1 Executive Summary

1.1 Project Scope

This application seeks approval for a Concept Plan across Goodman's Oakdale East Industrial Estate ("Estate") and approval for Stage 2 of works at the Estate. The site is located within the Fairfield Local Government Area and is legally described as Lot 102 and Lot 103 in DP1268366. Stage 1 of the works were completed in September 2021 and included Precinct 1 building and infrastructure works as indicated on the proposed Estate Masterplan. The Concept Plan is proposed to set the development controls for the Estate which will override the Development Control Plan ("DCP") that is currently with Department of Planning and Environment (DPE) for consideration. This DCP has been lodged with DPE to support the Rehabilitation Development Application that is currently with Fairfield City Council for consideration. The Rehabilitation Development Application seeks approval for works only to Precinct 1 expansion, Precincts 2, 3 and 4 and includes the following (this application excludes works to Precinct 5):

- Cut and fill works to provide bulk pad levels;
- Provision of Estate stormwater infrastructure including completion of detention basins and swales;
- Removal of 2.58 ha of vegetation;
- Demolition of the Brick Factory and rehabilitation of the surrounding land;
- Installation of 1 x retaining wall on the eastern portion of Precinct 3; and
- Consideration for Aboriginal Heritage and Geotech assessments.

The proposed Concept Plan approval seeks approval for:

- The proposed Estate masterplan allowing development of 303,330m² of GLA;
- 24/7 hours of operation;
- Building Height of 43m for Precinct 3 (excluding roof-top plant and solar) and 15m (excluding roof-top plant and solar) to the remainder of the Estate;
- Estate subdivision;
- Estate wide planning controls as shown in the EIS
- Construction hours 7 am to 6 pm Monday to Friday, 8 am to 1 pm Saturday
- Geotech and Aboriginal heritage considerations for Precinct 5

The Stage 2 works considered under this application include the following:

- Cut and fill works to Precinct 5 only to provide bulk pad level;
- Completion of lead-in infrastructure works including intersection upgrades at Millner Ave / Old Wallgrove Road and Lenore Drive / Old Wallgrove Road
- Clearing of 0.44 ha of native vegetation
- Completion of the internal road network (excl. the proposed private driveway providing access to Precinct 5 but including all other roads shown on the proposed masterplan);
- Reticulation of services infrastructure to provide serviced development pads to all precincts;
- Completion of retaining walls across the entire Estate;
- Completion of Building works to Precinct 1 expansion and Precinct 3 including any ancillary on lot infrastructure and detailed civil works required;

1.1.1 Precinct 1 Expansion

- Construction, operation, fit-out and use approval of a warehouse with ancillary office spanning 3,122 m² of GLA;

- 24/7 hours of operation;
- 15m building height (excluding solar and rooftop plant).

1.1.2 Precinct 3 Proposed Works

- Construction, operation, fit-out and use approval of a temperature controlled automated distribution centre;
- Total GLA of 96,810 m² including 10,009 m² of which is for future expansion;
- In addition to this, 38,050m² of mezzanines will be installed within the premises;
- 43m building height (excluding solar and rooftop plant)
- Storage of dangerous goods and flammable goods that exceed the SEPP33 threshold; and
- 24/7 hours of operation.

1.2 Executive Summary

As it relates to this report, the following presents the key findings of this TA:

TABLE 1 KEY FINDINGS OF THIS TA

Area	Precinct 1 Expansion	Precinct 3
Gross Leasable Area (GLA)	Total: 3,122m ²	Total: 96,810m ² (plus 38,050m ² of mezzanine)
Car Parking	Provision: 45 spaces Complies with OEE DCP 2022	Provision: 328 spaces Meets operational requirements
Traffic	<p>Traffic modelling has been conducted on an Estate-wide basis to determine the mitigation measures required to support the overall development (Precincts 1 to 5) for conservativeness. Intersection upgrades are required at the Old Wallgrove Road / Millner Avenue and Old Wallgrove Road / Lenore Drive intersections. These upgrades are:</p> <ul style="list-style-type: none"> • Old Wallgrove Road / Lenore Drive <ul style="list-style-type: none"> – Widening of the southern side of the intersection to accommodate a second departure lane, allowing for a continuous flow from the East approach; and – Widening and extension of the existing left-turn slip lane from the South approach from the existing 35 metres to 140 metres. • Old Wallgrove Road / Millner Avenue <ul style="list-style-type: none"> – Widening of the northern side of the intersection to accommodate an additional 100 metres left turn slip lane into Estate Road 02 (eastern arm of intersection); and – Extending the kerbside lane of the East approach from 50 metres to 140 metres (i.e. through No Stopping restrictions or similar). <p>With the proposed intersection upgrades, the intersections are expected to operate at a Level of Service (LoS) D or better in the 2036 horizon year.</p>	
Design	Tested for 20.0m Articulated Vehicles (AVs) at the access as the largest design vehicle.	Tested for 30.0m B-doubles at the access, for conservativeness and 20.0m Articulated Vehicles (AVs) for rear loading.

1.3 Liaison Process

Prior to the issue of SEARs, Ason Group has liaised with TfNSW with regards to the concept plan and stage 2 works for the Proposal (on 25 January 2022, Ref. Syd18/01298/03).

For this Site, consultation was held regarding the land uses, background growth, phasing assumptions and modelling at the Old Wallgrove Road / Millner Avenue and Old Wallgrove Road / Lenore Drive intersections. A detailed summary of this consultation is described in the sections below.

1.3.1 Consultation with TfNSW

During the liaison process, TfNSW noted that Ason Group's previously adopted trip generation rates (0.18 veh/hr per 100m² GFA during the AM Peak and 0.16 veh/hr per 100m² GFA during the PM Peak) were lower than the TfNSW recommended rates for warehousing (0.23 veh/hr per 100m² GFA during the AM Peak and 0.24 veh/hr per 100m² GFA during the PM Peak) and preferred the adoption of the higher rates.

However, TfNSW agreed that lower trip generation rates could be considered if sufficient evidence (e.g. surveys) was provided to demonstrate lower trip generation rates within the area.

Ason Group issued an email on 27 January 2022 with the information summarised in **Section 7.2.1**, providing evidence based on prior surveys in 2020 and 2022 to support the 0.18 and 0.16 trip rates adopted.

TfNSW had responded on 1 March 2022 noting a considerable number of surveys (9-10) were relied upon to determine their recommended Trip Generation Rates for the WSEA industrial zoning (IN1) and that the applicant use higher trip generation rates for the proposed development.

Further justification, separate to the email referenced above, based on the comparison to the existing Oakdale Central Estate (OCE) and Oakdale South Estate (OSE) trip generation has been added to this report and is summarised in **Section 7.2.2**. The observed trip generation rates at OCE and OSE are even lower than the 0.18 and 0.16 rates adopted for the OEE assessment.

Nonetheless, a sensitivity assessment has been prepared in **Section 0**, adopting the elevated trip rates of 0.23 and 0.24 trips per 100m² during the AM and PM peaks, to demonstrate the suitability of the proposed mitigation measures in a more conservative scenario.

1.3.2 Consultation with TfNSW – Modelling Assumptions

Relating to the Old Wallgrove Road / Millner Avenue intersection, TfNSW noted the standard position to adopt double diamond phasing for greenfield sites.

In response, Ason Group noted that the Old Wallgrove Road / Millner Avenue intersection is an existing intersection with the western leg already constrained (from expansion) by other existing developments. During the meeting, it was noted that the approved Traffic Control Signal (TCS) plan for this intersection (TCS 4656, accepted by TfNSW in 2015) shows a single diamond arrangement. As such, the Millner Avenue / Old Wallgrove Road intersection has been modelled as a single diamond (with the concept plan attached in **Appendix A**) in both the existing and future year modelling scenarios.

TfNSW also commented on the lack of pedestrian crossing at the northern approach of the Old Wallgrove Road / Millner Avenue intersection. The project team has considered this comment and have since updated the intersection concept design to include pedestrian crossings on all approaches. SIDRA modelling has been undertaken with signalised pedestrian crossings on all approaches for this intersection.

2 Planning History and Context

2.1 OEE DCP 2022

The approval for the Oakdale East Development Control Plan (OEE DCP 2022) was granted on 25 May 2022 (and came into force on 26 May 2022) and applies to the Austral Bricks Plant Site Boundary area shown in **Figure 1**.

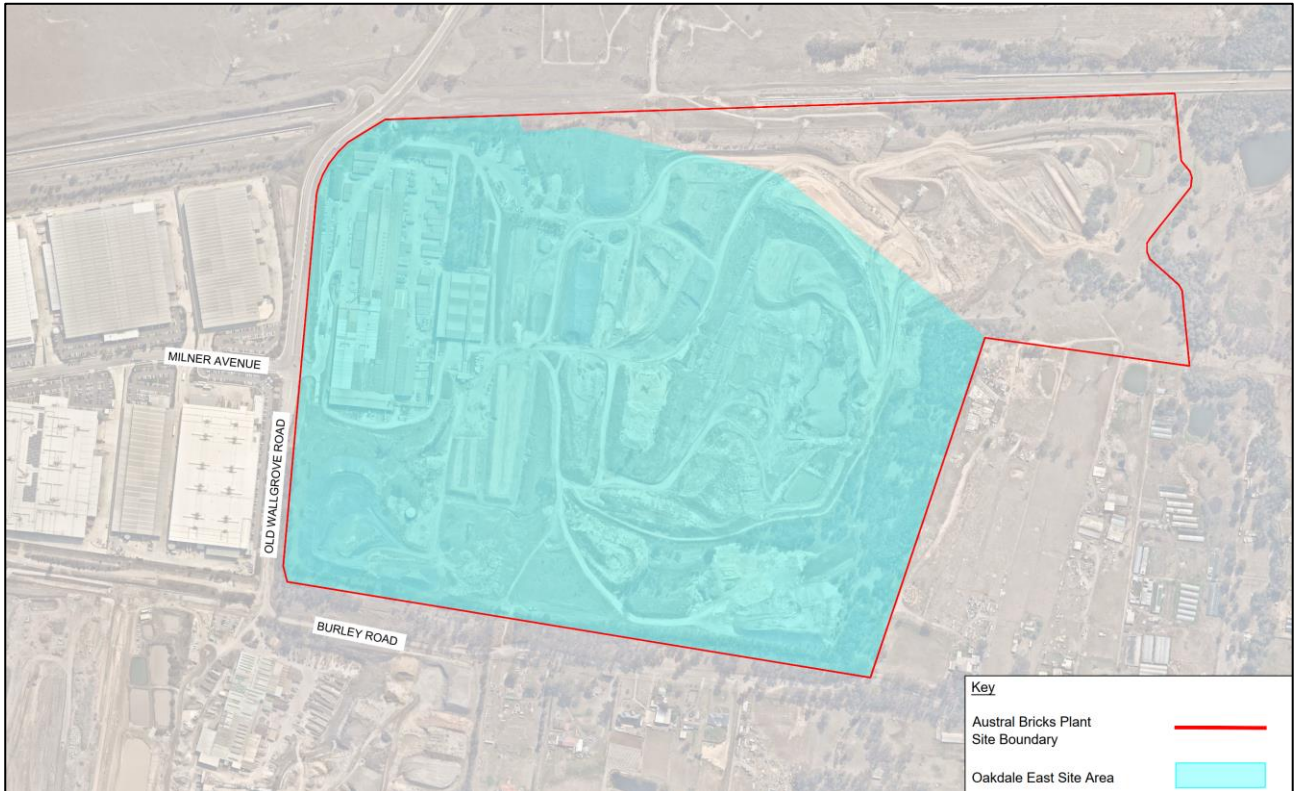

Figure 1: Land to Which this DCP Applies – Shown Blue (Source: OEE DCP, 2022)

The OEE DCP establishes the following rates for car parking requirements:

- Light industry, general industry (excluding masonry plant facilities), warehouse or distribution centre - 1 space per 300m² of GFA; and
- Office - 1 space per 40m² of GFA.

2.2 Development Application No. 93.1/2019

Precinct 1 within the OEE has already been approved in a previous DA (DA No. 93.1/2019) on 1 April 2020 and encompassed the following works:

- 4 warehouses with a combined Gross Floor Area (GFA) of 21,156m²;
- Ancillary office space with a GFA of 3,186m²;
- A Masonry Plant with a GFA of 10,430m² and ancillary office space of 1,040m²;
- A total of 265 car parking spaces, including 6 accessible spaces across the Site,

- The construction of Estate Road 1; and
- A separated light vehicle and truck access point for each lot to Estate Road 1.

Ason Group has undertaken a traffic assessment for this existing approval, which addressed the parking and traffic characteristics of only Precinct 1.

2.3 Oakdale South Estate

The approved and largely operational Oakdale South Estate (OSE) is located some 1.5-2km south west of the subject site. Condition C5 of the development consent (SSD-6917-MOD-16) establishes the following parking rates:

- 1 space per 300m² of warehouse GFA;
- 1 space per 40m² of office GFA; and
- 2 disabled spaces for every 100 car parking spaces.

2.4 Oakdale East Concept Plan

The Oakdale East Concept Plan sought as part of this application considers the approved parking rates established in the OEE DCP, and development consents from the approved and operational OSE and OCE; and seeks to confirm the development controls for the overall OEE. Details are provided in **Section 6**.

3 Introduction

3.1 Overview

Ason Group has been engaged by Goodman Property Services (Aust) Pty Ltd to prepare a Transport Assessment (TA) to assess the traffic and parking implications from the proposed development of Precinct 3 and proposed expansion of Precinct 1 within the OEE. This TA also reviews traffic assessment and modelling having regard for the revised concept plan prepared by SBA architects:

- SBA Architects, 20201 – *Oak E MP 02 – Oakdale East Industrial Estate – Estate Masterplan – Issue K* (received 7 April 2022);
- SBA Architects, 21144 – *DA301 – Site Plan – Precinct 3 – Issue A* (received 7 April 2022); and
- SBA Architects, 22103 – *DA101 – Site & Warehouse Plan – Precinct 1 – Issue C* (received 12 April 2022).

3.2 Key References

In preparing this TA, Ason Group has referenced key planning documents. These include:

- Oakdale East Development Control Plan (DCP) 2022;
- Fairfield City Wide Development Control Plan (DCP) 2013; and
- Fairfield Local Environmental Plan (LEP) 2013.

This TA also references general access, traffic and parking guidelines, including:

- Roads and Maritime Services, *Guide to Traffic Generating Developments* (RMS Guide 2002);
- Australian Standard 2890.1:2004 - Parking Facilities – Off Street Car Parking (AS 2890.1:2004);
- Australian Standard 2890.2:2018 - Parking Facilities – Off Street Commercial Vehicle Facilities (AS 2890.2:2018);
- Australian Standard 2890.3:2015 – Parking Facilities – Bicycle Parking (AS 2890.3:2015); and
- Australian Standard 2890.6:2009 – Parking Facilities – Off Street Parking for People with Disabilities (AS2890.6:2009).

This TA also references assessments relating to the development within the OEE, the broader Oakdale Industrial Estate in which the OEE lies and the Broader Western Sydney Employment Area, including:

3.3 Response to Secretary's Environmental Assessment Report

A summary of the relevant SSD-37486043 SEARs relating to the traffic and transport aspects is presented in **Table 2**, which also includes reference to the relevant sections of this TA where each requirement is addressed.

