site and surrounding area was conducted by Lotsearch Pty Ltd. Copies of relevant documents resulting from the Lotsearch report (Lotsearch Enviro Lite, Ref. LS024475EL, dated 22 September 2021) are presented in **Appendix H**. Information regarding business activities that operated on-site and surrounding lands, relevant for a contamination assessment, from 1950 to 1991 are outlined below:

Table 3-4 Summary of On-site and Surrounding Business Activity

Period	Business Activity	Direction & Distance in relation to the site
1950-1986	Cardboard box and carton manufacturers; Tailors, clothing, handbag manufacturers and sales.	On-site
1950-1991	Clothing, hats, footwear, jewellers, knitted goods manufactures; Plastic manufactures and moulders	Adjacent to the southwest of the site (cross-gradient)
1950-1991	Printers Electric Manufactures	Adjacent to the northeast (cross-gradient)
1950-1991	Engineers and/or manufacturers and/or mechanical Hardware, chain, heavy manufactures Textile Machinery manufacturers	8m north (downgradient)
1950-1986	Electroplated ware manufacturers	9m north-west (downgradient)
1950-1982	Plastic, jars and hosiery manufactures	9m west (cross/downgradient)
1950	Fuel merchants – coal, coke and wood Textile machinery manufacturers and or distributors	47m southwest (cross-gradient)
1950	Oil lubricating merchants Motor oil and spirit merchants	50m northeast (cross-gradient)
1965	Health centres and clinics	55m northwest (downgradient)
1950-1970	Dry cleaners, presses/dyers Laundries Disinfectant manufactures and suppliers	56m southwest (upgradient)
1961-1970	Motor garage, equipment/tool manufacturers Marine equipment manufacturers Motor testing equipment manufacturers	83m north (downgradient)
1961-1978	Battery acid	93m northeast

Period	Business Activity	Direction & Distance in relation to the site
	Acid manufacturers	(cross-gradient)
1948-1985	Motor garage and engineers and service station	110m southeast (upgradient)
1948-1990	Motor garage and service station-petrol, oil, etc	114m east (cross/upgradient)

Based on the business directory records, on-site activities between 1950 and 1991 consisted of a variety of manufacturing and sales of cardboard box, cartons, tailors, clothing, handbags. Also, a number of manufacturing activities existed surrounding the site during this period, being predominantly for manufacturing of goods. The activities within the surrounding lands of most concern and potentially hydraulically upgradient, consisted of:

- Dry cleaners, laundries and disinfectant manufactures, located approximately 56m south-west of the site; and
- Motor garage and service station, located approximately 110m south-east and 114m east of the site.

3.7 Previous Investigations

EI was not aware of any previous environmental investigation relating to the site at the time of drafting this report.

3.8 Summary of Site History and Areas of Concern

The site and surrounding lands had predominant use for commercial and manufacturing purposes. Historical contaminating activities of concern such as dry cleaners, motor garages and service stations existed in locations that are likely to be upgradient to the site.

4. Conceptual Site Model

The primary purpose of the site history review and walkover inspection was to appraise the potential for contamination to be present at the site, whether that be in soil (including soil vapour) and/or groundwater. This initial appraisal was based on:

- Information obtained from the archive / database searches, identifying previous land uses / activities;
- Predicted subsurface conditions, as deduced from the map information and site inspection; and
- Professional judgement, based on experience from investigating similar sites.

In accordance with NEPC (2013) *Schedule B2 – Guideline on Site Characterisation* and to aid in the assessment of data collected for the site, a conceptual site model (CSM) that assessed plausible linkages between potential contamination sources, migration pathways, and receptors was developed and refined with the soil and groundwater sampling data obtained during this DSI.

4.1 Potential Contamination Sources

The potential sources of site contamination were as follows:

- Imported fill soils of unknown origin and quality for levelling of the eastern half of the site;
- Historic commercial and industrial manufacturing use;
- Application of pesticides beneath the building footprints and around footings;
- Weathering of exposed building fabrics containing hazardous substances (including bonded ACM sheeting, lead-based paints and metallic surfaces) and/or deposition of such in site soils from minor past demolition;
- The migration of mobile contamination from off-site (up-gradient) properties historically used as dry cleaners, motor garages and service stations.

4.2 Contaminants of Potential Concern

The contaminants of potential concern (COPCs) were considered to be:

- Priority Metals (arsenic, cadmium, chromium copper, lead, mercury, nickel, zinc);
- Total Recoverable Hydrocarbons (TRH);
- Volatile Organic Compounds (VOC), including Benzene, Toluene, Ethylbenzene, Xylenes, Naphthalene (BTEXN) and chlorinated VOC (CVOC);
- Polycyclic Aromatic Hydrocarbons (PAH);
- Organochlorine and Organophosphorus Pesticides (OCP / OPP);
- Polychlorinated Biphenyls (PCB);
- Phenols; and
- Asbestos.

4.3 Other Potential Contaminants

Per- and Poly- Fluoro alkyl Substances

EPA (2017) requires that per- and poly- fluoro alkyl substances (PFAS) are considered when investigating land contamination. An assessment of the probability for PFAS occurrence is provided in **Table 4-1**. This was based on considerations outlined in the *PFAS National Environmental Management Plan* (NEMP 2020) and the EnRisk (2016) decision tree. In this instance, the potential for PFAS to be present on-site was considered to be low and further investigation was not warranted.

Table 4-1 PFAS Decision Tree

Preliminary Screening	Probability of Occurrence ¹
Has an activity listed in NEMP (2020) ² as being associated with PFAS contamination occurred on-site? If so, list activity.	L
Has an activity listed in NEMP (2020) ² as being associated with PFAS contamination occurred up-gradient or adjacent to the site? If so, list activity.	L
Did fire training involving the use of suppressants occur on-site between 1970 and 2010?	L
Did fire training occur up-gradient or adjacent to the site between 1970 and 2010? ³	L
Have “fuel” fires ever occurred on-site between 1970 and 2010? (e.g. ignition of fuel (solvent, petrol, diesel, kero) tanks?)	L
Have PFAS been used in manufacturing or stored on-site? ⁴	L
Could PFAS have been imported to the site in fill materials from a site with an activity listed in NEMP (2020)?	L
Could PFAS-contaminated groundwater or run-off have migrated on to the site?	L
Is the site or adjacent sites listed in the NSW EPA PFAS Investigation Program? ⁵	L
If the probability is medium or high in any of the rows, does the site analytical suite need to be optimised to include preliminary sampling and testing for PFAS?	No

Notes:

1 Probability: L – low (all necessary documentation has been reviewed and there is no recorded instance or compelling rationale); M – moderate (all necessary documentation has been reviewed and there is potential evidence of a recorded instance with compelling rationale); H – high (all necessary documentation has been reviewed and there is evidence of a recorded instance with compelling rationale).

2 Activities listed in Appendix B of NEMP (2020).

3 Runoff from up-gradient PFAS use may impact surface water, soil, sediment and groundwater.

4 PFAS is used wide range of industrial processes and consumer products, including in the manufacture of non-stick cookware, specialised garments and textiles, Scotchguard™ and similar products (used to protect fabric, furniture, leather and carpets from oils and stains), metal plating and in some types of fire-fighting foam.

(<https://www.nicnas.gov.au/chemical-information/factsheets/chemical-name/perfluorinated-chemicals-pfas>)

5 Refer to <https://www.epa.nsw.gov.au/your-environment/contaminated-land/pfas-investigation-program>.

Emerging Chemicals

The NSW EPA uses Chemical Control Orders (CCOs) as a primary legislative tool under the *Environmentally Hazardous Chemicals Act 1985*, to control chemicals of concern and limit their potential impact on the environment. Considerations for chemicals controlled by CCOs, and other potential emerging chemicals, are outlined in **Table 4-2**. In this instance, the potential for an emerging chemical of concern to be present on-site was limited to the application of organic pesticides (around building perimeters) and use of polychlorinated biphenyls (PCBs) associated with substation located to the neighbouring north-west site.

