Manildra – Port Kembla Bulk Liquid Terminal Bulk Liquid Terminal

Groundwater Assessment and Management Report

Client Reference No. 30013038-R06
Prepared for: Manildra Group Pty Ltd
26 May 2022

Through our specialist expertise, we deliver advanced infrastructure solutions for our clients and partners.

Leveraging our 70-year history of delivering nation-building infrastructure, we provide technical expertise and advanced engineering services to resolve complex challenges.

Through our network of global specialists collaborating with local partners, we connect you with the best teams and capabilities to deliver innovative and sustainable solutions.

We’re redefining exceptional

Important Notice

This report is confidential and is provided solely for the purposes of documenting a Groundwater Assessment and Management Report for Part of Lot 6 DP1236743 and Part of Lot 2 DP 1182823 Foreshore Road, Port Kembla This report is provided pursuant to a Consultancy Agreement between SMEC Australia Pty Limited ("SMEC") and Manildra Group Pty Ltd, under which SMEC undertook to perform a specific and limited task for Manildra Group Pty Ltd. This report is strictly limited to the matters stated in it and subject to the various assumptions, qualifications and limitations in it and does not apply by implication to other matters. SMEC makes no representation that the scope, assumptions, qualifications and exclusions set out in this report will be suitable or sufficient for other purposes nor that the content of the report covers all matters which you may regard as material for your purposes.

This report must be read as a whole. The executive summary is not a substitute for this. Any subsequent report must be read in conjunction with this report.

The report supersedes all previous draft or interim reports, whether written or presented orally, before the date of this report. This report has not and will not be updated for events or transactions occurring after the date of the report or any other matters which might have a material effect on its contents, or which come to light after the date of the report. SMEC is not obliged to inform you of any such event, transaction or matter nor to update the report for anything that occurs, or of which SMEC becomes aware, after the date of this report.

Unless expressly agreed otherwise in writing, SMEC does not accept a duty of care or any other legal responsibility whatsoever in relation to this report, or any related enquiries, advice or other work, nor does SMEC make any representation in connection with this report, to any person other than Manildra Group Pty Ltd. Any other person who receives a draft or a copy of this report (or any part of it) or discusses it (or any part of it) or any related matter with SMEC, does so on the basis that he or she acknowledges and accepts that he or she may not rely on this report nor on any related information or advice given by SMEC for any purpose whatsoever.

The findings of this this report are the result of methodologies used in accordance with normal practices and standards. We consider that they represent a reasonable interpretation of the general conditions of the Site at the time they were assessed and at the time of writing this report, but under no circumstances, can it be considered that these findings represent the actual state of the Site in all areas.

In preparing this report, current guidelines for assessment and management of groundwater were followed. This work has been conducted in good faith in accordance with SMECs understanding of the client's brief and general accepted practice for environmental consulting.

Executive Summary

Manildra Group Pty Ltd (Manildra) is proposing to construct an ethanol storage facility and pipeline located on Part of Lot 6 DP1236743 and Part of Lot 2 DP 1182823, Foreshore Road, Port Kembla (herein known as 'the Site').

This report presents a Groundwater Assessment and Management Report prepared by SMEC Australia Pty Ltd (SMEC) in support of the State Significant Development application for the proposed redevelopment of Manildra - Port Kembla Bulk Liquid Terminal ('the Project'). This report is written to address the Secretary Environmental Assessment Requirements (SEARs) and specifically to provide advice relating to potential groundwater interactions (dewatering) during construction. The Site is currently leased by Manildra from NSW Ports.

SMEC undertook groundwater investigations including:

- Desktop review of Site information sources pertaining to groundwater
- Installation of five groundwater wells to supplement existing available onsite wells within the Site main terminal
- Continuous water level logging for a period of 3 months within available wells (*pending completion)*
- One groundwater monitoring event carried out at eight wells. This constituted the third baseline monitoring event, supplementing two previous rounds (April and October 2021).

SMEC consider that the main development activities which could impact upon groundwater are three localised deep excavations for installation of stormwater features (including gross pollutant traps and an underground storage tank) and linear excavations for installation of gravity retaining wall foundations and underground stormwater pipework. In most cases, excavations and foundations would be installed 'wet' or using prefabricated material. A single excavation for installation of proposed stormwater underground storage tank (identified as 'Excavation 3') would have a significant interaction with groundwater requiring dewatering.

Remaining construction activities within the main terminal and pipeline route are not expected to involve direct interaction below the groundwater table. Driven piles foundations would not involve excavation but may displace sediments and groundwater.

The 'baseline' groundwater quality at the Site main terminal is characterised by elevated concentrations of heavy metals and nutrients (nitrogen and phosphorus) which exceeded adopted groundwater investigation levels at the 95% protection level. The groundwater quality considered a regional issue related to long term historical industrial activities and land reclamation with poorer quality fill in Port Kembla, including beneath and surrounding the Site. The quality of the groundwater is not likely to have an impact to the proposed development itself, but there is potential for impact to downgradient ecological receptors.

Site information was used to input to numerical modelling to inform the excavation strategy for 'Excavation 3'. Based on the modelling results, SMEC recommended sheet piles be installed to the depth of the basal clay layer (i.e. bottom of the aquifer at -7.5m AHD) in order to limit drawdown and the volume of water required to be pumped and treated. The likely volume of water which may be required to be pumped and treated is estimated to be as little as 500 m^3 and less than 2000 m^3 over a five-day installation period excluding installation of the sheet pile wall.

This Groundwater Management Procedures contained in this report includes proposed mitigation measures for excavations and dewatering which have potential for groundwater interaction during construction. Water quality monitoring would be carried out on a minimum quarterly basis during and post-construction to assess potential impacts to groundwater quality.

Impacts on groundwater are less likely to occur during operation of the proposed development. This assumes all plant and equipment designed, commissioned, operated and maintained to prevent and capture spills and leakages of bulk liquids during normal operational. Operational requirements consider exceptional events outside of normal operation as triggers for additional (event based) monitoring to enable further assessment of potential impacts.

Abbreviations

Abbreviation / Acronym	Description
AHD	Australian Height Datum
ASS	Acid sulfate soils
ASSMP	Acid Sulfate Soils Management Plan
BTEX	Benzene, toluene, ethylbenzene and xylenes
CEMP	Construction Environmental Management Plan

TPH	Total Petroleum Hydrocarbons
VHC	Volatile halogenated compounds

1. Introduction

1.1 General

Manildra Group Pty Ltd (Manildra) is proposing to construct an ethanol storage facility and pipeline located on Part of Lot 6 DP1236743 and Part of Lot 2 DP 1182823, Foreshore Road, Port Kembla (herein known as 'the Site'). The Site locality is shown on Figure 1, Appendix A.

The proposed development will consist of installation of six above ground storage tanks, associated bunds and features, construction of a new bridge crossing, a gravity retaining wall adjacent the existing tidal stormwater channel, installation of buried stormwater infrastructure including an underground storage tank and two stormwater treatment devices, construction of service road and driveway pavements, drainage and grading features. Earthworks activities associated with the development are expected to include deep excavations for stormwater infrastructure, a network of linear utilities trenches and foundation excavations for gravity retaining wall, and shallow site recontouring and timber driven piles beneath bridge and tank structures. The development includes construction of a new pipeline route connecting to existing Jetty No. 4. The Site layout is shown on Figure 2, Appendix A.

This report presents a Groundwater Assessment and Management Report prepared by SMEC Australia Pty Ltd (SMEC) in support of the State Significant Development application for the proposed redevelopment of Manildra - Port Kembla Bulk Liquid Terminal ('the Project'). This report is written to address the Secretary Environmental Assessment Requirements (SEARs) and specifically to provide advice relating to potential groundwater interactions (dewatering) during construction. The Site is currently leased by Manildra from NSW Ports. The scope of works was carried out in general accordance with SMEC's '*Fee Proposal – Groundwater assessment, Part of Lot 6 DP1236743, Foreshore Road, Port Kembla NSW*', dated 07/03/2022 (ref: 30013038-V05 Rev 2).

1.2 Project background

SMEC has previously undertaken investigations at two portions of the Site (identified herein as the 'main terminal' and 'pipeline route') to fulfil the planning process and requirements of NSW Ports Development Code, pertaining to contamination assessment and acid sulfate soils assessment information for the proposed design. These include:

- Preliminary Geotechnical and Contamination Investigation (SMEC, 2021a), ref: 30013028-R01)
- Detailed Site Investigation (DSI) (main terminal) in December 2021 (SMEC, 2021b, ref: 30013038-R04)
- Targeted Site Investigation (pipeline route) in April 2022 (SMEC, 2022a, ref: 30013038-R05)
- Acid Sulfate Soils Management Plan (ASSMP) (SMEC, 2022b, ref: 30013038-R03)
- Remedial Action Plan (RAP) (SMEC, 2022c, ref: 30013038-R02)

The Planning Secretary's Environmental Assessment Requirements (SEARS) were issued on 23 December 2021. The SEARs have identified several key issues including a groundwater assessment which are outlined in Table 1-1:. This Groundwater Assessment and Management Report was written to address the SEARs and specifically to provide advice relating to groundwater dewatering during construction.

Table 1-1: Summary of issues required by SEARs

Item	Key Issues required by SEARS	Where addressed in report
18	Soils and Water – a surface and groundwater assessment, including:	
18.1	an assessment of potential surface and groundwater impacts associated with the development, including potential impacts on receiving waters	Section 3
18.2	an assessment of contaminated groundwater and acid sulfate soils	Section 2.4 and 2.5
18.3	details of all proposed mitigation, monitoring and management measures	Section 7
18.4	characterisation of water quality at the point of discharge to surface and/or groundwater against the relevant NSW Water Quality Objectives and values for the waters of Port Kembla and demonstrate how the project will be designed and operated to protect, maintain or restore these requirements	Section 5

1.3 Project objectives

The objectives of this Groundwater Assessment and Management Report include:

- Carrying out a groundwater baseline characterisation assessment
- Identification of possible impacts to and develop proposed mitigation, monitoring and management measures for groundwater; and
- Prepare a dewatering strategy associated with installation of a proposed underground stormwater storage tank (UST).

Key issues identified by the SEARs relating to surface water are dealt with by others are therefore beyond the scope of this report.

1.4 Scope of work

To fulfill the above objectives, SMEC carried out the following scope:

- Desktop review of Site information sources pertaining to groundwater information including previous investigations by SMEC
- Installation of five groundwater wells (designated SMW02 to SMW06) to supplement existing available onsite wells within the Site main terminal
- Continuous water level logging for a period of 3 months within available wells

  (Note: At the time of this draft, water level logging had occurred for an initial period of approximately 1 month, noting monitoring is continuing for 2 more months)
- One groundwater monitoring event carried out to supplement previous groundwater monitoring at three existing wells (OHMW20, OHMW28 and SMW01) and including five installed wells (SMW02 to SMW06). This constituted the third baseline monitoring event, supplementing two previous rounds (April and October 2021).
- Modelling of groundwater to inform the dewatering strategy associated with installation of one underground storage tank within the Site main terminal.
- Groundwater assessment and interpretation discussing potential impacts on groundwater and waters of Port Kembla, stating the proposed mitigation, monitoring and management measures to be implemented during construction and operation stages.

2. Site information

2.1 Site identification and description

The proposed development is located at Part of Lot 6 DP1236743 and Part of Lot 2 DP 1182823 Foreshore Road, Port Kembla, NSW. The Site consists of two portions identified as 'main terminal' and 'pipeline route' as shown on Figure 2, Appendix A.

Figure 1 and Figure 2, Appendix A show the Site locality and Site layout, respectively.

A summary of Site information is presented below in Table 2-1:.

Table 2-1: Summary of Site information

Aspect	Details
Title identifier	Part of Lot 6 DP1236743 and Part of Lot 2 DP 1182823 (pipeline route only)
Address	Foreshore Road, Port Kembla NSW
Area	Main terminal Manildra supplied drawings showing a Site area of approximately 2.3ha (which excludes the stormwater channel). It is noted that the stormwater channel (approx. 0.14ha) is excluded from the lease. For Site description purposes, the Site has been divided into the three portions shown below on Figure 2–1including: • Western portion – Areas west of the stormwater channel (0.83ha) • Central portion – A centrally located area east of the stormwater channel (0.44 ha) differentiated by a historical property boundary • Eastern portion – An easterly located area east of the stormwater channel (1.02 ha). Pipeline route Manildra supplied drawings showing a proposed linear pipeline route of approximately 460m between the main terminal and Jetty No. 4 west to east with a 4m corridor along the route. The pipeline route occupies an area of approximately 0.18 ha.
Zoning	The Site is located within Port Kembla state significant precinct in NSW. The State Environmental Planning Policy (Three Ports) 2013 is the principal environmental planning instrument applying to the Site.
Current Land use	Main terminal The Site currently consists of vacant industrial land previously used for storage of miscellaneous maritime/port equipment. An open concrete lined stormwater channel passes through the Site, which discharges to the Port Kembla Outer Harbour immediately north of the Site (but does not form part of the lease area). A relatively large crushed or coarse fill stockpile up to about 11m high above current land platform level currently occupies most of the eastern portion of the Site. The coarse fill stockpile appears to comprise largely coarse sandstone boulders up to about 1m diameter. Pipeline route The pipeline route part of the Site is currently unused part of industrial foreshore land in the vicinity of harbour jetty operations.
Proposed land use	The proposed land use is for a bulk liquid (beverage grade ethanol) storage facility and product pipeline route as described further in Section 3.1
Surrounding land use	Main terminal The Site is presently surrounded by: • Remaining NSW Ports foreshore land on Lot 6 (west) currently containing several large soil stockpiles • Foreshore Road (south), then beyond this and further south various industrial facilities including: – Ixom (sulfuric acid plant)

Aspect	Details
	– Cleanaway waste recycling facility – Morgan Cement International Pty Ltd (cement manufacturing and grinding facility) • Other former industrial facilities such as the former copper smelter and fertiliser production facilities • Remaining stockpiled material and vacant land on Lot 6 (east) • Port Kembla Outer Harbour shoreline (north). Pipeline route The Site is surrounded by: • Vacant foreshore land, a sandstone stockpile and paved road to former jetty No. 3 on Part of Lot 6 • Vacant foreshore land, training conference centres, marine compounds/equipment stores and paved road/carparking areas on Part of Lot 2 • An acid production pipeline route bisects the Site (Chainage 390m) and diverts in similar alignment towards Jetty No. 4 (Chainage 390m to 460m) • Port Kembla Outer Harbour shoreline is north approximately between 5m and 25m from the centreline of the pipeline route.

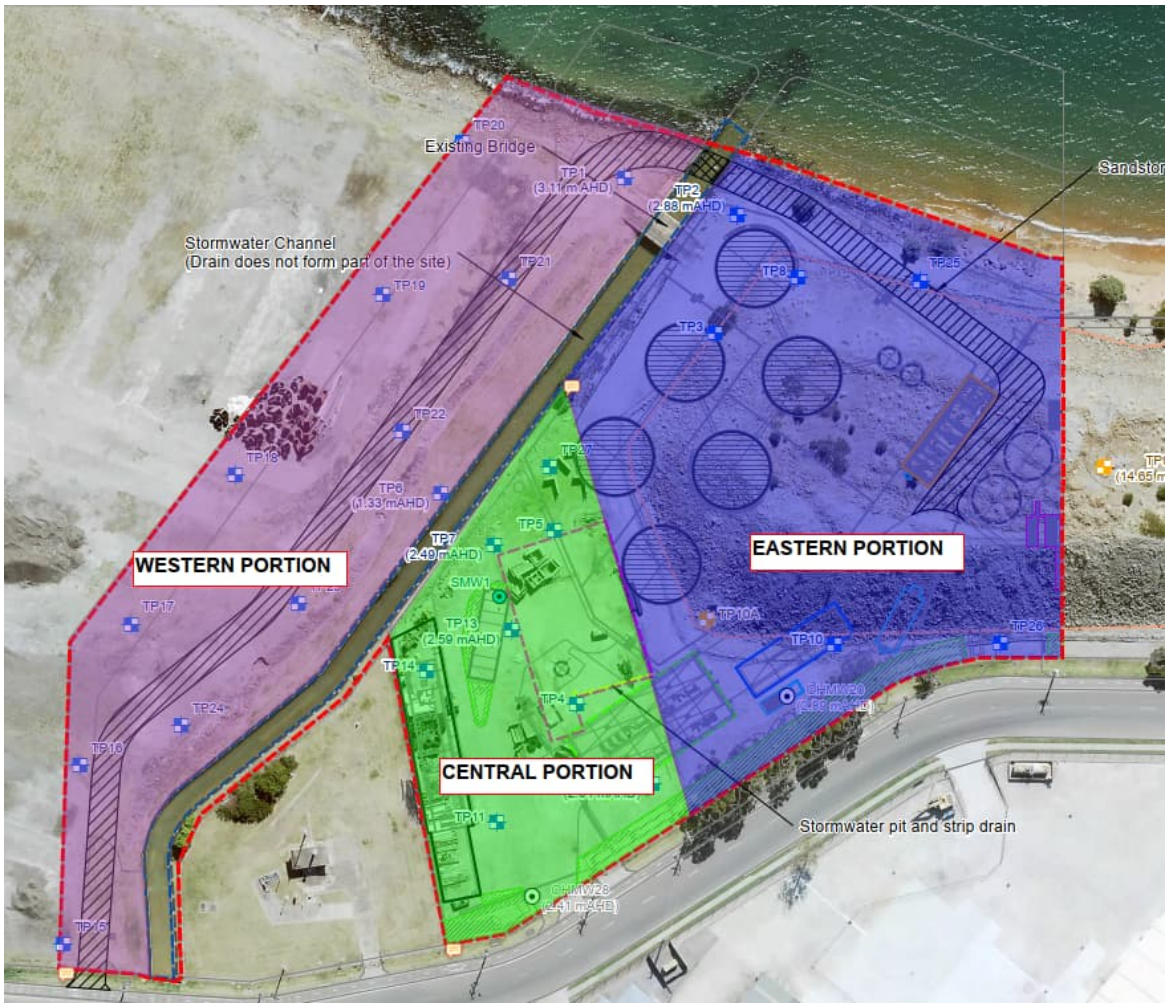

Figure 2–1: Site portions for description purposes – Main terminal

2.2 Previous reports

Background information contained in this Groundwater Assessment and Monitoring Report was sourced from the following previous reports:

- SMEC Australia Pty Ltd (2021a) Preliminary Geotechnical and Contamination Investigation, Part of Lot 6 DP1236743 Foreshore Road, Port Kembla, prepared for Manildra Group Pty Ltd, ref: 30013038-R01, Revision 2, dated 05 May 2021
- SMEC Australia Pty Ltd (2021b) Detailed Site Investigation, Part of Lot 6 DP1236743 Foreshore Road, Port Kembla, prepared for Manildra Group Pty Ltd, ref: 30013038-R04, Revision 1, dated 22 December 2021
- SMEC Australia Pty Ltd (2022a) Targeted Site Investigation – Pipeline Route, Part of Lot 6 DP1236743 and Part of Part of Lot 2 DP 1182823, Foreshore Road, Port Kembla, prepared for Manildra Group Pty Ltd, ref: 30013038-R05, Revision 1, dated 02 May 2022
- SMEC Australia Pty Ltd (2022b) Acid Sulfate Soil Management Plan, Manildra – Port Kembla Bulk Liquid Terminal, prepared for Manildra Group Pty Ltd, ref: 30013038-R03, Revision 2, dated 06 May 2022
- SMEC Australia Pty Ltd (2022c) Remedial Action Plan, Manildra – Port Kembla Bulk Liquid Terminal, prepared for Manildra Group Pty Ltd, ref: 30013038-R02, Revision 1, dated 9 May 2022

A summary of relevant information from these reports are included in this Groundwater Assessment and Management Report. SMEC (2021b) also previously undertook a review of several environmental reports pertaining to the Site and nearby surrounding areas. Reference should be made to the original reports for further detailed information.

2.3 Site information

Relevant Site information is summarised in Table 2-2 below.

Table 2-2: Site information summary

Aspect	Description
Topography	Main terminal The Site terrain appears to have been filled and levelled with a surface elevation between 3.5-4.5 metres above Australian Height Datum (m AHD). The Site surface is predominantly hardstand granulated slag material except for a concrete slab present in the central portion of the Site, and some localised grassed terrain. Other features of the Site include: • A large rock stockpile with steep batters (to a height of approximately +14m AHD) within the eastern portion • East and west of the channel there are localised steep slopes down to the edges of the concrete lined stormwater channel (approximately +2m AHD) • A fill embankment is noted west of the stormwater channel approximately 1.5m to 2m above top of the stormwater channel, indicating the Site terrain appears to have been filled and levelled. Pipeline route Based on survey carried out by Masters Surveying (Drawing 64146-2), the Site is relatively flat with some slight undulations at elevations ranging between 2.9m AHD (Chainage 90) and 4.3m AHD (Chainage 340m).
Vegetation	Main terminal The Site contains a stand of mature trees on the southern Site boundary adjacent to Foreshore Road. Sparsely scattered trees were noted elsewhere, noting most of the Site is hardstand gravel and pavements with some patches of exotic grass vegetation. Pipeline route Except some minor areas of grass coverage, the Site is mainly hardstand gravel and pavements with little or no vegetation.