TABLE 2 RESPONSE TO SEARS

Comment	Ason Response
Traffic and Transport – including	
<p>1 details of all daily and peak traffic volumes likely to be generated during all key stages of construction and operation (using traffic generation rates agreed with Transport for NSW), including a description of key accesses, haul routes, vehicle types, potential queuing impacts, swept paths and sight distance requirements</p>	<p>Details of the daily and peak traffic volumes generated during the operational phase have been described in further detail within Section 7. The consultation with TfNSW (regarding the trip rates) have been discussed in further detail within Section 1.3.1 and a sensitivity assessment has been prepared in Section 0, adopting the elevated trip rates of 0.23 and 0.24 trips per 100m² during the AM and PM peaks, to demonstrate the suitability of the proposed mitigation measures in a more conservative scenario.</p> <p>A preliminary Construction Traffic Management Plan (CTMP) has been provided within Section 8. It is noted that a detailed CTMP for the proposed development can be prepared separately and in response to a condition of consent as part of the Construction Certificate (CC) phase of this SSD.</p> <p>A description of the proposed access points is outlined in Section 4.3.</p> <p>The haul routes, vehicle types, potential queuing impacts, swept path assessment and sight distance requirements have been addressed within Section 9.</p>
<p>2 detailed justification of proposed access arrangements for Precinct 5 with consideration of future transport corridors, easements and site levels and outcomes of consultation with key stakeholders on the proposed arrangement</p>	<p>This has been addressed within Section 9.3 of this report.</p> <p>Notwithstanding, this will be addressed in further detail within the Town Planning report and Civil Engineering report, prepared separately.</p>
<p>3 an assessment of the predicted impacts of this traffic on road safety and the capacity of the road network, including consideration of cumulative traffic impacts at key intersections using SIDRA or similar traffic model. This is to include the identification and consideration of approved and proposed developments/planning proposals/road upgrades in the vicinity of the site in the 2026, 2031 and 2036 scenarios</p>	<p>Refer to Section 7 which outlines the proposed development's traffic generation and provides cumulative traffic impacts at nearby key intersections for the proposed years 2026, 2031 and 2036.</p>
<p>4 details of road upgrades, infrastructure works or new roads or access points required for the development, supported by modelling</p>	<p>Refer to Section 7.8.4 which outlines the mitigation measures required to support the proposed development during the years 2026, 2031 and 2036.</p>

TABLE 2 RESPONSE TO SEARS

	Comment	Ason Response
5	integration with and impacts on the future Southern Link Road and consideration of Clause 33B of the WSEA SEPP	It is noted that the SLR network planning and development process is ongoing and is therefore subject to change due to further refinement of the route alignment and access arrangements. As at the time of this report, SLR was not funded nor committed, hence the Site does not rely on this road for access. Should the SLR be constructed in the future, access to the Site via SLR can be possible via Old Wallgrove Road.
6	plans demonstrating how all vehicles likely to be generated during construction and operation and awaiting loading, unloading or servicing can be accommodated on the site to avoid queuing on public roads, including a loading management plan	<p>A preliminary CTMP has been provided within Section 8. It is noted that a detailed CTMP or Loading Dock Management Plan (LDMP) for the proposed development can be prepared separately and in response to a condition of consent as part of the CC phase of this SSD.</p> <p>Refer to Section 9 which includes details regarding the vehicles expected to load, unload and service the proposed Site.</p>
7	details and plans of the proposed internal road network, loading docks, servicing areas, on-site parking including provisions for electric vehicle charging, pedestrian and cyclist facilities, in accordance with the relevant Australian Standards	<p>Refer to Section 4 which outlines the proposed access points, loading docks and servicing areas for the proposed Site.</p> <p>Refer to Section 6 which outlines the car parking, bicycle parking and End-of-Trip (EoT) requirements and provision for the proposed Site.</p> <p>Refer to Section 9 which outlines compliance of the above facilities with regards to the relevant Australian Standards.</p>
8	details of the largest vehicle anticipated to access and move within the site, including swept path analysis and diagrams depicting vehicles entering, exiting and manoeuvring throughout the site	<p>Refer to Section 9 which includes details regarding the vehicles expected to load, unload and service the proposed Site.</p> <p>Swept path assessment confirms suitability for a 30.0m Super B-double at the proposed access point and internal commercial area for Precinct 3. However, it is noted that based on the proposed tenant's operational information, the proposal will only require 26.0m B-Double as the design vehicle. Hence, the simulation for 30.0m Super B-double is considered to be conservative.</p> <p>With regards to the Precinct 1 expansion, the largest vehicles at the proposed access point and internal commercial area will be a 20.0m AV.</p>
9	assessment of existing and future transport networks, including buses, and their ability to accommodate the forecast number of trips generated by the development	Refer to Section 7 which outlines the proposed development's traffic generation and provides cumulative traffic impacts at key intersections for the years 2026, 2031 and 2036.
10	details of sustainable travel initiatives for the development.	A Green Travel Plan (GTP) has been prepared and is submitted as part of this application.

4 Description of the Proposal

Full details of the SSD are provided in the Environmental Impact Statement (EIS) which this TA accompanies.

4.1 SSD Plans

A reduced scale copy of the SSD plan is provided in **Figure 2** and **Figure 3** for context. For detailed plans, refer to the architectural package by SBA Architects.

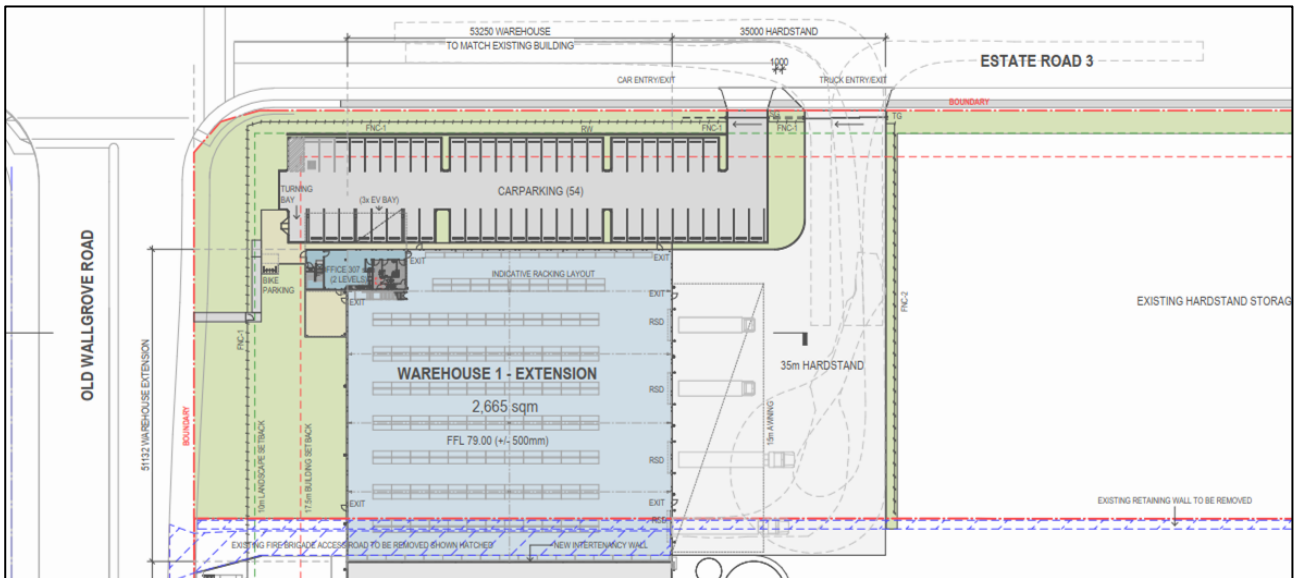

Figure 2: Proposed SSD Site Plan for the Precinct 1 Expansion

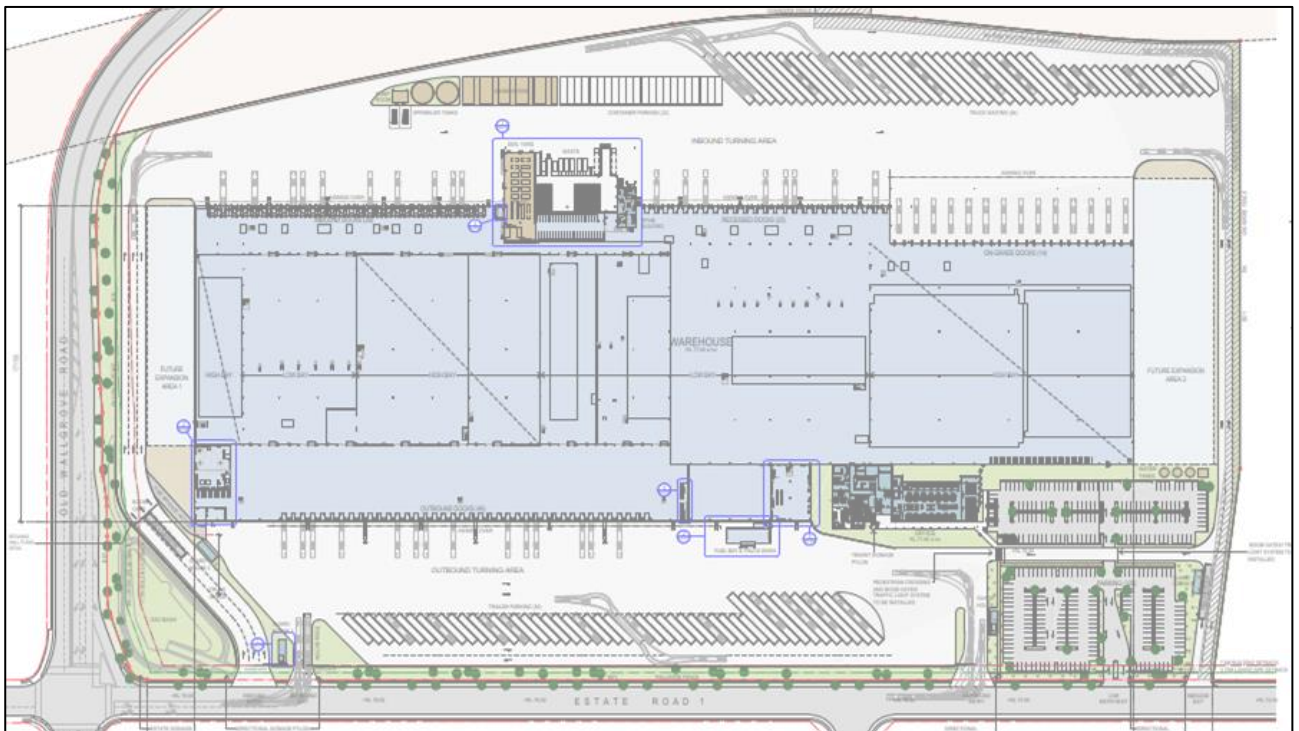

Figure 3: Proposed SSD Site Plan for Precinct 3

4.2 Proposed SSD Description

The application seeks approval for the Concept Plan for OEE and Stage 2 works at OEE.

The Stage 2 works includes the construction, fit-out and use of the Precinct 1 expansion and Precinct 3 of the Oakdale East Estate. The proposed development comprises warehouses, associated car and truck parking, office facilities, loading bays along with landscaping, signage, solar panels, lighting and includes subdivision approval. The proposed development will facilitate warehouse and distribution uses consistent with the IN1 General Industrial zone under the State Environmental Planning Policy (Western Sydney Employment Area) 2009.

The proposed Site encompasses the following summarised in **Table 3**:

TABLE 3 PROPOSAL YIELD		
Component	Precinct 1 Expansion	Precinct 3
Warehouse GLA (m ²)	2,815	84,826 (+10,009 m ² expansion)
Office GLA (m ²)	307	1,975
Total GLA	3,122	96,810
Loading Dock Provision	4 ¹	104 ³
Trailer Parking Provision	-	96
Car Parking Provision (Spaces)	54 ²	328 ⁴

Note: 1) This provision includes 4 Roller Shutter Doors (RSDs).

2) This provision includes 1 accessible space.

3) This provision includes 12 RSDs and 92 recessed docks.

4) This provision includes 6 accessible spaces.

4.3 Vehicular Access Strategy

4.3.1 Precinct 1 Expansion

The Precinct 1 expansion proposes two (2) new vehicular access points (a car and a truck access off Estate Road 02). This is shown in **Figure 4**.

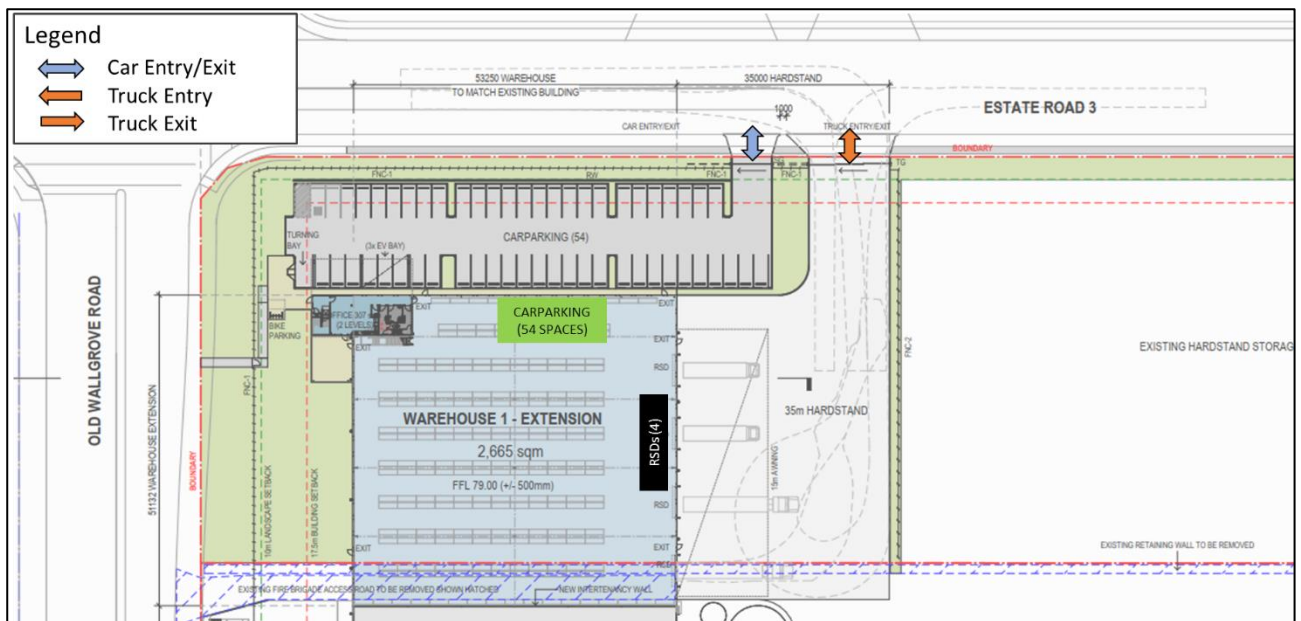

Figure 4: Proposed Vehicular Access Strategy (for Precinct 1 Expansion)

4.3.2 Precinct 3

Precinct 3 has 5 proposed vehicular access points. It has separate car and truck entry / exit points on Estate Road 02. Furthermore, the truck entry and exit points are also separated. This is shown **Figure 5**.