Table 4-2 Emerging or Controlled Chemicals

Chemicals of Concern (CCO or emerging)	Decision
Were aluminium smelter wastes used or stored on site (CCO, 1986)?	No
Do dioxin contaminated wastes (CCO, 1986) have the potential to impact the site? ¹	No
Were organotin products (CCO, 1989) used or stored on site? ²	No
Were polychlorinated biphenyls (PCBs) used or PCB wastes (CCO, 1997) stored on-site? ³	Potential for PCB to be present due to electrical equipment on site
Were scheduled chemical or wastes (CCO, 2004) used or stored? ⁴	Potential for organic pesticides to have been used, or in fill
Are other emerging chemicals suspected? ⁵	No
If Yes to any questions, has site sampling suite been optimised to include sampling for these chemicals of concern?	Yes

Notes:

- 1 From burning of certain chemicals, smelting or chemical manufacturing or fire on or near the site.
- 2 From anti-fouling paints used or removed at boat and ship yards and marinas.
- 3 From older transformer oils and electrical capacitors.
- 4 Twenty-four mostly organochlorine pesticides and industrial by-products
- 5 Other chemicals considered as emerging (e.g. 1, 4 dioxane; associated with some CVOC).

4.4 Potential Receptors and Exposure Pathways

In view of the proposed site use and current site settings, the following potential receptors that may be affected by site contamination:

- Construction workers during the development stage, mainly during earthworks;
- Future site users;
- Future intrusive workers;
- Biota between 0 and 2 mBGL;
- Local groundwater users; and
- Nearest surface water receptor (Sydney Harbour)

The transport mechanisms and pathways to partial or complete exposure of receptors to the COPCs were as follow:

- Dermal contact;
- Accidental human ingestion;
- Inhalation of dust and/or vapours;
- Leaching from contaminant sources;
- Natural advection of vapours through the vadose zone;
- Natural advection of solutes and suspended solids in groundwater; and
- Bioaccumulation (via plant uptake and microorganisms absorption).

4.5 Source-Pathway-Receptor (SPR) Assessment

In accordance with NEPC (2013) *Schedule B2*, the plausible connections between potential contamination sources, migration pathways and receptors were assessed in **Table 4-3**.

Table 4-3 SPR Assessment

COPC	Receptor	Exposure Pathway / Transport Mechanisms	SPR Complete?
Priority metals	Construction workers during the development stage. Future intrusive workers.	Accidental human ingestion. Dermal contact. Inhalation of dust.	No The use of personal protective equipment (PPE) is mandatory during construction works, as such the exposure likelihood can be considered low and acceptable.
	Biota between 0 and 2 mBGL.	Bioaccumulation (via plant uptake or microorganisms absorption).	No Small deep soil landscaping areas were proposed in the southern half of the site. Soil results for metals were below the EIL and ESL criteria.
	Local groundwater. The Sydney Harbour, groundwater receptor.	Leaching from contaminant sources. Natural advection of solutes and suspended solids in groundwater. Diffusion in groundwater.	No Low concentrations of dissolved metals were reported in groundwater data collected during this DSI, being all below the human health and ecological criteria.
VOCs (including BTEXN) and TRHs	Construction workers during the development stage. Future intrusive workers. Future site users.	Accidental human ingestion. Dermal contact. Inhalation of vapours. Natural advection of vapours through the vadose zone.	Potentially complete. Concentrations reported in soils and groundwater during this DSI were below the adopted human-health based criteria. However, elevated concentration of TRH F3 in groundwater was detected, although no guideline screening value is provided for F3.
	Biota between 0 and 2 mBGL.	Bioaccumulation (via plant uptake or microorganisms absorption).	Potentially complete. Soil results for VOCs and TRHs were below the EIL and ESL criteria.
OCPs/OPPs and PCBs	Construction workers during the development stage. Future intrusive workers.	Accidental human ingestion. Dermal contact.	No All samples analysed during this DSI reported concentrations of OCPs/OPPs and PCBs below the laboratory limits of reporting (LORs).
	Biota between 0 and 2 mBGL.	Bioaccumulation (via plant uptake or microorganisms absorption).	No All samples analysed during this DSI reported concentrations of OCPs/OPPs and PCBs below the laboratory limits of reporting (LORs).
Asbestos	Construction workers during the development stage. Future intrusive workers.	Accidental human ingestion. Inhalation of dust.	No No asbestos reported in samples collected during this DSI.

5. Methodology

5.1 Sampling and Analysis Quality Plan (SAQP)

The SAQP ensures that the data collected during environmental works at a site were representative and provide a robust basis for assessment decisions. The SAQP for this DSI included the following:

- Data quality objectives, including a summary of the objectives of the DSI;
- Investigation methodology, including the media to be sampled, details of analytes and parameters to be monitored and a description of intended sampling points;
- Sampling procedures (including sample handling, preservation and storage);
- Field screening methods;
- Laboratory analysis methods; and
- Analytical quality assurance / quality control (QA/QC).

5.2 Data Quality Objectives

In accordance with the USEPA (2006) *Data Quality Assessment* and NSW EPA (2017) *Guidelines for the NSW Site Auditor Scheme*, data quality objectives (DQO) were established to determine the appropriate level of data quality needed for the specific requirements of this project. The DQO process applied for this DSI is documented in **Table 5-1**.

Table 5-1 Summary of Project Data Quality Objectives

DQO Steps	Details	Comments
<p>1. State the Problem Summarise the contamination problem that will require new environmental data, and identify the resources available to resolve the problem; develop a conceptual site model</p>	<p>The site is to be redeveloped into mixed use commercial/residential apartment building with basement car parking facilities and associated landscaped areas. The most sensitive land use of the proposed development is equivalent to a generic NEPC (2013) setting of residential with minimal opportunities for soil access. Based on the contamination appraisal (Section 4), there was potential for soils and groundwater contamination to be present. The degree of any site contamination was to be established, by intrusive sampling and laboratory analysis for the contaminants of concern, thereby determining the land's suitability for the proposed development. The conceptual site model for the site was refined with the results of data collected during field work and it is presented in Section 4.5.</p>	-
<p>2. Identify the Goal of the Study (Identify the decisions) Identify the decisions that need to be made on the contamination problem and the new environmental data required to make them</p>	<p>The decisions for this DSI concerned the following questions:</p> <ul style="list-style-type: none"> ▪ Has the nature, extent and source of any soil and groundwater contamination onsite been defined? ▪ What impact do the site specific, geologic and hydrogeological conditions have on the fate and transport of any impacts that may be identified? ▪ Has enough data been collected to determine the risk of contamination at the site, including potential offsite migration? and ▪ Does the level of impact coupled with the fate and transport of identified potential contaminants represent an unacceptable risk to identified human and/or environmental receptors on or offsite? <p>Does the collected data provide sufficient information to allow the selection and design of an appropriate remedial strategy, if necessary?</p>	-
<p>3. Identify Information Inputs (Identify inputs to decision) Identify the information needed to support any decision and specify which inputs require new environmental measurements</p>	<p>Inputs to the decision making process included:</p> <ul style="list-style-type: none"> ▪ Proposed development plans and end land-use; ▪ Available previous investigation data, including site historical information; ▪ Assessment of soil and groundwater analytical results in relation to the adopted human health and ecological criteria; and ▪ Visual observation and documentation during site works. <p>Decision rules for soil and groundwater and criteria exceedances are outlined in Step 6. At the end of the assessment, a decision had to be made regarding the suitability of soil and local groundwater for the proposed development, or if additional investigation or remedial works were required to make the site suitable for the proposed use.</p>	-
<p>4. Define the Boundaries of the Study Specify the spatial and temporal aspects of the environmental media that the data must represent to support decision</p>	<p><u>Literal</u> – the investigation was conducted within the cadastral boundaries of the site (Figure 2, Appendix A). <u>Vertical</u> – From existing ground surface to underlying fill and natural soil horizons at all borehole locations to maximum depth of 13.5 mBGL within the monitoring well BH2M. <u>Temporal</u> – Results are valid on the day of data / sample collection and remain valid as long as no changes occur on site or contamination (if present) does not migrate on site or on to the site from off-site sources. Sampling constraints included access restrictions due to current site structures and/or presence of underground services (details on Section 5.5).</p>	-