Aspect	Description
Geology	The 1:100,000 scale geological series sheet of Wollongong to Port Hacking indicates that the Site is underlain by Quaternary quartz and lithic fluvial sand, silt and clay which most likely will overlay either or both the rock formations of: • The Dapto Latite Member, comprising of a melanocratic coarse grained to porphyritic latite • The Budgong Sandstone formation, comprising red-brown and grey volcanic sandstones. Reference to previous drilling in the area of Port Kembla Outer Harbour indicates that the Site is likely underlain by the Budgong Sandstone Formation. However, the Site is also located very close to the boundary between the overlying Dapto Latite and it is possible that some Dapto Latite could be encountered in some parts of this Site particularly towards the southern portion of the Site.
Soil Landscape	Reference to the 1:100,000 Soil Landscape Series Sheet for Central and Eastern NSW (OEH 2019) indicates the Site is within the disturbed terrain soil landscape.
Acid Sulfate Soil	Reference to Acid Sulfate Soil (ASS) risk mapping (NSW Government eSPADE, accessed 23/03/2021) indicates that the Site is located within areas mapped as 'disturbed terrain' with an unknown probability of ASS occurrence. Risk map guidance indicates *that 'disturbed terrain may include filled areas, which often occur during reclamation of low-lying swamps for urban development. Other disturbed terrain includes areas which have been mined or dredged or have undergone heavy development or construction of dams or levees. Soil investigations are required to assess these areas for acid sulfate potential.*' Figure 3, Appendix A shows the acid sulfate soils risk mapping for the Site and surrounding areas. The map indicates the following: Main terminal • The Site western, central and eastern portion is primarily underlain by disturbed terrain (X) at an elevation (2) of 2 to 4m AHD • A relatively smaller northern portion of the Site identifies disturbed terrain (X) at an elevation (1) of 1 to 2m AHD. From preliminary investigation by SMEC (2021a), acid sulfate soils were assessed to be present at the main terminal portion of the Site within relatively thin layers of natural estuarine soils beneath the fill. Further consideration and management of acid sulfate soils was recommended where these soils are to be intersected via excavation or if dewatering will occur which could lower the water table and expose soils to oxidation. Pipeline route • Between Chainage 0 to 180m, the Site is underlain by disturbed terrain (X) at an elevation (2) of 2 to 4m AHD • Between Chainage 180 to 430m, the Site is underlain by disturbed terrain (X) at an elevation (2) of greater than 4m AHD. Based on the Site topography and proposed disturbance depths (refer to Section 3.1), excavations depths were assessed as: • Base level 1.9 to 2.6m AHD (Above ground section of pipeline route - Shallow concrete footings, approximately 1m deep) • Base level 2.3 to 3.3m AHD (Underground section of pipeline route – Cut and cover trenching, approximately 1.8m deep). At these earthworks' levels, acid sulfate soils (if present) within the Site area were assessed to be greater than the depth of proposed disturbance.
Groundwater	Main terminal Based on previous groundwater monitoring that has occurred at the Site, groundwater beneath the Site were historically recorded typically between 1.5m and 3.0m below ground surface with an inferred groundwater flow in a north-easterly direction towards Port Kembla Outer Harbour. Groundwater depths and directions may vary based on Site specific conditions, including tidal influences. A search of the Department of Water and Energy Online Database [accessed 22 March 2021] was carried out to identify registered groundwater bores within the vicinity of the Site. The search indicated multiple registered bores are within industrial properties for monitoring purposes located within 500m of the Site including:

Aspect	Description
	• One registered bore (GW114085) located 100m south of the Site (within Morgan Cement International property) • Greater than 50 registered bores between 300m and 600m south of the Site (former Port Kembla Copper Smelter) • Six registered bores 450m south-east of the Site (Vesuvius manufacturing facility. Pipeline route Based on Site topography, the depth of groundwater along the pipeline route is expected to be at depths between 2-3m below ground level based on the proximity to the open harbour environment. Groundwater within the Site area is assessed to be greater than the depth of proposed disturbance.
Surface Water	Main terminal Surface water at the main terminal Site is likely to infiltrate into Site soils or shed as runoff partly to Foreshore Road (south), partly to Port Kembla harbour (north) and partly into the adjacent open concrete lined drain (west). The open drain receives stormwater from upslope areas offsite and runs through the Ixom sulfuric acid plant as an open drain, and underground beyond, including through the former copper smelter land further upslope. Pipeline route Surface water runoff from the Site (pipeline route) is likely to shed from hardstand areas directly towards Port Kembla harbour. At asphalt paved areas (Chainage 320 to 460m), surface water runoff is expected to enter urban stormwater drainage pits and pipework prior to discharge at the harbour.
Contamination	From previous investigations by SMEC (2021a, 2021b and 2022a), contamination was identified in soils and groundwater beneath the site including: • Soil recorded elevated concentrations of heavy metals (including lead and arsenic) within fill and underlying natural soils at four test locations (TP5, TP6, TP13,TP14 and TP23 – main terminal) and one test location (BH06 – pipeline route) exceeding human health investigation levels for the proposed industrial land use. Depths of contamination appeared to be within fill/natural clayey soils (typically between 1m bgl and 2.2m bgl) except at one location (TP13) where elevated lead concentrations were recorded within natural sand at a depth of at least 3.0 m bgl (TP13) suggesting deeper lead impact in this area. • The results of two groundwater monitoring events in March and October 2021 recorded elevated concentrations of heavy metals (including cadmium, copper, lead, nickel and zinc) and ammonia which exceeded adopted groundwater investigation levels for protection of marine aquatic ecosystems at the 95% species protection level. Existing soil contamination issues at the Site will be managed under the RAP (SMEC, 2022c).

2.4 Groundwater contamination

2.4.1 Historic monitoring – 1996 to 2011

Groundwater monitoring events were carried out previously for broader foreshore lands which included the Site (main terminal only), between 1996 and 2011. The monitoring data is presented within reports by Groundwater Technology Australia (1996), Flour Daniel GTI (1996 to 1997), IT Environmental (2001 and 2002), URS (2004 to 2006), Douglas Partners (DP, 2009) and SLR (2011). During this period, at least seven groundwater monitoring wells have been installed and monitored at the Site, some of which have now been lost.

The following relevant summary information is noted for this assessment:

- Groundwater monitoring data is available on selected monitoring reports for up to 7 onsite monitoring wells (MW4, MW5, MW7, OHMW20, OHMW28, OHMW26 and MW317) and one nearby offsite monitoring well (MW3) located just down-gradient. Figure 4A, Appendix A shows the historic groundwater well locations and details are summarised below:
  - In 1996, one onsite wells (MW7) was installed within the western portion of the Site, two onsite wells (MW4 and MW5) were installed with the eastern and central portions of the Site, respectively, and one

offsite well (MW3) was installed just east at down gradient location (GTA, 1996). Note: Monitoring at MW5 and MW7 appeared to have discontinued after 1997 and 2006 respectively.

  - Prior to 2003, two onsite wells (OHMW28* and OHMW26) were installed in the eastern and northern portion of the Site (URS, 2006). (*Note: The original location indicated on the URS 2006 plan shows OHMW28 in the eastern portion of the Site).
  - In 2009, an onsite well (OHMW28-1**) was reinstalled in the central portion of the Site (Douglas Partners, 2009). A second onsite well designated (OHMW20) was sampled in the eastern portion of the Site. (**Note: The revised location indicated on the DP 2009 plan shows OHMW28 in the central portion of the Site, the original location now appears to be identified as OHMW20 in subsequent rounds).
  - In 2011, an onsite well (MW317) in the eastern portion of the Site was monitored (SLR, 2011). Monitoring at offsite monitoring well (MW3) and onsite monitoring well (OHMW26) appeared to have discontinued.

- Groundwater samples were analysed for selected heavy metals including arsenic (As), cadmium (Cd), chromium (Cr), copper (Cu), lead (Pb), nickel (Ni), mercury (Hg) and zinc (Zn), selenium (Se), antimony (Sb), polycyclic aromatic hydrocarbons (PAH), total recoverable hydrocarbons (TRH) and/or benzene, toluene, ethylbenzene, xylene (BTEX). During DP (2009) and SLR (2011) Arsenic speciation was carried out on selected samples (OHMW28 and MW3).
- Table 2-3 includes a summary of historical groundwater monitoring data, including the highest recorded heavy metals concentrations recorded by each consultant within onsite or nearby offsite (less than 10m) well locations (including arsenic, cadmium, chromium, copper, lead, nickel, antimony, selenium, and zinc). They provided an indication for preliminary comparison purposes to monitoring data obtained during further baseline groundwater quality assessment (Refer to Section 5.5).
- During Douglas Partners (2009) and SLR (2011) Arsenic speciation was carried out on selected samples indicating the main components was Arsenous Acid (As III) followed by Arsenic Acid (As V). It is noted that ANZG (2018) 95% protection levels criteria for As III and As V apply to freshwater only and have not been assigned for marine ecosystems. The report concluded that some of the metal exceedances may be representative of contamination that may warrant further investigation.

SMEC (2021b) concluded the findings of the desktop contamination study indicated widespread historical industrial land use in the surrounds and elevated concentrations of contaminants of potential concern (particularly heavy metals) within groundwater beneath the Site from past monitoring.

Table 2-3: Summary of site historical groundwater monitoring data

Source reference	Details of groundwater monitoring locations	Contaminants of concern	Contaminant concentrations (highest recorded) (mg/L)								Inferred groundwater flow direction
			As	Cd	Cr	Cu	Pb	Other	Ni	Zn

Note 1: Highest recorded heavy metals concentrations are included for summary purposes noting this may represent more than one monitoring location or groundwater monitoring event. No detections above the laboratory reporting limit were recorded for remaining heavy metals (including mercury), TRH, BTEX and/or PAHs (where tested).

Note 2: DP (2009) noted that speciated arsenic samples were not field filtered. This explains comparatively higher concentration than dissolved arsenic which were field filtered.

Note 3: DP (2009) indicates another onsite well identified on map as MW317 however this was not sampled.

Note 4: URS (2006) recorded a cadmium result of 0.0684mg/L within the primary sample, but not the corresponding duplicate 0.0001mg/L. The primary has been disregarded based on historical trends.

LOR – Limit of reporting

2.4.2 Baseline monitoring – 2021

Baseline groundwater quality and levels were assessed at the Site (main terminal) by SMEC during two previous groundwater monitoring events; one in March 2021 during the preliminary investigation (SMEC, 2021a) and an additional groundwater monitoring event in October 2021 (SMEC, 2021b).

During one or both rounds, contamination laboratory testing of groundwater samples was carried out at three wells (OHMW28, OHMW20 and SMW01) for potential contaminants of concern and additional 'baseline' monitoring parameters including:

- Total recoverable hydrocarbons (TRH)
- Benzene, Toluene, Ethylbenzene, Xylenes (BTEX),
- Polycyclic aromatic hydrocarbons (PAH)
- Speciated Phenols
- Organochlorine pesticides (OCP) and organophosphorus pesticides (OPP) and Polychlorinated Biphenyls (PCB)
- Volatile halogenated compounds (VHCs)
- Nitrogen (ammonia, nitrate, nitrite)
- Total phosphorus*, Reactive phosphorus
- Hardness, Total Dissolved Solids (TDS)
- Major cations (calcium, magnesium, potassium, sodium)
- Major anions (chloride, sulphate and fluoride)
- Alkalinity
- Dissolved heavy metals (aluminium, arsenic, cadmium, chromium (total), cobalt*, copper, iron, lead, mercury, nickel, selenium, uranium* and zinc)
- Total heavy metals (aluminium*, manganese* and iron*)
- Ammonium ion*
- Total acidity*
- Per and poly fluoro alkyl substances (PFAS)

*Note: In October 2021, additional groundwater analysis was also carried out for baseline parameters recommended in the draft Acid Sulfate Soil Management Plan (SMEC, 2021c) including selected additional dissolved heavy metals (cobalt, uranium), total metals (aluminium, iron and manganese), ammonium ion and total phosphorus, and total acidity.

Table E1, Appendix E includes a laboratory summary table for previous groundwater samples sampled and tested during the March and October 2021 events. Figure 4A, Appendix A shows the baseline monitoring 2021 locations and previous monitoring results. Reference should be made to the DSI (SMEC, 2021b) for factual details on monitoring data, including laboratory reports and quality assurance and quality control data evaluation.

2.5 Acid sulfate soils

Acid sulfate soil (ASS) materials are naturally occurring soil and sediment, distinguished from other soil or sediment materials by having properties and behaviour that have either:

1. Been affected considerably by the oxidation of Reduced Inorganic Sulfur (RIS) (principally the mineral iron pyrite), or
2. The capacity to be affected considerably by the oxidation of their RIS constituents.

The factor common to all ASS materials is that RIS components have either had, or may have, a major influence on the properties or behaviour of these soil materials. These soils are typically found in low-lying coastal areas and saline inland areas; however, they have been identified in a wide range of environmental settings.

Acid sulfate soil materials include Potential acid sulfate soils (PASS or sulfidic soil materials) and Actual acid sulfate soils (AASS or sulfuric soil materials). These are often found in the same profile, with AASS overlying PASS.

2.5.1 Subsurface conditions

The subsurface soil conditions across the Site have been summarised by SMEC (2021a, 2021b and 2022a) with five main lithological units, summarised below.

Unit 1	Fill, which is divided into the following main subunits – Unit 1A (Filling Cemented slag), Unit 1B (General fill) within the main terminal, Unit 1C (Stockpile fill) over the eastern portion, Unit 1D (Inferred location of PAH contamination) localised in the western portion. Along the pipeline route, fill consisted of topsoil, Unit 1A (Cemented slag) and Fill (variable)
Unit 2	Aeolian Sands consisting typically of poorly graded, fine to coarse grained sand with some black carbonaceous and dark grey clay laminations, moist to wet. Prior to land reclamation, these materials are inferred to have been deposited in a combination of beach and dune environments. This unit is inferred to be generally in a loose to medium dense condition.
Unit 3	Estuarine soils (sand and clay) high plasticity, firm and loose to medium dense, fine to coarse grained sand with some black carbonaceous and dark grey clay laminations, moist to wetter than the plastic limit. Estuarine clays were typically encountered as a relatively thin layer (typically less than 0.3m thick) from depths of 1.2m bgl, whereas estuarine sands were typically encountered beyond depths of 2.4 m bgl.
Unit 5	Residual Soil which is clay/gravelly clay/sandy clay derived from in-situ weathered latite. The consistency of this unit ranges from very stiff to hard. This unit tends to grade from residual soil to extremely weathered rock with increasing depth. Residual clays were typically encountered during preliminary geotechnical boreholes SMEC (2021a) at depths below 8.5 to 9.0m bgl.
Unit 6	Extremely weathered rock, consisting of extremely to distinctly weathered Latite.

For further details, reference should be made to engineering logs presented within previous investigation reports by SMEC (2021a, 2021b and 2022a).

2.5.2 ASS occurrence and extent

SMEC (2021a) previously carried out soil sampling and testing to assess the potential for ASS within two suspected units based on geological origin; Unit 2 (Aeolian sands) and Unit 3 (Estuarine soils). A summary of ASS laboratory soil data is presented on Figure 4B, Appendix A and factual details are included within the Acid Sulfate Soils Management Plan (ASSMP) (SMEC, 2022b). In summary:

- Potential ASS was likely to be present within:
  - A relatively thin estuarine layer (Unit 3) described as dark grey/grey sandy clay/clay at depths between 1.9-2.2 m bgl.
  - Deeper estuarine sand layers (Unit 3) described as pale grey, medium to coarse grained sand encountered within BH5 and BH7 at depths of 6.0-6.45m bgl and 7.2-7.65 m bgl. Relatively high acid neutralising capacity was noted within these sands, suggesting the potential ASS may be self-buffering.
- The upper natural layers inferred to be Unit 2 (Aeolian sands) in origin (described as pale brown, fine to coarse grained) were not considered to be ASS.
- Due to the expected reduced scale of the soil earthworks, delineation of ASS lateral extents was not assessed as part of SMEC's preliminary investigation. For the purposes of the ASSMP (SMEC, 2022b), the inferred extents of ASS have been assessed from previous investigation findings as follows:
  - Horizontally: Site wide within the extent of works
  - Vertically: At depths greater than 1.2m below ground level (m bgl) within estuarine clays and sands (Unit 3). Previous survey shows the top of Unit 3 (Estuarine soils) is expected to be in the general range of about +1.2 mAHD to 0 mAHD.
- SMEC (2021a) previously recommended that further consideration and management of ASS should be implemented during Site development where the above soils are to be intersected via excavation or if dewatering will occur which could lower the water table and expose soils to oxidation. Groundwater table drawdown can occur from excavation dewatering and affect ASS as they can be exposed to oxygen and oxidise.

2.6 Groundwater wells

Twelve groundwater monitoring wells are onsite (including six existing historic wells and six new wells installed by SMEC 2021-2022). Eleven wells appear to be still useable for monitoring and one well was damaged and partially buried under a drum ('MW damaged' shown on Figure 4A, Appendix A). Where previous survey was carried out to some of the monitoring wells, a summary of survey details is provided in Table 2-4.

Table 2-4 Summary of groundwater wells onsite

Well no.	Inferred monitoring well ID	Easting	Northing	Reduced Level (m AHD)			Details
				Ground level	Top of well casing	Well stickup (m)	
1	MW316 (note 1)	307769.09	6183022.99	2.54	2.46	-0.12	Gatic well - Hex-key metal gatic flush with ground surface
2	MW5 (Note 2)	NS	NS	NS	NS	NS	Gatic well – 'Older style' metal gatic flush with ground surface
3	OHMW28 (Note 3)	307778.51	6182987.64	2.41	3.09	0.68	Monument Well
4	ID Unknown (Note 4)	307814.26	6183015.20	2.66	3.23	0.57	Monument Well
5	OHMW20 (Note 3)	307832.75	6183030.30	2.89	3.83	0.94	Monument Well
6	*MW Damaged* (Note 4)	307826.72	6183045.32	3.31	NS	NS	Monument Well – Well damaged
7	SMW01	307771.69	6183048.65	2.57	3.33	0.76	Monument Well
8	SMW02	307889.38	6183043.42	NS	3.63	0.74	Monument Well
9	SMW03	307881.90	6183114.52	NS	3.78	0.69	Monument Well
10	SMW04	307848.12	6183124.30	NS	3.61	0.65	Monument Well
11	SMW05	307825.76	6183134.07	NS	3.58	0.72	Monument Well
12	SMW06	307734.25	6183055.70	NS	4.17	0.76	Monument Well

Note 1: Well location MW316 was labelled on the well cap, noting this location was not formerly shown on historical monitoring reports.

Note 2: Well locations MW5 was inferred from maps within contamination assessment (CMPS&F, 1996).

Note 3: Well location OHMW28 and OHMW20 were inferred from maps within historical groundwater monitoring report (DP, 2009 and SLR, 2011).

Note 4: Remaining well identification remains unknown.

NS – Not surveyed

Gatic well = well finished level with ground surface with a steel gatic type cover

Monument well = well finished above ground surface with a steel monument

3. Environmental activities and impacts

3.1 Proposed development

3.1.1 Main terminal

Manildra propose to lease and redevelop the Site into an ethanol storage facility. Based on information provided by Manildra, the proposed development is expected to comprise:

- Six above ground storage tanks (2.5ML to 5ML capacity for beverage grade alcohol) located inside a raised bunded area, plus two slops tanks
- Demolition of existing bridge and construction of one new proposed bridge crossing over the adjacent stormwater channel to the west, to connect to a service road with Foreshore Road
- A gravity retaining wall installed along the boundary with the stormwater channel (approx. 220m length) including either side of the proposed bridge and along the western Site boundary adjacent to the adjoining sewer pump station (offsite)
- New stormwater network including pipework, underground storage tank, two stormwater treatment devices and outlet structures
- Perimeter roadways/pavements
- Firefighting system including foam suppressant system and water supply tanks
- Ancillary features such as substation, workshop and sheds which would be small and single storey.

Figure 2, Appendix A shows the approximate position of proposed Site development features relative to the Site boundaries.

Some Site recontouring involving both 'cut to fill' earthworks are required to achieve design ground levels. SMEC understand 'site won' excavated soils are proposed for reuse with the balance imported material proposed to be used to raise existing ground levels as fill. Alternatively, if contaminated, onsite containment of soils in designated areas is proposed as outlined in the RAP (SMEC, 2022c). It is understood the proposed development layout includes Site earthworks which seek to minimise ground and groundwater disturbance by minimising the quantity and depth of excavations/cuts. An exception applies to deeper localised excavations associated with stormwater pipework, underground tank and gross pollutant traps; these areas will generate surplus excavated spoil to be managed onsite.

SMEC understand that timber driven piles will be used for foundations of the tank structures. Except for minor disturbances at the surface, these are expected to result in minimal ground disturbance as soils are displaced laterally to accommodate the pile.

A Fire Safety Study prepared by Pinnacle Risk Management Pty Ltd (2022), indicates the proposed facility would be also equipped with a foam suppressant system at the bulk ethanol storage facility which will contain Per and Poly Fluoro Alkyl Substances (PFAS). The Site will also store non-PFAS (fluorine free) firefighting foam for certain applications and scenarios where effective. The Fire Safety Study indicates that no PFAS foam would be used for testing, training and commissioning but only for an actual fire event. Firewater in the tank farm will be contained in the bunds and pumped to the slops tank for offsite disposal at the Shoalhaven Starches facility.

Regarding the foam chemical constituents, the current excerpt from the Fire Safety Study is below:

'All firefighting foams will be stored in containers within the foam house near the fire tanks to east of the site. This store will include secondary containment for potential loss of foam from any container. The type of foam will be a 3/3 alcohol resistant foam suitable for the application required. Under the Environment Protection Authority (EPA) regulations, firefighting foams are expected to be PFAS (per and polyfluoroalkyl substances) free unless needed for 'catastrophic fires'. As such, the site will store non PFAS (fluorine free) firefighting foam for all applications for which this foam has been shown to have adequate efficacy. This will be applied to the truck loading bays, transfer pumps, monitors at the tank bund and the marine berth area.

However, for the potential larger fires such as the large storage tanks, the use of PFAS free foam is still being trialled. As such it is proposed to use a current PFAS foam for this purpose unless evidence is provided that would prove efficacy for this application such as planned to be carried out by LASTFire in April 2022. To reduce environmental exposure, no

*PFAS foam will be used for testing, training or commissioning but only for an actual fire event. To achieve this the type of proportioner (FireDOS) will enable proof of foam mixing ratio without the need to transfer the foam into a water solution. All testing will be done using water only simulating foam/water pressures and only controlled samples will be produced in a contained area to provide foam test records.' (*Pinnacle Risk Management Pty Ltd, 2022, pp30)

Regarding the management of contaminated firewater retained at the Site, the First Safety Study stated, '*Firewater in the tank farm will be contained in the bunds and pumped to the slops tank for offsite disposal at the Shoalhaven Starches facility.' (*Pinnacle Risk Management Pty Ltd, 2022, pp16).

3.1.2 Pipeline route

The Site boundary extends to the east of the main terminal along a 4m wide easement for construction of a new pipeline route connecting to existing Jetty No. 4, including a parcel of land within Part of Lot 2 DP 1182823 owned by Transport for NSW (TfNSW).

Based on the current set of design drawings (20399-DA-P01 to P05, dated 10 March 2022) prepared by TFA Group Pty Ltd., the pipeline route would consist of:

- Approximately 180m above-ground pipeline mounted on footings between the main terminal (Chainage 0m) and a dive thrust block (Chainage 180m). Along this portion, shallow foundation excavations are anticipated to be 1.0m deep (each 0.4m wide x 1.0m length) at regular intervals (roughly every 5-6m spacing)
- Approximately 280m underground pipeline between dive thrust block (Chainage 180m) and Jetty No. 4 (Chainage 460m) – Trench excavations are anticipated to be 1.8m deep by 2.0m wide. Installation is expected to involve 'cut and cover' trenches reusing materials excavated during backfill (minimum 1.2m compacted backfill) and removal of surplus spoil material for reuse/containment within main terminal.

Figure 2, Appendix A shows the proposed layout of the pipeline route (including marking of Chainage 0 to 460m) relative to the Site boundaries.

3.2 Construction details

3.2.1 Construction activities

The Project's construction activities can have a direct impact on the environment and can contribute to a larger environmental change.

SMEC consider that the main development activities which could impact upon groundwater are localised deep excavation for installation of stormwater features and linear excavation for installation of gravity retaining wall foundations and underground stormwater pipework.

3.2.2 Excavations

SMEC consider the following expected areas and scale of groundwater interaction disturbance based on preliminary drawings provided by Manildra:

- Three localised deeper excavations to depths between 3.0m and 4.5 m bgl for installation of stormwater treatment devices and an underground storage tank are likely to extend below the current groundwater table. Specifically, the underground storage tank (Excavation 3) which requires dewatering. Based on information supplied to SMEC, preliminary estimated dimensions for excavations are included within Table 3-1 below.