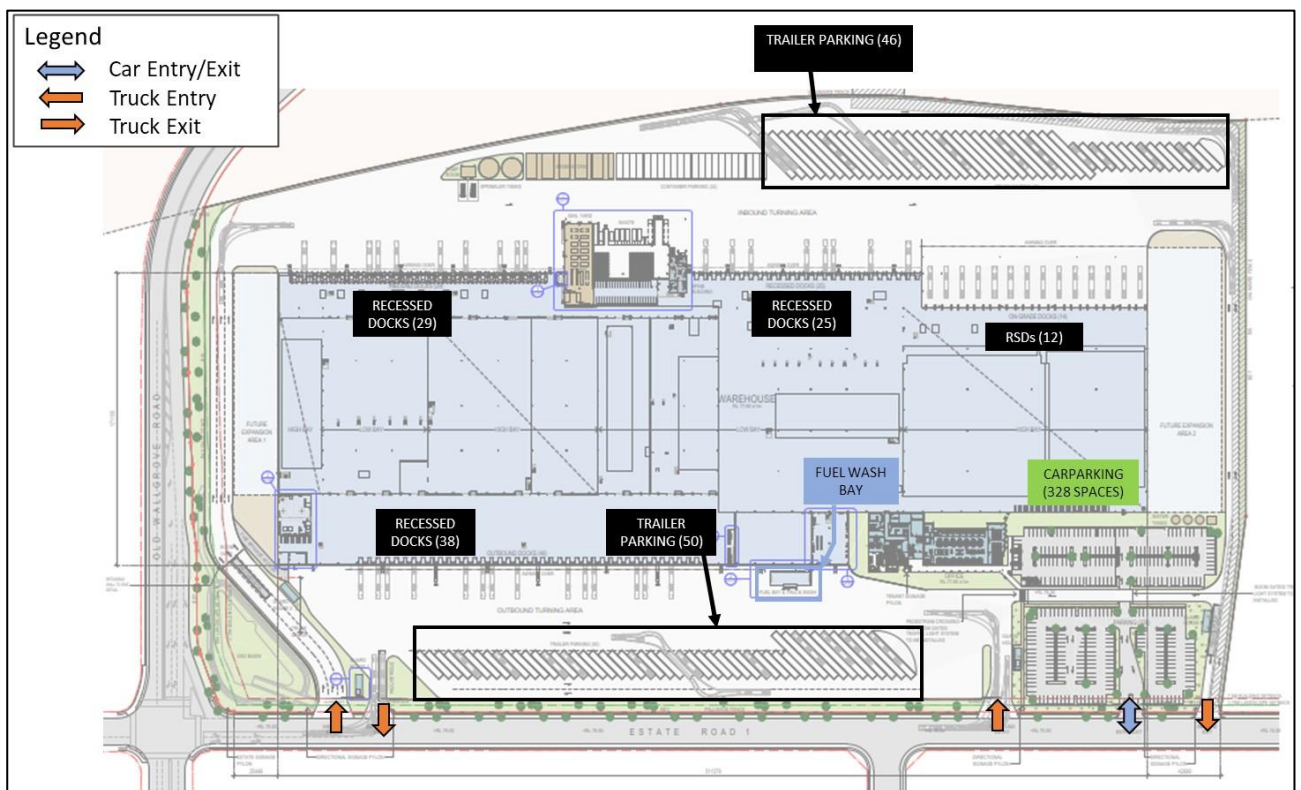

Figure 5: Proposed Vehicular Access Strategy (for Precinct 3)

5.2 Existing Road Network

The Site location and existing road network providing access to the Site is shown in **Figure 7**. Key existing roads and recently completed network upgrades are detailed in sections below.

5.2.1 M7 Motorway

The M7 Motorway is a high capacity road link of state significance and was built to accommodate future traffic growth in the Western Sydney region. It provides a key north-south link between the M2 Motorway to the north and the M5 Motorway to the south as part of the Sydney orbital road network. A major interchange between the M7 Motorway and M4 Western Motorway is located approximately 3.5km north of the Site, which connects the Sydney CBD and western Sydney suburbs. The M7 Motorway provides 4 lanes (2 lanes per direction, divided carriageway) and has a posted speed limit of 100km/h.

5.2.2 Wallgrove Road

Wallgrove Road is an arterial road that runs in a north-south direction parallel to the M7 Motorway east of the Site. It provides a link between the Great Western Highway to the north and Elizabeth Drive to the south, as well as a connection to the M7 Motorway, some 2.5k north-west of the Site. North of Russell Road, Wallgrove Road generally provides 4 lanes (2 lanes per direction), while south of Russell Road it generally provides 2 lanes (1 lane per direction). Wallgrove Road in the vicinity of the Site has a posted speed limit of 60km/h.

5.2.3 Lenore Drive

Lenore Drive is a sub-arterial route providing an east-west connection between Old Wallgrove Road to the east and Mamre Road to the west. Lenore Drive provides 4 lanes (2 lanes per direction) along a divided carriageway with a shared path along the northern side of the road and has a posted speed limit of 80km/h.

5.2.4 Old Wallgrove Road

Old Wallgrove Road is a local collector route providing an east-west and north-south connection between Wallgrove Road to the east and Lenore Drive to the west. Old Wallgrove Road provides 4 lanes (2 lanes per direction) along a divided carriageway with a shared path along the western side of the road and has a posted speed limit of 60km/h.

5.2.5 Millner Avenue

Millner Avenue is a local road providing east-west connection between Old Wallgrove Road to the east and Otellia Road to the west. Millner Avenue provides 4 lanes (2 lanes per direction) along a divided carriageway with footpaths along both sides.

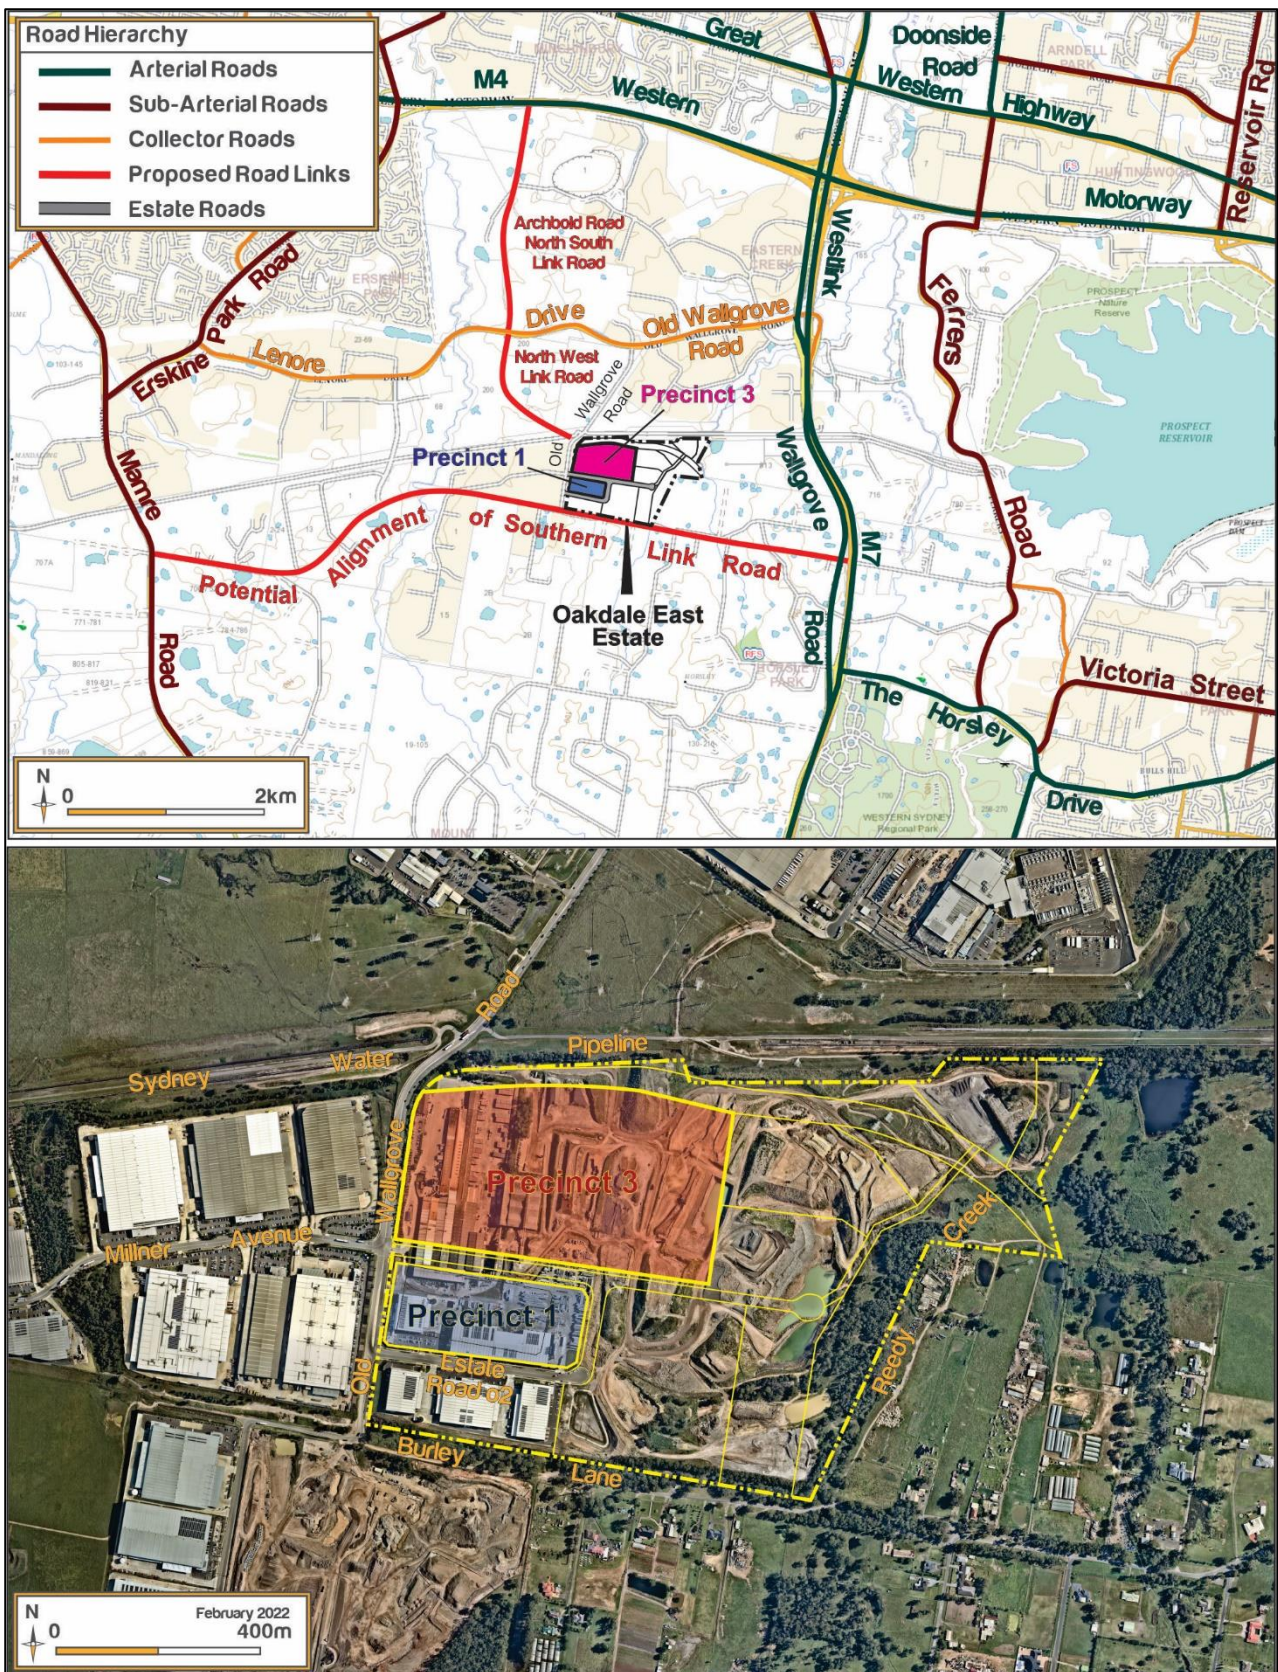

Figure 7: Site Location and Road Hierarchy

5.3 Future Road Network

As it relates to this report, the Southern Link Road (SLR) will provide additional road infrastructure to accommodate travel demand generated by employment areas within the Warragamba Pipeline area. The indicative route alignment for the SLR was initially identified in the SEPP (WSEA) 2009 and has since been refined to the current alignment as shown in **Figure 9**. A key component of the SLR includes:

- A connection to Old Wallgrove Road and then to a future North-South Link Road connection to Archbold Road at Lenore Road. The proposed Archbold Road extension would connect the M4 to Lenore Drive, with a new interchange of M4 Western Motorway and Archbold Road; this extension is currently being progressed by the TfNSW and is expected to be delivered in 5-10 years (subject to further liaison between stakeholder), providing improved WSEA accessibility to the M4 Western Motorway without the need to access either Wallgrove Road or the M7 Motorway.

It is noted that the SLR network planning and development process is ongoing and is therefore subject to change due to further refinement of the route alignment and access arrangements. As at the time of this report, SLR was not funded nor committed, hence the Site does not rely on this road for access. Should the SLR be constructed in the future, access to the Site via SLR can be possible via Old Wallgrove Road.

Furthermore, the same comment also applies to Archbold Road. It is noted that the Archbold Road network planning and development process is ongoing and is therefore subject to change. Furthermore, at the time of this report, Archbold Road has also not been funded nor committed, hence the Site does not rely on this road for access. Should Archbold Road be constructed in the future, access to the Site via Archbold Road can be possible (through Old Wallgrove Road). The most recent update was in 2017, with the concept design shown in **Figure 8**.

Figure 8: Archbold Road Concept (Source: RMS (May 2017))²

Furthermore, the proposed Site plan appreciates the potential future delivery of SLR and sets aside land to allow for the NSW Government to implement this road as necessary. A figure depicting the proposed Site plan in appreciation for the potential future delivery of SLR is shown in **Figure 10**.

Figure 10: Proposed Southern Link Road Network and Alignment with Respect to the Site Plan (Source: SBA Architects)

5.4 Existing Intersection Operation

The baseline traffic on the surrounding road network was surveyed for 24-hours on Tuesday, 26 October 2021. The network peak hour times (as informed by the Mamre Road Precinct (MRP) AIMSUN transport model, refer to **Section 7.1**) of 7:30 AM to 8:30 AM (AM peak period) and 3:00 PM to 4:00 PM (PM peak period) was adopted for the following key intersections:

- Old Wallgrove Road / Lenore Drive; and
- Old Wallgrove Road / Millner Avenue.

The surveyed traffic flows during the peak periods are shown in **Figure 11**.