DQO Steps	Details	Comments
<p>5. Develop the Analytic Approach (Develop a decision rule)</p> <p>To define the parameter of interest, specify the action level, and integrate previous DQO outputs into a single statement that describes a logical basis for choosing from alternative actions</p>	<p>Parameters of interest included the laboratory results for primary and quality control soil and groundwater analytical testing. Laboratory test results would be accepted if:</p> <ul style="list-style-type: none"> ▪ All contracted laboratories are accredited by NATA for the analyses undertaken; ▪ Laboratory methods are conducted in accordance with NEPC (2013) guidelines; ▪ Laboratory and field quality control sample results are within the adopted Data Quality Indicators; and ▪ Laboratory QA/QC protocols and results comply with NEPC requirements. ▪ Decision criteria for QA/QC measures are defined by the Data Quality Indicators (DQI) in Table 5-2 	<p>RPDs shown in Table 3.1 and 3.2 (Appendix B). RPDs assessment detailed in Appendix N.</p>
<p>6. Specify Performance or Acceptance Criteria (Specify limits on decision errors)</p> <p>Specify the decision-maker's acceptable limits on decision errors, which are used to establish performance goals for limiting uncertainties in the data</p>	<p>Specific limits for this project were in accordance with national and NSW EPA guidance, and appropriate indicators of data quality and standard procedures for field sampling and handling. This included the following points to quantify tolerable limits:</p> <ul style="list-style-type: none"> ▪ The null hypothesis for the investigation is that the 95% Upper Confidence Limits (UCL) of the mean for contaminants of concern exceed relevant commercial land use criteria across the site. ▪ The acceptance of the site will be based on the probability that: <ul style="list-style-type: none"> ▸ The 95% UCL of the mean of the data will satisfy the given site criteria. Therefore, a limit on the decision error will be 5% that a conclusive statement may be incorrect; ▸ The standard deviation of the results is less than 50% of the relevant criterion; and ▸ No single results exceed the acceptance criteria by 250% or more. ▪ Soil and groundwater concentrations for chemicals of concern that are below criteria made or approved by the NSW EPA will be treated as acceptable and indicative of suitability for the proposed land use(s). <p>If contaminant concentrations in soil and groundwater exceed the adopted criteria, further investigation will be considered prudent. If no contamination is detected, no further action is required.</p>	
<p>7. Develop the Detailed Plan for Obtaining Data (Optimise the design for obtaining data)</p> <p>Identify the most resource-effective sampling and analysis design for general data that are expected to satisfy the DQOs</p>	<p>In order to identify the most resource-effective sampling and analysis design for general data that are expected to satisfy the DQO:</p> <ul style="list-style-type: none"> ▪ Written instructions were issued to guide field personnel in the required fieldwork activities. ▪ Seven soil sampling locations (BH1, BH2M, BH3M and TP1-4), distributed across the site on accessible locations. Sampling rationale is detailed in Section 5.4. <ul style="list-style-type: none"> ▸ An upper soil profile sample was collected at each borehole location, to assess the condition of the fill/topsoil layer; ▸ Natural samples were collected at each borehole location, to evaluate potential impacts from migration of contaminants; ▸ Samples were selected based on field observations (including visual and olfactory evidence), whilst giving consideration to characterise the subsurface soil stratigraphy. ▪ Two monitoring wells (BH2M and BH3M) were installed up- and down-gradient to target potential groundwater impacts from on- and off-site source (historical neighbouring service station (south-east) and potential migration off-site). <ul style="list-style-type: none"> ▸ The monitoring well was gauged, developed / purged and sampled, to enable assessment of local groundwater conditions. ▪ Selected soil and groundwater samples were tested for the potential contaminants of concern, as per preliminary CSM (Section 4). 	<p>Limited access across the site due to presence of buildings and infrastructure. Groundwater at monitoring well BH3M could not be sampled during the GME, due to a car parked above the well.</p>

5.3 Data Quality Indicators (DQI)

To ensure that the investigation data were of an acceptable quality, they were assessed against the DQI outlined in **Table 5-2**. Assessment of data quality is presented in **Section 6**.

Table 5-2 Data Quality Indicators

QA/QC Component	Data Quality Indicator(s)
<p>Precision A quantitative measure of the variability (or reproducibility) of data</p>	<p>Data precision was assessed by reviewing the performance of blind field duplicate sample sets, through calculation of relative percentage differences (RPD). Data precision was deemed acceptable if RPDs were found to be less than 30%. RPDs that exceeded this range were considered acceptable where:</p> <ul style="list-style-type: none"> ▪ Results were less than 10 times the limits of reporting (LOR); and ▪ Results were less than 20 times the LOR and the RPD was less than 50%.
<p>Accuracy A quantitative measure of the closeness of reported data to the “true” value</p>	<p>Data accuracy was assessed through the analysis of:</p> <ul style="list-style-type: none"> ▪ Split field duplicate sample sets; ▪ Trip blank and spike samples; ▪ Field and method blanks, analysed for the analytes targeted in the primary samples; ▪ Matrix spike sample sets; and ▪ Laboratory control samples.
<p>Representativeness The confidence (expressed qualitatively) that data are representative of each medium present onsite</p>	<p>To ensure the data produced by the laboratory were representative of conditions encountered in the field, the following measures were taken:</p> <ul style="list-style-type: none"> ▪ Blank samples run in parallel with field samples, to confirm there were no unacceptable instances of laboratory artefacts; ▪ Review of RPD values for field and laboratory duplicates to provide an indication that the samples were generally homogeneous, with no unacceptable instances of significant sample matrix heterogeneities; and ▪ The appropriateness of collection methodologies, handling, storage, and preservation techniques was assessed to ensure/confirm there was minimal opportunity for sample interference or degradation (i.e. volatile loss during transport due to incorrect preservation / transport methods).
<p>Completeness A measure of the amount of useable data from a data collection activity</p>	<p>Analytical data sets acquired during the ASI were evaluated as complete upon confirmation that:</p> <ul style="list-style-type: none"> ▪ Standard operating procedures (SOPs) for sampling protocols were adhered to; and ▪ All chain of custody (COC) documentation was properly completed and received. <p>It could therefore be considered whether the proportion of “useable data” was sufficient for the purposes of the land use assessment.</p>
<p>Comparability The confidence that data were equivalent for each sampling and analytical event</p>	<p>Issues of comparability between data sets were reduced through adherence to SOPs and regulator-endorsed or published guidelines. In addition, the data were collected by experienced samplers and NATA-accredited laboratory methodologies were employed for all laboratory testing programs.</p>

5.4 Sampling Rationale

Soil and groundwater investigation works were planned in accordance with the following rationale:

- Sampling of fill and natural soils from 3 borehole locations (BH1, BH2M, BH3M) and 4 test pits TP1, TP2, TP3 and TP4) judgements positioned across the site in accessible areas (**Figure 2**).
- Environmental sampling of fill soils occurred at depths ranging from 0.3 to 0.6 mBGL and sampling of natural soils occurred at depths ranging from 0.5 to 1.0 mBGL;

- A single groundwater monitoring event (GME) at one monitoring well (BH2M), located at the south-eastern corner of the site, hydraulically upgradient to assess groundwater conditions and potential impacts from off-site sources. Monitoring well BH3M could not be sample (refer to **Section 5.5**); and
- Laboratory analysis of soil and groundwater samples for the identified chemicals of potential concern.

5.5 Investigation Constraints

A systematic grid sampling plan could not be conducted for the site due to the presence of site buildings and infrastructure making access difficult. As such, sampling locations were judgementslly positioned across the site in accessible areas.