Table 3-1 Summary of proposed deep excavations

Excavation ID	Proposed feature	Dimensions	Estimated depth below water table	Dewatering required
Excavation 1	Excavation 1- Stormwater Gross Pollutant Trap (GPT 1/D Southern)	Approximately 3m x 3m x 3.3m depth	Less than 0.5m	No – Short duration wet installation (< 1 day)
Excavation 2	Excavation 2 – Stormwater Gross Pollutant Trap (GPT 1/A Northern)	Approximately 3m x 3m x 3.0m depth	Less than 0.5m	No – Short duration wet installation (< 1 day)
Excavation 3	Stormwater underground storage tank	Approximately 10m x 5m x 4.5m depth	Approximately 2.0m	Yes – Extended duration dry installation (estimated 3-5 days)

- Multiple linear excavations up to 2 m bgl allowing for installation of gravity retaining wall foundations and underground stormwater pipework. Linear excavations and installations have potential to extend slightly below the groundwater table (less than 0.5m) and not expected to require dewatering. Concreting of foundation piers /shallow piles may be required below groundwater table.
- Multiple driven timber piles (approximately 700) are to be installed for foundations for bridge and tanks, with some potential additional screw piles or steel posts (along proposed retaining walls, if required) are expected to extend to bedrock to below current groundwater table. No dewatering activities or disturbances are proposed at individual pile locations.

Figure 5, Appendix A shows the indicative locations of deeper excavations.

Except for the above, remaining construction activities within the main terminal are not expected to involve direct interaction below the groundwater table. Site recontouring will involve sitewide shallow excavation (typically less than 1m bgl) and therefore interacting with groundwater is unlikely.

Along the pipeline route, groundwater was not intersected by the Targeted Site Investigation (SMEC, 2022a) and is unlikely to be intersected as part of the proposed development based on Site topography and subsurface observations. An assessment of groundwater was therefore not carried out or considered relevant in these areas.

3.2.3 Dewatering

Dewatering is likely to be required for installation of the underground storage tank (Excavation 3) which occurs below the groundwater level (Excavation 3 shown on Figure 5, Appendix A). This excavation is expected to be approximately 4.5m below the existing ground level, noting standing water levels are expected at around 1.8 m bgl based on previous groundwater monitoring near this proposed excavation. Dewatering may be required for a period of less than 5 days to facilitate excavation, installation/commissioning and backfilling following initial excavation to base depth (estimated between 2-5 days subject to confirmation of installer methods and requirements). Based on discussions with Manildra, temporary shoring/retention of the excavation (Excavation 3) would include sheet piles to minimise:

- inflows to the excavation;
- drawdown of the surrounding aquifer; and
- changes to the groundwater flow regime.

An assessment of the potential dewatering requirements for Excavation 3 is included based on modelling in Section 6. Manildra has indicated a preliminary estimated duration for each excavation is between two and five days (subject to confirmation of installer methods and requirements).The excavation strategy includes modelling to assess the potential radius of influence and inflows based on proposed mitigation measures consisting of sheet piling..

Dewatering is unlikely to be required for remaining installations of gross pollutant traps (Excavation 1 and Excavation 2) which may occur below groundwater levels, noting these will be installed as ‘wet installations’ without the need for dewatering. Stormwater pipework excavations are not expected to extend below groundwater levels and do not require dewatering.

SMEC note that if retention systems such as sheet piles that limit impacts from drawdown are not used, then to address impacts of deeper dewatering, a further assessment of the implications of dewatering on groundwater would need to be carried out. Where the results of assessment indicate further control measures beyond those described in this ASSMP, then an addendum will be required.

3.3 Construction impacts

If construction activities are not managed correctly, potential impacts on groundwater may include:

- Lowering of groundwater table during dewatering
- Impacts to groundwater quality from excavations/disturbances:
  - Draw down of groundwater table below depths of PASS with the potential to generate acid upon exposure to oxygen and acidify
  - Increase acidity from ASS disturbance (i.e. low pH groundwater) or
  - Decreased acidity from concreting (i.e. higher pH groundwater)
  - Change to existing groundwater contaminant concentrations (i.e. increased dissolved metals)
  - Mobilisation/leaching of contaminated soil disturbed during development
- Impacts to groundwater quality from other Site activities:
  - Spillage/uncontrolled release of chemicals stored at the Site
- Impacts to receiving waters (i.e. Port Kembla harbour) during groundwater dewatering
  - Spillage/uncontrolled release of contaminated groundwater during 'dewatering'
  - Uncontrolled discharges of extracted groundwater via stormwater drains affecting surface water quality.

Management procedures have been developed to mitigate these potential impacts and are outlined in Section 7. A construction water quality monitoring programme, including groundwater monitoring during and post construction, has been recommended to compare to baseline (refer to Section 7.2).

3.4 Operational impacts

Impacts on groundwater are less likely to occur during operation of the proposed development. SMEC understand that the proposed development includes all plant and equipment designed, commissioned, operated and maintained to prevent and capture spills and leakages of bulk liquids during normal operational. The ethanol storage tanks will be within a fully bunded area with greater than 100% capacity to contain any spills. Storm water within the bunded areas is captured assessed and treated if required before disposal.

In exceptional circumstances, such as an emergency fire, controlled releases of firefighting foams (non PFAS based) from the fire suppressant system are expected to occur. The potential release of firefighting foams (containing PFAS) is possible in certain circumstances such as 'catastrophic fire'. Such an event is expected to trigger an environmental site condition assessment, including additional groundwater quality assessment.

If operational activities are not managed correctly, potential impacts on groundwater may include:

- Impacts to groundwater quality from Site operational activities:
  - Spillage/uncontrolled release of chemicals stored at the Site
  - Discharge of firefighting foams from fire suppressant systems (potentially containing PFAS)
- Impacts to groundwater quality from non-Site activities (i.e. offsite development/ operational activities)
  - Migration of offsite groundwater contamination

In the case of certain events, additional 'operational' groundwater monitoring requirements are proposed to be implemented to monitor possible impacts to groundwater as outlined in Section 7.3.

4. Field investigations

4.1 General

SMEC undertook field investigations in April 2022 to inform this Groundwater Assessment and Management Report, which consisted of:

- Five new groundwater monitoring well installations (SMW02 to SMW06) in April 2022
- One additional groundwater monitoring event carried out at eight well locations, including three existing monitored wells (OHMW20, OHMW28 and SMW01) and five additional wells (SMW02 to SMW06). This was considered a third 'baseline' water quality monitoring event, supplementing two previous rounds (April and October 2021).
- Continuous water level logging for a period of three months within available existing/additional wells

  (Note: At the time of this draft, water level logging had occurred for an initial period of approximately 1 month, noting monitoring is continuing for 2 more months)
- Permeability testing to assess groundwater flow characteristics.

Figure 2, Appendix A shows the location of existing and new wells utilised during the field investigations. Details of well locations are summarised in Table 2-4.

Prior to the commencement of fieldwork, SMEC prepared a Safe Work Method Statement (SWMS) to manage the potential risks to Work Health and Safety (WHS) associated with the fieldwork. Subcontractor drillers were engaged who were approved under SMEC's supplier register.

Drilling and logging were undertaken under the constant observation of SMEC engineer/geologists. Groundwater monitoring was undertaking by a trained and experienced graduate environmental scientist (Mr Joel Reynolds). Test location coordinates were undertaken by SMEC surveyors.

4.2 Well installation and development

Five boreholes (SMW02 to SMW06) were drilled to facilitate installation of new monitoring wells including:

- Two boreholes (SMW02 and SMW06) were drilled using hollow flight auger (SFA) techniques through clayey fill and sandy natural soils.
- Three boreholes (SMW03, SMW04 and SMW05) were drilled using sonic drilling techniques to penetrate through a buried layer of boulders encountered approximately 3.0m bgl near the harbour foreshore. Casing were used to retain the hole during well installation where collapsing sandy soils were encountered.

The boreholes were logged in general accordance with AS 1726-2017 and in conjunction with SMEC's geotechnical explanatory notes, as provided in Appendix D together with piezometer details. In summary, the subsurface conditions encountered were generally consistent with that of previous geotechnical studies by SMEC (2021a and 2021b), comprising layers of fill, aeolian sand and/or estuarine sand deposit.

Installation of monitoring wells occurred following the drilling of boreholes. The monitoring wells were constructed generally as per the *'Minimum Construction Requirements for Water Bores in Australia, 3rd ED 2012'* using Class 18 uPVC casing and machine slotted screens, clean washed 2 mm to 4 mm bagged sand, bentonite seals and a grouted collar with lockable steel monument. Details of installation are included within Table 4-1 below.

Following installation, wells were developed to remove sediment/debris from the well by purging at least 40 litres of water (minimum 3 well volumes) using a decontaminated stainless-steel bailer. The groundwater recharge was observed to be relatively rapid with a minimal drop in groundwater level during well development.

The spatial position of existing/new groundwater wells were captured by Masters Surveying on 26 April 2022 noting coordinates are in GDA94. Easting, northing and reduced levels were reported on the borehole logs in Appendix D and included in summary Table 2-4.

Table 4-1 Summary of well installation details

Monitoring Well ID	Date installed	Total well Depth (m bgl)	Screened Interval (m bgl)	Groundwater inflow (m bgl)
SMW01	3 March 2021 (SMEC, 2021a)	4.5	1.5-4.5	2.5
SMW02	5 April 2022	4.0	1.0-4.0	1.5
SMW03	20 April 2022	4.5	1.5-4.5	2.6
SMW04	20 April 2022	4.5	1.5-4.5	2.5
SMW05	20 April 2022	4.5	1.5-4.5	2.7
SMW06	5 April 2022	4.5	1.5-4.5	2.5

4.3 Groundwater monitoring event

4.3.1 Monitoring objectives

A groundwater monitoring event was carried out on 26 April 2022 to assess the groundwater quality across the main terminal Site and compare with adopted assessment criteria applicable to the relevant NSW Water Quality Objectives and values for the waters of Port Kembla.

This was also considered a third 'baseline' water quality monitoring event, supplementing two previous rounds (April and October 2021) reported within the DSI (SMEC, 2021b) (refer to Section 2.4.2). Table 4-2 includes a summary of previous / current groundwater monitoring events carried out by SMEC at the Site include.

Table 4-2 Summary of groundwater monitoring events

Round	Date	Purpose	Wells monitored
Round 1	10 March 2021	Baseline	3 (SMW01, OHMW20 and OHMW28)
Round 2	21 October 2021	Baseline	3 (SMW01, OHMW20 and OHMW28)
Round 3 (this 'Groundwater monitoring event')	26 April 2022	Baseline and Characterisation of groundwater	8 (SMW01 to SMW)6, OHMW20 and OHMW28)

4.3.2 Sampling and analysis plan

The groundwater monitoring event was carried out generally consistent with the previous Sampling and Analysis Plan outlined in Section 5 of the DSI (SMEC, 2021b) which was based on the requirements described in ASC NEPM (1999). Data Quality Indicators (DQIs) are included in Appendix C.

The following changes were adopted during this monitoring round 3:

- Five additional groundwater monitoring wells were monitored with the three existing wells
- Adjustment to monitoring suite by removal of pesticides (OCP/OPP) and PCB –
- Adjust to adopted assessment criteria - Following initial liaison with NSW Ports and NSW EPA, adopted assessment criteria were confirmed to be protective of 'slightly to moderately disturbed ecosystems' apply to Port Kembla outer harbour waters.

Further details on sampling methodology are provided in subsequent sections.

4.3.3 Monitoring locations

One groundwater monitoring event was carried out at eight wells (SMW01 to SMW06, OHMW20 and OHMW28) on 26 April 2022, approximately one week after installation/development of the five new wells (SMW02 to SMW06).

The sampling design including locating wells 'judgmentally', targeting areas surrounding the proposed development features and to provide spatial coverage across the Site. The sampling design consisted of monitoring locations at both 'control' (inferred upgradient monitoring locations) and 'impact' (inferred down-gradient monitoring locations) relative to the Site main terminal features and existing known contaminated areas.

Table 4-3 below outlines the selected monitoring locations and rationale. Figure 2, Appendix A includes the groundwater monitoring locations.

Table 4-3 Summary of monitoring locations – Groundwater quality

Location ID	Location relative to Site main terminal features	Control or impact
SMW01	East of the tidal stormwater channel. Up-gradient of proposed ethanol tanks / Down-gradient of proposed gantry	Impact
SMW02	Southern Site boundary Up-gradient of the Site main terminal	Control
SMW03	Northern Site boundary Down-gradient of proposed ethanol tanks	Impact
SMW04	Northern Site boundary Down-gradient of proposed ethanol tanks	Impact
SMW05	Northern Site boundary Down-gradient of proposed ethanol tanks	Impact
SMW06	West of the tidal stormwater channel. Note: Location is down-gradient of an inferred location of PAH site contamination identified previously within the DSI (SMEC, 2021b)	Impact
OHMW28	Southern Site boundary Up-gradient of the Site main terminal	Control
OHMW20	Southern Site boundary Up-gradient of the Site main terminal	Control

4.3.4 Water Quality Objectives and assessment criteria

SMEC note that Illawarra Water Quality Objectives for harbours, including Port Kembla harbour, (URL Water Qualtiy Objectives - Illawarra (nsw.gov.au) Water Quality Objectives - Illawarra (nsw.gov.au) access 22/04/2022) includes:

- Aquatic ecosystems - Maintaining or improving the ecological condition of waterbodies and their riparian zones over the long term
- Visual amenity - The objective applies to all waters, particularly those used for aquatic recreation and where scenic qualities are important.

On 3 May 2022, SMEC liaised with a representative of NSW EPA (Chris Kelly) who confirmed NSW EPA's position to assess Port Kembla Outer Harbour under water quality criteria protective of 'slightly to moderately disturbed ecosystems', with the aim for improvement to the water quality even though the area has historically been disturbed.

Groundwater quality assessment criteria were therefore adopted for 'slightly moderately disturbed systems' for groundwater assessment based on the receiving environment (Port Kembla Outer Harbour). The adopted Groundwater Investigation Levels (GILs) were generally consistent with previous assessment criteria and rationale outlined the DSI (SMEC, 2021b) which were based on the following assumptions:

- Default Guideline Values for toxicants applying to 'marine' aquatic ecosystems were considered most applicable for the Site which is adjacent to Port Kembla Outer Harbour
- Based on the industrial setting of the Site, the 95% level of species protection applying to slightly moderately disturbed systems was considered applicable for initial screening. Where available, low or unknown reliability trigger values were adopted from ANZG (2018) for toxicants assigning protection 95% of species (or unknown).

Furthermore, where toxicants are noted to be potentially bio-accumulative (i.e. cadmium, mercury), the trigger value for the protection of 99% of species was adopted.

- The ANZG (2018) have not yet published default guideline values for Physical and Chemical Stressors for all Australian inland waters and bioregions (http://waterquality.gov.au/anz-guidelines/your-location/australia-inland). Therefore, this assessment adopts the previous ANZECC & ARMCANZ (2000) Default trigger values for physical and chemical stressors for South-east Australia for slightly disturbed marine ecosystems (applying to estuaries).
- ANZECC & ARMCANZ (2000) have not published guidelines for total petroleum hydrocarbons or total recoverable hydrocarbons in groundwater. For this assessment, the laboratory limits of reporting have been adopted as initial screening criteria.
- The PFAS National Environment Plan (Version 2.0 – January 2020) interim ecological water quality guideline values were adopted for the groundwater assessment at the Site. SMEC adopted the 95% criteria for species protection within a slightly to moderately disturbed system for the receiving environment (Outer Harbour). It is noted that the PFAS NEMP (2020) considers the bio accumulative nature of PFAS and suggests that 99% be used for slightly to moderately disturbed ecosystems. Due to the extremely low laboratory limits of reporting required to assess with respect to these criteria, SMEC have adopted 95% protection levels as Tier 1 investigation levels. Where investigation levels are exceeded, the bioaccumulation potential of this contaminant would be considered as part of a Tier 2 assessment (if required).

Adopted groundwater assessment criteria for this Site is included within Appendix B.

4.3.5 Monitoring methods

Groundwater samples were collected using low flow sampling techniques in general accordance with Victoria EPA (2000) Groundwater sampling guidelines. The sampling method was as follows:

- The depth to groundwater standing water level (SWL) was gauged using a water interface probe meter, accurate to the nearest 0.01m. The total well depth and 'well stickup' relative to ground surface were also measured. Observations were made for visual or olfactory evidence of contamination such as Light/Dense Non-aqueous Phase Liquids (LNAPL/DNAPL), oily sheens or hydrocarbon odours.
- A peristaltic pump with dedicated tubing at each sample point was used to collect a representative water sample
  - Prior to sample collection, 3 consecutive field parameter readings were recorded, along with several 'equipment' volumes being purged from the well
  - Field parameters were measured at volume intervals using a calibrated water quality meter which included dissolved oxygen (DO), electrical conductivity (EC), pH, redox potential, and temperature.
  - Groundwater samples were then collected once groundwater parameters had stabilised, using a new clean pair of nitrile gloves.
  - Samples were transferred directly into sampling containers supplied by contract laboratories which contained appropriate preservatives for the analysis undertaken. Sample containers were filled to the brim and sample lids were sealed to prevent exposure to atmosphere. Samples requiring analysis of heavy metals and cations were field filtered to 45µm prior to filling sample containers.
  - Samples were then immediately placed in an ice-filled chest to keep the samples chilled until transport to the laboratory.
- Observations of groundwater were also made including water clarity, colour, odours, presence of staining and groundwater recharge.

4.3.6 Laboratory analysis

Laboratory analysis for environmental testing was carried out by the following contract laboratories which are NATA accredited for the tests performed.

- ALS Environmental Laboratory, Smithfield NSW (Primary laboratory)

- Eurofins Environmental Laboratories, West Lane Cove NSW (Secondary laboratory)

Eight primary samples were selected for laboratory analysis of the groundwater contaminants of potential concern identified within the DSI (SMEC, 2021b). An exception was analysis of pesticides (OCP, OPP) and polychlorinated biphenyls (PCB) were excluded during this groundwater monitoring event. Based on the findings of the DSI, these contaminants of potential concern were considered less likely based on desktop site history information and soil contamination data at the Site.

Additional laboratory analysis of the following parameters was also carried out for 'baseline' purposes:

- Per- and Poly-Fluor Alkyl Substances (PFAS) - Due to the proposed firefighting sprinkler system including foam suppressant system, analysis of PFAS was recommended to Manildra as part of 'baseline' groundwater quality testing.
- Heavy metals (Al, Fe, Mn – total unfiltered), Heavy metals (Co, U – dissolved), total phosphorus, ammonium and total acidity – These additional groundwater analysis parameters was carried out concurrently to supplement 'baseline' parameters recommended in the Acid Sulfate Soil Management Plan (SMEC, 2022b).

In addition to the primary samples, an additional intra-laboratory duplicate (QA1) and inter-laboratory duplicate (QA1A) duplicates were collected and submitted to the primary and secondary laboratory respectively. These quality assurance samples were analysed for the same suite of contaminants as the primary samples. Table 4-4 presents a summary of laboratory analysis carried out during Round 3.

Table 4-4 Summary of laboratory analysis

Analytes	No. of Primary analysis		
	Primary sample	Intra-laboratory duplicate	Inter-laboratory duplicate (Eurofins)
Heavy metals (Al, As, Cd, Cr, Co, Cu, Fe, Pb, Hg, Ni, Se, U, Zn) - dissolved	8	1	1
Heavy metals (Al, Fe, Mn) – total unfiltered	8	1	1
TRH, BTEX, PAH	8	1	1
Phenolic compounds	8	1	1
VHCs	8	1	1
Nitrogen compounds (Ammonia, Nitrite, Nitrate, Ammonium ion)	8	1	1
Other inorganics (TDS, Hardness, Total Phosphorus Reactive Phosphorus	8	1	1
Major cations (Calcium, magnesium, potassium, sodium)	8	1	1
Major anions (Chloride, fluoride, sulphate)	8	1	1
Alkalinity	8	1	1
Total acidity	8	1	1
Per- and Poly-Fluor Alkyl Substances (PFAS)	8	1	1

4.3.7 Quality assurance and quality control

4.3.7.1 QAQC plan

The following quality assurance and quality control (QAQC) plan was adopted for the work in general accordance with the Assessment of Site Contamination – National Environment Protection Measure 2013:

- Field monitoring instruments used to collect data were calibrated in accordance with manufacturers calibration requirements. Calibration certificates are included in Appendix F.

- Well installations and sampling of groundwater was carried out by trained and experienced environmental staff using sampling protocols which minimise potential cross contamination occurring in between sampling locations. The following was carried out during field investigations:
  - During well installation, the drill rods were decontaminated between sample locations by removing soil, particles, washing in a solution with Liquinox detergent and rinsing with potable water using a high pressure gurney. Drillers handled well installation materials in original sealed packaging and/or wearing nitrile gloves during installation.
  - During well development and groundwater sampling, reusable sampling equipment (including stainless steel bailer and interface probe to gauge wells) were decontaminated between sample locations by removing soil particles, washing in a solution with Liquinox detergent, rinsing with potable water and then rinsing with distilled water.
  - A rinsate blank was collected from the interface probe and tested to assess the effectiveness of decontamination for heavy metals and PFAS only (results are presented within Table E3, Appendix E)
  - Equipment rinsate samples were collected from reusable sampling equipment to assess the effectiveness of decontamination. Rinsate samples were collected off Stainless steel bailer (2 samples), Drillers rod (1 sample) and interface probe (1 sample). Rinsates were analysed for heavy metals and PFAS only (results are presented within Table E3, Appendix E)
  - Groundwater samples were collected with dedicated disposable tubing for each monitoring location.
- As the investigation involved sampling for PFAS analysis in groundwater, additional precautions outlined within Section 18 of the PFAS NEMP (2020) were adopted. In summary:
  - Prior to sample collection, any personnel that handled decontaminated groundwater sampling equipment that directly contacted the environmental media to be sampled washed their hands with plain soap and rinse thoroughly with tap water before donning a clean, new pair of disposable nitrile gloves.
  - A selection of PFAS-suitable sampling equipment was used including HDPE tubing for low flow sampling and PFAS-free detergents (i.e. Liquinox detergent). Sampling containers for PFAS analysis were supplied by the laboratory (no Teflon lined).
  - Care was taken to avoid the handling of additional sources of PFAS within the sampling area (such as sunscreen, Teflon products, aluminium foil, stain/water resistant fabrics and ice bricks) as per the requirements of the PFAS NEMP (2020).
  - Field blank samples were collected from drillers tank water to assess the potential for PFAS to have been introduced whilst drilling. Field blank samples were analysed for PFAS only (results are presented within Table E3, Appendix E).
- During fieldworks, all samples were placed in an ice-filled chest to keep the samples cool. Samples were kept on ice until delivered to the testing laboratory.
- Samples were then transported to the laboratory with relevant Chain of Custody (CoC) documentation. The CoC form was completed with the sample names, sampling date and required analyses. The samples were sent to the laboratory for analysis within the prescribed analyte holding times
- Duplicate samples were collected and tested for each analyte to assess precision in field sampling techniques and laboratory methods. Duplicate samples (comprising both intra-laboratory duplicates and intra-laboratory duplicates) were analysed at a frequency of 1 in every 20 samples (minimum 5%) as recommended in NEPM. The duplicate analysis summary is summarised in Table 4-4. Relative precent differences (RPD) were calculated using the method in Section 8.2.6 of AS4482.1-2005 and presented in Table E2, Appendix E.