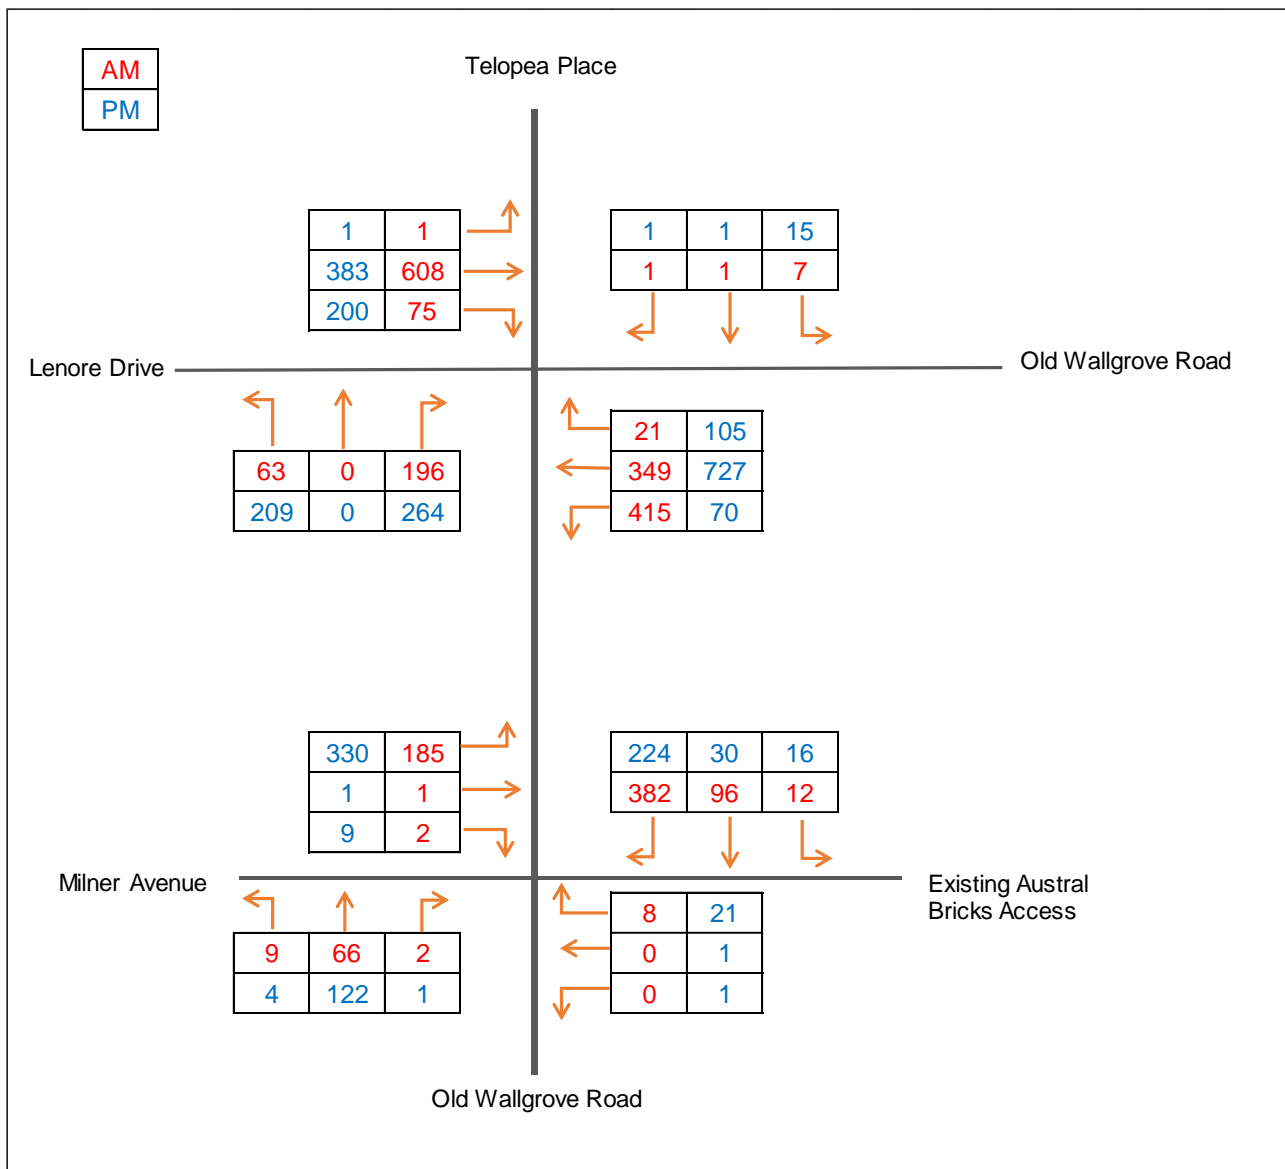

Figure 11: Traffic demand – Existing volumes

5.4.1 Assessment Criteria

SIDRA Intersection modelling has been undertaken to quantify the performance of the existing intersections and – using the same set of parameters – predict the performance of these intersections under future demand scenarios. The SIDRA models provide a number of outputs to measure the performance of an intersection including:

- **Delay:** Also known as Average Vehicle Delay or AVD, which is expressed in seconds. The Delay or AVD is measured across all vehicles in a signalised intersection and for the worst movement in a priority-controlled intersection;
- **Level of Service (LoS):** An indication of critical AVD in any intersection, denoted by the alphabetic letters from A to F. AVD in the range of LoS A up to LoS D are considered acceptable; and
- **Degree of Saturation (DoS):** The ratio of volumes by capacity. The maximum acceptable DoS for signalised and priority-controlled intersections are 0.90 and 0.80, respectively.

Table 4 provides a summary of the SIDRA recommended criteria for the assessment of intersections with reference to AVD and LoS, as outlined in the RMS Guide.

TABLE 4 SIDRA LEVEL OF SERVICE CRITERIA			
LoS	Average Vehicle Delay (sec/veh)	Traffic Signals & Roundabout	Give Way & Stop Signs
A	<14	Good Operation	Good operation
B	15 – 28	Good with acceptable delays & spare capacity	Acceptable delays & spare capacity
C	29 – 42	Satisfactory	Satisfactory, but accident study required
D	43 - 56	Operating near capacity	Near capacity & accident study required
E	57 – 70	At capacity: at signals, incidents will cause excessive delays. Roundabouts require other control mode	At capacity, requires other control mode
F	>70	Unsatisfactory and requires additional capacity	Unsatisfactory and requires other control mode or major treatment

When applying the above criteria, it is recommended that for traffic signals, the LoS should be calculated based on the average vehicle delay at the whole intersection, whereas for roundabouts and priority-controlled intersections, the critical measure of LoS is determined by the movement with the highest delay.

5.4.2 2021 Existing Scenario

The SIDRA results for the existing scenario (2021) are shown in the following table:

TABLE 5 SIDRA RESULTS – 2021 EXISTING						
Intersection No	Intersection Name	Control	Peak	DoS	Delay (s)	LoS
1	Old Wallgrove Road / Lenore Drive	Signal	AM	0.37	26	B
			PM	0.58	35	C
2	Old Wallgrove Road / Millner Avenue	Signal	AM	0.57	19	B
			PM	0.77	13	A

The analysis demonstrates that the existing two intersections currently operate satisfactorily in both peak periods with Level of Service C or better.

5.5 Truck Routes

As is appropriate for a predominately industrial area, all key roads providing access for the Site are designated for Restricted Access Vehicles (RAVs), as summarised in **Table 6** and **Figure 12**.

TABLE 6 RMS APPROVED RESTRICTED VEHICLE ACCESS ROUTES

Road	Section	RMS Approval
Old Wallgrove Road	Entire Length	Approved for 25.0 / 26.0m B-double Routes
Wallgrove Road	Entire Length	
Lenore Drive	Entire Length	
M7 Westlink	Entire Length	
Erskine Park Road	Entire Length	
M4 Western Motorway	Entire Length	
Mamre Road	Entire Length	

Figure 12: Restricted Vehicle Access Routes (Source: RMS)

The future SLR is also expected to similarly provide for 25.0 / 26.0m B-doubles.

5.6 Public Transport Services

5.6.1 Existing Bus Services

While existing bus services within the vicinity of the OEE are shown in **Figure 13**, it is evident that OEE is not directly serviced by public transport services at this time. Notwithstanding, the opportunities for future connections have been identified and are discussed further below. In particular, the extension of bus route 738 to Oakdale Central Estate (OCE) and Oakdale South Estate (OSE).

5.6.2 Bus Service Opportunities

There are substantial opportunities to provide improvements to public transport connectivity within WSEA (likely via Lenore Drive and Old Wallgrove Road further to a connection to the SLR) and additional provisions for 'localised' services as employment numbers increase and additional road infrastructure becomes available.

The planning of bus services in Sydney is governed by the NSW Service Planning Guidelines, which aim to establish Strategic Transport Corridors and a hierarchy of bus route types that:

- Link to regional centres (such as Penrith and Mt Druitt);
- Pass through patronage generators such as district centres, TAFE colleges, hospitals and universities;
- Connect with other transport modes (trains, ferries and other buses);
- Are multifunctional (serving journeys to work, education, shopping and recreation);
- Are direct and frequent; and
- Meet the network planning principles.

The establishment of public transport services as early as possible in the development stages of the area is important to ensure that a culture of public transport use is achieved from the outset. To make public transport a viable choice in the study area, the services should ideally:

- Integrate with existing bus services in the area;
- Connect to regional centres of Penrith, Mt Druitt and Blacktown; and
- In the longer term, connect to areas such as Leppington in the South West Growth Centre, Prairiewood and the Liverpool to Parramatta T-Way.

It should be noted that the current bus route 738 extends partially into Old Wallgrove Road from the east. There have been discussions between TfNSW and Goodman regarding the extension of the Rooty Hill Bus service through to Oakdale Central, South and East. It is understood that TfNSW are in the process of commencing these services to OCE and OSE in the next few months and the process is currently going through traffic committee approvals for the bus stops.

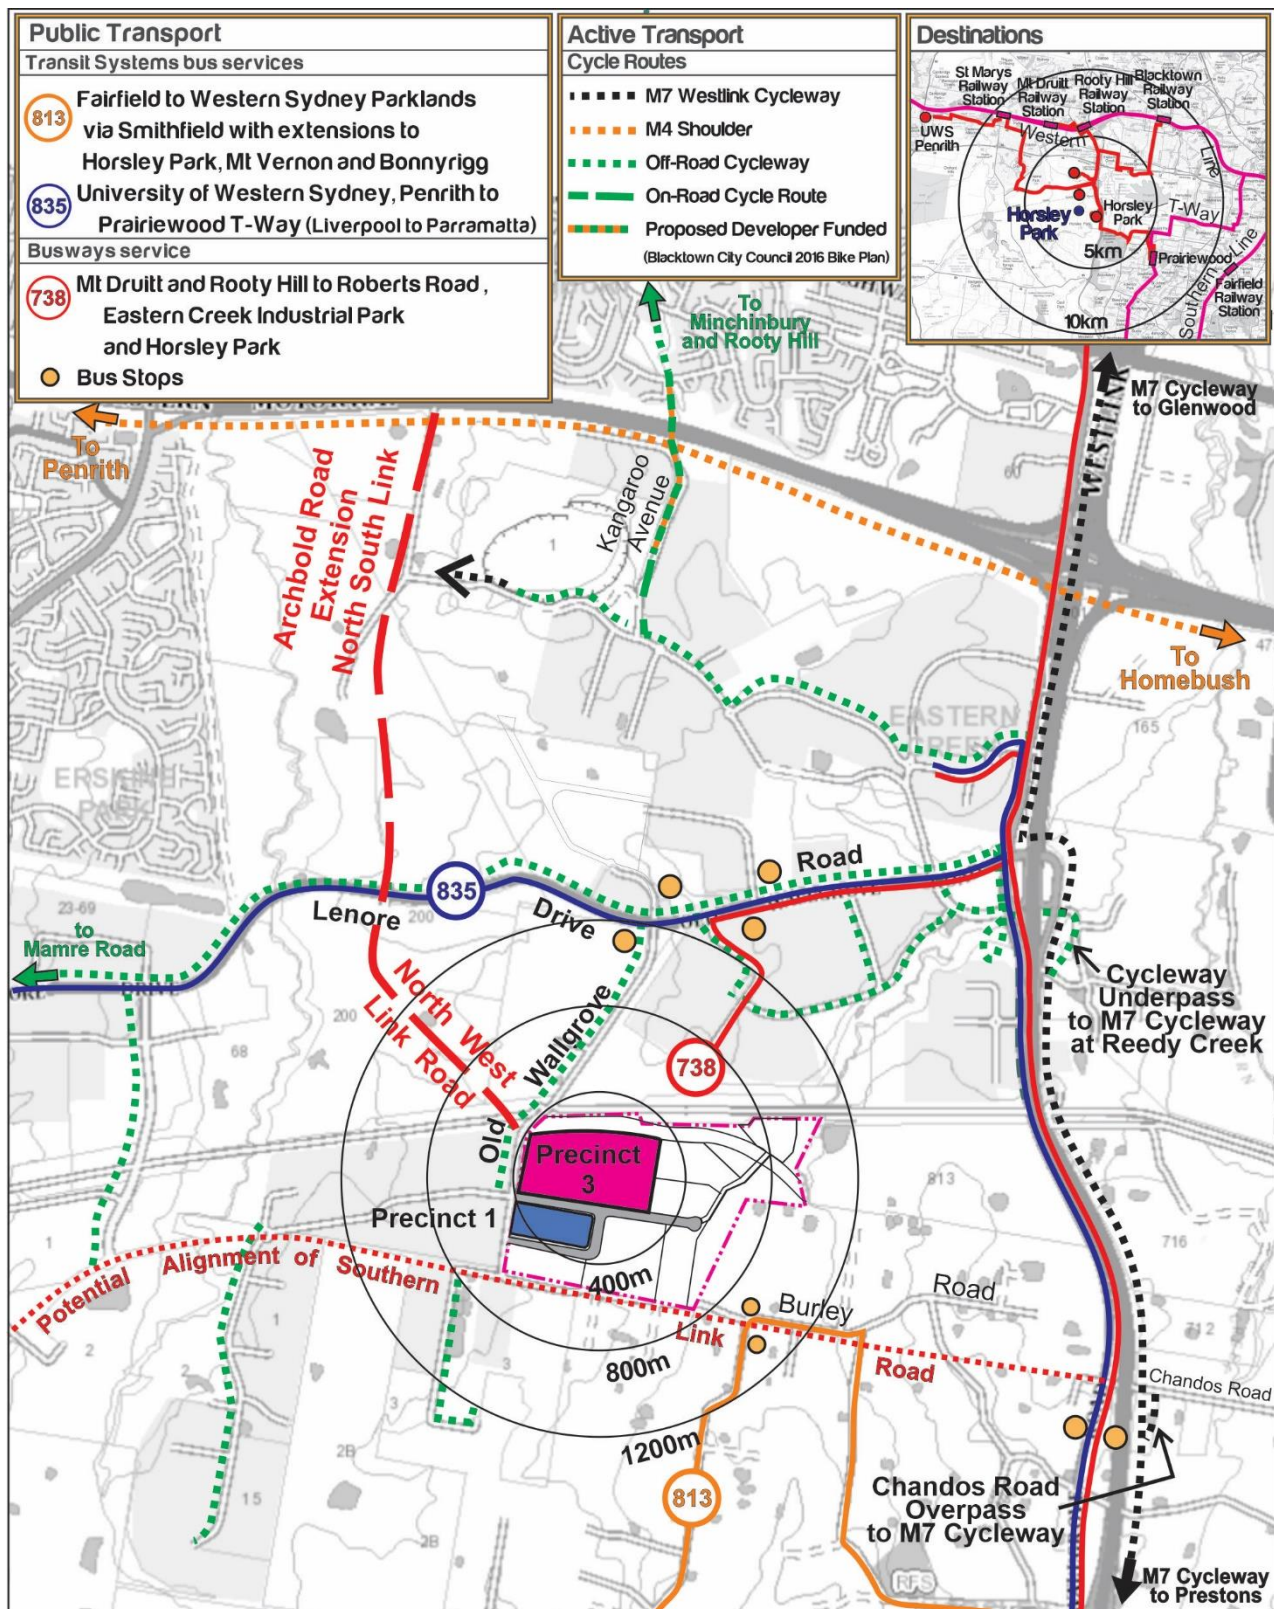

Figure 13: Existing Public Transport and Cycle Links

5.7 Active Transport

Lenore Drive has specifically been designed to provide appropriate cycle infrastructure, linking to the east (to the M7 Motorway cycleway) and the west (to the existing Mamre Road cycle path, which is expected to play a key connector role in the broader framework of cycleways in the sub-region).