Groundwater at monitoring well BH3M could not be sampled during the GME, due to a car parked above the well.

Although these investigation constraints existed during the investigation phase, data collected were considered sufficient to achieve the planned scope described in **Section 5.2**.

5.6 Assessment Criteria

The assessment criteria adopted for this DSI are outlined in **Table 5-3**. These were selected from available published guidelines that are endorsed by national or state regulatory authorities, with due consideration of the exposure scenarios that are expected for various parts of the site.

Table 5-3 Adopted Investigation Levels for Soil and Groundwater

Medium	Guidelines	Rationale
Soil	NEPC (2013) HILs, HSLs, EILs, ESLs and Management Limits for TRH	<p>Soil Health-based Investigation Levels (HILs)</p> <p><u>Building footprint and paved areas</u>: NEPC (2013) <i>HIL-B</i> thresholds for residential with minimal opportunities for soil access settings.</p> <p><u>Landscaping areas</u>: NEPC (2013) <i>HIL-C</i> thresholds for public open space settings.</p> <p>Soil Health Screening Levels (HSLs)</p> <p><u>Building footprint and paved areas</u>: NEPC (2013) <i>HSL-D</i> thresholds for vapour intrusion in residential buildings with basement car park or commercial setting at the ground floor. Criteria applied to assess potential human health impacts from residual vapours resulting from petroleum, BTEX and naphthalene (Section 2.4.8 Schedule B1 NEPC 2013).</p> <p><u>Retained deep soil for landscaping areas</u>: NEPC (2013) <i>HSL-C</i> thresholds for public open space area.</p> <p>For asbestos:</p> <ul style="list-style-type: none"> ▪ Bonded ACM - HSL-B for paved areas; ▪ Bonded ACM - HSL-C for landscaping areas; ▪ Friable Asbestos: 0.001% w/w in all areas of the site; ▪ No visible asbestos on soil surface in all areas of the site. <p>Ecological Investigation Levels (EILs) / Ecological Screening Levels (ESLs)</p> <p>EILs / ESLs were considered relevant for any retained deep soils on the site. EILs / ESLs only apply to the top 2 m (root zone). The derived EIL criteria are based on the addition of site specific Added Contaminant Limit (ACL) criteria and the Ambient Background Concentration (ABC)</p>

Medium	Guidelines	Rationale
		for a high traffic NSW suburb. Coarse grained criteria were applied.
	CRC CARE (2017) High reliability ecological criteria for benzo(a)pyrene	High reliability ecological criteria for Benzo(a)pyrene CRC Care's high reliability derived ecological guideline for benzo(a)pyrene in urban residential and public open space was used to assess benzo(a)pyrene for protection of terrestrial ecosystems.
Groundwater	ANZG (2018) GILs for Marine Waters, NEPC (2013) Groundwater HSLs, NHMRC (2018) for Recreational criteria	GILs for Marine Water ANZG (2018) provides GILs for typical, highly disturbed aquatic ecosystems, Trigger Values (TVs) for the 95% level of protection of aquatic ecosystems. Note: Nearest surface water receptor is inferred to be Sheas Creek which discharges into Alexandra Canal located 1km south west from the subject site. Alexandra Canal was a long history of industrial use in the vicinity and is considered as a highly disturbed aquatic system. Also, given that the ultimate water receptor is Sydney Harbour, the marine water criteria was considered, although groundwater sampled present parameters of electro conductivity consistent with fresh. HSLs The NEPM (2013) groundwater HSLs for vapour intrusion will be used to assess for potential human health impacts from residual vapours resulting from petroleum, BTEX and naphthalene impacts. The HSL D thresholds for commercial exposure settings will be applied as the proposed development a single level basement (Section 2.4, Schedule B1, NEPC (2013)). Recreational Use The NHMRC (2018) <i>Australian Drinking Water Guidelines Paper 6 National Water Quality Management Strategy</i> . National Health and Medical Research Council, National Resource Management Ministerial Council, Commonwealth of Australia, Canberra. Version 3.5, August 2018. Where no criteria are available, the lowest value from the NHMRC (2018) Drinking Water Human health criteria (multiplied by a factor of 10) or the aesthetic criteria will be used.

For the purposes of this DSI, the adopted soil assessment criteria are referred to as the *Soil Investigation Levels (SILs)* and the adopted groundwater assessment criteria are referred to as *Groundwater Investigation Levels (GILs)*.

5.7 Soil Sampling Methodology

The soil sampling works conducted at the site are described in **Table 5-4**. Sampling locations are illustrated in **Figure 2, Appendix A**.

Table 5-4 Soil Sampling Methodology

Activity/Item	Details
Fieldwork	Intrusive soil investigations were conducted on 5 October 2021 and comprised soil sampling at 7 borehole locations.
Drilling Method and Investigation Depth	Test bore BH1 was drilled using a hand portable rig, followed by a track-mounted drilling rig (CE 180), with diatube TC-bit. BH2M and BH3M were drilled using the same drilling rig. Final bore depths were 7.43 mBGL, 13.52 mBGL and 8.86 mBGL respectively, all terminating in natural soil. The boreholes were also used for geotechnical purposes. Test pits TP1, TP2, TP3 and TP4 were excavated with shovel. Final bore depths ranged from 0.3 mBGL to 0.6 mBGL. TP1 and TP4 terminated in fill material and TP2

Activity/Item	Details
	and TP3 terminated in natural (residual) soil.
Soil Logging	Drilled soils were classified in the field with respect to lithological characteristics and evaluated on a qualitative basis for odour and visual signs of contamination. Soil classifications and descriptions were based on Australian Standard (AS) 1726-2017. Borehole logs are presented in Appendix I .
Soil Sampling	Soil samples were collected by dry grab method (with unused, dedicated nitrile gloves) and placed into laboratory-supplied, acid-washed, solvent-rinsed glass jars. Blind field duplicates separated from primary samples and placed into glass jars, For each fill sample, an aliquot was placed in a zip-lock bag for asbestos analysis.
Sample Preservation and Transport	<ul style="list-style-type: none"> ▪ Samples were directly transferred into laboratory supplied glass jars or plastic bags, with each sample container sealed to eliminate cross contamination during transportation to the laboratory; ▪ Sample containers were placed into a chilled, enclosed and secure container for transport to the laboratory; ▪ Chilled sample chests were transported to the primary laboratory (SGS Australia Pty Ltd (SGS)) using Chain of custody (COC) procedures. COC documentation was provided to ensure that sample tracking and custody can be cross-checked at any point in the transfer of samples from the field to the environmental laboratory; and ▪ Split (inter-laboratory) soil field duplicates were submitted to Envirolab Services Pty Ltd (Envirolab; the secondary laboratory) under strict COC conditions. ▪ Signed COC forms and SRA provided by SGS and Envirolab are attached in Appendix K.
Laboratory Analysis and Quality Control	Soil samples were analysed by SGS for the identified potential chemicals. QA/QC testing comprised a rinsate blank, trip spike / blank samples and intra-laboratory (blind field) duplicates tested by SGS, as well as an inter-laboratory (split field) duplicate tested by Envirolab Services (Envirolab). Discussion of QA/QC testing is presented in Appendix M .
Laboratory Quality Assurance and Quality Control	<p>The contracted laboratories conducted in-house QA/QC procedures, such as:</p> <ul style="list-style-type: none"> ▪ Reagent blanks; ▪ Spike recoveries; ▪ Laboratory duplicates; ▪ Calibration standards and blanks; and ▪ Control standards. <p>Laboratory QA/QC performance is attached in Appendix M.</p>

5.8 Groundwater Sampling Methodology

The groundwater sampling works are described in **Table 5-5**. The monitoring well locations are illustrated in **Figure 2, Appendix A**.

Table 5-5 Groundwater Sampling Methodology

Activity/Item	Details
Fieldwork	Two groundwater monitoring wells (BH2M and BH3M) were installed and developed on 5 October 2021. All wells were purged three times the well volume. A GME consisting of water level gauging, well purging, field testing and groundwater sampling at the well BH2M was conducted on 13 October 2021. BH3M could not be accessed during the GME.