4.3.7.2 QAQC Data evaluation

Quality assurance and quality controls (QAQC) data evaluation was carried out in general accordance with the National Environment Protection (Assessment of Site Contamination) Measure 1999. The results were assessed with respect to predetermined DQIs as referenced in the in the ASC NEPM, 2013 and as presented in Appendix C.

The following non-compliances were noted:

- Due to incomplete field records retain for groundwater sampling location SMW06, field parameters were not recorded. This is unlikely to affect the useability of the data for baseline characterisation.
- Trip spike and trip blank samples were not analysed together with samples collected during the groundwater quality monitoring event. The potential for loss of volatiles during transport was therefore unable to be assessed. The omission of these samples is unlikely to affect usability of the data noting samples were transported to the primary laboratory at recommended temperatures and sample concentrations indicated a low likelihood for volatile contaminants to be present.
- Some samples were noted as being analysed outside of holding times, including;
  - Primary sample batch (ALS - EW2201994) – Primary samples were analysed outside of holding times for pH (overdue by 3 days) and Nitrite as N and Reactive Phosphorus as P (overdue by 1 day). The analysis of pH by the laboratory has been omitted in preference for field measured pH The results of Nitrite as N and Reactive Phosphorus appeared similar to previous monitoring concentrations at the same locations (refer to Table E1, Appendix E).
  - Secondary sample batch (Eurofins – 884366) – This single sample was analysed outside of holding times for analysis of TRH, VOCs, PAHs, Phenols (non-halogenated) (overdue by 2 days) and Nitrite as N and Reactive Phosphorus as P (overdue by 6 days).Secondary sample analysis results are considered useable for purposes of precision assessment, noting concentrations of these parameters appeared similar to corresponding primary and duplicate samples.
- Some sample batches were noted as being received with temperatures higher than 6°C upon receipt at the laboratory, including Eurofins batch 882352 (Equipment rinsate - Well installation second round) and Eurofins batch 884366 (QA1A - Round 3 inter-laboratory duplicate) with temperatures of 10.3°C and 18.7°C respectively. Elevated sample temperatures are unlikely to affect useability of data in these batches, noting PFAS and heavy metals within rinsates data are not volatile (batch 882352). In Eurofins batch 884366, the concentrations recorded within QA1A appeared similar to corresponding primary and duplicate samples (refer to Table E2, Appendix E).
- Equipment rinsate samples in Eurofins batch 882352 returned detectable concentrations of heavy metals during the second round of well installation of wells SMW03, SMW04 and SMW05. The sample taken from the drilling rod (Rinsate 01 – Drill rod) recorded detections of heavy metals (aluminium, copper and iron) and the sample taken from the stainless-steel bailer (Rinsate 02 – Bailer) recorded detections of heavy metals (aluminium, chromium, copper, iron, lead, manganese and nickel). Slight detections of heavy metals in equipment rinsates may have originated from ineffective equipment decontamination (i.e. groundwater or soil residues) or from within the rinsate water itself.

  SMEC consider rinsate detects are minor and unlikely to indicate potential cross contamination to have occurred based on the following:
  - Potential for cross contamination was minimised between groundwater sampling locations, noting decontamination procedures were implemented in between well installations and well development (refer to Section 4.3.7.1).
  - Groundwater sample concentrations at these locations during the April 2022 monitoring event recorded elevated heavy metals (including aluminium, copper and manganese) above adopted GILs, suggesting a source of these contaminants in groundwater. Remaining heavy metals (including nickel, chromium and lead) were either below criteria or not detected suggesting a low potential for cross contamination to have occurred.
- Field and laboratory groundwater duplicates recorded relative percentage differences (RPDs) outside of adopted control limits (30%) for some analytes, including:

  - Field duplicate RPDs ranging from 59% to 74% for Ammonia and Ammonium ion as N between the primary sample (OHMW28) and corresponding intra-laboratory duplicate (QA1) and inter-laboratory duplicate (QA1A) samples. Some variability is noted for ammonia.
  - Field duplicate RPDs ranging from 99% to 154% for other inorganic analytes between the primary sample (OHMW28) and corresponding inter-laboratory duplicate (QA1A) sample, including Total Phosphorus as P (99%), Nitrite + Nitrate as N (152%) and Nitrate as N (154%). RPDs were within control limits between corresponding primary (OHMW28) and intra-laboratory duplicate (QA1) suggesting slight variability for these groundwater analytes between laboratory test methods.
  - Field duplicate RPD of 196% was recorded for iron (total) between the primary sample (OHMW28) and corresponding inter-laboratory duplicate (QA1A) sample. Upon query with the laboratory, Eurofins indicated that the sample container submitted for total metals analysis appear of much greater clarity than corresponding bottles, suggesting sample heterogeneity may be reason for variability. The interlaboratory duplicate data for iron (total) (QA1A) has therefore been disregarded (not useable), noting remaining total metals analysed (manganese and aluminium) recorded RPDs within control limits and appear useable
  - In batch 884366, laboratory duplicate RPDs recorded from 40% to 73% above the control limit of 30% for several PAH compounds. Further analysis indicated that sample heterogeneity was the cause of the PAH exceedances. It is noted this sample corresponded to another project Site and has therefore been disregarded.
  - Several RPDs which were recorded above the field or laboratory acceptance limits have been disregarded where sample concentrations were less than 10 times the laboratory limit of reporting.
- Laboratory quality assurance and quality control testing was carried out and the following was noted:
  - In batch 882352, a reduced frequency of laboratory duplicates and matrix spikes were analysed for heavy metals due to small batch size. The omission of these tests is unlikely to affect useability of these rinsate samples.
  - In batch 884366, a reduced frequency of matrix spikes was analysed for BTEX and VOC due to small batch size. A sufficient number of laboratory control spikes were analysed, and recoveries were within laboratory acceptance limits.
  - In batch EW2201994, matrix spike recoveries were unable to be determined in Sulfate and Nitrite + Nitrite as N due to background levels being greater than or equal to 4x spike level in both cases. A sufficient number of laboratory control spikes were analysed, and recoveries were within laboratory acceptance limits.

Based on the above data evaluation, SMEC consider the remaining data to be useable for the objectives of this assessment to assess the baseline groundwater quality.

4.4 Groundwater level monitoring

Continuous groundwater level monitoring was carried out at eight wells (SMW01 to SMW06, OHMW20 and OHMW28) for a period of up to three months. Additional monitoring was carried out at an available onsite well (ID unknown) for a period of 2 weeks. Table 4-5 provides a summary of monitoring locations and periods.

Table 4-5 Summary of monitoring locations – Groundwater levels

Location ID	Date commenced	Date ended	Period (weeks)
SMW01	6/04/22	11/05/22 (*continued)*	5
SMW02	6/04/22	11/05/22 (*continued)*	5
SMW03	20/04/22	11/05/22 (*continued)*	3
SMW04	27/04/22	11/05/22 (*continued)*	2
SMW05	20/04/22	11/05/22 (*continued)*	3
SMW06	6/04/22	11/05/22 (*continued)*	5
OHMW28	6/04/22	11/05/22 (*continued)*	5
OHMW20	6/04/22	11/05/22 (*continued)*	5
ID Unknown	6/04/22	20/04/22	2

Continuous water level monitoring was carried out at the wells by the following method:

- Loggers were initially setup to record at 1-hour recording intervals, recorded on the hour.
- Loggers were installed to approximately 0.5m above the base of the well. A single logger was installed at the top of the well for atmospheric correction.
- Manuel water level measurements were carried out over three discrete events; approximately 3 weeks, 5 weeks and 12 weeks* from logger installation (**Note: Not completed at the time of this draft report).*
- Manual water level measurements we carried out with a water dip meter to measure standing water levels to the nearest 0.01m, below the top of well casing (m bTOC). Water level measurements were corrected to reduced level (mAHD) using well survey information.
- Continuous logger data was processed within Excel and presented on groundwater hydrographs.

4.5 Permeability testing

Permeability testing was carried out at selected wells (including SMW01, SMW02, SMW05, SMW06 and OHMW20) using the rising head test method as follows:

- Loggers were initially setup to record at 1-second recording intervals, recorded every second
- Loggers were installed to approximately 0.5m above the base of the well.
- Twin bailers were inserted and used to rapidly remove 2L of water from the well
- Discrete water level measurements were carried out within a water dip meters to measure SWLs at regular intervals (typically every 30s) or until the water had return to original level

Permeability tests were inconclusive with recovery of the water level almost instantaneous in all tested wells. The permeability of the sand aquifer was estimated to be over 10 m/day.

5. Characterisation of Groundwater

5.1 Standing water level

Groundwater depths to standing water level (SWL) recorded during the water level monitoring (discrete measurements) are summarised in Table 5-1. Hydrographs showing standing water levels (continuous) for each of the wells are included in Appendix I.

Depths to standing water level appeared relatively consistent between monitoring rounds typically within ±0.1m, suggesting groundwater level changes do appear to change. The following was observed from hydrographs in Appendix I:

- Tidal influences appear the more dominant factor on SWLs within wells along the northern boundary of the Site (i.e. SMW03 to SMW05) with obvious periodic fluctuations (typically ±0.5m). Groundwater SWLs in the southern part of the Site (i.e. OHMW28, OHMW20, SMW02) appear relatively stable noting tidal influences appear to have minimal influence on water levels in these wells.
- Rainfall influences appear more dominant factor on SWLs within wells within the centre and southern part of the Site (SMW01, SMW02, SMW06, OHMW28 and OHMW20). For example, an increase of approximately 0.3m in water level is noted in response to heavy rainfall in early April.

Table 5-1 Summary of groundwater standing water level

Location ID	Date / Time	Standing water level	
		m bTOC	m AHD
SMW01	10/03/21 11:33	2.83	0.50
	21/10/21 13:05	2.87	0.46
	26/04/2022 12:26	2.726	0.604
	11/05/2022 10:52	2.725	0.605
SMW02	26/04/2022 11:30	2.783	0.847
	11/05/2022 8:04	2.816	0.814
SMW03	26/04/2022 13:06	3.487	0.293
	11/05/2022 14:40	3.33	0.45
SMW04	26/04/2022 13:19	3.455	0.155
	27/04/2022 8:14	3.145	0.465
	11/05/2022 14:30	3.28	0.33
SMW05	26/04/2022 13:00	3.574	0.006

m bTOC – Metres below top of casing m AHD – Metres above Australian Height Datum			

5.2 Groundwater flow direction

Figure 6, Appendix A shows the inferred groundwater contours and flow direction based on well gauging data during groundwater monitoring event on 26 April 2022.

Inferred groundwater contours indicate flow in a northerly direction towards the Port Kembla Outer Harbour. Groundwater levels beneath the Site ranged between 0.98m AHD (OHMW28) at the southern boundary and 0.01mAHD (SMW05) at the northern boundary. By comparison, a similar north-easterly groundwater flow direction was noted from historic monitoring by others (refer to Section 2.4.1).

5.3 Permeability observation

A rising head recovery test was undertaken on fives bores (including SMW01, SMW02, SMW05, SMW06 and OHMW20) on the 11 May 2022. At each well, the groundwater level was reduced by removing 2L of water and the change in groundwater level over time was monitored. The recovery was nearly 'instantaneous' indicating a high permeability sand aquifer, as observed in the subsurface logs. Analysis of the data was not carried out as the limited recovery data provided a low level of confidence in the results; suffice to say they indicate permeabilities well over 10 m/day. Modelling inputs were based on assumed hydraulic conductivities typical of 'beach sand' (refer to Section 6.2) and adjusted during calibration to the observed heads.

5.4 Groundwater quality

5.4.1 Field observation

Field observations during groundwater monitoring did not observe evidence of contamination such as hydrocarbon odours, oily sheen or evidence of phase separate hydrocarbons (i.e. Light Non-Aqueous Phase Liquids/Dense Non-Aqueous Phase Liquids).

5.4.2 Laboratory results

A laboratory summary table is included within Table E1, Appendix E, including the previous results (Rounds 1 and 2) and current April 2022 results (Round 3). Laboratory analytical reports from April 2022 (Round 3 only) are included within Appendix G. Groundwater sampling locations are shown on Figure 2, Appendix A.

The analytical results across each Rounds 1 to Round 2 are summarised below:

- Physical parameters typically exceeded adopted ANZECC 2000 threshold ranges for physical and chemical stressors (applying to estuaries) including:
  - pH concentrations were less than 7 (lower limit) within some wells
  - Dissolved oxygen concentrations were below 90-110% (range)
- Nutrient concentrations exceeded adopted ANZECC 2000 threshold for physical and chemical stressor (applying to estuaries) including Nitrate/Nitrite (NOx), Ammonium ion (as N), Reactive phosphorus (FRP) and/or Total Phosphorus (TP) at several sampling locations.
- Electrical conductivity ranged between 1,840 and 2,880µs/cm within most groundwater well locations (excluding OHMW20 which ranged 14,274 and 23,158 µs/cm). The data suggest a lower electrical conductivity at wells located in the central and western portion (<3,000 µS/cm) and higher conductivity localised at well OHMW20 located in the eastern portion (>14,000µS/cm) suggesting likely saline influences.

- PFAS compounds did not exceed adopted PFAS NEMP (2020) Ecological (interim marine) 95% protection level at all groundwater location for PFOS and PFOA criteria. Slight detections of PFOS were noted to exceed the adopted limit of reporting (0.01µg/L) at four wells (SMW01, SMW03, SMW05 and SMW06).
- Ammonia was recorded at 0.85-1.3mg/L[1] slightly above the adopted GIL (95% protection level) at OHMW28 only, including corresponding inter-laboratory duplicate data (QA1A – October 2021). Further testing at this location during October 2021 recorded ammonium ion between 0.81-1.4mg/L, suggesting the ammonia is mainly present in the ionised ammonium ion form. The ANZG (2018) states 'The toxicity of ammonia is primarily attributed to the un-ionised ammonia NH3…however, ammonium ion can also contribute significantly to ammonia toxicity under certain conditions.' (ANZG, 2018, URL Ammonia in freshwater and marine water (waterquality.gov.au)). It is also noted that a lower pH (pH<8), the marine trigger value for total ammonia-N increases.
- Elevated concentrations of dissolved heavy metals (including aluminium, cadmium, cobalt, copper, lead, nickel, selenium, uranium and zinc) and total heavy metals (including aluminium and manganese) were recorded which exceeded adopted GILs at the 95% protection level.
- Organic compounds were typically below laboratory detection limits and did not exceed adopted ANZG 95% protection level (or 99% bio accumulative) including TRH, BTEX, PAHs*, Phenolic compounds and VHC. *The exception was for detections of PAHs above laboratory limits of reporting.
- Some limitations are noted for comparison of groundwater concentrations reported to laboratory limits of reporting which exceed adopted GILs for selected PAHs (Anthracene), dissolved heavy metal (Aluminium and Uranium), ammonium ion as N, nitrate and nitrite as N, Filterable Reactive Phosphorus due to (refer to Section 4.3.7.2).

Table 5-2 presents a summary of monitoring parameters and monitoring points which exceeded the adopted assessment criteria during both rounds of the DSI. Bold text indicates concentration exceeded.

Table 5-2 Summary of analysis concentration ranges and criteria exceedances

Analyte	Concentrations of contaminant (mg/L) (Note 1)		Assessment criteria summary	
	Min	Max	Locations exceeded criteria	Criteria exceeded / comment
Field parameters				
pH (units)	6.38	7.40	OHMW20, OHMW28, SMW01	ANZECC (2000) *Lower pH noted
Electrical conductivity (specific) (µS/cm))	1,840	23,158	N/A	*Saline influences at OHMW20 noted
Dissolved oxygen (%)	0.9	18.7	Nil	ANZECC (2000)

5.5 Groundwater quality summary

The ‘baseline’ groundwater quality at the Site main terminal is characterised by elevated concentrations of heavy metals and nutrients (nitrogen and phosphorus) which exceeded adopted GILs.

The results of groundwater monitoring events in March, October 2021 and April 2022 recorded elevated concentrations of heavy metals (including aluminium, cadmium, cobalt, copper, lead, manganese, nickel, selenium and zinc) which exceeded adopted GILs for protection of marine aquatic ecosystems at the 95% species protection level (ANZG 2018). Total Ammonia (as N) also slightly exceeded adopted GIL (95% protection level) at one location OHMW28 during both March and October 2021 events.

Nutrient concentrations exceeded adopted ANZECC 2000 threshold for physical and chemical stressor (applying to estuaries) including Nitrate/Nitrite (NOx), Ammonium ion (as N), Reactive phosphorus (FRP) and/or Total Phosphorus (TP).

As identified in the DSI (SMEC, 2021b), heavy metal concentrations in groundwater were typically below or within the range of historical groundwater monitoring data (refer to Table 2-3), with exception of slightly higher selenium. Heavy

metal exceedances have also been recorded in the broader Port Kembla foreshore lands. The groundwater quality considered a regional issue related to long term historical industrial activities and land reclamation with poorer quality fill in Port Kembla, including beneath and surrounding the Site. The quality of the groundwater is not likely to have an impact to the proposed development itself, but there is potential for impact to downgradient ecological receptors.

PFAS compounds did not exceed adopted PFAS NEMP (2020) Ecological (interim marine) 95% protection level at all groundwater locations for PFOS and PFOA criteria. Slight detections of PFOS were noted to exceed the adopted laboratory limit of reporting (0.01µg/L) at four wells (SMW01, SMW03, SMW05 and SMW06). It is noted the bioaccumulation potential of this contaminant has not been assessed, for which lower laboratory limits of reporting are required to assess with respect to 99% protection levels in accordance with PFAS NEMP (2020).

SMEC recommend NSW Ports should be made aware of the results of the groundwater quality and as the landowner, they should confirm their acceptance of the development given these groundwater conditions. We understand the pre-existing groundwater contamination (if any) is the responsibility of NSW Ports and may be required to be assessed or managed at a later stage. With respect to baseline conditions, SMEC note that groundwater concentrations can fluctuate over time and during different temporal conditions.

It was beyond the scope of this groundwater assessment to assess the risks currently posed to the aquatic ecosystems by existing groundwater quality conditions. The proposed development activities should be managed to minimise groundwater interaction, thereby reducing potential exacerbation of existing contamination issues. Further it is recommended that groundwater quality monitoring would be carried out during construction stages to assess potential changes in groundwater quality through direct or indirect interactions from the development.

6. Excavation strategy

6.1 General

Based on Site information and results of field investigation, SMEC undertook numerical modelling to inform the excavation strategy for Excavation 3 installation of proposed stormwater underground storage tank. Key assumptions of numerical model were based on agreed inputs from Manildra regarding assumed excavation dimensions and duration as outlined within Table 6-1.

Table 6-1 Excavation 3 modelling assumptions

Modelling input	Assumption
Size of excavation	5m wide x 10m long
Depth of excavation	5m (max) below ground level (Ground level 2.9m AHD, Excavation base -2.1m AHD)
Depth of sheet piling	Variable - To be assessed
Depth of groundwater	Assume 1.835m bgl (highest recorded 6/04 - subject to variability once water level logger data is obtained)
Duration of open excavation	5 days (maximum)
Soil profile	Modelling assumes simplified soil layers at this excavation would include: • Fill -0.0 to 1.5m bgl* (1.5m thick) • Beach Sand (unit identified as 'Aeolian/Estuarine') – 1.5 to 10.5m bgl* (9m thickness) • Clay (unit identified as 'Residual Soil' layer) – 10.5 to 23.5m bgl* (13m thickness) *Depths based on previous borehole logs at the Site and as per generalised subsurface conditions (Section 2.5.1)

6.2 Methodology

A numerical three-dimensional model was been developed using FEFLOW code (Version 7.5) in saturated mode to assess:

- The impact of excavation of a pit (Excavation 3) for the installation of a below ground storage tank on the local groundwater system; and
- Estimate the groundwater inflow to the pit during excavation under different sheet pile wall (SPW) design scenarios; being
  - fully drained (no sheet pile wall);
  - sheet pile wall to 2m below the excavation depth; and
  - sheet pile wall to the bottom of the aquifer (-7.5m AHD)

The adopted model domain extends 200 m to the East and South of the project site to capture the extent of drawdown impact of pit excavation on the groundwater system. The model mesh is shown on Figure 6–1with mesh sizes around 8 m over most of the model domain and refined to 1 m around the proposed excavation.

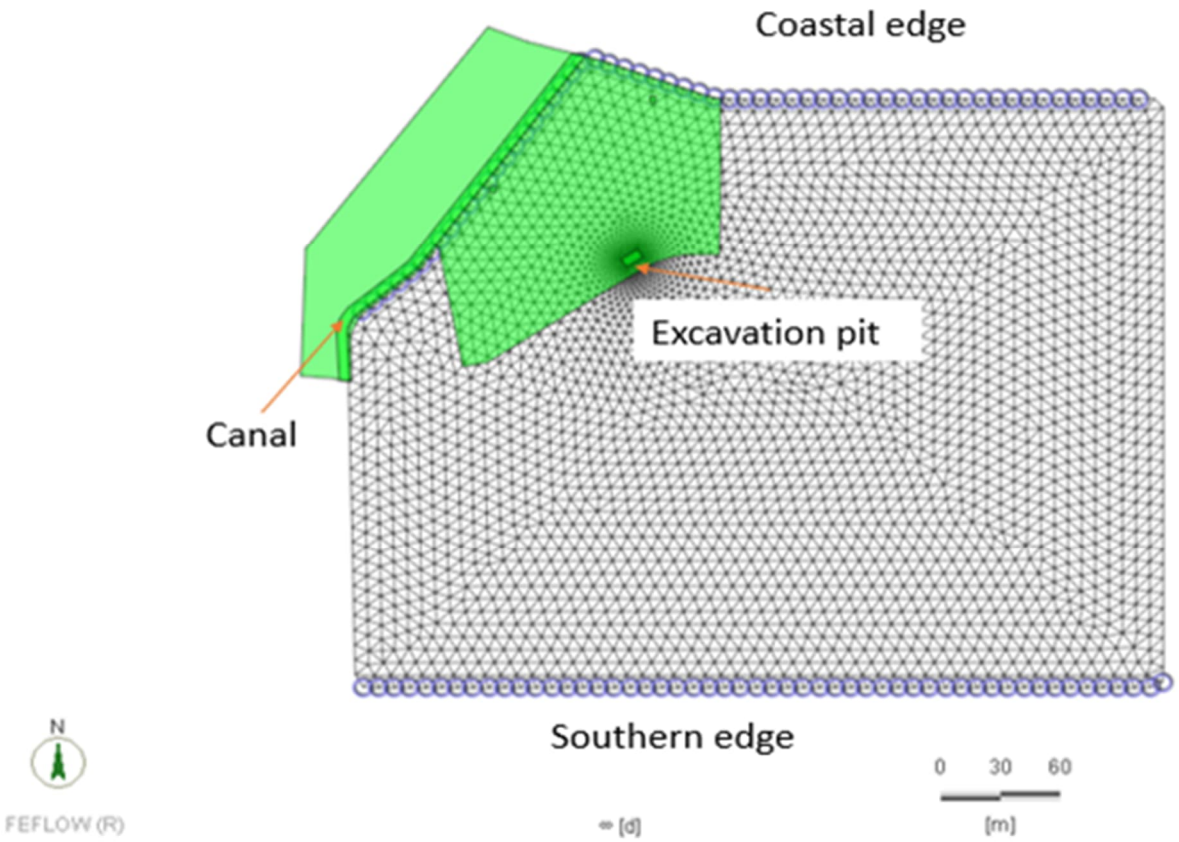

Figure 6–1: Model domain, mesh and boundaries

The hydrogeological layers and elevation of each unit were based on a review of available borehole logs for the Site during Preliminary Geotechnical investigations (SMEC, 2021a) and generalised subsurface conditions (refer to Section 2.5.1). Three hydrogeological layers are included in the model, including Fill, Beach Sand (unit identified as 'Aeolian/Estuarine') and Clay (unit identified as 'Residual Soil' layer). The bottom elevation is assumed to be -20 mAHD. The average thickness of the three layers are 1.5 m, 9 m and 13 m respectively from top to bottom. The hydrogeological parameters used for each hydrogeological unit are based on literature (A.R.Costall, et al 2020, Duffield,G, 2019), and summarised in Table 6-2.