As evident in **Figure 13**, there is a shared path on the western side of Old Wallgrove Road that connects to Lenore Drive. Furthermore, Old Wallgrove Road and Lenore Drive provide active transport coverage which will ideally connect to the Estate. Notably, Estate Road 01 currently provides footpaths on both sides (as shown in **Figure 14**).

Figure 14: Existing Footpath Provision at Estate Road 01

The existing signalised intersection of Old Wallgrove Road / Milner Avenue provides for pedestrian crossing facilities on three approaches.

As discussed earlier, the upgraded intersection as part of this SSD will provide pedestrian crossing facilities on all directions at this signal, hence improving the active transport network for the Estate.

6 Parking Provisions

6.1 Car Parking

The Concept Plan seeks to establish the following car parking rates for the Estate. These rates are consistent with the current OEE DCP (which currently comprises Precinct 1 of the OEE) and the approved and operational OCE and OSE. These rates are shown in **Table 7**.

TABLE 7 CAR PARKING RATES

Land Use	Parking Rate ¹
Warehouse	1 space per 300m ²
Office	1 space per 40m ²

Note: 1) Parking calculations are rounded up.

6.2 SSD Parking Assessment

6.2.1 Precinct 1 – OEE DCP 2022

Application of the above car parking rates to the proposed Precinct 1 GLAs result in the following car parking requirements.

TABLE 8 CAR PARKING REQUIREMENT AND PROVISION FOR PRECINCT 1

Land Use	Precinct 1 Yield (m ²)	Car Parking Required	Parking Provided
Warehouse	2,815	18	54 ¹
Office	307		

Note: 1) This provision includes 1 accessible space.

Application of the above rates to the Precinct 1 expansion results in the requirement of 18 spaces. In response, the Precinct 1 future expansion provides for 54 on-site car parking spaces, indicating a surplus of 36 car parking spaces and thus satisfying and exceeding the OEE DCP 2022 requirements. It is noted that the additional on-site car parking spaces are mainly provided to allow for flexibility in terms of on-site parking facilities.

6.2.2 Precinct 3 – OEE DCP 2022

Application of the rates set out in **Table 7** to Precinct 3 GLA results in the following car parking requirements.

TABLE 9 CAR PARKING REQUIREMENT AND PROVISION FOR PRECINCT 3

Land Use	Precinct 3 Yield (m ²)	Car Parking Required	Parking Provided
Warehouse	84,826 (+10,009 expansion)	316	328 ¹
Office	1,975	50	
Total	96,810	366	328

Note: 1) This provision includes 6 accessible spaces.

Application of the DCP rates to Precinct 3 results in the requirement of 366 spaces. In response, the Proposal provides 328 on-site car parking spaces (90% of the DCP rate). Based on the proposed known tenant's operational requirements, the provision of 328 spaces accommodates their actual expected parking demand.

A GTP also accompanies this TA. This GTP provides measures to reduce dependency on private vehicular travel by providing on-site End of Trip Facilities and bicycle parking. Furthermore, the owner has been in discussion with TfNSW regarding extension of a bus service to OEE (similar to what is currently in motion for OSE and OCE (see **Section 5.6**).

In summary, this TA suggests that the proposed 328 car parking spaces is sufficient to satisfy the proposed operation of the Precinct 3 on the following grounds:

- The current provision is almost 90% of the theoretical DCP rates;
- Future tenant has specifically requested for 328 spaces based on their actual forecast requirements and is comfortable to run their operation based on this provision;
- The Proposal encourages other modes of transport by provision of EoTF; and

A GTP has been prepared for this Site to promote use of other modes of transport

6.3 Accessible Parking

The OEE DCP 2022 does not stipulate accessible car parking requirements. Instead, it defers to the requirements outlined within the National Codes of Construction (NCC) and the respective Australian Standards. In this regard, the NCC rate of 1 space for every 100 carparking spaces or part thereof applies, which results in the following requirements for Precinct 1 and Precinct 3:

TABLE 10 ACCESSIBLE CAR PARKING REQUIREMENTS AND PROVISION

Land Use	Car Parking Provision	Accessible Car Parking Required	Accessible Car Parking Proposed
Precinct 1	54	1	1
Precinct 3	328	4	6

This equates to a required provision of 1 accessible space for Precinct 1 and 4 accessible spaces for Precinct 3. In response, 1 space has been provided for Precinct 1 and 6 spaces have been provided for Precinct 3, satisfying and exceeding the NCC requirement.

6.4 Bicycle Parking

6.4.1 Precinct 1

OEE DCP 2022 does not stipulate bicycle parking requirements for developments. In this regard, it is recommended to adhere to the requirements set out in the *Planning Guidelines for Walking and Cycling*. Therefore, the Precinct 1 development should provide bicycle spaces and EoT facilities (as required by the *Planning Guidelines for Walking and Cycling*) to promote the active transport mode share as much as possible.

Therefore, it is recommended that this precinct provide bicycle parking numbers at a rate of 3-5% of staff numbers (for long-term use) and 5-10% of staff numbers (for short-term use) outlined by the *Planning Guidelines for Walking and Cycling*. In this regard, it is estimated the Precinct 1 expansion would have up to 75 staff. Therefore, the operation of the Precinct 1 expansion would require a total of 6-12 spaces. Furthermore, the following table also sets out the minimum requirements for EoT facilities for the Precinct 1 expansion.

TABLE 11 EOT FACILITIES REQUIREMENTS

Staff Numbers	Lockers	Showers	Change Rooms
50-149	1 per 3 racks	4 (2 male and 2 female)	2 (1 male and 1 female)

The current Site plan for the Precinct 1 expansion shows 6 bicycle spaces, multiple lockers and 4 (2 male and 2 female) showers. 2 change rooms (1 male and 1 female) can be provided within the office / amenities area prior to the CC phase of the project.

6.4.2 Precinct 3

The *Planning Guidelines for Walking and Cycling* (2004) requires bicycle parking to be provided at a rate of 3-5% of staff numbers (for long-term use) and 5-10% of staff numbers (for short-term use).

It is noted that detailed staff numbers for Precinct 3 have been provided by the immediate tenant for this Site. As such, at any given time, there would be a maximum of 232 staff on the Site.

Accordingly, the respective bicycle parking requirements for a sum of 232 personnel is outlined in **Table 12**:

TABLE 12 BICYCLE PARKING REQUIREMENTS

Development	Estimated Staff Numbers	Bicycle Parking Requirement (Bicycle Spaces)
Precinct 3	232	7-12

Additionally, the *Planning Guidelines for Walking and Cycling* also provides the following minimum requirements (shown in **Table 13**) for End of Trip (EoT) facilities on-site.

TABLE 13 EOT FACILITIES REQUIREMENTS

Staff Numbers	Lockers	Showers	Change Rooms
150-299	1 per 3 racks	6 (3 male and 3 female)	2 (1 male and 1 female)

The current site plan for Precinct 3 does not show any bicycle parking spaces. Provision of bicycle parking in line with the requirements outlined in **Table 12** are recommended to be provided prior to the CC phase of the project.

The current site plan indicates sufficient space near the proposed offices, and it is expected that adequate bicycle parking spaces facilities can be readily provided as part of the SSD.

Notwithstanding, 130 lockers and 8 change rooms (4 male and 4 female) have been provided within the office / amenities area. 8 showers (4 male and 4 female) will be provided within the area in the future, as outlined within **Table 13**.

7 Traffic Assessment

7.1 Background

An AIMSUN microsimulation model, named the Mamre Road Precinct (MRP) AIMSUN transport model has been prepared by Ason Group previously. This model covers the majority of the Western Sydney Employment Area (WSEA) and provides detailed network coding and land-use assessment for the MRP. Details of inputs, assumptions and outcomes of the base MRP model are documented by Ason Group in *P1316r02 Mamre Road Precinct Base Model Development Report*, dated 11 November 2020.

Future years 2026, 2031 and 2036 base volumes and turning movements have been sourced from the AIMSUN model and input into SIDRA for the purposes of this traffic assessment. This modelling is considered robust and provides a base line for future modelling.

The network peak hours as identified by this model is 7:30 - 8:30 AM (AM Peak) and 3:00 - 4:00 PM (PM Peak), which is adopted for the OEE traffic assessment. The MRP model also identified an inbound / outbound split of 80% / 20% in the AM peak and 20% / 80% in the PM peak.

7.2 Trip Generation Rate

The adopted trip generation rates are based on the previous Mamre Road Precinct Study as detailed below:

- AM Peak: 0.18 peak hour vehicle trips per 100m² of industrial GFA including ancillary office floor space;
- PM Peak: 0.16 peak hour vehicle trips per 100m² of industrial GFA including ancillary office floor space; and
- Daily: 2.43 vehicle trips per 100m² of industrial GFA including ancillary office floor space.

7.2.1 Previous Studies

The Mamre Road Precinct Study included reference surveys for six industrial sites with generally similar functionality to OEE. Surveys were conducted in 2020 for the first 5 sites and in 2018 for the sixth site. The surveys found the road network peak hours to be 7:30 - 8:30AM (AM Peak) and 3:00-4:00 PM (PM Peak) and an average trip generation rate of:

- AM Peak: 0.18 trips per 100m² GFA;
- PM Peak: 0.16 trips per 100m² GFA; and
- Daily: 2.43 trips per 100m² GFA.

Further to this, studies conducted for the 579 Mamre Road & 14A Distribution Drive, Orchard Hills found the following trip generation for the Mamre West Precinct Stage 1 (also known as First Estate Precinct). These surveyed rates are less than those established in the Mamre Road Precinct Study and highlight the suitability of the above rates.

- 2020 survey
 - AM Peak: 0.15 trips per 100m² GFA; and
 - PM Peak: 0.11 trips per 100m² GFA.
- 2021 survey
 - AM Peak: 0.14 trips per 100m² GFA; and
 - PM Peak: 0.15 trips per 100m² GFA.

7.2.2 Oakdale South Estate and Oakdale Central Estate comparison

To further validate the adopted trip generation rate, reference is also made to the nearby approved, and largely constructed and operational Oakdale South Estate (OSE) and Oakdale Central Estate (OCE) Developments. Due to the configuration of the existing road network, all traffic from these developments must travel through the Old Wallgrove Road / Millner Avenue intersection as there is no alternate route choice. Thus, an appreciation of the actual traffic generation, and by extension, trip generation rate for OSE and OCE can be obtained.

OCE has a total GFA of 231,012m² and OSE has a total GFA of 331,739m², for a total of 562,754m² GFA. Based on the existing traffic surveys (refer to **Section 1.3**), the total number of vehicle movements entering / exiting the western arm of the Old Wallgrove Road / Millner Avenue intersection is 567 in the AM peak, 554 in the PM peak and 9,683 daily. This correlates to the following observed trip generation rates:

- AM Peak: 0.10 trips per 100m² GFA;
- PM Peak: 0.10 trips per 100m² GFA; and
- Daily: 1.72 trips per 100m² GFA.

7.2.3 Summary

As such, the adopted rates of 0.18 / 0.16 trips per 100m² GFA in the AM and PM peaks (and 2.43 trips per 100m² daily) is considered an appropriate rate to adopt given comparable building typology and user mix between the sites investigated in the Mamre Road Precinct Study, and the proposed OEE. These rates are conservative and are greater than the observed traffic generation rates as demonstrated in OCE and OSE during road network peak periods.

7.3 Traffic Generation

Application of the above trip generation rates (0.18 / 0.16 / 2.43 trips per 100m² GFA AM / PM / Daily) results in the following trip generation for the Concept Plan (i.e. all five Precincts)⁴:

⁴ For the purposes of this assessment, it is assumed GLA = GFA

TABLE 14 OAKDALE EAST ESTATE OVERALL TRIP GENERATION – PRECINCTS 1 TO 5

Period	Vehicle Movements
AM Peak Hour	546
PM Peak Hour	485
Daily	7,371

Broken down by Precinct, this relates to a trip generation (during the network peak hour) of:

TABLE 15 OAKDALE EAST ESTATE TRIP GENERATION BY PRECINCT

Precinct	GLA (m ²)	AM		PM		Daily
		LV	HV	LV	HV	
1	38,772	58	12	52	10	942
2	82,490	123	25	110	22	2,005
3	96,810	145	29	129	26	2,352
4	55,800	83	17	74	15	1,356
5	15,400	23	5	20	4	374
Other	14,058	21	4	19	4	342
Total	303,330	453	92	403	82	7,371

The values in **Table 14** and **Table 15** outline the total vehicle movements and include both inbound and outbound movements.

7.4 Cumulative Traffic Impacts

To provide a robust assessment of future road network performance, the cumulative impact of other nearby approved developments has been considered. These include OCE and OSE to the west and ESR and Frasers' Nu Pure to the south. As OCE / OSE are constructed and operational, the quantum of trips has been extracted from the survey data (traffic movements in / out of Millner Avenue). The traffic generation for ESR and Frasers' Nu Pure have been forecasted using a rate of 0.18 / 0.16 trips per 100m² GFA in the AM and PM peaks respectively. This is summarised in **Table 16**.

TABLE 16 NEARBY DEVELOPMENTS TRIP GENERATION

Development	Gross Floor Area (m ²)	AM Peak Trip Generation	PM Peak Trip Generation
Oakdale Central Estate (OCE)	231,012	567	554
Oakdale South Estate (OSE)	331,739		
ESR Site	109,048	196	174
Fraser Nu Pure	20,575	37	33

7.5 Traffic Distribution

The following assumptions have been adopted for the traffic distribution.