Activity/Item	Details
Drilling Methodology	Drilling of the groundwater monitoring wells were advanced using a track-mounted (CE 180), drilling rig with 110mm diameter, diatube-bit, solid flight augers.
Well Construction	<p>Well construction was in general accordance with the standards described in NUDLC (2020) and involved the following:</p> <ul style="list-style-type: none"> ▪ 50 mm, Class 18 uPVC, threaded, machine-slotted screen and casing, with slotted intervals set to screen to at least 1m above the standing water level to allow sampling of phase-separated hydrocarbon product, if present; ▪ The base and top of each well were sealed with a uPVC cap; ▪ An annular filter comprising graded sand was applied to approximately 500mm above the top of the screen interval; ▪ Granular bentonite was applied above the annular filter to seal the screened interval; ▪ Drill cuttings were used to backfill the bore annulus to just below ground level; and ▪ Surface completion comprised 50mm uPVC casing to approximately 0.8m above ground level. <p>Well construction details for new and existing functional wells are tabulated in Table 7-2.</p>
Well Survey	Well head elevations at each monitoring well were survey during EI geotechnical investigation (refer to E25342.G03).
Well Gauging	Monitoring well BH2M was gauged to determine standing water level (SWL) prior to well purging at the commencement of the GME on 13 October 2021. Gauging was conducted with a water/oil interface probe.
Well Purging and Field Testing	<p>Groundwater was purged and sampled by a low-flow / minimal draw-down sampling method using a MicroPurge kit (MP15) and a portable pump. The MicroPurge system incorporated a low density poly-ethylene (LDPE) pump bladder and Teflon-lined, LDPE tubing. Pressurised carbon dioxide gas was employed to regulate pump pressure and pumping cycles were adjusted accordingly to regulate extraction flow rate, without causing excessive water level drawdown during the sampling process.</p> <p>During micro-purging the field water quality parameters Temperature, EC, Reduction-Oxidation potential (Redox), Dissolved Oxygen (DO) and pH were continuously measured using a Hanna Multi Parameter 9829 probe positioned within an open flow-through cell. Measurements were recorded onto field data sheets (Appendix F). Once water quality parameters stabilised in accordance with NEPC (2013) guidelines (i.e. within $\pm 10\%$ for DO, $\pm 3\%$ for EC, ± 0.2 for pH, $\pm 0.2^\circ$ for temperature and $\pm 20\text{mV}$ for redox), groundwater sampling was undertaken.</p>
Decontamination Procedure	<p>The micro-purge pump was decontaminated in a solution of potable water and Decon 90 and then rinsed with potable water before sampling commencement. The micro-purge system employed a disposable bladder and tubing, which was changed between wells, further minimising potential (cross) contamination.</p> <p>The water/oil interface probe was washed in a solution of potable water and Decon 90 and then rinsed with potable water before measurement of water level at wells.</p>
Sample Containers and Preservation	<p>The following laboratory-supplied containers were used to collect groundwater samples:</p> <ul style="list-style-type: none"> ▪ One, 500 mL amber glass, acid-washed and solvent-rinsed bottle; ▪ Two, 40mL amber glass vials, preserved with hydrochloric acid (1mL), Teflon-sealed;

Activity/Item	Details
Sample Transport	<ul style="list-style-type: none">▪ One, 250 mL HDPE bottle, preserved with nitric acid (1mL).▪ Samples for heavy metal analysis were field-filtered using 0.45 µm pore membranes. <p>Each sample container was filled to the brim with groundwater sample, then capped and stored in an insulated chest with plastic sealed ice-packs, until completion of the fieldwork and during sample transit to the laboratory.</p>
Laboratory Analysis and Quality Control	<p>After sampling, refrigerated sample chests were transported to SGS under strict COC conditions. A split (inter-laboratory) field duplicate was submitted to Envirolab under strict COC conditions. Signed COC certificates and sample receipt documentation were provided by SGS and Envirolab for confirmation purposes (Appendix K).</p> <p>Groundwater samples were analysed for the chemicals of concern. All samples were analysed within the required holding period, as documented in the corresponding laboratory reports (Appendix L).</p> <p>QC testing comprised a blind (intra-laboratory) field duplicate, an equipment rinsate blank, a laboratory-prepared, trip spike water sample and a laboratory-prepared, trip blank water sample, all tested by SGS. A split (inter-laboratory) field duplicate was analysed by Envirolab.</p>
Laboratory QA/QC	<p>The contracted laboratories conducted in-house QA/QC procedures, which included:</p> <ul style="list-style-type: none">▪ Reagent blanks;▪ Spike recoveries;▪ Laboratory duplicates;▪ Calibration standards and blanks; and▪ Control standards. <p>The QA/QC process is discussed in Section 6 and laboratory QA/QC results are presented in Appendix M.</p>

6. Data Quality Assessment

The assessment of data quality is defined as the scientific and statistical evaluation of environmental results to determine if they meet the objectives of the project (USEPA, 2006). For this DSI, the data quality assessment involved an evaluation of the compliance of the field (sampling) and laboratory procedures with established protocols, as well as the accuracy and precision of the associated results from the quality control measures. The sections of the report are outlined in **Table 6-1** and discussed in detail in **Appendix J**.

Table 6-1 Quality Control Process

Stage	Control	Conformance [Yes, Part, No]	Report Section(s)
Preliminaries	DQO established	Yes	See DQO/DQI, Sections 5.2 and 5.3
Field work	Suitable documentation of fieldwork observations including borehole logs, field notes.	Yes	See Appendix I and J
Sampling plan	Use of relevant and appropriate sampling plan (density, type, and location)	Yes	Refer to Section 5
	All media sampled and duplicates collected	Yes	See Appendix I
	Use of approved and appropriate sampling methods (soil, groundwater)	Yes	Refer to Section 5
	Preservation and storage of samples upon collection and during transport to the laboratory	Yes	See Sampling Methodology (Section 5.7 and 5.8)
	Appropriate field QA/QC	Yes	See Sampling Methodology (Section 5.7 and 5.8) and Appendix N
	Completed field and analytical laboratory sample COC procedures and documentation	Yes	See Appendix K
Laboratory	Sample holding times within acceptable limits	Yes	See laboratory QA/QC, Appendix M and N
	Use of appropriate analytical procedures and NATA-accredited laboratories	Yes	See Appendix K and M
	LOR/PQL low enough to meet adopted criteria	Yes	See Appendix L
	Laboratory blanks Laboratory duplicates Matrix spike/matrix spike duplicates Surrogates (or System Monitoring Compounds)	Yes	See laboratory QA/QC, Appendix M
	Checking for the occurrence of apparently unusual or anomalous results (e.g. laboratory results that appear to be inconsistent with field observations or measurements)	Yes	See Appendix N

Stage	Control	Conformance [Yes, Part, No]	Report Section(s)
Reporting	Report reviewed by senior staff to assess project meets desired quality, NSW EPA guidelines and project outcomes.	Yes	See Document Control

In summary, the overall quality of the analytical data from this DSI was considered to be of an acceptable standard for interpretive use.

7. Results

7.1 Soil Investigation Results

7.1.1 Sub-Surface Conditions

The general site lithology consisted of a layer of gravelly sand/sand and silty clay fill to maximum depth of 1.0 mBGL, overlying residual silty clay (up to 9.3 mBGL). Shale and sandstone was encountered at depth from 2.9 mBGL. More details are provided in **Table 7-1**. Borehole logs are presented in **Appendix I**.