Constant Head Boundary Conditions are defined on the coast (Northern), canal and Southern edges of the model domain to allow exchange of groundwater between the model and its surroundings, as shown on Figure 6–1. The constant head value assigned to the coastal edge and canal edge is 0 mAHD, representing mean sea level. For the Southern edge, the constant head value is based on groundwater head measurements and adjusted in the model calibration.

Table 6-2 Hydrogeological parameters for each layer

Layer	Material	Horizontal Hydraulic Conductivity (m/d)		Porosity (%)	Specific Storage (1/m)
		Min	Max		
Fill	Fill Gravelly silt with sand Fill clayey sand	0.0005	0.5	30	0.000005
Beach sand	Beach fine sand with gravel	5	3000	25	0.000005
Clay	Clayey sand, gravelly clay with sand	0.0005	0.5	30	0.000005

The average rainfall for the site area is 1,272 mm/year based on rainfall record from Port Kembla Signal station (068053) from Bureau of Meteorology.

The model has been calibrated manually in steady state and the calibrated hydraulic head distribution is assigned as the initial head condition for excavation simulation. The Southern boundary head and hydrogeological parameters were adjusted through trial and error to obtain a reasonable match between calculated groundwater level and observed groundwater level measurements collected on 26/04/2022.

The modelling relies on the following assumptions:

- The excavation is assumed to be 5 m below ground elevation (-2.1 m AHD)
- Is wished in place instantly and
- Is open for 5 days.

To simulate the excavation, the Constant Head Boundary Condition is assigned to the nodes within the excavation, and active for 5 days. After 5 days, the groundwater head around the pit will recover to its natural condition over time. Three design options have been simulated as below:

- Scenario A: Without sheet pile wall around the excavation considered the base (worst) case
- Scenario B: With sheet pile wall around the pit extending from ground surface to 2 m below bottom of excavation (-4.1 mAHD)
- Scenario C: With sheet pile wall around the excavation extending from ground surface to the bottom of sand layer (-7.5 mAHD, within Clay)

The hydraulic conductivity of sheet pile wall is assumed to be 0.001 m/d (ArcelorMittal Sheet Piling), representing an impermeable barrier with small gaps between each sheet. The thickness of sheet pile wall is assumed to be 0.1 m for modelling purposes.

6.3 Results and discussion

6.3.1 Calibration results

The Southern edge boundary head is calibrated to be 4 mAHD, and the recharge rate is 0.1 mm/d (16% of rainfall). For hydraulic conductivity, the upper range values of Table 6-2 are used for a conservative assessment. Calibrated hydraulic conductivity are summarized in Table 6-3. The calibrated hydraulic head distribution contour and scatter plot of observed and calculated head is shown on Figure 6–2. The calculated heads match with the observed heads reasonably well.

Table 6-3 Calibrated hydraulic conductivity

Layer	Horizontal Hydraulic Conductivity (m/d)	Vertical Hydraulic Conductivity (m/d)
Fill	0.5	0.05
Beach sand	100	20
Clay	0.5	0.05

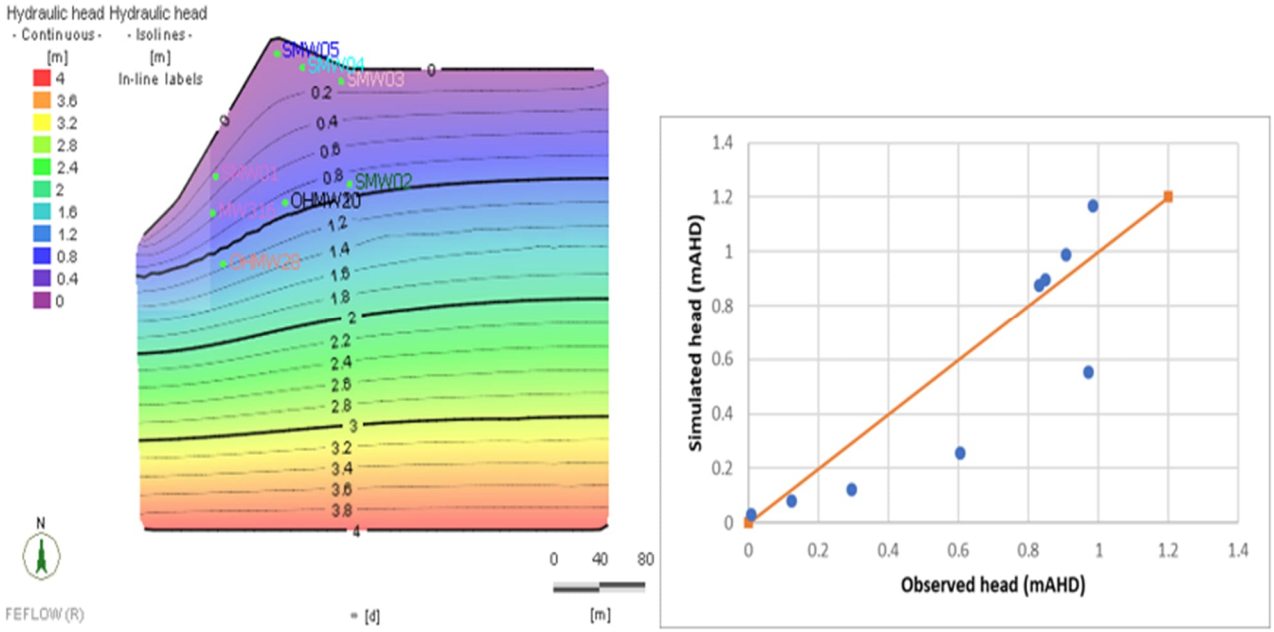

Figure 6–2: Calibrated hydraulic head distribution map and scatter plot

6.3.2 Groundwater inflow to the excavation

The cumulative groundwater inflows to the excavation, are 16,868m^3, 13,917m^3 and 2,008 m^3 for the three scenarios (Scenario A, B and C respectively) and are plotted on Figure 6–3. The average inflow rates are 39L/s, 32.2 L/s and 4.6 L/s respectively. These results are considered conservative as the excavation is wished in place and remains open for five days. In reality inflow would not commence until the excavation reaches the water table at day two and would peak when the excavation reaches maximum depth at day three and cease on or about day five when the excavation is closed.

The simulated scenarios clearly indicate the benefit of sheet pile wall installation in controlling inflows with Scenarios B and C effectively reducing groundwater inflow by 18% and 89%, respectively, effectively cutting off the lateral and vertical flow.

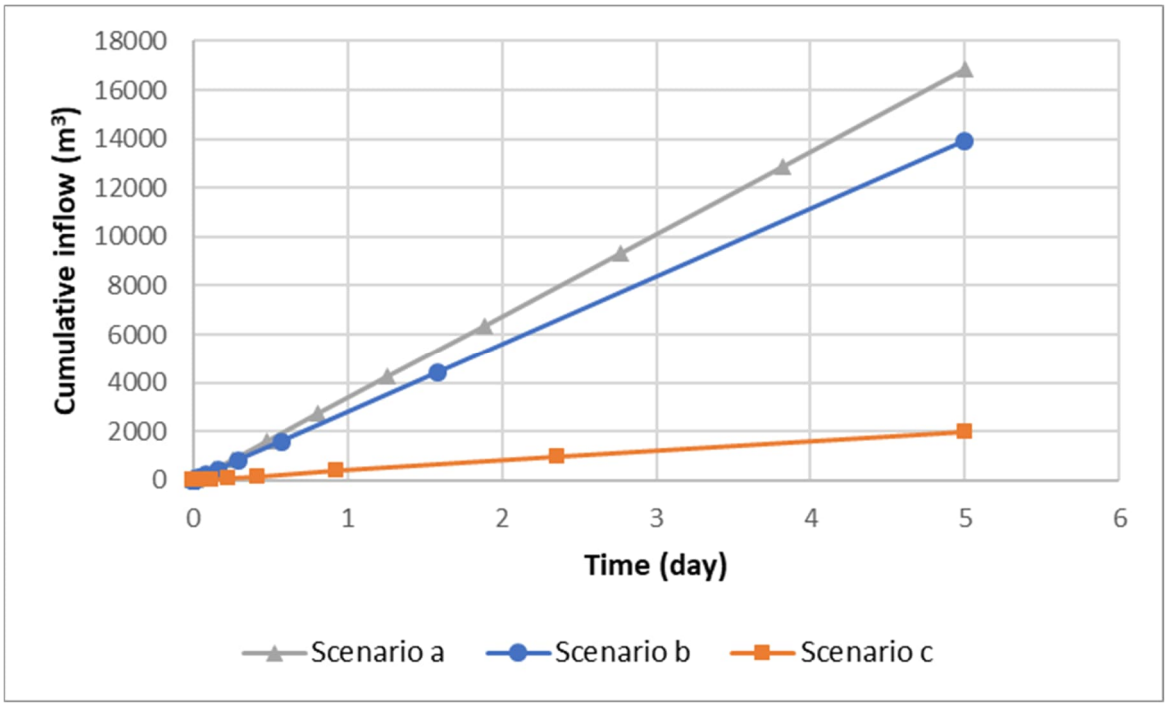

Figure 6–3: Cumulative groundwater inflow to the pit during excavation for the three SPW design scenarios

6.3.3 Drawdown

The drawdown contours at end of excavation for the three Scenarios are shown for Scenario 1 (Figure 6–4), Scenario 2 (Figure 6–5), and Scenario 3 (Figure 6–6). As the drawdown extent is restricted by the coast and canal in the Northern and Western direction and groundwater flows towards the North, it extends further in the Eastern direction. For Scenario A, B and C, the 0.2 m drawdown contour line extends out to 160 m, 150 m and 10 m, respectively, from the excavation. The drawdown adjacent to the excavation outside the SPW is estimated to be approximately 2.8 m, 2.2 m and 0.6 m respectively for scenarios A to C.

As with the inflows this is considered conservative and likely overestimates the drawdown.

6.4 Discussion

The modelling undertaken demonstrates the benefit of installing sheet piles to support the excavation, limit inflows and reduce drawdown. The results provided are considered conservative, that is they overestimate the inflows and associated drawdown as the assessment assumes the excavation reaches full depth at time zero and inflows are consistent over the modelled five days. In reality, inflows will not commence till the excavation intercepts the water table likely on day two and would increase to reach a maximum when the excavation reaches full depth on day three. The tank would be installed, and the excavation backfilled on days four and five.

It is recommended that Scenario C, sheet piles installed to the basal clay layer, will be employed as the management and mitigation measures for the excavation in order to limit drawdown and the volume of water required to be pumped and treated. The likely volume of water which may be required to be pumped and treated is estimated to be as little as 500 m^3 and less than 2000 m^3 over a five-day installation period excluding installation of the sheet pile wall. If the excavation remains open for more than five days additional inflows are likely to be realised.

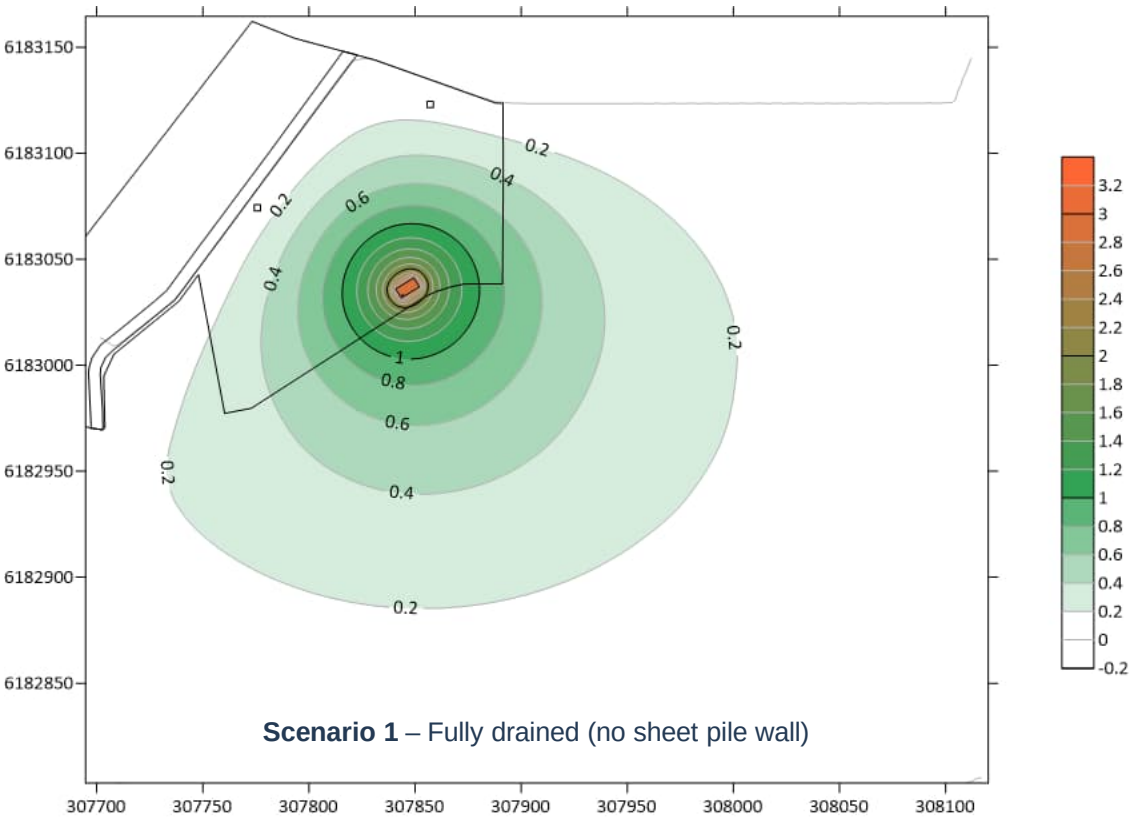

Figure 6–4: Drawdown contour (m) map at end of excavation for scenario 1

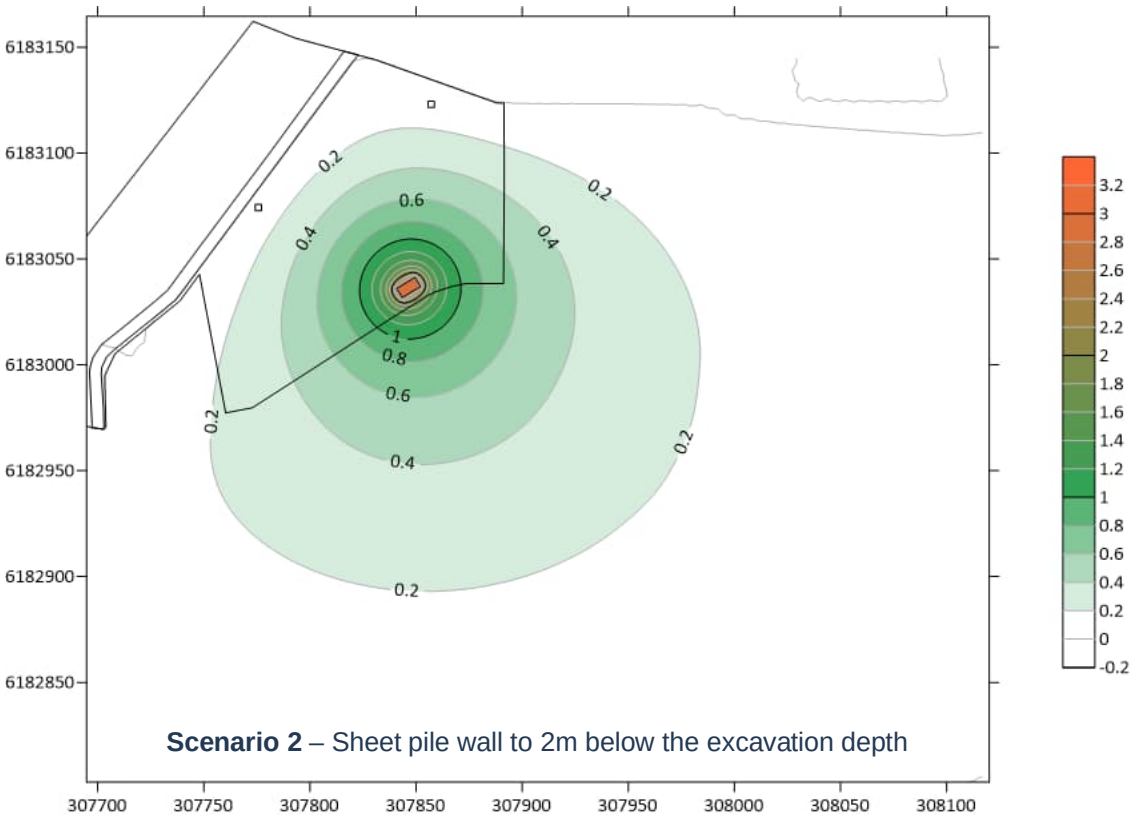

Figure 6–5: Drawdown contour (m) map at end of excavation for scenario 2

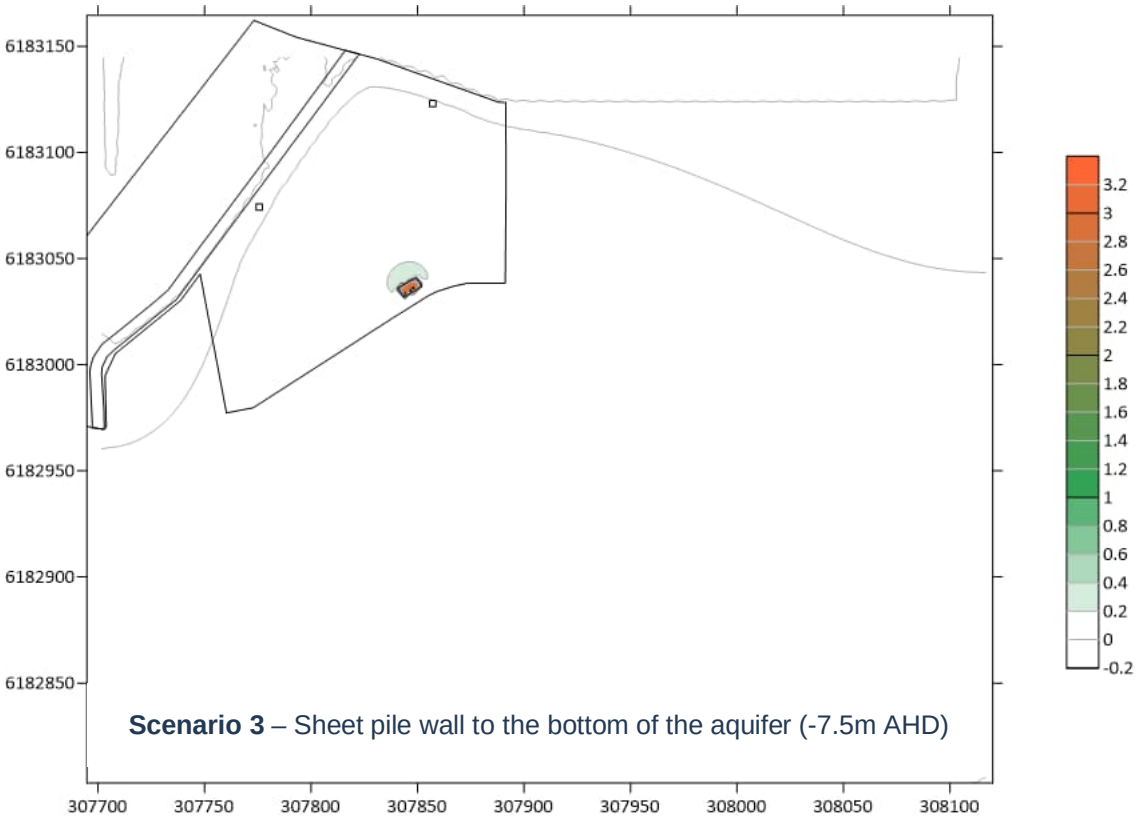

Figure 6–6: Drawdown contour (m) map at end of excavation for scenario 3

7. Groundwater Management Procedures

The details of all proposed mitigation, monitoring and management measures are outlined in this section based on the identified activities and impacts for both construction and operation (Section 3) and findings of the groundwater assessment.

7.1 Construction

The construction methodology to be adopted by Manildra is to minimise interactions with groundwater where possible. To achieve this construction would be undertaken at ground surface above the water table with the exception of three excavations, the gravity retaining wall and driven timber piles (refer to Section 3.2.2).

Driven piles would not involve excavation but may displace sediments and groundwater and yet will maintain saturated conditions. The gravity retaining wall would be excavated and foundations installed 'wet' or using prefabricated material. Of the three excavations, only Excavation 3 (stormwater underground storage tank) would have a significant interaction with groundwater. To minimise the interaction, the excavation would have a sheet pile cut off wall installed.

7.1.1 General

Environmental management measures would be employed during construction to mitigate potential impacts on groundwater including, but not limited to, the following:

- A Construction Environmental Management Plan (CEMP) should be prepared outlining the environmental management measures to be adopted during construction, including any groundwater management procedures outlined in the following sections of this report.
- Plant and machinery refuelling should be carried out at designated areas to prevent uncontrolled discharges to the groundwater.
- Fuels and chemicals should be sealed in labelled container and stored within suitable bunded storage areas with construction compound.
- Emergency spill response equipment and procedures should be implemented during all construction, installation and commissioning activities to contain liquid spillages.
- Groundwater abstraction should not be carried out except as outlined for construction dewatering within Excavation 3 (refer to Section 7.1.3)
- Uncontrolled discharges to groundwater should not be permitted during construction.
- All groundwater monitoring locations are required to be maintained and protected during construction to enable continued groundwater monitoring as required (Section 7.2).

7.1.2 Excavation

Excavations would be carried out to facilitate the construction of the proposed development features as outlined within Section 3.2.2.