7.5.1 Oakdale Central Estate (OCE) and Oakdale South Estate (OSE)

- AM split: 68% in / 32% out (based on the existing survey of OCE and OSE);
- PM split: 40% in / 60% out (based on the existing survey of OCE and OSE);
- All inbound trips turn right from Old Wallgrove Road into Millner Avenue at the Old Wallgrove Road / Millner Avenue (only available route choice) intersection; and
- All outbound trips turn left from Millner Avenue to Old Wallgrove Road at the Old Wallgrove Road / Millner Avenue intersection (only available route choice).

7.5.2 ESR site and Fraser Nu Pure

- AM split: 68% in / 32% out (based on existing survey of OCE and OSE);
- PM split: 40% in / 60% out (based on existing survey of OCE and OSE);
- All inbound trips travel through from Old Wallgrove Road (north) into Old Wallgrove Road (south) at the Old Wallgrove Road / Millner Avenue (only available route choice) intersection; and
- All outbound trips travel through from Old Wallgrove Road (south) into Old Wallgrove Road (both) at the Old Wallgrove Road / Millner Avenue (only available route choice).

7.5.3 Oakdale East Estate (OEE)

- AM split: 80% in / 20% out (assumption based on MRP model);
- PM split: 20% in / 80% out (assumption based on MRP model); and
- **Figure 15** illustrates the relevant turning movements into and out of OEE:
 - At the Old Wallgrove Road / Millner Avenue intersection, inbound trips either turn left from Old Wallgrove Road into Estate Road 02 or continue straight beyond the intersection to turn left into Estate Road 01 (split accordingly based on shortest route to each Precinct); and
 - At the Old Wallgrove Road / Millner Avenue intersection, all outbound trips turn right from Estate Road 02 into Old Wallgrove Road (only available route choice).

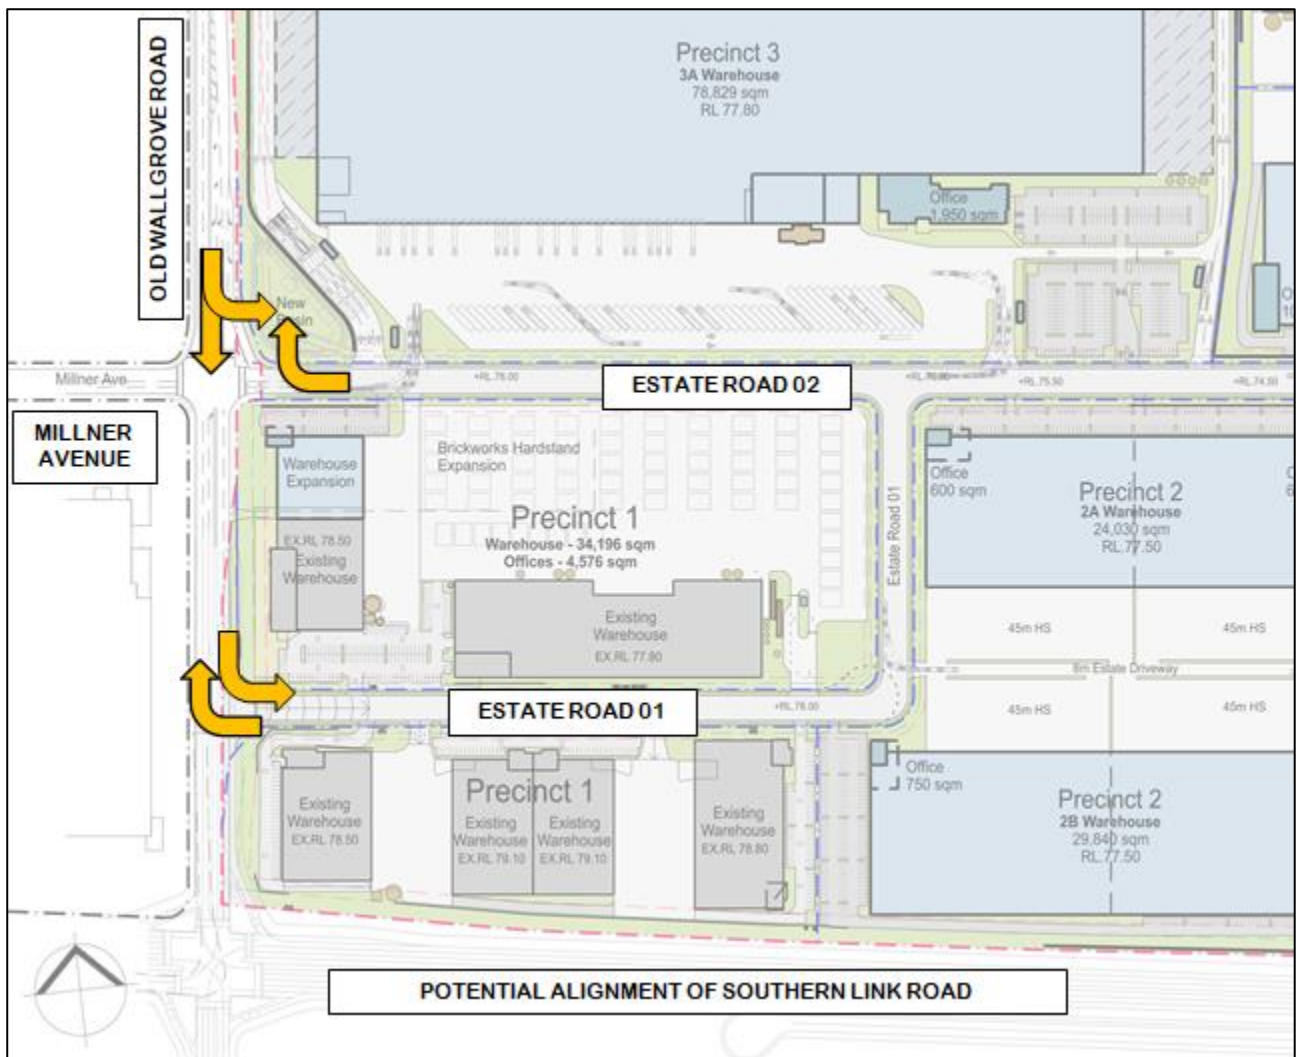

Figure 15: OEE Traffic Movements prior to SLR Construction

7.5.4 Southern Link Road

As the Southern Link Road (SLR) is neither committed nor funded, the influence of this potential link is excluded from this analysis. Future assessment of the SLR and associated impacts upon adjoining intersections will be addressed by TfNSW's SLR team.

7.6 Future Year Models

As mentioned in **Section 7.1**, future year 2026, 2031, and 2036 base volumes and turning movements were extracted from the MRP model for the Old Wallgrove Road / Lenore Drive intersection.

TABLE 17 INTERSECTIONS ASSESSED IN SIDRA

Intersection No	Intersection	Control
1	Old Wallgrove Road / Lenore Drive	Signal
2	Old Wallgrove Road / Millner Avenue ¹	Signal

Note 1: The Estate Road 02 forms the eastern arm of the Old Wallgrove Road / Millner Avenue intersection upon construction of OEE Stage 2

The traffic flow diagrams for the 2026 Base Case, 2026 Project Case (base + development), 2031 Project Case, and 2036 Project Case are shown in **Figure 16** to **Figure 19**. For conservativeness, it is assumed that OEE is fully constructed and operational in 2026. The adjacent developments (OSE, OCE, ESR, Frasers' Nu Pure) are also assumed to be fully constructed and operational by 2026.