Table 7-1 Generalised Subsurface Profile

Layer	Description	Depth top of unit (mBGL)
Pavement	Concrete	0
Fill/top soil	SAND; fine to coarse grained, dark grey-dark brown. Gravelly SAND, fine to coarse grained, brown/orange brown with clay and brick, plastic and tile fragments, fine to coarse, sub angular to angular gravels. Silty CLAY; medium plasticity, pale grey, mottled orange, trace of fine to medium sub-angular to angular gravels and brick fragments	0.1 to 0.35
Residual	Silty CLAY; low to medium plasticity, pale grey/red-brown with fine to medium ironstone gravels.	0.23 to 1.0
Bedrock	SHALE; distinctly weathered, very low strength, dark grey/red-brown, very thinly bedded, with sub horizontal siltstone laminations and iron staining. SANDSTONE; fine to medium grained, grey with iron staining, siltstone laminations.	2.93 to 9.32

7.1.2 Field Observations - Soil

Soil samples obtained from the test bores were evaluated on a qualitative basis for odour and visual signs of contamination (e.g. hydrocarbon odours, oil staining, petrochemical filming, asbestos fragments, ash, charcoal). No obvious hydrocarbon odour or staining was detected in any of the examined soils. Fragments of ACM were not observed in any of the sampling locations.

7.2 Groundwater Field Results

7.2.1 Monitoring Well Construction

Construction details of the groundwater monitoring wells are summarised in **Table 7-2**.

Table 7-2 Monitoring Well Construction Details

Well ID	Surface RL ¹ (mAHD)	Total well depth (mBGL)	Screen Interval - Top – Bottom (mAHD)	Lithology Screened
BH2M	20.40	10.80	12.6 – 9.6	Silty Clay and Sandstone

Well ID	Surface RL ¹ (mAHD)	Total well depth (mBGL)	Screen Interval - Top – Bottom (mAHD)	Lithology Screened
BH3M	17.55	6.80	14.75 - 10.75	Silty Clay and Sandstone

Notes: ¹ Surface RLs at the wellhead were surveyed during geotechnical investigation (Ref. E25342.G03).

7.2.2 Field Observations - Water

No groundwater or significant seepage was observed during or after auger drilling of the boreholes. However, water circulation due to coring within the boreholes prevented further observations of groundwater levels within BH1, BH2M and BH3M on the day of drilling.

Field data recorded before sampling during the GME conducted on 13 October 2021 is presented in **Table 7-3**. Field data sheets are attached in **Appendix F**. Groundwater sample was evaluated on the basis of odour and visual signs of contamination, with the following observations noted:

- Groundwater recovered from monitoring wells was observed to be brown, with high turbidity.
- No olfactory or visual evidence of contamination, such as hydrocarbon odours, was detected in the monitoring wells. No sheens were observed on the sampled groundwater.
- Groundwater at monitoring well BH3M could not be sampled during the GME, due to a car parked above the well.
- The field data indicated that the local groundwater was slightly acidic (pH 6.46) and fresh (EC 415 $\mu\text{S/cm}$)

Table 7-3 Groundwater Field Data

Well	Top of Casing (mAHD)	SWL (mAHD)	DO (mg/L)	pH	EC ($\mu\text{S/cm}$)	T ($^{\circ}\text{C}$)	Redox ¹ (mV)
BH2M	20.3	16.46	NA	6.46	415	22.08	138.1

Notes:

¹ Field Redox (mV) readings adjusted to Standard Hydrogen Electrode (SHE) by adding field electrode potential (205mV).
 DO – Dissolved Oxygen in units of milligrams per litre (mg/L)
 EC – groundwater electrical conductivity as measured onsite using portable EC meter
 mV – millivolts
 L – litres (referring to volume of water purged from the well prior to groundwater sample collection)
 Redox – Reduction Potential
 $\mu\text{S/cm}$ – micro Siemens per centimetre (EC units)

7.3 Laboratory Analytical Results

7.3.1 Soil Analytical Results

Summary of the soil analytical results for this investigation is presented in **Table 7-4**. More detailed tabulation of results showing the concentrations for individual samples alongside the adopted soil criteria are presented in **Tables 1.1 and 1.2, Appendix B**.

Table 7-4 Summary of Soil Analytical Results

Number of Primary Samples	Analyte	Minimum Concentration (mg/kg)	Maximum Concentration (mg/kg)	SILs Samples Exceeding
Priority Metals				
8	Arsenic	1	19	None
8	Cadmium	<0.3	<0.3	None
8	Chromium (Total)	3.1	13	None
8	Copper	0.9	28	None
8	Lead	6	150	None
8	Mercury	<0.05	0.2	None
8	Nickel	<0.5	1.6	None
8	Zinc	2.2	120	None
BTEX				
8	Benzene	<0.1	<0.1	None
8	Toluene	<0.1	<0.1	None
8	Ethyl benzene	<0.1	<0.1	None
8	Xylenes (Total)	<0.3	<0.3	None
8	Naphthalene	<0.1	<0.1	None
TRH				
8	F1	<25	<25	None
8	F2	<25	<25	None
8	F3	<90	<90	None
8	F4	<120	<120	None
Pesticides				
7	OCP	<1	6	None
7	OPP	<1.7	<1.7	None
PCB				
7	Total PCB	<1	<1	None
PAH				
8	Benzo(a)pyrene	<0.1	0.3	None
8	Carcinogenic PAH (as B(a)P TEQ)	<0.3	0.5	None
8	Total PAH	<0.8	4.8	None
Asbestos				
6	Asbestos	Not detected	Not detected	None

All soil samples concentrations were found to comply with the SILs presented in **Section 5.6**.

7.3.2 Groundwater Analytical Results

Detailed tabulation of results showing the concentrations for tested sample alongside the adopted groundwater criteria is presented in **Table 2, Appendix B**.

All concentrations were found to comply with the GILs presented in **Section 5.6**.

It is noted that TRH (fraction F3) was detected in well BH2M (820 µg/L). However, once silica gel clean-up was undertaken on the sample, no petroleum hydrocarbons were reported. This suggests that the chemical compounds reported as TRH likely comprise organic matter within the sediments in groundwater and not anthropogenic petroleum hydrocarbons.

8. Site Characterisation

8.1 Subsurface Conditions

The site lithology was generalised as a layer of gravelly sand/sand and silty clay fill to maximum depth of 1.0 mBGL, overlying residual silty clay (down to 9.3 mBGL). Shale and sandstone was encountered at depths from 2.9 mBGL.

8.2 Soil Impacts

Based on results obtained during this investigation, soils were not impacted by any of the COPCs. For all tested samples, soil concentrations did not exceed the human-health and ecological criteria.

Asbestos fragments were not detected.

8.3 Groundwater Impacts

Groundwater depth at the south-eastern corner of the site (BH2M) was 3.94 mBGL (RL 16.46 mAHD). No visual or olfactory signs of contamination were observed during groundwater sampling (i.e. no hydrocarbon odours, no sheen). The field data indicated that the local groundwater was slightly acidic (pH 6.46) and fresh (EC 415 $\mu\text{S}/\text{cm}$). Groundwater flow direction could not be measured, however was inferred to be to the northwest, based on the site topography.

The concentrations of the potential contaminants were below the adopted GILs for the tested sample. Although monitoring well BH3M could not be sample, the likelihood of contamination deriving from on-site sources in that location is low, since well BH2M (where no exceedances were reported) is positioned upgradient of BH3M.

It is noted that TRH (fraction F3) was detected in well BH2M (820 $\mu\text{g}/\text{L}$). However, once silica gel clean-up was undertaken on the sample, no petroleum hydrocarbons were reported. This suggests that the chemical compounds reported as TRH likely comprise organic matter within the sediments in groundwater and not anthropogenic petroleum hydrocarbons.

8.4 Review of the CSM

On the basis of additional investigation findings, the CSM discussed in **Section 4** was considered to appropriately identify contamination sources, migration mechanisms and exposure pathways, as well as potential on-site and off-site receptors.

The potential for contamination in subsurface soils and groundwater from investigation of accessible areas of the site was considered low, and a low human health and ecological risk is indicated.

In view of the proposed development, which includes a single level basement across the eastern and southern most portion of the site, a substantial amount of fill and also natural soils and bedrock will be surplus material that will require removal and disposal off site. At this stage, waste classification for fill and natural soils is anticipated.