The following mitigation measures would be employed to minimise impacts to groundwater:

- Excavations should be limited to required depth of installations to avoid direct interaction below the groundwater table within the design requirements.
- Excavations for installation of proposed development features which are slightly below water table should adopt methods which avoid the need for groundwater dewatering including:
  - Gross pollutant traps (Excavation 1 and Excavation 2) which are slightly below water table, would be installed as 'wet installations' within relative short duration (estimated less than 1 day each)
  - Construction of gravity retaining wall foundations would be constructed using either 'wet concreting' methods and/or using prefabricated materials

- Excavations of contaminated soil materials should be carried out in accordance with requirements of the RAP (SMEC, 2022c) to assess, treat and/or manage surplus soils for onsite reuse and/or containment, where appropriate. In particular, excavated contaminated soils are required to be placed within designated onsite containment locations at depths no greater than 1.5m below ground surface or below 1m AHD, whichever is shallower as outlined within the RAP.
- Excavations of acid sulfate soil (ASS) should be carried out in accordance with requirements of Acid Sulfate Soils Management Plan (SMEC, 2022b) to assess, treat and/or manage surplus soils for onsite reuse, where appropriate. In particular, excavated ASS impacted materials are required to be stockpiled within a containment area, treated using lime neutralisation and validated prior to onsite reuse as backfill within excavations.

7.1.3 Dewatering

Groundwater dewatering is likely to be required to facilitate the installation of the underground storage tank (Excavation 3 only) which occurs below the groundwater levels as outlined within Section 3.2.3. An assessment of the potential dewatering requirements for Excavation 3 is included based on modelling in Section 6 based on stated assumptions.

The following mitigation measures would be employed to minimise impacts to groundwater:

- Temporary shoring/retention of Excavation 3 using sheet piles installed be installed to the depth of the basal clay layer (i.e. bottom of the aquifer at -7.5m AHD), designed and installed to minimise:
  - inflows to the excavation;
  - drawdown of the surrounding aquifer; and
  - changes to the groundwater flow regime.
- Dewatering activities would be carried out in accordance with the planning approval conditions. Dewatering activities are not expected to trigger a need for licence/permits considering the anticipated small volume of groundwater expected (estimated less than 2000m^3). WaterNSW website states construction dewatering may trigger the need for a water access licence (WAL), unless an exemption applies. The WaterNSW factsheet *Water access licence exemption for aquifer interference activities taking 3ML or less of groundwater per year*, Factsheet 250920 (copy in Appendix H) further outlines when a small volume of groundwater may be taken through certain aquifer interference activities without the need for a water access licence.
- Details of proposed sheet piling and groundwater dewatering methods should be documented within the CEMP. Based on current information, it is understood that the following procedure (or similar) would generally be adopted for dewatering:
  1. Installation of temporary sheet piles to required depth
  2. Excavate soil materials inside sheet piling. Once below water table, wet soils removed to required depth should be placed in bunded stockpile area and water runoff retained.
  3. Commence monitoring of groundwater inflow volumes and quality
  4. Submersible pump (or equivalent) installed to extract the groundwater from excavation prior to facilitate dry installation activities (i.e. underground storage tank and foundations etc).
  5. Retain the pumped water within holding tank
  6. Following installation, backfill excavation with suitable backfill materials
  7. Remove temporary sheet piles
  8. Complete dewatering record forms as required by the CEMP including record groundwater dewatering volumes, quality and disposal method.
- All wastewater generated from dewatering the excavations should be contained within suitable capacity holding tanks to prevent runoff into creeks and drainage lines or return to the groundwater system. Wastewater should be tested and disposed offsite appropriately which may include:
  - Disposal via a licensed liquid waste contractor to an appropriate facility
  - Disposal to stormwater under relevant guidelines and approval from Council or relevant Authority with any supporting testing and monitoring requirements.

7.2 Water monitoring

7.2.1 Water quality monitoring

SMEC recommend that a construction water quality monitoring programme be carried out to comply with the planning approval conditions and NSW Ports specific requirements (refer to Section 11 Water Quality and Stormwater of Port Kembla Development Code – June 2021). The construction water quality monitoring programme should be developed and documented within the CEMP (or sub plan) along with monitoring criteria and response actions. It should also address any additional construction water quality monitoring requirements required by a licence or approval which are not specified here.

The following groundwater monitoring would be carried out to monitor impacts to groundwater during construction stage:

- Monitoring objectives: Groundwater monitoring events would be carried out during and post-construction with the monitoring objectives to:
  - Monitor for potential changes in groundwater quality by comparison pre-construction baselines
  - Monitoring water table changes during dewatering activities
  - Assess potential impacts associated with construction activities
  - Decide whether additional monitoring (post-construction) is required to further assess impacts (if any).
- Sampling and analysis plan: Table 7-1 outlines the proposed minimum frequency and number of groundwater monitoring events during construction/post-construction stages of the proposed development. Groundwater monitoring events would be generally consistent with Section 4.3.2 to Section 4.3.7 to enable comparison with the baseline groundwater quality data. Predetermined DQIs would continue to be adopted consistent with Appendix C of this report.

Table 7-1 Summary of proposed groundwater monitoring

Development stage	Frequency (no. of monitoring)	Monitored parameters
During construction/	Quarterly During construction (minimum. 4 quarterly events) – Assumes at least 1-year construction period. One round is recommended within 2 weeks after deep excavations and/or dewatering activities	Field parameters + Water quality analysis
	Dewatering-specific During dewatering of Excavation 3 – Additional specific monitoring to include: • Field measurements using calibrated water quality meter short intervals during dewatering (Daily - minimum 5 daily) • Continuous water level monitoring should commence during and after dewatering (Hourly - minimum 14 days) Assumes groundwater returns to original water level within approximately within 1 week after dewatering of Excavation 3. Continued measurements at longer intervals (e.g. weekly) is required until groundwater returns to original water level and no impacts observed.	Field parameters + Water level (continuous)
Post-construction	Post-construction (min. 2 rounds) – Monitoring to continue for a minimum 6 months beyond construction subject to the final assessment.	Field parameters + Water quality analysis

- Monitoring locations: Groundwater monitoring event locations would include at a minimum the eight monitoring locations (SMW01 to SMW06, OHMW20 and OHMW28) adopted within Section 4.3.3 to enable comparison with baseline groundwater quality data. Further, the following is noted during construction:
  - Any construction activities requiring placement of additional fill materials adjacent to selected monitoring locations should ensure protection, access and modifications can be carried out by a licensed driller (i.e. increasing the height of the well standpipe to new ground level)

  - NSW Ports should be consulted on the need for Manildra to protect, retain or appropriately decommission remaining existing wells during development (refer to Section 2.6). Unless required for ongoing monitoring, wells should be decommissioned in accordance with Guidelines on Minimum Construction Requirements for Water Bores in Australia, 3rd ED 2012' so that they do not act as a direct pathway for groundwater contamination during Manildra's lease of the Site.

- Monitoring Parameters: Table 7-2 outlines the proposed monitoring parameters to be carried out during groundwater monitoring events. Laboratory analysis would be adopted the same as Section 4.3.6 to enable comparison with baseline groundwater quality data.

Table 7-2 Proposed monitoring parameters

Monitoring parameters	Description
Water level (continuous)	Continuous standing water level measurement using data loggers (recorded hourly) to be carried out during the dewatering activities as per Section 4.4
Field parameters	Field measurements including: • Discrete measurements of standing water level using water level dipper • Water quality parameter using a calibrated water quality meter at short intervals during dewatering (e.g. daily) including pH, specific electrical conductivity, redox potential, dissolved oxygen and redox potential. • Visual observations including olfactory (odour) observations of noxious gases.
Water quality analysis	Groundwater sampling and testing for same laboratory analytical suite adopted for the baseline water quality parameters outlined within Table 4-4.

- Reporting: Groundwater monitoring and assessment would be reported according to the following minimum reporting frequency:
  - Following each groundwater monitoring events, monitoring results should be presented within brief factual monitoring reports and include a comparison to baseline groundwater characteristics (water level and groundwater quality) within Section 5of this report. The report should include an assessment of potential change from baseline conditions.
  - A groundwater assessment report should be prepared to summarise findings of all groundwater monitoring events and assessment of potential impacts. The assessment should conclude whether additional monitoring (post-construction) is required to further assess impacts.

7.2.2 Visual monitoring

Due to proximity of works to Port Kembla Outer Harbour, the CEMP should also include regular visual monitoring inspections of sensitive nearby water receptors (including adjacent harbour, stormwater drains and onsite/nearby stormwater pits) to enable early detection of possible impacts. These should be carried out at frequent intervals (e.g. daily) during excavations, dewatering, stockpiling, lime neutralisation/treatment where ASS is disturbed. Outside of these activities, the frequency may be reduced (e.g. weekly or monthly) checks as required by the CEMP.

The CEMP (or subplan) should include contingency response actions for addressing any visual signs of unusual discolouration, odour or significant change to baseline water quality within sensitive nearby water receptors as a result of construction activities

7.3 Operational requirements

As outlined within Section 3.4, impacts on groundwater are less likely to occur during operation of the proposed development. This assumes all plant and equipment designed, commissioned, operated and maintained to prevent and capture spills and leakages of bulk liquids during normal operational.

To account for possible groundwater impacts following exceptional events outside of normal operation, additional groundwater monitoring would be carried out to monitor possible impacts to groundwater. Additional 'event based' groundwater monitoring event(s) would be employed following one of the trigger events including:

- Trigger 1 – A product or chemical spillage* or uncontrolled discharge exceeding 100L to ground outside of bunded areas *(*Sampling and analysis requirements would be adjusted to suit likely chemical constituents of the spill).*
- Trigger 2 – A product or chemical spillage* or uncontrolled discharge exceeding 50% bund capacity inside of tank bunded areas *(*Sampling and analysis requirements would be adjusted to suit likely chemical constituents of the spill).*
- Trigger 3 - Following activation of firefighting systems in an emergency fire scenario and/or as required to inform an environmental condition assessment (event-based).
- Trigger 4 – At a minimum once prior to change of lease arrangements and/or to fulfil environmental requirements of the lease.

Additional monitoring would be carried out as per Section 7.2.1 and a groundwater assessment report would be prepared to summarise findings of the additional groundwater monitoring events and assessment of potential impacts. The assessment should conclude whether additional monitoring (post-event) is required to further assess impacts.

LEGEND

Site Location

Former Site Features

- Former quarantine area (circa 1977 to 1986)
- Former scrap metal yard (circa 1977)
- Former timber yard (circa 1977)
- Former building structure (removed prior to 2001)
- Inferred location of PAH site contamination (CMPS&F 1994)
- Remaining area to be assessed

Test Locations

- Groundwater Monitoring Well (SMEC)
- Historical Groundwater Monitoring Locations
- Historical groundwater monitoring wells (not sampled)
- Historical groundwater well inferred location (not observed)

Round	Location ID	Analyte
Date measured/ sampled	Standing water level (m AHD)	Concentration (mg/L) exceeds GIL (95%)

Notes

[A] ANZG recommend taking into account potential bioaccumulative effects
[B] Low or unknown reliability value
[C] Based on As (III) (lower of the AS(III) and As(V) criteria)
[D] Default guideline value assumes chromium (VI)
[E] Level of species protection unknown

Appendix C

Data Quality Indicators

Data Quality Indicators

DQIs for the project will be based on the field and laboratory considerations in NEPM Schedule B2 Appendix B, (NEPC 1999), which include:

- Completeness – a measure of the amount of useable data (expressed as %) from a data collection activity
- Comparability – the confidence (expressed qualitatively) that data may be considered to be equivalent for each sampling and analytical event
- Representativeness – the confidence (expressed qualitatively) that data are representative of each media present on the site
- Precision – A quantitative measure of the variability (or reproducibility) of data
- Accuracy – a quantitative measure of the closeness of reported data to the true value.

The DQIs adopted for this assessment and checking of compliance is discussed in Table C-1 to C-5 below.

Table C-1: Data quality indicators - Completeness

Completeness					
Field considerations	DQI	DQI Compliance	Laboratory considerations	DQI	DQI Compliance
All critical locations will be sampled	Samples will be collected as per Section 4.3	Yes	All critical samples analysed.	Samples will be analysed as per Section 4.3	Yes
All samples collected	Samples will be collected from relevant media as per Section 4.3	Yes	All analytes analysed according to sampling plan	Samples will be analysed as per Section 4.3	Yes
SOPs appropriate and complied with	SMEC SOPs/Field instructions will be implemented	Yes	Appropriate methods and limits of reporting	Samples will be analysed by laboratories NATA accredited for the analyses to be performed and appropriate methods will be used. LORs will be less than or equal to the assessment criteria.	Yes (minor exceptions noted in Section 4.3.7.1)
Experienced sampler	An experienced SMEC environmental consultant will conduct the sampling	Yes (refer to Section 4.1).	Sample documentation complete	CoCs will be returned, signed, and dated by laboratory. NATA endorsed laboratory certificates will be completed in accordance with NEPC (1999). Field documentation will be completed in accordance with SMEC SOPs.	Yes
Documentation correct	Samples will be handled and transported under appropriate chain of custody documentation. Sample Receipt Advice (SRA) (or equivalent) from the laboratory will be reviewed to assess that samples are received cool and in good condition. Calibration certificates for the field instruments will be provided daily (or in accordance with manufacturers recommended calibration interval).	Yes Equipment calibration (refer to Section 4.3.7.1) Minor exception for missing field parameters for SMW06 (Section 4.3.7.1)	Sample holding times complied with	Samples will be analysed within holding times specified by NEPC (1999, amended 2013)	Yes (minor exceptions noted in Section 4.3.7.1)

Table C-2: Data quality indicators - Comparability

Comparability					
Field considerations	DQI	DQI Compliance	Laboratory considerations	DQI	DQI Compliance
Same SOPs used on each occasion	SMEC SOPs/field instructions will be implemented	Yes	Same sample analytical methods used	The same NATA accredited laboratory will be used to undertake analyses of all primary samples collected for this study. The laboratory will use the same analytical methods for each sample for each analytical parameter	Yes
Experienced sampler	An experienced SMEC environmental consultant will conduct the sampling.	Yes (refer to Section 4.1).	Same sample limits of reporting (LOR)		Yes (minor exceptions noted in Section 4.3.7.1)
Climatic conditions (temperature, rainfall, wind…)	Sampling for this work will be completed when necessary. Climatic conditions are not expected to cause issues for comparability of data	Yes.	Same laboratories (justify/quantify if different)		Yes (refer to Section 4.3).
Same types of samples collected	Samples will be collected in the appropriate laboratory supplied container specific to the analyses performed.	Yes	Same units (justify/quantify if different)		Yes

Table C-3: Data quality indicators – Representativeness

Representativeness					
Field considerations	DQI	DQI Compliance	Laboratory considerations	DQI	DQI Compliance
Appropriate media sampled according to sample plan	Samples will be collected and analysed as listed in Section 4.3. Any variations will be justified.	Yes	All samples analysed according to sample plan	Samples will be collected and analysed as listed in Section 4.3. NATA accredited environmental testing laboratories will implement a quality control plan conforming to Schedule B (3) 'Guideline on Laboratory Analysis of Potentially Contaminated Soils' of the National Environment Protection (Assessment of Site Contamination) Measure 1999.	Yes
All media identified in sample plan sampled	Samples will be collected and analysed as listed in Section 4.3	Yes	All samples analysed according to sample plan	Samples will be collected and analysed as listed in Section 4.3	Yes

Table C-4: Data quality indicators – Precision

Precision					
Field considerations	DQI	DQI Compliance	Laboratory considerations	DQI	DQI Compliance
SOPs appropriate and complied with	SMEC SOPs/field instructions will be implemented	Yes	Analysis of laboratory duplicates	The number of duplicate analyses should be the smaller of one per process batch or one per 10 samples.	Yes (refer to Section 4.3
Analysis of: field duplicates	Collection of field duplicate samples including: • Field intra-laboratory duplicate samples (1 in 20 samples). • Field inter-laboratory duplicate samples (1 in 20 samples).	Yes (refer to Section 4.3 and Table 4-4)	Analysis of: field duplicates	Field duplicates have relative percentage difference (RPD) control limits: • Less than 30% (groundwater), where result is greater than 10 times limit of reporting (LOR). • No limit where result is less than 10 times LOR.	No (refer to Section 4.3.7.2)
	Experienced and trained staff to carry out sampling. Sampling methodologies appropriate and complied with.	Yes (refer to Section 4.1)	Analysis of: laboratory duplicates	Laboratory duplicates have relative percentage difference (RPD) control limits: • Results <10 times the LOR: No Limit • Results between 10-20 times the LOR: RPD must lie between 0-50% • Results >20 times the LOR: RPD must lie between 0-30% In accordance with laboratory specific QC Acceptance criteria.	No (refer to Section 4.3.7.2)
			Analysis of: laboratory-prepared volatile trip spikes	Trip spikes recoveries were recorded between 60% and 110% for volatile contaminants (TRHC6-C10/BTEX)	No – Trip spike not analysed (refer to Section 4.3.7.2)
			Analysis of: laboratory-prepared volatile trip blanks	Trip blanks were free of detectable concentrations of volatile contaminants (TRHC6-C10/BTEX)	No – Trip blank not analysed (refer to Section 4.3.7.2)

Table C-5: Data quality indicators - Accuracy (Bias)

Accuracy (bias)					
Field considerations	DQI	DQI Compliance	Laboratory considerations	DQI	DQI Compliance
SOP appropriate and complied with	SMEC SOPs/field instructions will be implemented	Yes	Analysis of field blanks	A laboratory prepared trip blank will be analysed for soil sampling (as defined in AS4482.2-1999 and NEPC (1999). Results are to be less than the LOR	No – Trip blank not analysed (refer to Section 4.3.7.2)
Rinsate blank	Where reusable sampling equipment is utilised (if any) a rinsate blank will be analysed and results compared against the PQL	Yes (Refer to Section 4.3.7.2)	Analysis of method blank	Method blanks will be analysed as per NEPC (1999) at least 1 per process batch (typically 1 in 20). Results to be less than LOR	Yes
Trip spike	Trip spikes are collected and analysed together with samples	No – Trip spike not analysed (refer to Section 4.3.7.2)	Analysis of matrix spike	Matrix spikes will be analysed as per NEPC (1999) (one matrix spike per soil type per process batch). Results to be within laboratory acceptance limits based on NEPC (1999). Acceptance limits are on the laboratory certificates (typically 70-130%, depends on analyte. A lower range typically accepted for phenols 30%-130%)	Yes (minor exceptions, refer to Section 4.3.7.2)
Preservation, transport, and storage	Samples appropriately preserved in laboratory supplied containers, stored, and transported correctly and within holding times	Yes (minor exceptions, Refer to Section 4.3.7.2	Analysis of surrogate spike	Surrogates will be analysed as per NEPC Schedule B3 (1999). All samples spiked where appropriate (e.g. chromatographic analysis of organics). Acceptance limits 70% to 130% (inorganics), or 50% to 150% (organics).	Yes
			Analysis of laboratory control samples	Laboratory control samples (LCS) will be analysed as per NEPC Schedule B3 (1999) (at least 1 per batch). Results to be within laboratory acceptance limits based on NEPC (1999). Acceptance limits are on the laboratory certificates (typically 70-130%, depends on analyte)	Yes
			Analysis of laboratory-prepared spikes	Spikes will be analysed as per NEPC Schedule B3 (1999). Recovery results to be within laboratory acceptance limits based on NEPC Schedule B3 (1999). Acceptance limits are on the laboratory certificates.	Yes

Explanatory Notes of Abbreviations and Terms

Used on Borehole and Excavation Logs

General

The “Geological and Engineering Log” presents data from drilling or excavation operations where material recovery is soil and or rock. Data presented is a combination of material recovered, regular sampling and in-situ testing. Excavations may present data obtained on the subsurface profile from observations of natural or man-made excavations. Logs may contain scaled graphical presentations, photography, or downhole imagery results. Logs may not contain all data types presented in these notes.

The “Non Core Drill Hole Engineering Log” presents data from drilling operations where a core barrel has not been used. The material is penetrated using methods other than those designed to recover core and is commonly soil or extremely to highly weathered. The “Cored Drill Hole Engineering Log” presents data from drilling operations where a core barrel has been used. The “Excavation - Geological Log” presents data obtained on the subsurface profile from observations of excavations, either natural or anthropogenic.

As far as is practicable, the data contained on the log sheet is factual. Some interpretation is inevitable with respect to the:

a. assessment of material boundaries in areas of partial sampling and recovery,

b. location of areas of core loss,

c. description and classification of material,

d. estimate of field strength, and

e. identification of drilling induced fractures.

Material description and classification is generally based on AS1726-2017 (as amended).

Drilling Method

Code	Description
ADT	Auger drilling with TC-bit
ADV	Auger drilling V-bit
AS	Auger screwing
AT	Air track
CA	Casing advancer
CC	Concrete core
CTR	Cable tool rig
DB	Wash bore drag bit
HA	Hand auger
HAND	Hand methods
HF	Hollow flight auger
HMLC	Diamond core 63.5 mm diameter
HQ / HRQ	Wire line core barrel 63.5 mm diameter
HQ3	Wire line core barrel 61.1 mm diameter
NDD	Non destructive drilling
NMLC	Diamond core 51.9 mm diameter
NQ	Wire line core barrel 47.6 mm diameter
NQ3	Wire line core barrel 45.1 mm diameter
PT	Continuous push tube
PQ	Wire line core barrel 85.0 mm diameter
RAB	Rotary air blast
RC	Reverse circulation
RD	Rotary blade or drag bit
RR	Rock roller
RT	Rotary tricone bit
SD	Sonic drilling
TBX	Tube-X
VC	Vibro-core drilling
WB	Wash bore drilling

Drilling Penetration

Ease of penetration in non-core drilling

Term	Description
VE	Very easy
E	Easy
F	Firm
H	Hard
VH	Very hard

Support and Casing

Code	Description	Code	Description
C	Casing	Hw	114.3 mm
M	Mud	Nw	88.9 mm
W	Water	PVC 150	150 mm

Core Run

Core lifts are identified by a line and depth with core loss per run as a percentage. Core loss is shown in the core run unless otherwise indicated.

Defect Spacing

The average distance between defects is measured parallel to the core axis in mm and may be expressed as a range or average.

Angle / Orientation

Angle from horizontal and orientation to magnetic north.

For inclined cored boreholes the Alpha and Beta angles are presented for orientated core. Alpha (α) is measured relative to the core axis, whilst Beta (β) is measured clockwise from the reference line looking down the core axis in the direction of drilling.

Excavation Method

Term	Definition
N	Natural exposure
X	Existing excavation
BB	Tractor mounted backhoe bucket
EX	Hydraulic excavator
EH	Hydraulic excavator with hammer
B	Bulldozer blade
R	Ripper

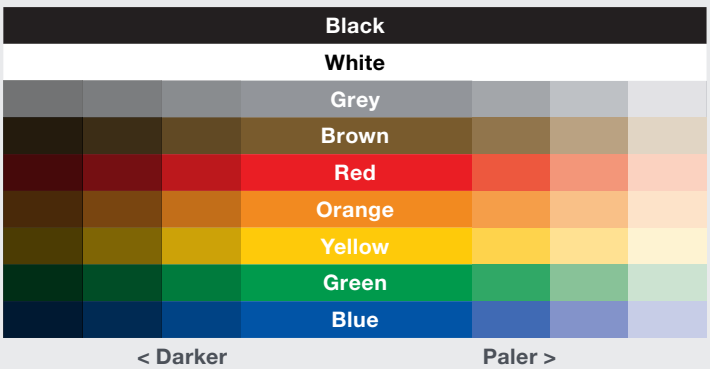
Water / Drilling Fluid

The drilling fluid used is identified and loss of return to the surface is estimated as a percentage, generally of each core lift.