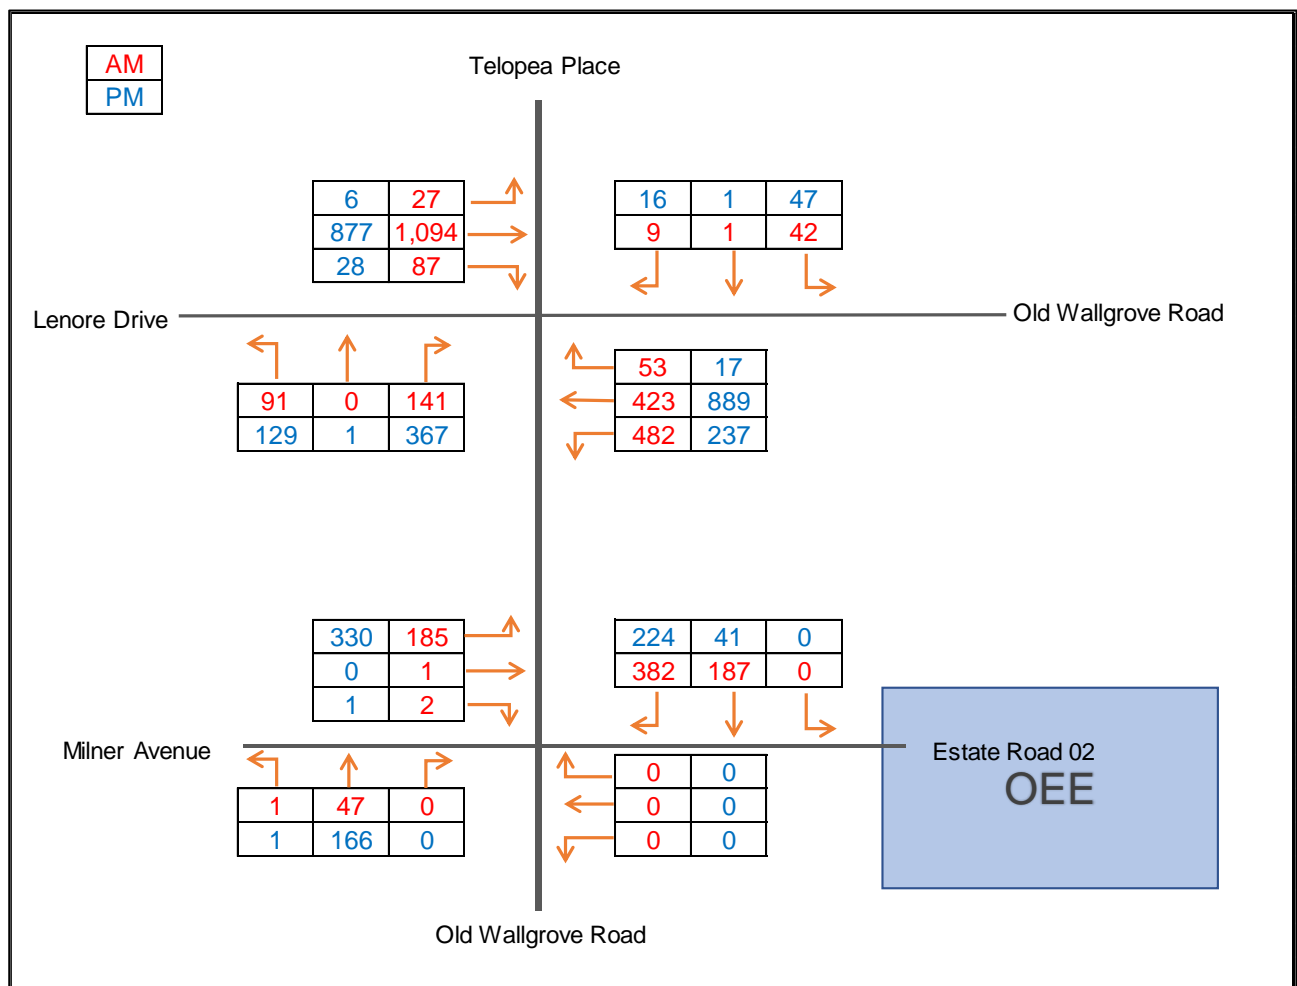

Figure 16: Traffic Demand - 2026 Base Case

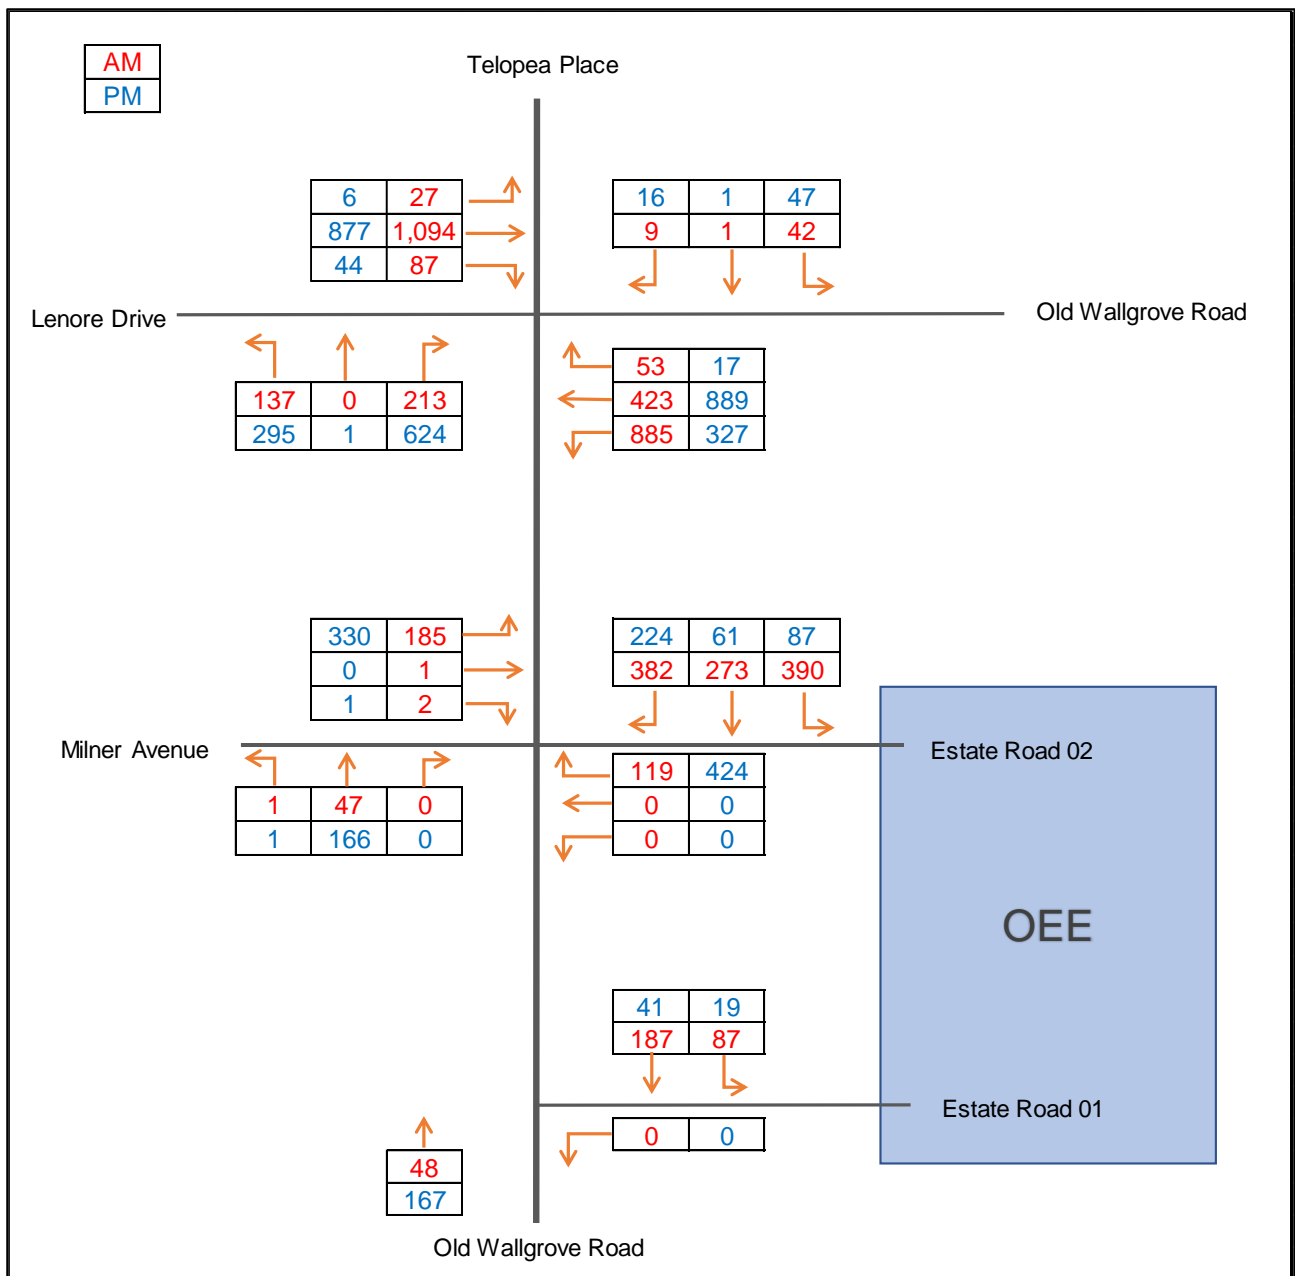

Figure 17: Traffic Demand - 2026 Project Case

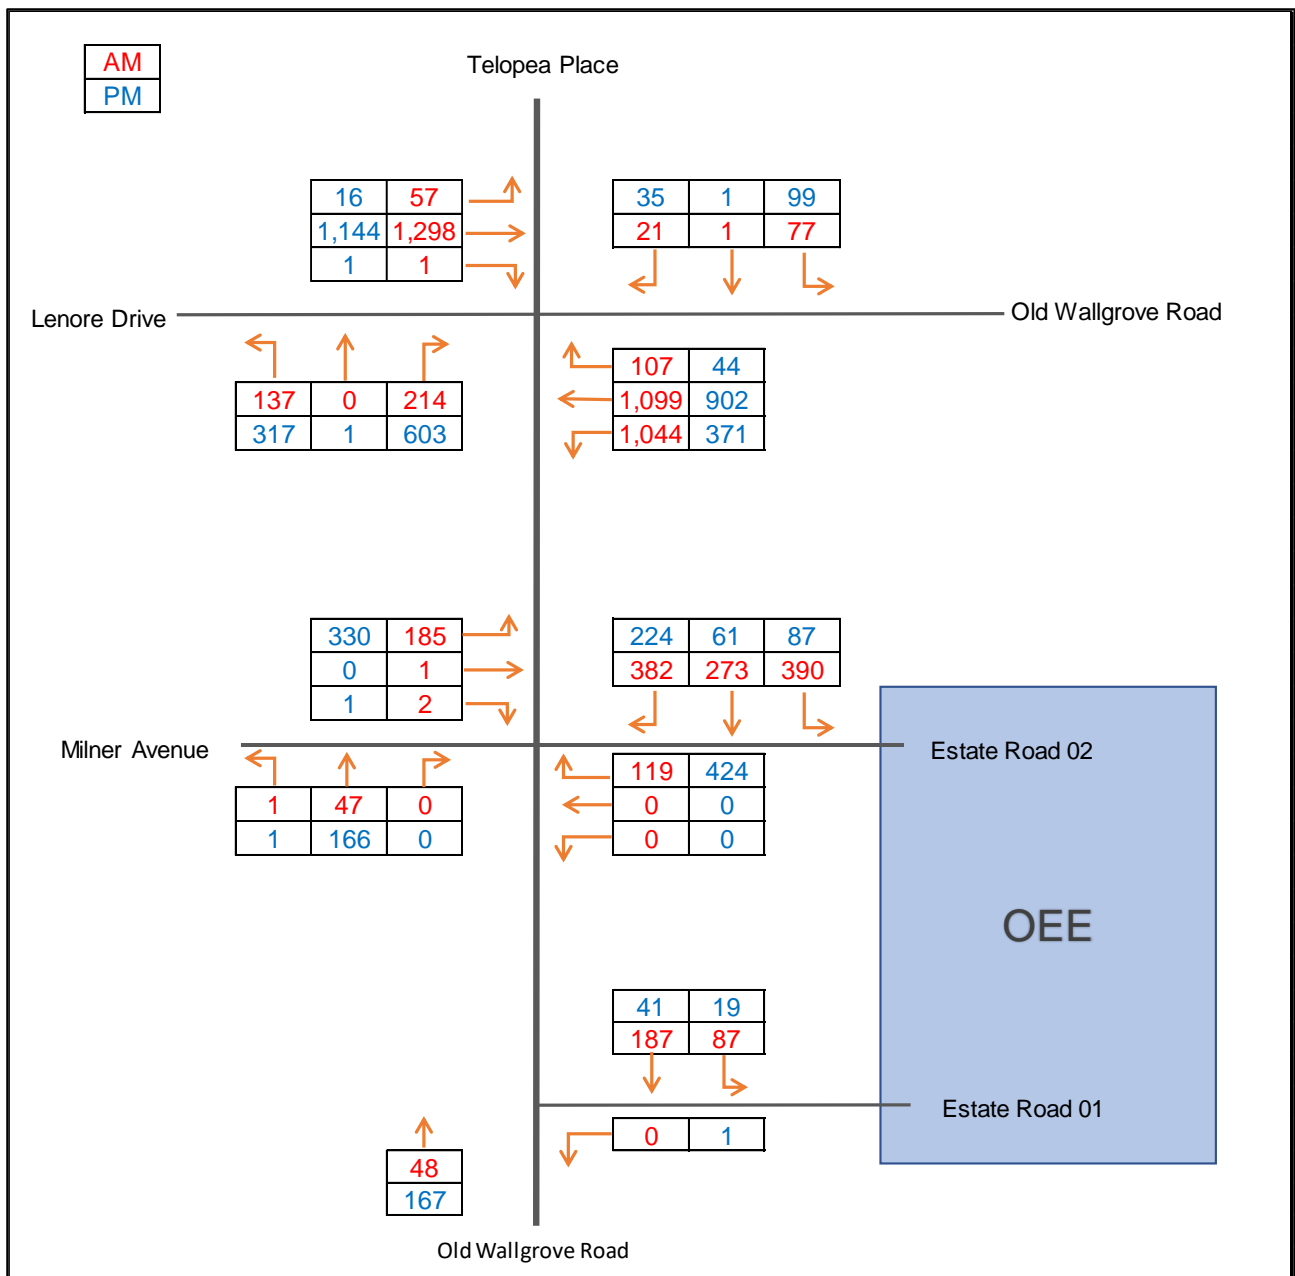

Figure 18: Traffic Demand - 2031 Project Case

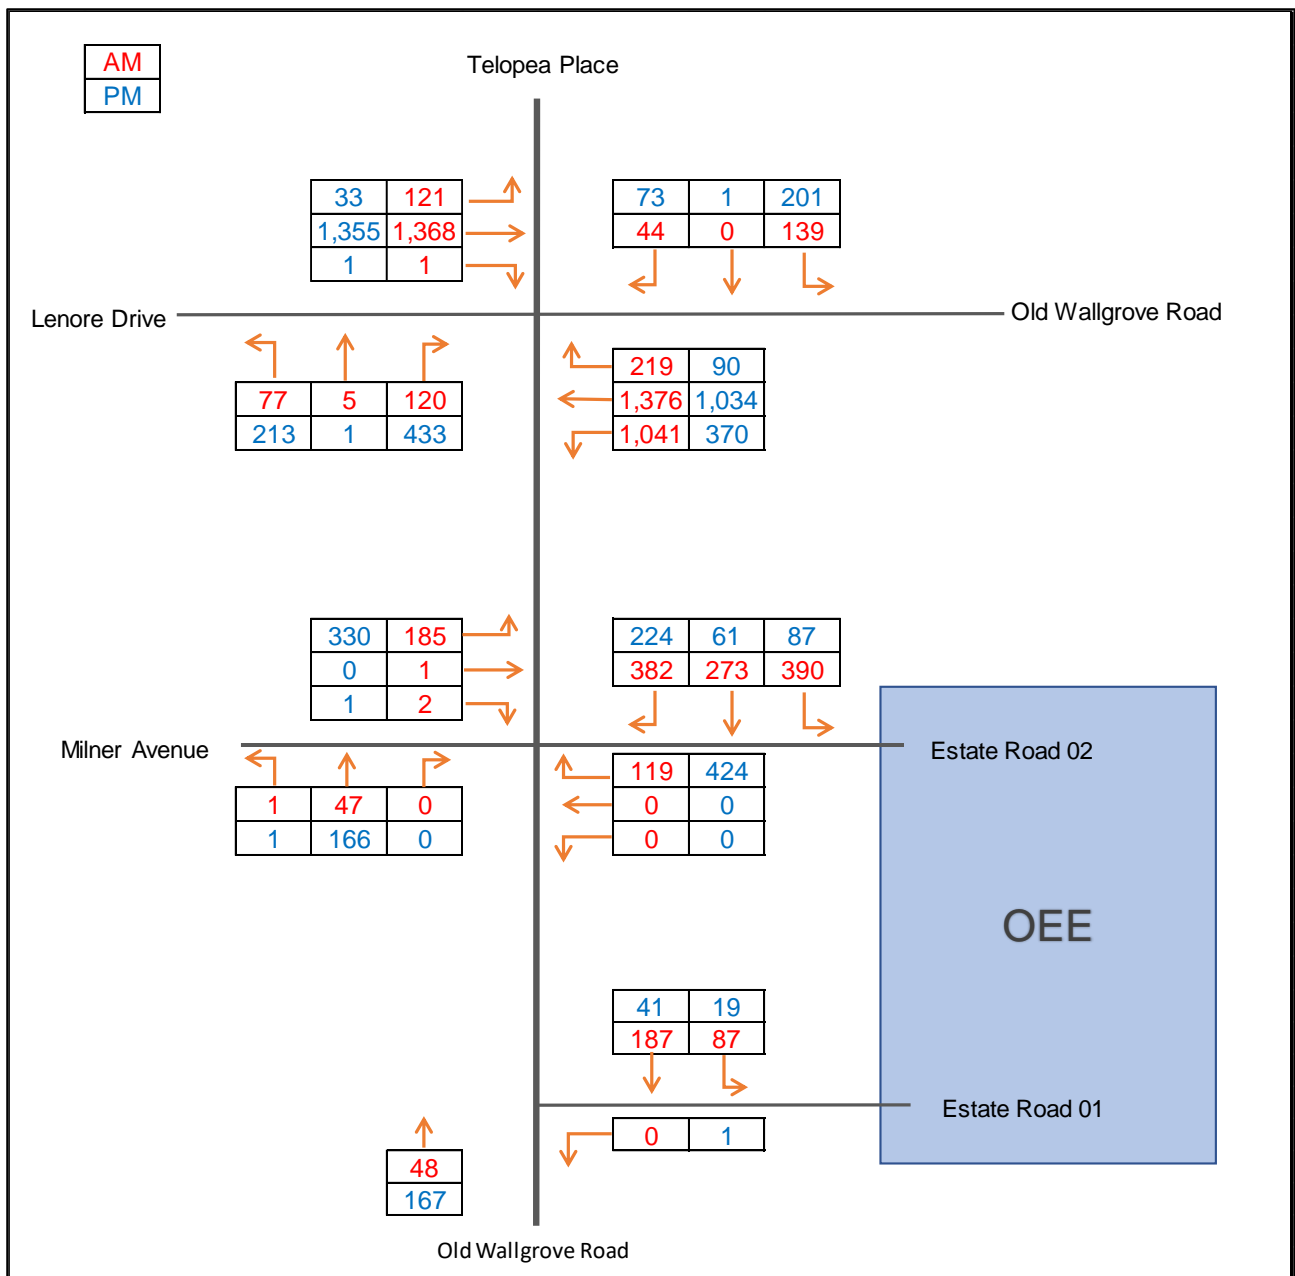

Figure 19: Traffic Demand - 2036 Project Case

The modelling scenarios are summarised in **Table 18**.

TABLE 18 MODELLING SCENARIOS

Scenario No	Scenario Name	Geometry	Traffic Demand		Mitigation
			Background	Development	
1	2021 Existing	Existing	√		
2	2026 Base Case	Existing	√		
3	2026 Project Case	Existing	√	√	
4	2026 Project Case + Mitigation	Per Scenario 3 + mitigation	√	√	√
5	2031 Project Case	Per Scenario 4	√	√	
6	2036 Project Case	Per Scenario 5	√	√	

7.7 Modelling Parameters

7.7.1 SIDRA Input Parameters

Key input parameters for SIDRA Intersection modelling are summarised below:

- Site Level of Service Method was set to 'Delay (RTA NSW)';
- Physical features of the existing intersection geometries were coded with reference to Nearmap aerial imageries;
- Default values of basic saturation flow, peak flow factor, pedestrian walking speed, gap acceptance and environmental factors were unchanged;
- Speed limits were input as per existing posted speed limits at each location; and
- For heavy vehicles, the Passenger Car Unit (or PCU) factor were adopted as 2.0; whereas for light vehicles, the default PCU value (1.0) was unchanged.

7.7.2 Signal Phasing Assumptions

TCS plans were collated for both signalised intersections within the study area. Signal phase times have been set to be 140 second cycle time as requested by TfNSW for future signals. In order to replicate the practical operation of these intersections, a number of assumptions were adopted, such as:

- At the Old Wallgrove Road / Lenore Drive intersection, the left-turn slip lanes are signalised. However, it is noted that the left-turn signals would 'activate' or turn red only when there is a pedestrian demand across the slip lane, which occurs very rarely. At all other times, the left-turn movements on these slip lanes operate as a give-way. To replicate the operation, each of these 1-lane, left-turn slip lanes were coded as priority-controlled with a zebra crossing, instead of signalised.
- The bus lanes on the east and west approaches of Old Wallgrove Road / Lenore Drive intersection were not coded to simplify the signal operation and limit the manual assignment of lane usage. Since the number of buses are negligible (2 per hour in each direction), exclusion of the bus pre-emption is not expected to have a notable impact on the overall intersection performance.
- The Timing Option of 'User-Given Cycle Time' was generally adopted. In some instances, 'User-Given Phase Times' was used due to SIDRA's default allocation of phase times resulting in unbalanced delays between approaches

7.8 Modelling Outcomes

SIDRA modelling results for each scenario are briefly discussed in the following sections. Note that the SIDRA assessment was prepared on an earlier scheme which had higher Precinct GLA than the current scheme (330,898m² vs the current 303,330m², i.e. some 9% greater), hence the presented modelling has an additional element of conservativeness.