In regards to groundwater, contamination from on-site and off-site sources is unlikely. Additional investigation is not warranted.

The following data gap was identified at the end of this investigation and a comment on how each of these can be addressed is outlined in **Table 8-1**.

Table 8-1 Data Gap Closure

Data Gap	Comment
Portions of the site not accessed due to current site structures.	Soil results demonstrate no exceedances of the adopted criteria for any of the collected samples. Fill and natural soils will require removal and disposal off site during basement construction. Waste classification assessment during site redevelopment (following demolition and prior to earthworks) will address this data gap.

9. Conclusions

The property located at 6-8 Woodburn Street, Redfern NSW was the subject of a DSI, which was conducted in order to assess the nature and degree of on-site contamination associated with current and historical land uses.

The key findings of this DSI were as follows:

- The site has been predominantly used for commercial purposes since at least 1929. Building demolitions were not evident and building structures remained unchanged from 1930s. Historical site uses between 1950 and 1991 included a variety of manufacturing and sales of cardboard box, cartons, tailors, clothing, handbags.
- Surrounding lands also appeared to be fully developed from the 1930s and building structures and uses has generally remained commercial. A number of manufacturing activities existed surrounding the site between 1950 and 1991. Also, potential contaminating activities within the surrounding lands that were hydraulically upgradient consisted of dry cleaners, motor garage, battery and acid manufactures and a service station.
- The site slopes down towards the west. A retaining wall was observed along the central portion of the site, being the eastern end of the retaining wall filled to a level of approximately reduced level (RL) 20.4 metres Australian Height Datum (mAHD). On the western side of the wall a RL17.4 mAHD was recorded.
- The site walkover outlined the following:
 - › No fragments of potential asbestos containing material (ACM) were observed at the surface across the site.
 - › Potential lead based paints were observed on external walls paint.
 - › No unusual odours were noted.
 - › No underground storage tanks (UST) or aboveground storage tanks (AST) were present.
- The site lithology was generalised as a layer of gravelly sand/sand and silty clay fill to maximum depth of 1.0 metres below ground level (mBGL), overlying residual silty clay (down to 9.3 mBGL). Shale and sandstone were also encountered at depths from 2.9 mBGL.
- Based on results from this investigation, soils were not impacted by any of the COPCs. For all tested samples, soil concentrations did not exceed the human-health and ecological criteria. Asbestos fragments were not detected.
- Groundwater depth at the south-eastern corner of the site (BH2M) was recorded at 3.94 mBGL (RL 16.46 mAHD).
- Groundwater flow direction was inferred to be north-west, based on site topography.
- No visual or olfactory signs of contamination were observed during groundwater sampling (i.e. no hydrocarbon odours, no sheen). The field data indicated that the local groundwater was slightly acidic (pH 6.46) and fresh (electro-conductivity (EC) 415 μ S/cm).
- For tested groundwater samples, the concentrations of the potential contaminants were below the adopted groundwater investigation levels (GILs) for all samples. It was noted that although total recoverable hydrocarbons (TRH) (fraction F3) were detected at samples

collected from well BH2M, they are likely due to the presence of natural organic matter in groundwater (based on non-detect results reported by the same sample after silica gel clean-up).

- Portions of the site that could not be accessed due to existing site structures remained as a data gap, which can be closed following demolition works.

Based on the findings of this DSI, and with consideration of EI's Statement of Limitations (**Section 11**), EI concluded that the site can be made suitable for the proposed mixed use development (that includes a mixed commercial and residential building overlying a single level basement car park) subject to the implementation of the recommendations listed in **Section 10**.

10. Recommendations

In view of the findings of this investigation and in accordance with the NEPC (2013) guidelines, the site can be made suitable for the proposed mixed commercial and residential on completion of the following recommendations:

- Before commencement of any demolition works, a Hazardous Materials Survey (HMS) should be completed by a suitably qualified consultant, to identify any hazardous materials present within the existing building fabrics.
 - › If present, all identified hazardous materials must be appropriately managed, to maintain worker health and safety during demolition works and prevent the spread of hazardous substances.
 - › An asbestos clearance inspection and certificate should be completed by a suitably qualified professional (SafeWork NSW Licensed Asbestos Assessor) following the removal of all ACM from the site.
 - › Where clearance inspection indicates the presence of hazardous materials remaining on the site, further removal and validation works must be undertaken.
- Preparation of a waste management plan to classify all waste material and surplus material including potential virgin excavated natural material (VENM) to be removed from the site, in accordance with the NSW EPA (2014) Waste Classification Guidelines, Protection of the Environment Operations Act 1997, and Work Health and Safety Regulation 2017;
 - › An unexpected finds protocol for implementation following pavement removal and during site excavation to ensure any potential contamination sources (e.g. soil staining and odour, or buried asbestos) are identified and managed in accordance with the NSW EPA legislation and guidelines.
 - › The unexpected finds protocol should also include a section for acid sulfate soil management, should any signs encountered during basement excavation.

11. Statement of Limitations

This report has been prepared for the exclusive use of YPI2B Ownership Trust No 6, whom is the only intended beneficiary of EI's work. The scope of the investigation carried out for this report was limited to that agreed with YPI2B Ownership Trust No 6.

This report was prepared for the above named client and no responsibility is accepted for use of any part of this report in any other context or for any other purpose or by other third parties. This report does not purport to provide legal advice.

EI has used a degree of care and skill ordinarily exercised in similar investigations by reputable members of the environmental industry in Australia, as at the date of this document. No other warranty, expressed or implied, is made or intended. Each section of this report must be read in conjunction with the whole of this report, including its appendices.

EI's professional opinions are reasonable and based on its professional judgment, experience and training. They are subject to modification, however, if additional information is obtained through other data searches initiated with government authorities and/or additional intrusive investigations.

Technical opinions may also be amended in the light of further investigation, observations, or validation testing and analysis during remedial activities. In some cases, further testing and analysis may be required, which may result in a further report with different conclusions. Neither EI, nor any other reputable consultant, can provide unqualified warranties nor does EI assume any liability for site conditions not observed or accessible during the time of the investigations.

This report and associated documents remain the property of EI subject to payment of all fees due for this investigation. The report shall not be reproduced except in full and with prior written permission by EI.

Notes:
 Highlighted cell indicates which criteria exceeded.
 Indicated chemical concentration exceeded Ecological Based Soil Criteria. □
 Indicated chemical concentration exceeded Human Health Based Soil Criteria.

All concentrations are recorded in mg/kg (unless otherwise stated)
 NA = 'Not Analysed' i.e. the sample was not analysed.
 ND = 'Not detected' i.e. all concentrations of the compounds within the analyte group were found to be below the laboratory limits of detection.
 NL = 'Not Limiting' - The tested contaminant cannot exceed the maximum allowable vapour risk due to its specific chemical solubility limit - Ref. NEPC 2013, Schedule B1, Table 1A(3).
 NR = No current published criterion.
 SILS = Soil Investigation Levels - NEPC (2013) National Environmental Protection (Assessment of Site Contamination) Measure 1999 - 2013 Amendment, Schedule B1, for the indicated exposure settings
 1 = HIL - Health based investigation levels.
 2 = HSL - Health based screening levels for vapour intrusion - Coarse Grained soil values were applied, being the most conservative of the material types.
 3 = EIL - Ecological investigation levels and ESL - Ecological screening levels. These are generic and site-specific values derived for the site using ASC NEPM Schedule B1, Tables 1B(1), 1B(2), 1B(3), 1B(4), 1B(5) and 1B(6). EILs / ESLs only apply to the top 2.0 m (root zone).
 4 = Management Limits for TPH fractions in soil - Coarse Grained soil values were applied, being the most conservative of the material types.
 5 = All tested VOCs were below the laboratory PQL.
 6 = DDT+DDE+DDD

TRH Fractions
 F1 = To obtain F1 subtract the sum of BTEX concentrations from the C6-C10 fraction.
 F2 = To obtain F2 subtract Naphthalene from the >C10-C16 fraction.
 F3 = (>C16-C34)
 F4 = (>C34-C40)

Notes:
 Highlighted cell indicates the criteria exceeded.
 Indicates analyte concentration exceeded the adopted ecological criteria.
 Indicates analyte concentration exceeded the adopted human health criteria.