Symbol	Description
	Water inflow
	Water outflow
	Water level: during drilling or immediately after completion of drilling
	Groundwater level with date observed prior to introduction of fluids or after standpipe construction
Not observed	The observation of groundwater, whether present or not, was not possible due to drilling water, surface seepage or cave in of the borehole / test pit.
Not encountered	The borehole / test pit was dry soon after excavation, however groundwater could be present in less permeable strata. Inflow may have been observed had the borehole / test pit been left open for a longer period.

Colour

The colour of a soil or rock is described in a moist/wet condition using simple terms, such as black, white, grey, red, brown, orange, yellow green or blue. These are modified as necessary by 'pale', 'dark' or 'mottled'. Borderline colours are described as a combination of these colours (e.g. orange-brown). Where a soil or rock consists of a primary colour with a secondary mottling it is described as (primary colour) mottled (first colour) and (secondary colour). Where colour is described outside of the material description it is for the interval.



Description of Soil

vi. Soil name (BLOCK LETTERS)

vii. Plasticity or particle size of soil

viii. Colour (i.e. dominant colour of material)

ix. Secondary soil components names & estimated proportions, including their plasticity / particle characteristics, colour

x. Minor soil components name, estimated proportions, including their plasticity / particle characteristics, colour

xi. Other minor soil components

xii. Moisture condition

xiii. Consistency / density

xiv. Structure of soil, geological origin

xv. Additional observations

Particle Size

Term		Grain Size
Clay		< 2 µm
Silt		2 – 75 µm
Sand	Fine	0.075 – 0.21 mm
	Medium	0.21 – 0.6 mm
	Coarse	0.6 – 2.36 mm
Gravel	Fine	2.36 – 6.7 mm
	Medium	6.7 – 19 mm
	Coarse	19 – 63 mm
Cobbles		63 – 200 mm
Boulders		> 200 mm

Fine Grained and Coarse Grained Soils

Term	Description
Fine Grained Soil (cohesive)	More than 35% of the material less than 63 mm is smaller than 0.075 mm (silts and clays)
Coarse Grained Soil	More than 65% of the material less than 63 mm is larger than 0.075 mm (sands, gravels and cobbles)

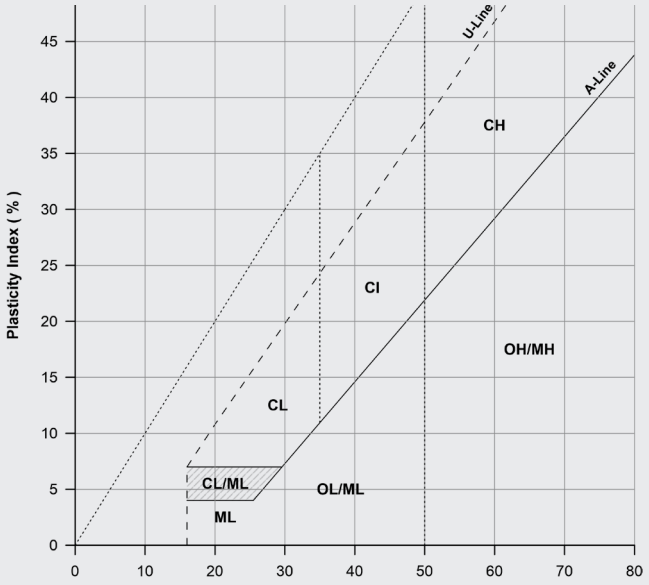
Descriptive Terms for Secondary and Minor Components

Designation of Components	In coarse grained soils				In fine grained soils	
	% Fines	Terminology	% Accessory coarse fraction	Terminology	% Sand / Gravel	Terminology
Minor	≤5	trace	≤ 15	trace	≤ 15	trace
	> 5, ≤ 12	with	> 15, ≤ 30	with	> 15, ≤ 30	with
Secondary	> 12	prefix	> 30	prefix	> 30	prefix

Plasticity – Fine Grained Soils

Liquid Limit (LL) %	Description
≤ 35	Low plasticity (L)
> 35 to ≤ 50	Medium plasticity (I)
> 50	High plasticity (H)

Plasticity Chart– Fine Grained Soils



Consistency Terms – Fine Grained Soils

Term	Undrained shear strength (kPa)	Indicative SPT (N) Blow Count	Field Guide to Consistency
Very Soft (VS)	< 12	0 – 2	Easily penetrated several centimetres by fist, exudes between fingers when squeezed in fist
Soft (S)	12 – 25	2 – 4	Easily penetrated several centimetres by thumb, easily moulded by light finger pressure
Firm (F)	25 – 50	4 – 8	Can be penetrated several centimetres by thumb with moderate effort, and moulded between the fingers by strong pressure
Stiff (St)	50 – 100	8 – 15	Readily indented by thumb but penetrated only with difficultly. Cannot be moulded by fingers
Very Stiff (VSt)	100 – 200	15 – 30	Readily indented by thumb nail, still very tough
Hard (H)	> 200	> 30	Indented with difficulty by thumb nail, brittle
Friable (Fr)	-		Can be easily crumbled or broken into small pieces

Density Terms – Coarse Grained Soils

Term	Density Index (%)	SPT (N) Blow Count
Very Loose (VL)	< 15	0 – 4
Loose (L)	15 – 35	4 – 10
Medium Dense (MD)	35 – 65	10 – 30
Dense (D)	65 – 85	30 – 50
Very Dense (VD)	> 85	> 50

Particle Characteristics – Coarse Grained Soils

Term	Description
Well graded	Having good representation of all particle sizes
Poorly graded	With one or more intermediate size poorly represented
Gap graded	With one or more intermediate sizes absent
Uniform	Essentially of one size

Angularity – Coarse Grained Soils

	Rounded
	Sub-rounded
	Angular
	Sub-angular

Origin of Soil

Fill	Formed by anthropogenic activity
Aeolian	Formed by wind
Alluvial	Formed by streams and rivers
Colluvial	Formed on slopes (talus)
Estuarine	Formed in marine environments
Lacustrine	Formed in lakes
Residual	Formed by weathering insitu

Soil Moisture

	Term	Code	Description
Coarse Grained	Dry	D	Looks and feels dry and free running
	Moist	M	Soil feels cool, darkened in colour, soils tend to stick together, soil grains do not run freely through fingers and no visible free water
	Wet	W	Soil feels cool, darkened in colour, soils tend to stick together, free water on remoulding
Fine Grained	Moist, Less than Plastic Limit	W < PL	Hard and friable or powdery, moisture content well below Plastic Limit
	Moist, Near Plastic Limit	W ≈ PL	Soil feels cool, darkened in colour, can be moulded, near Plastic Limit
	Moist, Wet of Plastic Limit	W > PL	Soil feels cool, dark, usually weakened, free water, moisture content well above Plastic Limit
	Wet, Near Liquid Limit	W ≈ LL	Soil exudes easily
	Wet, Wet of Liquid Limit	W > LL	Soil behaves as a liquid

Boundary Classifications

Soils possessing characteristics of two groups are designated by combinations of group symbols. For example, GW-GC, well graded gravel-sand mixture with clay binder.

Graphic Symbols

	Asphalt		MH
	CH		ML
	CI		OH
	CL		OL
	Concrete		PT
	Fill		SC
	GC		SM
	GM		SP
	GP		SW
	GW		Topsoil

Soil Classification

Soils are described in general accordance with AS1726-2017 as shown below.

FIELD IDENTIFICATION PROCEDURES (Excluding particles larger than 63 mm and basing fractions on estimated mass)						GROUP SYMBOL	PRIMARY NAME
COARSE GRAINED SOILS More than 65% of the material is less than 63 mm and is larger than 0.075 mm	A particle size of 0.075 is about the smallest size distinguishable to the naked eye	**GRAVELS** More than half of coarse fraction is larger than 2.36 mm	**CLEAN GRAVELS** (Little or no fines)	Wide range in grain size and substantial amounts of all intermediate particle sizes, not enough fines to bind coarse grains, no dry strength; ≤ 5% fines		GW	GRAVEL
				Predominantly one size or a range of sizes with more intermediate sizes missing, not enough fines to bind coarse grains, no dry strength; ≤ 5% fines		GP	GRAVEL
			GRAVELS w/ FINES (Appreciable amount of fines)	'Dirty' materials with excess of non-plastic fines, none to medium dry strength; ≥ 12% silty fines		GM	SILTY GRAVEL
				'Dirty' materials with excess of plastic fines, medium to high dry strength; ≥ 12% clayey fines		GC	CLAYEY GRAVEL
		SANDS More than half of coarse fraction is smaller than 2.36 mm	**CLEAN SANDS** (Little or no fines)	Wide range in grain size and substantial amounts of all intermediate particle sizes, not enough fines to bind coarse grains, no dry strength; ≤ 5% fines		SW	SAND
				Predominantly one size or a range of sizes with more intermediate sizes missing, not enough fines to bind coarse grains, no dry strength; ≤ 5% fines		SP	SAND
			SANDS w/ FINES (Appreciable amount of fines)	'Dirty' materials with excess of non-plastic fines, none to medium dry strength; ≥ 12% silty fines		SM	SILTY SAND
				'Dirty' materials with excess of plastic fines, medium to high dry strength; ≥ 12% clayey fines		SC	CLAYEY SAND
FINE GRAINED SOILS More than 35% of the material less than 63 mm is less than 0.075 mm		**IDENTIFICATION PROCEDURES ON FRACTIONS** < 0.075 mm					
		SILTS AND CLAYS Liquid Limit < 50%	**DRY STRENGTH**	**DILATANCY**	**TOUGHNESS**	**GROUP SYMBOL**	**PRIMARY NAME**
			None to low	Slow to rapid	Low	ML	SILT
			Medium to high	≥ 12% clayey fines	Medium	CL, CI*	CLAY
			Low to medium	Slow	Low	OL	ORGANIC SILT
		SILTS AND CLAYS Liquid Limit > 50%	Low to medium	None to slow	Low to medium	MH	SILT
			High to very high	None	High	CH	CLAY
			Medium to high	None to very slow	Low to medium	OH	ORGANIC CLAY
HIGHLY ORGANIC SOILS: readily identified by colour, odour, spongy feel and frequently fibrous texture						PT	PEAT

* CL is low plasticity clay, CI is medium plasticity clay

Description of Rock

i. Rock name (BLOCK LETTERS)
ii. Grain size and mineralogy
iii. Colour (i.e. dominant colour of material)
iv. Fabric and texture
v. Features, inclusions, minor components, moisture content and durability
vi. Strength
vii. Weathering and/or alteration
viii. Rock mass properties – discontinuities and structure of rock
ix. Interpreted stratigraphic unit
x. Additional observations including geological structure

Simple rock names are used to provide a reasonable engineering description, rather than a precise geological classification. The rock name is chosen by considering the nature and shape of the grains or crystals, the texture and fabric of the rock material, the geological structure and setting, and information from the geological map of the area. Further guidance on the naming of rocks can be found in AS1726-2017, Tables 15, 16, 17 and 18. Typical rock types are described below, though subject to site specific variations.

Rock Type	Description	Example of Rock Name
Sedimentary	Formed by deposited beds of sediments, have grains that are cemented together and often rounded. Significant porosity	COMMON: Conglomerate, Breccia, Sandstone, Mudstone, Siltstone, Claystone ≥90% CARBONATE: Limestone, Dolomite, Calcirudite, Calcarenite, Calcisiltite, Calcilutite PYROCLASTIC: Agglomerate, Volcanic Breccia, Tuff
Igneous	Formed from molten rock and have a crystalline texture. Typically massive and low porosity. Rock types are from coarse to fine grained.	HIGH QUARTZ CONTENT: Granite, Microgranite, Rhyolite MODERATE QUARTZ CONTENT: Diorite, Microdiorite, Andesite LOW QUARTZ CONTENT: Gabbro, Dolerite, Basalt
Metamorphic	Formed when rocks are subject to heat and/or pressure and have typically have directional fabric. Typically have low porosity and crystalline structure. Rock types are from coarse to fine grained	FOLIATED: Gneiss, Schist, Phyllite, Slate NON-FOLIATED: Marble, Quartzite, Serpentinite, Hornfels
Duricrust	Formed as part of a weathering profile and show evidence of being cemented in situ. Cementation is typically irregular and exhibits replacement textures.	Ferricrete (Iron oxides and hydroxides) Silicrete (Silica) Calcrete (Calcium carbonate) Gypcrete (Gypsum)

Note: ( ) denotes dominant cementing mineralogy

Grain Size

Terms describing dominate grain size in sedimentary rocks.

Term	Grain size
Coarse	Mainly 0.6 mm to 2.0 mm
Medium	Mainly 0.2 mm to 0.6 mm
Fine	Mainly 0.06 mm (just visible) to 0.2 mm

Terms describing dominate grain size in igneous and metamorphic rocks

Term	Grain size
Coarse	Mainly greater than 2 mm
Medium	0.06 mm to 2 mm
Fine	Mainly less than 0.06 mm (just visible) to 0.2 mm

Texture and Fabric

Sedimentary rocks

Thickness	Bedding Term
< 6 mm	Thinly laminated
6 – 20 mm	Laminated
20 – 60 mm	Very thinly bedded
60 – 200 mm	Thinly bedded
0.2 – 0.6 m	Medium bedding
0.6 – 2 m	Thickly bedded
> 2 m	Very thickly bedded

Igneous rocks

Term	Definition
Amorphous	Indicates that the rock has no obvious crystalline structure
Crystalline	A regular molecular structure, showing crystal structure and symmetry.
Cryptocrystalline	The texture comprises crystals that are too small to recognise under an ordinary microscope. Indistinctly crystalline.
Porphyritic	Indicates the presence of phenocrysts (relatively large crystals in a fine grained ground mass) in igneous rocks.
Flow banded	Indicates visible flow lines in volcanic rocks and some intrusive rocks
Glassy	Entirely glass like. No crystalline units and without crystalline structure.
Vesicular	A texture of volcanic rocks that indicates the presence of vesicles (small gas bubbles). Where the vesicles are filled with a mineral substance they are termed Amygdales and the texture is Amygdaloidal.

Metamorphic

Term	Definition
Foliation	The parallel arrangement of minerals due to metamorphic process, which shall be defined by the terms in weak, moderate and strongly foliated.
Porphyroblastic	A texture indicating the presence of porphyroblasts (larger crystals formed by recrystallization during metamorphism, such as garnet or staurolite in a mica schist).
Cleavage	A type of foliation developed in fine grained metamorphic rocks such as slates.

Bedding and Fabric Development

Type	Definition
Massive	No obvious development of bedding – rock appears homogeneous
Poorly Developed	Bedding is barely obvious as faint mineralogical layering or grain size banding, but bedding planes are poorly defined.
Well Developed	Bedding is apparent in outcrops or drill core as distinct layers or lines marked by mineralogical or grain size layering.
Very Well Developed	Bedding is often marked by a distinct colour banding as well as by mineralogical or grain size layering.
Indistinct Fabric	There is little effect on strength properties
Distinct Fabric	The rock may break more easily parallel to the fabric

Rock Strength

Term (Code)	UCS (MPa)	$Is_{(50)}$ (MPa)	Field Guide to Strength
Very Low (VL)	0.6 - 2	> 0.03 to ≤ 0.1	Material crumbles under firm blows with sharp end of pick; can be peeled with knife; too hard to cut a triaxial sample by hand. Pieces up to 3 cm thick can be broken by finger pressure.
Low (L)	2 - 6	> 0.1 to ≤ 0.3	Easily scored with a knife; indentations 1 mm to 3 mm show in the specimen with firm blow of the pick point; has dull sound under hammer. A piece of core 150 mm long 50 mm in diameter may be broken by hand. Sharp edges of core may be friable and break during handling.
Medium (M)	6 - 20	> 0.3 to ≤ 1.0	Readily scored with a knife; a piece of core 150 mm long by 50 mm in diameter can be broken by hand with difficulty.
High (H)	20 - 60	> 1 to ≤ 3	A piece of core 150 mm long by 50 mm in diameter cannot be broken by hand but can be broken by a pick with a single firm blow; rock rings under hammer.
Very High (VH)	60 - 200	> 3 to ≤ 10	Hand specimen breaks with pick after more than one blow; rock rings under hammer.
Extremely High (EH)	> 200	> 10	Specimen requires many blows with geological pick to break through intact material; rock rings under hammer.

Rock strength is assessed by laboratory Uniaxial Compressive Strength (UCS) testing and/or Point Load Strength Index (PLT) testing to obtain the $Is_{(50)}$ the strength table implies a 20 times correlation between $Is_{(50)}$ and UCS used for classification. Note however, multiplier may range from 4 (e.g. some carbonated and low strength rocks) to 40 (e.g. some igneous rocks and/or some high strength rocks). A site specific correlation based on testing, previous investigation or literature may be used where available. These terms refer to the strength of the rock material and not to the strength of the rock mass which may be considered weaker due to the effect of rock defects.

Visual Log

A diagrammatic plot of defects showing type, spacing and orientation in relation to the core axis.

- Defects open in situ or clay sealed
- Defects closed in-situ
- Drill induced fractures or handling breaks
- Infilled seam

Rock Weathering and or Alteration Classification

Term (Code)		Definition	
Residual soil (RS)		Soil developed on extremely weathered rock. The rock mass structure and substance fabric are no longer evident but the soil has not been significantly transported.	
Extremely weathered (XW) Extremely altered (XA)		Rock is weathered to such an extent that it has 'soil' properties, i.e, it either disintegrates or can be remoulded in water, but the texture of original rock is still evident.	
Highly weathered (HW) Highly Altered (HA)	Distinctly weathered (DW)*	Whole rock material is discoloured usually by extent that iron staining or bleaching and other signs of chemical or physical decomposition are evident. Porosity and strength may be increased or decreased compared to the fresh rock usually as a result of iron leaching or deposition. The colour and strength of the original rock substance is no longer recognisable	*Where is it not practical to distinguish between 'HW' and MW'. Rock strength usually changed by weathering. The rock may be highly discoloured, usually by iron staining. Porosity may be increased by leaching, or may be decreased due to deposition of weathering products in pores
Moderately weathered (MW) Moderately Altered (MA)	Distinctly Altered (DA)	Whole rock material is discoloured usually by staining that original colour of the fresh rock is no longer recognisable	
Slightly weathered (SW) Slightly altered (SA)		Rock is slightly discoloured but shows little or no change of strength from fresh rock	
Fresh rock (FR)		Rock shows no sign of decomposition or staining.	

Rock Core Recovery

TCR = Total Core Recovery (%)

$$\frac{\textbf{Length of Core Recovered}}{\textbf{Length of Core run}} \times 100$$

SCR = Solid Core Recovery (%)

$$\frac{\textbf{Sum Length of Cylindrical Core Recovered}}{\textbf{Length of Core run}} \times 100$$

RQD = Rock Quality Designation (%)

$$\frac{\textbf{Sum Length of Sound Core Pieces > 100mm in length}}{\textbf{Length of Core run}} \times 100$$

Types of Defects

Term		Code	Description
Parting		PT	A surface or crack across which the rock has little or no tensile strength. Parallel or sub-parallel to layering (e.g. bedding) or a planar anisotropy in the rock material (i.e. cleavage). May be opened or closed.
Joint		JT	A surface or crack with no apparent shear displacement and across which the rock has little or no tensile strength, but which is not parallel or sub-parallel to layering or to planar anisotropy in the rock material. May be open or closed.
Sheared Surface		SR	A near planar, curved or undulating surface which is usually smooth, polished or slickensided and which shows evidence of shear displacement.
Sheared Zone		SZ	Zone of rock material with roughly parallel, near planar, curved, or undulating boundaries cut by closely spaced joints, sheared surfaces or other defects. Some of the defects are usually curved and intersect to divide the mass into lenticular or wedge-shaped blocks.
Crushed Zone [a]		CZ	A zone of broken and disturbed ground containing more than one identifiable Crushed Seam.
Fracture Zone [a]		FZ	A zone of broken ground with parallel to opposing boundaries dominated by abundant, extremely closely to closely spaced defects, which may be intact or open, and planar, curved, undulating, irregular, or stepped, resulting in a dissected rock mass of angular trapezoidal, triangular or rectangular fragments.
Seam (SE)	Sheared Seam	SS	Seam of soil material with roughly parallel almost planar boundaries, composed of soil materials with roughly parallel near planar, curved or undulating boundaries cut by closely spaced joints, sheared surfaces or other defects. Some of the defects are usually curved and intersect to divide the mass into lenticular or wedge-shaped blocks.
	Crushed Seam	CS	Seam of soil material with roughly parallel almost planar boundaries, composed of disoriented, usually angular fragments of the host rock material which may be more weathered than the host rock. The seam has soil properties.
	Infilled Seam	IS	Seam of soil material usually with distinct roughly parallel boundaries formed by the migration of soil into an open cavity or joint, infilled seams less than 1 mm thick may be described as a veneer or coating on a joint surface.
	Extremely Weathered Seam	XS	Seam of soil material, often with gradational boundaries. Formed by weathering of the rock material in place.
Fault [b]		FT	A fracture (defect) or fracture zone along which there has been an observable amount of displacement.
Vein [c]		VE	Any fracture that contains mineralized material. Veins can display either crack-normal extension or shear displacement coupled with crack-normal extension.
Vugh [a]		VG	An open void with secondary crystallisation which may be coated, partly or nearly completely filled.
Void [a]		VO	An open space created through natural or anthropogenic processes, including, but not limited to, caves, kettles, tunnels, mines, pipes, piping, landslides, faulting, shearing, dissolution, & erosion.
Mechanical Break		MB	A fracture or break induced or created by the sampling process (i.e. drilling (DB) handling (HB), drill lift (DL), excavation, or blasting).

All definitions as per AS1726-2017, except:

[a] SMEC Field Manual,
[b] British Standard BS 5930:2015, and
[c] Glossary of Geology (Fifth Edition - revised) (2011), American Geosciences Institute.

Defect Planarity

Code	Description
CR	Curved – A defect with a gradual change in orientation
IR	Irregular – A defect with many sharp changes in orientation
PL	Planar – Defect forms a continuous plane without variation in orientation
ST	Stepped – A defect with distinct sharp steps or step
UN	Undulose – A defect with undulations

Defect Roughness

Code	Description
RO	Rough – Many small surface irregularities generally related to the grain size of the parent rock
SM	Smooth – Few or no surface irregularities related to the grain size of the parent rock
PO	Polished – Planes have a distinct sheen or a smoothness
SL	Slickensided – Planes have a polished, grooved or striated surface consistent with differential movement of the parent rock along the plane
VR	Very rough – many large surface irregularities, amplitude generally more than 1mm

Type of Structures

Term	Code	Description
Bedding	BD	A layered arrangement of minerals parallel to the surface of deposition which has caused planar anisotropy in the rock substance.
Cleavage	CV	An alignment of fine grained minerals caused by deformation.
Schistosity	SH	A layered arrangement of minerals to each other
Foliation	FO	A planar alignment of minerals caused by deformation.
Void	VO	A completely empty space
Dyke	DK	Sheet-like bodies of igneous rock that cut across sedimentary bedding or foliations in rocks. They may be single or multiple in nature
Sill	SL	A sill is an intrusion of magma that spreads underground between the layers of another kind of rock
Contact	CX	A contact between intrusive and stratigraphic units.
Boundary	BN	A distinct boundary between two stratigraphic units
Vugh	VG	An open void with crystalisation

Note: Drill breaks (DB) and handling breaks (HB) are not included as natural discontinuity.