All values are µg/L unless stated otherwise

NR = No current publish criterion

ND = "Not Detected" i.e. the concentration was below the laboratory limit of reporting.

1 = ANZG criteria applied are the low-moderate reliability default guideline values for marine water quality at the 95% protection level for moderately disturbed aquatic ecosystems. A 99% level of species protection was used for the bioaccumulative metals Cadmium and Mercury.

2 = NEPC criteria for public recreational area, applied for landscape are where potential deep soils are to be retained. Ref. ASC NEPM 2013, Schedule B1, Table 1A(4).

3 = NEPC criteria applied are the Groundwater Health Screening Levels for vapour intrusion for low to high density residential, applied where basement car park exist. Ref. ASC NEPM 2013, Schedule B1, Table 1A(4).

4 = NHMRC Recreational Water criteria are the lower value between NHMRC (2017) Australian Drinking Water Guideline x 10 and the Aesthetic based drinking quality guideline. An * is shown where the Aesthetic value is applied.

5 = NJDEP Vapour Intrusion Screening Levels and indoor air remediation Standards, Table 1.

6 = The extraction date for TRH Silica Gel clean-up on sample BH2M was due 20 October 2021. Sample extraction was completed on 18 November 2021.

7 = Value based on the higher Groundwater remediation standard.

Please do not amend the subject line of this email

Dear Mr Chen

Re: Site Search for Schedule 11 Hazardous Chemicals on premises Application – Result not found

I refer to your application for a Site Search for Schedule 11 Hazardous Chemicals on premises for the following site: 6-8 Woodburn St, Redfern.

A search of the records held by SafeWork NSW has not located any records pertaining to the above-mentioned premises.

If you have any further information or if you have any questions, please use one of the following options, quoting the SafeWork NSW enquiry reference number: 00604787

- Email: licensing@safework.nsw.gov.au
- Phone: 13 10 50

Kind regards

Gabriela Draper
Licensing Representative
SafeWork NSW | Better Regulation Division

Contaminated Land

6-8 Woodburn Street, Redfern, NSW 2016

List of NSW contaminated sites notified to EPA

Records from the NSW EPA Contaminated Land list within the dataset buffer:

Map Id	Site	Address	Suburb	Activity	Management Class	Status	Location Confidence	Dist	Direction
13482	Cnr Regent Street & Wellington Street, Chippendale	Wellington STREET	CHIPPENDALE	Chemical Industry	Contamination currently regulated under CLM Act	Current EPA List	Premise Match	270m	North
458	Australian Technology Park	Henderson Road	Eveleigh	Other Industry	Regulation under CLM Act not required	Current EPA List	Premise Match	442m	South West
1136	BP Service Station	116 Regent Street	Redfern	Service Station	Regulation under CLM Act not required	Current EPA List	Premise Match	452m	South
13435	Formerly Gas N Go Alexandria (fully redeveloped into residential apartment as of September 2016)	10-20 Botany ROAD	ALEXANDRIA	Service Station	Regulation under CLM Act not required	Current EPA List	Premise Match	644m	South
1351	Shell Coles Express Service Station	387-429 Wattle Street	Ultimo	Service Station	Regulation under CLM Act not required	Current EPA List	Premise Match	897m	North

The values within the EPA site management class in the table above, are given more detailed explanations in the table below:

EPA site management class	Explanation
Contamination being managed via the planning process (EP&A Act)	The EPA has completed an assessment of the contamination and decided that the contamination is significant enough to warrant regulation. The contamination of this site is managed by the consent authority under the Environmental Planning and Assessment Act 1979 (EP&A Act) planning approval process, with EPA involvement as necessary to ensure significant contamination is adequately addressed. The consent authority is typically a local council or the Department of Planning and Environment.
Contamination currently regulated under CLM Act	The EPA has completed an assessment of the contamination and decided that the contamination is significant enough to warrant regulation under the Contaminated Land Management Act 1997 (CLM Act). Management of the contamination is regulated by the EPA under the CLM Act. Regulatory notices are available on the EPA's Contaminated Land Public Record of Notices.
Contamination currently regulated under POEO Act	The EPA has completed an assessment of the contamination and decided that the contamination is significant enough to warrant regulation. Management of the contamination is regulated under the Protection of the Environment Operations Act 1997 (POEO Act). The EPA's regulatory actions under the POEO Act are available on the POEO public register.
Contamination formerly regulated under the CLM Act	The EPA has determined that the contamination is no longer significant enough to warrant regulation under the Contaminated Land Management Act 1997 (CLM Act). The contamination was addressed under the CLM Act.
Contamination formerly regulated under the POEO Act	The EPA has determined that the contamination is no longer significant enough to warrant regulation. The contamination was addressed under the Protection of the Environment Operations Act 1997 (POEO Act).
Contamination was addressed via the planning process (EP&A Act)	The EPA has determined that the contamination is no longer significant enough to warrant regulation. The contamination was addressed by the appropriate consent authority via the planning process under the Environmental Planning and Assessment Act 1979 (EP&A Act).
Ongoing maintenance required to manage residual contamination (CLM Act)	The EPA has determined that ongoing maintenance, under the Contaminated Land Management Act 1997 (CLM Act), is required to manage the residual contamination. Regulatory notices under the CLM Act are available on the EPA's Contaminated Land Public Record of Notices.

EPA site management class	Explanation
Regulation being finalised	The EPA has completed an assessment of the contamination and decided that the contamination is significant enough to warrant regulation under the Contaminated Land Management Act 1997. A regulatory approach is being finalised.
Regulation under the CLM Act not required	The EPA has completed an assessment of the contamination and decided that regulation under the Contaminated Land Management Act 1997 is not required.
Under assessment	The contamination is being assessed by the EPA to determine whether regulation is required. The EPA may require further information to complete the assessment. For example, the completion of management actions regulated under the planning process or Protection of the Environment Operations Act 1997. Alternatively, the EPA may require information via a notice issued under s77 of the Contaminated Land Management Act 1997 or issue a Preliminary Investigation Order.

Dry Cleaners, Motor Garages & Service Stations 1948-1993 Road or Area Matches

Dry Cleaners, Motor Garages & Service Stations from UBD Business Directories, mapped to a road or an area, within the dataset buffer. Records are mapped to the road when a building number is not supplied, cannot be found, or the road has been renumbered since the directory was published.

Note: The Universal Business Directories were published between 1948 and 1993. Dry Cleaners, Motor Garages & Service Stations have been extracted from all of these directories except the following years 1951, 1955, 1957, 1960, 1963, 1973, 1974, 1977, 1987.

Geological Units 1:100,000

What are the Geological Units within the dataset buffer?

Symbol	Description	Unit Name	Group	Sub Group	Age	Dom Lith	Map Sheet	Dist	Dir
Rwa	Black to dark grey shale and laminate	Ashfield Shale	Wianamatta Group		Triassic		Sydney	0m	On-site
mf/Qha	Man-made fill (dredged estuarine sand and mud, demolition rubble, industrial and household waste) overlying silty to peaty quartz sand, silt and clay with ferruginous & humic cementation in places and common shell layers				Quaternary		Sydney	41m	North West
Qhd	Medium to fine-grained marine sand with podsols				Quaternary		Sydney	76m	South East
Rh	Medium to coarse grained quartz sandstone, very minor shale and laminate lenses				Triassic		Sydney	288m	North
Qha	Silty to peaty quartz sand, silt, and clay. Ferruginous and humic cementation in places. Common shell layers				Quaternary		Sydney	863m	North East

Geological Structures 1:100,000

What are the Geological Structures within the dataset buffer?

Feature	Name	Description	Map Sheet	Distance	Direction
Dyke			Sydney	68m	South