Discontinuity Spacing

Spacing (mm)	Description
> 6000	Extremely Widely Spaced
2000 - 6000	Very Widely Spaced
600 - 2000	Widely Spaced
200 - 600	Medium Spaced
60 - 200	Closely Spaced
20 - 60	Very Closely Spaced
< 20	Extremely Closely Spaced

Infill Material

Code	Name	Code	Name
Ap	Apatite	Ga	Galena
Ca	Calcite	Gp	Gypsum
Ch	Chlorite	Mn	Manganese
Cl	Clay	MnO	Manganese Oxide
Co	Coal	MS	Secondary mineral
Ep	Epidote	Py	Pyrite
Fe	Limonite/ Ironstone/ Goethite	Um	Unidentified mineral
FeO	Iron oxide	Qz	Quartz
Fs	Feldspar	X	Carbonaceous
		Ze	Zeolite

Discontinuity Observation

Term	Code	Description
Clean	CN	No visible coating or infill
Stain	SN	No visible coating or infill but surfaces are discoloured by mineral staining
Veneer < 1 mm	VN	A visible coating or soil or mineral substance but usually unable to be measured. If discontinuous over the plane, patchy veneer.
Coating > 1 mm to < 10 mm	CT	A visible coating or infilling of soil or mineral substance. Describe composition and thickness.
Filling (Filled) > 10 mm	FD	A visible filling of soil or mineral substance. Describe composition and thickness.

Discontinuity Orientation

Code	Description
VT	Vertical
HO	Horizontal
RL	Top right to bottom left
LR	Top left to bottom right

Samples and Field Tests

Code	Description
B	Bulk disturbed sample
BLK	Block sample
C	Core sample
CBR	CBR Mould Sample
CPT_u	Cone Penetration Test (with pore pressure)
DT	Dilatometer
DS	Small disturbed sample
ES	Soil sample for environmental testing
EW	Water sample for environmental testing
FP	Pressuremeter
G	Gas sample
H	Hydraulic fracturing
HP	Hand penetrometer test
I	Impression device
$Is_{(50)}$	Point Load Index
K	Permeability
LB	Large bulk disturbed sample
N	Standard penetration test result (N* denotes SPT sample recovery)
O	Core orientation
P	Piston sample
PID	Photoionisation detector reading in ppm
PP	Penetrometer
R	Hammer bouncing / refusal
SPT	Standard Penetration Test
U	Undisturbed push in sample
UCS	Uniaxial Compressive Strength
U50	Undisturbed tube sample (50 mm diameter)
U75	Undisturbed tube sample (75 mm diameter)
U100	Undisturbed tube sample (100 mm diameter)
VS	Vane shear test
● (A)	Axial Test
○ (D)	Diametral Test
□	Irregular Lump test

Laboratory Tests

Code	Description
ACM	Asbestos Containing Material
CD	Consolidated Drained
CU	Consolidated Undrained
LL	Liquid Limit
LS	Linear Shrinkage
MC	Moisture Content
MDD	Maximum Dry Density
OMC	Optimum Moisture Content
PBT	Plate Bearing Test
PI	Plasticity Index
PL	Plastic Limit
PSD	Particle Size Distribution
ρ_b	Bulk Density
ρ_p	Particle Density
ρ_d	Dry Density
UU	Undrained Unconsolidated

Backfill / Standpipe Detail

Symbol	Description	Symbol	Description
	Cement seal		Filter pack: sand filter
	Grout backfill GP -Cement BE - Bentonite Cement		Filter pack: gravel filter
	Un-slotted pipe		Bentonite seal
	Slotted pipe		Cutting – excavated material backfill
	Surface Completion: Monument Above Ground		Surface Completion: Gatic Ground Monument

Completion Details

Type	Description
Collapse	Exploratory hole collapsed before reaching planned depth
Equipment Failure	Boring or excavator equipment operational failure
Flooding	Flooding of excavation
Machine Limit	Limit of machine capability reached
Obstruction	Obstruction preventing further advancement
Operator Limit	Limit of operator limit/safety reached
Possible services	Indication of possible services below
Services present	Services encountered during exploratory hole
Squeezing	Hole squeezing boring equipment
Target Depth	Depth reached as planned
Target Depth (Instrumentation Installed)	Depth reached as planned instrumentation installed
Target Depth (Standpipe Installed)	Depth reached as planned open standpipe constructed
Material Refusal	Material preventing further advancement

Status

Code	Description
-2	Historic
-1	For information
0	Preliminary
1	Checked
2	Draft
3	Final

Appendix E

Laboratory summary tables

				Standing water level			Field parameters					Inorganics																			
Water Sample ID	Sample Date	Lab Batch	Observations	Depth (m bgl)	Reduced Level (m AHD)	Evidence of oily sheen or NAPL?	pH	Specific Conductivity (Ec @ 25°C)	Temperature	Dissolved Oxygen	Redox Potential	Ammonia as N	Ammonium as N	Nitrate and Nitrite as N (Sum)	Nitrite as N	Nitrate as N	Reactive Phosphorus as P	Total Phosphorus as P	Total Hardness as CaCO3	Total Acidity as CaCO3	Total Dissolved Solids (Calc.)	Calcium	Magnesium	Sodium	Potassium	Chloride	Fluoride	Sulphate as SO4 - Turbidimetric	Bicarbonate Alkalinity as CaCO3	Carbonate Alkalinity as CaCO3	Hydroxide Alkalinity as CaCO3	Total Alkalinity as CaCO3

*RPDs have only been considered where a concentration is greater than 1 times the EQL.
**Elevated RPDs are highlighted as per QAQC Profile settings (Acceptable RPDs for each EQL multiplier range are: 999 (1 - 10 x EQL); 50 (10 - 20 x EQL); 50 (> 20 x EQL))
***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

Instrument Check

Item	Test	Test Passed	Comments
2 x Alkaline C-size Batteries	Klein Tools MM300 Multimeter	✓	Both batteries reading above 2.9V
Battery Saver Function	Operation	✓	Automatically turns off after 60 minutes if idle
Unit Display	Operation	✓	Screen visible, no damage
Keypad	Operation	✓	Responsive, no damage
Connection Port and Cable	Condition/Check	✓	Clean, no damage
Monitor Housing	Condition/Check	✓	No damage
Firmware	Version	✓	4.0.0
pH Probe	Condition/Calibration	✓	Calibrated and conforms to manufacturer's specs
pH millivolts for pH 7.00	Calibration	✓	pH 7.00 calibration range between 0 mV ± 50 mV
pH millivolts for pH 4.00	Calibration	✓	pH 4 mV range +165 to +180 from 7 buffer mV value
pH slope	Calibration	✓	Range between 55 to 60 mV/pH (ideal value 59 mV)
Response time < 90 seconds	Calibration	✓	Responds to correct value within 90 seconds
ORP Probe	Condition/Calibration	✓	Calibrated and conforms to manufacturer's specs
ORP Reading	Calibration	✓	Within ± 80 mV of reference Zobell Reading
Response time < 90 seconds	Calibration	✓	Responds to correct value within 90 seconds
Conductivity/Temp Probe	Condition/Calibration	✓	Calibrated and conforms to manufacturer's specs
Conductivity Cell	Calibration	✓	Conductivity cell constant 5.0 ± 1.0 in GLP file
Clean Sensor Readings	Calibration	✓	Clean sensor reads less than 3 uS/cm in dry air
Dissolved Oxygen Probe	Condition/Calibration	✓	Calibrated and conforms to manufacturer's specs
DO Cap	Condition/Calibration	✓	1.25 mil PE membrane (yellow membrane)
DO Sensor in Use	Condition	✓	Polarographic DO sensor
DO Sensor Value	Calibration	✓	(min 4.31 uA - max 8.00 uA) Avg 6.15 uA

Instrument Readings

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
µg/L: micrograms per litre
ppm: parts per million
ppb: parts per billion
%: Percentage
org/100 mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100 mL: Most Probable Number of organisms per 100 millilitres

Terms

APHA	American Public Health Association
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment however free tributyltin was measured and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.4 where no positive PFAS results have been reported have been reviewed and no data was affected.

.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code
Method Blank

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Temperature of Chilled samples on receipt	4.1°C
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
Q15	The RPD reported passes Eurofins Environment Testing's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.

Sample Receipt Advice

Company name:	SMEC Australia Pty Ltd (WOLL)
Contact name:	Alexander Williams
Project name:	PORT KEMBLA MANILDRA
Project ID:	30013174
Turnaround time:	5 Day
Date/Time received	Apr 7, 2022 3:07 PM
Eurofins reference	878309

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : 4.1 degrees Celsius.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
X	Split sample sent to requested external lab.
X	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Emma Beesley on phone : or by email: EmmaBeesley@eurofins.com

Results will be delivered electronically via email to Alexander Williams - alex.williams@smec.com.

Note: A copy of these results will also be delivered to the general SMEC Australia Pty Ltd (WOLL) email address.

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
µg/L: micrograms per litre
ppm: parts per million
ppb: parts per billion
%: Percentage
org/100 mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100 mL: Most Probable Number of organisms per 100 millilitres

Terms

APHA	American Public Health Association
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment however free tributyltin was measured and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.4 where no positive PFAS results have been reported have been reviewed and no data was affected.

.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Temperature of Chilled samples on receipt	10.3°C
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
Q02	The duplicate %RPD is outside the recommended acceptance criteria. Further analysis indicates sample heterogeneity as the cause

Sample Receipt Advice

Company name:	SMEC Australia Pty Ltd (WOLL)
Contact name:	Alexander Williams
Project name:	PORT KEMBLA MANILDRA
Project ID:	30013174
Turnaround time:	10 Day
Date/Time received	Apr 22, 2022 12:00 PM
Eurofins reference	882352

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : 10.3 degrees Celsius.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
X	Split sample sent to requested external lab.
X	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Analysis updated as per provided COC.

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Emma Beesley on phone : or by email: EmmaBeesley@eurofins.com

Results will be delivered electronically via email to Alexander Williams - alex.williams@smec.com.

Note: A copy of these results will also be delivered to the general SMEC Australia Pty Ltd (WOLL) email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
µg/L: micrograms per litre
ppm: parts per million
ppb: parts per billion
%: Percentage
org/100 mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100 mL: Most Probable Number of organisms per 100 millilitres

Terms

APHA	American Public Health Association
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment however free tributyltin was measured and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.4 where no positive PFAS results have been reported have been reviewed and no data was affected.

.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Temperature of Chilled samples on receipt	18.7°C
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
Q02	The duplicate %RPD is outside the recommended acceptance criteria. Further analysis indicates sample heterogeneity as the cause
Q15	The RPD reported passes Eurofins Environment Testing's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.
R09	Theoretically the TKN result should be greater or equal to the ammonia concentration. However the difference reported is within the measurement uncertainty of the individual tests

Sample Receipt Advice

Company name:	SMEC Australia Pty Ltd (WOLL)
Contact name:	Alexander Williams
Project name:	PORT KEMBLA MANILDRA
Project ID:	30013174
Turnaround time:	5 Day
Date/Time received	Apr 28, 2022 6:08 PM
Eurofins reference	884366

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : 18.7 degrees Celsius.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
X	Split sample sent to requested external lab.
X	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Samples received by the laboratory after 5.30pm are deemed to have been received the following working day.

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Emma Beesley on phone : or by email: EmmaBeesley@eurofins.com

Results will be delivered electronically via email to Alexander Williams - alex.williams@smec.com.

Note: A copy of these results will also be delivered to the general SMEC Australia Pty Ltd (WOLL) email address.

No. of samples analysed	: 10		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Ankit Joshi	Senior Chemist - Inorganics	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW
Wisam Marassa	Inorganics Coordinator	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- **Analytical work for this work order will be conducted at ALS Sydney.**
- EP075 (SIM): Where reported, Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP080: Where reported, Total Xylenes is the sum of the reported concentrations of m&p-Xylene and o-Xylene at or above the LOR.
- EP074: Where reported, Total Trihalomethanes is the sum of the reported concentrations of all Trihalomethanes at or above the LOR.
- EP074: Where reported, Total Trimethylbenzenes is the sum of the reported concentrations of 1.2.3-Trimethylbenzene, 1.2.4-Trimethylbenzene and 1.3.5-Trimethylbenzene at or above the LOR.
- EP075(SIM): Where reported, Total Cresol is the sum of the reported concentrations of 2-Methylphenol and 3- & 4-Methylphenol at or above the LOR.
- EG020: It is recognised that total concentration is less than dissolved for some metal analytes. However, the difference is within experimental variation of the methods.
- Amendment (16/05/2022): This report has been amended following the removal of analytes not required per Alex Williams. All other analysis results are as per the previous report.
- EA016: Calculated TDS is determined from Electrical conductivity using a conversion factor of 0.65.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

QUALITY CONTROL REPORT

Work Order	: **EW2201994**	Page	: 1 of 22
Amendment	: **1**		
Client	: **SMEC AUSTRALIA PTY LTD**	Laboratory	: Environmental Division NSW South Coast
Contact	: JOEL REYNOLDS	Contact	: Katie Davis
Address	: LEVEL 2 6-8 REGENT STREET WOLLONGONG 2500	Address	: 1/19 Ralph Black Dr, North Wollongong 2500 NSW Australia
Telephone	: ----	Telephone	: 02 42253125
Project	: Port Kembla GME	Date Samples Received	: 27-Apr-2022
Order number	: -	Date Analysis Commenced	: 29-Apr-2022
C-O-C number	: 36757	Issue Date	: 16-May-2022
Sampler	: JOEL REYNOLDS		
Site	: Port Kembla Manildra April 2022		
Quote number	: SY/080/21 V3		
No. of samples received	: 13		
No. of samples analysed	: 10		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
Ankit Joshi	Senior Chemist - Inorganics	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Franco Lentini	LCMS Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW
Wisam Marassa	Inorganics Coordinator	Sydney Inorganics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **WATER**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **WATER**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EW2201994**	Page	: 1 of 16
Amendment	: **1**		
Client	: **SMEC AUSTRALIA PTY LTD**	Laboratory	: Environmental Division NSW South Coast
Contact	: JOEL REYNOLDS	Telephone	: 02 42253125
Project	: Port Kembla GME	Date Samples Received	: 27-Apr-2022
Site	: Port Kembla Manildra April 2022	Issue Date	: 16-May-2022
Sampler	: JOEL REYNOLDS	No. of samples received	: 13
Order number	: -	No. of samples analysed	: 10

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **Analysis Holding Time Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	*Method*	*QC*	*Regular*	***Actual***	***Expected***	*Evaluation*	
Laboratory Duplicates (DUP)							
Acidity as Calcium Carbonate	ED038-P	2	17	**11.76**	**10.00**	✓	NEPM 2013 B3 & ALS QC Standard
Alkalinity by Auto Titrator	ED037-P	2	16	**12.50**	**10.00**	✓	NEPM 2013 B3 & ALS QC Standard
Ammonia as N by Discrete analyser	EK055G	3	28	**10.71**	**10.00**	✓	NEPM 2013 B3 & ALS QC Standard
Chloride by Discrete Analyser	ED045G	2	14	**14.29**	**10.00**	✓	NEPM 2013 B3 & ALS QC Standard

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
pH by Auto Titrator	EA005-P	WATER	In house: Referenced to APHA 4500 H+ B. This procedure determines pH of water samples by automated ISE. This method is compliant with NEPM Schedule B(3)
Conductivity by Auto Titrator	EA010-P	WATER	In house: Referenced to APHA 2510 B. This procedure determines conductivity by automated ISE. This method is compliant with NEPM Schedule B(3)
Calculated TDS (from Electrical Conductivity)	EA016	WATER	In house: Calculation from Electrical Conductivity (APHA 2510 B) using a conversion factor specified in the analytical report. This method is compliant with NEPM Schedule B(3)
Alkalinity by Auto Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Acidity as Calcium Carbonate	ED038-P	WATER	In house: Referenced to APHA 2310 B Acidity is determined by titration automated titration (e.g. by PC Titrate) of a settled supernatant aliquot of the sample with a standardised alkali to an end-point pH of 8.3. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride.in the presence of ferric ions the librated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm APHA seal method 2 017-1-L
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.

Analytical Methods	Method	Matrix	Method Descriptions
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM Schedule B(3).
Dissolved Metals in Fresh Water -Suite A by ORC-ICPMS	EG094A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020 Samples are 0.45µm filtered prior to analysis. The ORC-ICPMS technique removes interfering species through a series of chemical reactions prior to ion detection. Ions are passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to measurement by a discrete dynode ion detector. This method is compliant with NEPM Schedule B(3).
Dissolved Metals in Fresh Water -Suite B by ORC-ICPMS	EG094B-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020 Samples are 0.45µm filtered prior to analysis. The ORC-ICPMS technique removes interfering species through a series of chemical reactions prior to ion detection. Ions are passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to measurement by a discrete dynode ion detector. This method is compliant with NEPM Schedule B(3).
Fluoride by Auto Titrator	EK040P	WATER	In house: Referenced to APHA 4500-F C: CDTA is added to the sample to provide a uniform ionic strength background, adjust pH, and break up complexes. Fluoride concentration is determined by either manual or automatic ISE measurement. This method is compliant with NEPM Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Ammonium as N	EK055G-NH4	WATER	Ammonium in the sample is reported as the ionised / unionised fractions by the use of a nomograph and the initial pH and Temperature. Ammonia is determined by direct colorimetry by Discrete Analyser according to APHA 4500-NH3 G. This method is compliant with NEPM Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM Schedule B(3)
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 4500-P H, Jirka et al, Zhang et al. This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM Schedule B(3)
Reactive Phosphorus as P-By Discrete Analyser	EK071G	WATER	In house: Referenced to APHA 4500-P F Ammonium molybdate and potassium antimonyl tartrate reacts in acid medium with othophosphate to form a heteropoly acid -phosphomolybdic acid - which is reduced to intensely coloured molybdenum blue by ascorbic acid. Quantification is by Discrete Analyser. This method is compliant with NEPM Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015 The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM Schedule B(3)
Volatile Organic Compounds	EP074	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270 Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260 Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM Schedule B(3)
PAH Compounds in Water	EP132-ST	WATER	In house, Samples are extracted into solvent in original containers. Determination by large volume injection GCMS in selected ion monitoring (SIM) mode.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
TKN/TP Digestion	EK061/EK067	WATER	In house: Referenced to APHA 4500 Norg - D; APHA 4500 P - H. This method is compliant with NEPM Schedule B(3)
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM Schedule B(3)
Digestion for Total Recoverable Metals - ORC	EN25-ORC	WATER	In house: Referenced to USEPA SW846-3005. This is an Ultrapure Nitric acid digestion procedure used to prepare surface and ground water samples for analysis by ORC- ICPMS. This method is compliant with NEPM Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Liquid Liquid Extraction (in-bottle - trace) -	ORG14-IB-ST	WATER	In house: A 50 mL of representative portion of a 500 mL sample is discarded. A portion of solvent (less dense than water) is used to extract the sample (horizontal shaker for 30 minutes) and a portion of the extract analysed directly.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for purging.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- This is an updated SRN which indicates the addition of metals and PFAS analysis on RInsate sample.
- **TB and TS received damaged, unable to conduct analysis.**
- **Unable to conduct NT-13 analysis on Rinsate sample as no green bottle received.**
- **Analytical work for this work order will be conducted at ALS Sydney.**
- Sample QA1A PLEASE SEND TO EUROFINS FOR ANALYSIS was not received due to the following reason: Sample Not Received
- **Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.**
- **Please direct any queries you have regarding this work order to the above ALS laboratory contact.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

Method Sample ID	Sample Container Received	Preferred Sample Container for Analysis
Dissolved Metals by ICP-MS - Suite A : EG020A-F		
Rinsate 01	- Clear Plastic Bottle - Nitric Acid; Unfiltered	- Clear Plastic Bottle - Nitric Acid; Filtered

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Fact sheet

Water access licence exemption
for aquifer interference activities taking 3ML or less of groundwater per year

In December 2019 the NSW government introduced an exemption in the Water Management (General) Regulation 2018 that allows a small volume of groundwater to be taken through certain aquifer interference activities without the need for a water access licence.

Exemption from needing a water access licence

Under the exemption, a person can take up to 3 megalitres of groundwater through an aquifer interference activity per authorised project per water year without needing to obtain a water access licence, provided:

a) the water is not taken primarily for consumption or supply; and
b) the person claiming the exemption keeps a record of the water taken under the exemption and provides this to the Minister within 28 days of the end of the water year; and
c) the records are kept for 5 years.

Examples of aquifer interference activities to which the exemption may apply include:

- quarrying, excavating, dredging or exploring for stone, aggregate, sand or gravel;
- exploring for minerals, (including coal) or petroleum;
- excavation to construct or maintain a building, road or infrastructure;
- remediation of groundwater contamination;
- conducting pumping tests to investigate bore capacity or groundwater system characteristics;
- sampling for water quality from monitoring bores;
- ongoing dewatering of basements;
- creation of an artificial lake that intersects with groundwater and allows evaporation from it;
- investigation of groundwater resources or geotechnical investigation;
- operation of ground source heating or cooling systems.

The exemption provides a consistent, volume-based approach for the take of small volumes of groundwater and reduces red tape, delays and costs for businesses undertaking these aquifer interference activities.

Three megalitres per year is similar to the volume taken by landholders in accordance with domestic and stock rights held under section 52 of the *Water Management Act 2000*, for which a water access licence is not required to be held.

For mining and petroleum (including coal seam gas) activities, the exemption only applies to groundwater taken at the exploration stage. It does not apply to water taken during the production stage of mining and petroleum activities.

Water access licence exemption
for aquifer interference activities taking 3ML or less of groundwater per year

Claiming the exemption

The exemption only applies where groundwater is taken incidentally so that the aquifer interference activity can occur. That is, the purpose of taking the water must not be for its consumption or supply. The groundwater taken may subsequently be used for other purposes, for example for dust suppression or mixing concrete.

No application is needed to rely on the exemption, however proponents must record the water taken under the exemption on the approved recording and reporting form at the end of each period of take no later than 24 hours after the water is taken, for each water year in which an exemption is claimed. The form must be provided to the Minister's representative within 28 days of the end of the water year in which the water was taken.

Proponents must record the following information:

- The total amount of groundwater taken per year per authorised project under the exemption.
- The date or dates on which the groundwater was taken.
- A description of the method used to measure the volume of groundwater taken.
- The groundwater source from which the water was taken.
- The authority under which the water is being taken, for example water supply work approval, licence under the *Water Act 1912*, development consent, complying development or an approval exemption under legislation.
- The details of the person taking water.
- A description of the activity taking water.
- The location of the activity taking water.

Proponents of activities should check whether an approval and an assessment of impacts are required to carry out the activity regardless of whether this water access licence exemption applies.

More information

See FAQs for this exemption.

If you have any questions, please contact one of our friendly Customer Service team on 1300 662 077 or email Customer.Helpdesk@waternsw.com.au

[1] ***Authorised project*** *is defined in clause 7(5) of Schedule 4 to the Water Management (General) Regulation 2018, being an activity –*

a) that is the subject of a consent, approval or other lawful authority conferred by or under an Act, or

b) to which Division 5.1 of the Environmental Planning and Assessment Act 1979 applies, or

c) that is exempt development under that Act.