7.8.1 2021 Existing Scenario

The SIDRA results for the existing scenario (2021) is shown in the following table:

TABLE 19 SIDRA RESULTS – 2021 EXISTING

Intersection No	Intersection Name	Control	Peak	DoS	Delay (s)	LoS
1	Old Wallgrove Road / Lenore Drive	Signal	AM	0.37	26	B
			PM	0.58	35	C
2	Old Wallgrove Road / Millner Avenue	Signal	AM	0.57	19	B
			PM	0.77	13	A

The analysis demonstrates that the existing two intersections operate satisfactorily in both peak periods with a LoS C or better.

7.8.2 2026 Base Case

The SIDRA results for the 2026 base case scenario are shown in the following table:

TABLE 20 SIDRA RESULTS – 2026 BASE CASE

Intersection No	Intersection Name	Control	Peak	DoS	Delay (s)	LoS
1	Old Wallgrove Road / Lenore Drive	Signal	AM	0.61	22	B
			PM	0.61	30	C
2	Old Wallgrove Road / Millner Avenue	Signal	AM	0.45	30	C
			PM	0.46	38	C

The analysis demonstrates that in the future 2026 Base Case scenario, the two intersections continue to operate satisfactorily in both peak periods with a LoS C or better. The Old Wallgrove Road / Millner Avenue intersection has been modelled with the 140 seconds cycle time in this scenario (refer to **Section 7.7.2**) which results in the delay increase and subsequent transition from LoS A to C.

7.8.3 2026 Project Case

The SIDRA results for the 2026 project case scenario are shown in the following table:

TABLE 21 SIDRA RESULTS – 2026 PROJECT CASE

Intersection No	Intersection Name	Control	Peak	DoS	Delay (s)	LoS
1	Old Wallgrove Road / Lenore Drive	Signal	AM	0.73	24	B
			PM	0.79	40	C
2	Old Wallgrove Road / Millner Avenue	Signal	AM	0.67	34	C
			PM	0.84	44	D
3	Proposed secondary Estate access	Left-in / Left-out	AM	0.10	7.4	A
			PM	0.06	7.4	A

The results suggest that, with the additional OEE traffic, the signalised intersections continue to operate satisfactorily in the AM peak period. In the PM peak, the Old Wallgrove Road / Millner Avenue intersection worsens to a LoS D. When sensitivity testing these intersections (refer to **Section 0**) with an elevated trip rate of 0.23 / 0.24 trips per 100m² in the AM / PM peak hours, it was found that the two signalised intersections exceeded capacity in the PM peak period. To address this, mitigation measures as outlined in the following section were proposed to increase capacity and improve operation of the intersections.

As the priority-controlled intersection at Old Wallgrove Road / Estate Road 01 will be reconfigured to be left-in / left-out only (removal of the right-turn out to Old Wallgrove Road) upon construction of OEE Stage 2, it has also been assessed in this scenario. This intersection operates at a LoS A with minimal delay.

7.8.4 2026 Project Case + Mitigation

The proposed mitigation measures are summarised in **Figure 20** and **Figure 21** and described below.

- Old Wallgrove Road / Lenore Drive
 - Widening of the southern side of the intersection to accommodate a second departure lane, allowing for a continuous flow from the East approach; and
 - Widening and extension of the existing left-turn slip lane from the South approach from the existing 35 metres to 140 metres.
- Old Wallgrove Road / Millner Avenue
 - Widening of the northern side of the intersection to accommodate an additional 100 metres left turn slip lane into Estate Road 02 (eastern arm of intersection); and
 - Extending the kerbside lane of the East approach from 50 metres to 140 metres (i.e. through No Stopping restrictions or similar).

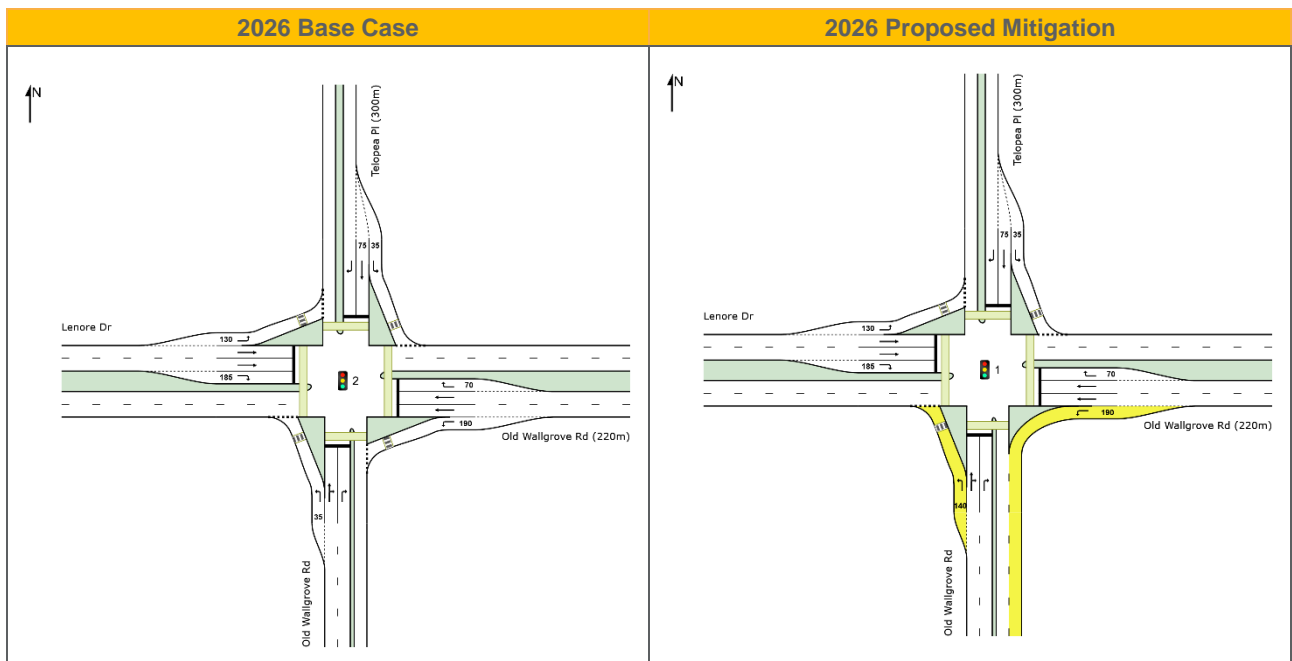

Figure 20: Old Wallgrove Road / Lenore Drive intersection Mitigation

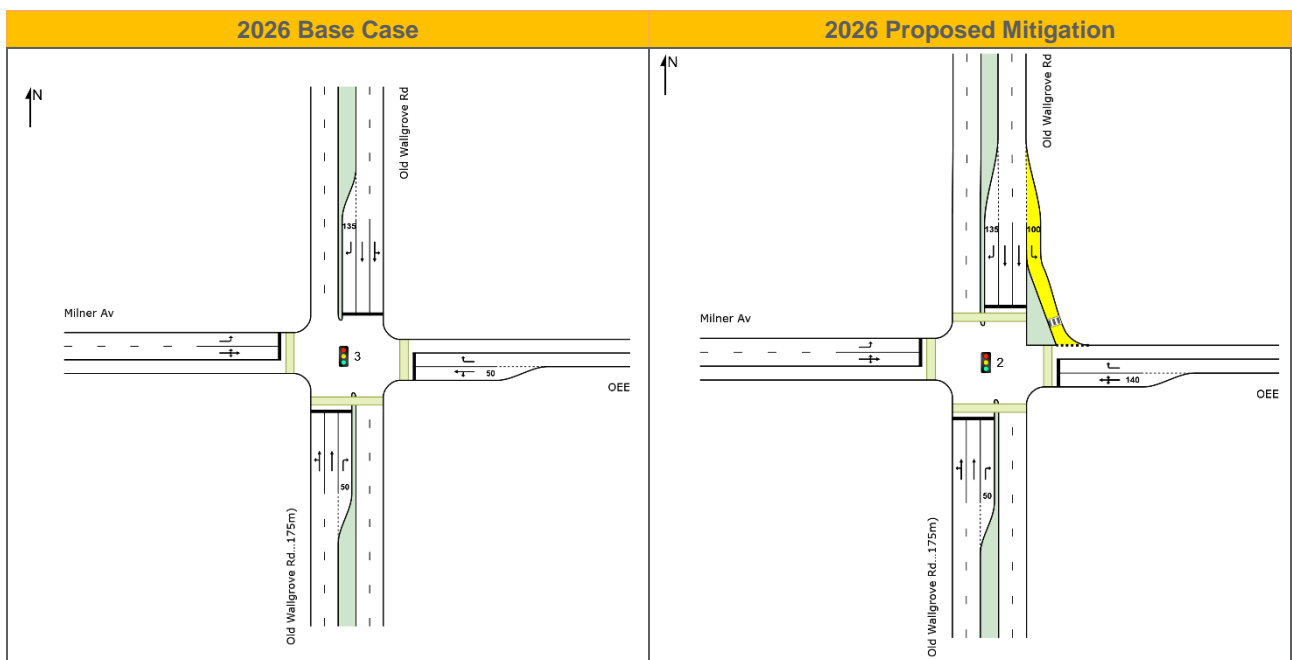

Figure 21: Old Wallgrove Road / Millner Avenue intersection Mitigation

The SIDRA results for the mitigation measures (for the 2026 project case) are shown in the table attached overleaf:

TABLE 22 SIDRA RESULTS – SCENARIO 3 (2026 PROJECT CASE + MITIGATION)

Intersection No	Intersection Name	Control	Peak	DoS	Delay (s)	LoS
1	Old Wallgrove Road / Lenore Drive	Signal	AM	0.65	22	B
			PM	0.75	36	C
2	Old Wallgrove Road / Millner Avenue	Signal	AM	0.53	29	C
			PM	0.68	39	C
3	Proposed secondary Estate access	Left-in / Left-out	AM	0.10	7.4	A
			PM	0.06	7.4	A

As seen in **Table 22**, the following mitigation measures improve the operation of both intersections, with the intersections operating at a LoS C or better in both peak periods and individual approaches operating at LoS D or better (refer to **Appendix B** for detailed SIDRA movement summaries).

7.8.5 2031 Project Case

The SIDRA modelling results for the 2031 project case scenario are shown in the following table:

TABLE 23 SIDRA RESULTS – SCENARIO 6 (2036 PROJECT CASE)

Intersection No	Intersection Name	Control	Peak	DoS	Delay (s)	LoS
1	Old Wallgrove Road / Lenore Drive	Signal	AM	0.81	23	B
			PM	0.91	46	D
2	Old Wallgrove Road / Millner Avenue	Signal	AM	0.53	29	C
			PM	0.68	39	C
3	Proposed secondary Estate access	Left-in / Left-out	AM	0.10	7.4	A
			PM	0.06	7.4	A

The analysis demonstrates that the mitigation measures proposed for the 2026 Project Case + Mitigation scenario are sufficient in maintaining acceptable operation of the signalised intersections in the 2031 model year. In 2031, both signalised intersections continue to operate with sufficient spare capacity, with a LoS D or better in all approaches.

It is noted that the Old Wallgrove Road / Millner Avenue intersection continues to operate identically to the 2026 Project Case (after mitigation) as we've conservatively assumed full uplift in the adjoining sites and in OEE by 2026. Increases in volumes at the Old Wallgrove Road / Lenore Drive intersection is due to background growth elsewhere.

7.8.6 2036 Project Case

The SIDRA modelling results for the 2036 project case scenario are shown in the following table:

TABLE 24 SIDRA RESULTS – SCENARIO 6 (2036 PROJECT CASE)

Intersection No	Intersection Name	Control	Peak	DoS	Delay (s)	LoS
1	Old Wallgrove Road / Lenore Drive	Signal	AM	0.91	32	C
			PM	0.88	38	C ¹
2	Old Wallgrove Road / Millner Avenue	Signal	AM	0.53	29	C
			PM	0.68	39	C
3	Proposed secondary Estate access	Left-in / Left-out	AM	0.10	7.4	A
			PM	0.06	7.4	A

Note that the Old Wallgrove Road / Lenore Drive intersection performs better in the 2036 PM peak compared to 2031 PM peak due to other local and regional upgrades assumed in the Aimsun model which reduce the cumulative background increase (amongst other factors).

The analysis demonstrates that the mitigation measures proposed for the 2026 Project Case + Mitigation scenario are sufficient in maintaining acceptable operation of the signalised intersections in the 2036 model year. In 2036, both signalised intersections continue to operate with sufficient spare capacity, with a LoS D or better in all approaches.

It is noted that the Old Wallgrove Road / Millner Avenue intersection continues to operate identically to the 2026 Project Case (after mitigation) as we've conservatively assumed full uplift in the adjoining sites and in OEE by 2026. Increases in volumes at the Old Wallgrove Road / Lenore Drive intersection is due to background growth elsewhere.

7.8.7 Summary

In summary, the projected traffic associated with this SSD will result in the requirement to increase intersection capacity through widening at the southern approach of the Old Wallgrove Road / Lenore Drive intersection and the northern approach of the Old Wallgrove Road / Millner Avenue intersection. These intersection upgrades will enable the intersections to operate at a LoS D or better in the 2036 model year. The Old Wallgrove Road / Estate Road 01 priority-controlled intersection, after reconfiguration to a left-in / left-out, will continue to operate at a LoS A.

7.9 Sensitivity Analysis

In line with comments received from TfNSW (see **Section 1.3**), further sensitivity testing has been applied to test the impact of adoption of higher trip rates. That is:

- AM Peak: From 0.18 to 0.23 trips per 100m² GFA;
- PM Peak: From 0.16 to 0.24 trips per 100m² GFA; and
- Daily: Unchanged at 2.43 trips per 100m² GFA.

It is our view that the adopted trip rates documented in the previous section (0.18 and 0.16) are appropriate for the development, however, testing for the TfNSW recommended trip rates (0.23 and 0.24) provides a more robust assessment and confidence in the proposed mitigation measures. For the sensitivity analysis, the elevated trip rates are applied to both the OEE development and also adjacent developments which are not yet fully developed (i.e. ESR and Frasers' Nu Pure). Specifically, as it relates to the trip generation for OEE:

TABLE 25 OAKDALE EAST ESTATE TRIP GENERATION BY PRECINCT

Precinct	GLA (m ²)	AM		PM		Daily
		LV	HV	LV	HV	
1	38,772	74	15	77	16	942
2	82,490	158	32	165	33	2,005
3	96,810	185	38	193	39	2,352
4	55,800	107	22	111	23	1,356
5	15,400	29	6	31	6	374
Other	14,058	27	5	28	6	342
Total	303,330	580	118	605	123	7,371

Application of the elevated rates to the 2036 project case SIDRA model results in the following outcomes:

TABLE 26 SIDRA RESULTS – SCENARIO 6A (2036 PROJECT CASE) SENSITIVITY ANALYSIS

Intersection No	Intersection Name	Control	Peak	DoS	Delay (s)	LoS
1	Old Wallgrove Road / Lenore Drive	Signal	AM	0.93	36	C
			PM	0.92	47	D
2	Old Wallgrove Road / Millner Avenue	Signal	AM	0.53	29	C
			PM	0.71	40	C
3	Proposed secondary Estate access	Left-in / Left-out	AM	0.12	7.4	A
			PM	0.09	7.4	A

As demonstrated, with the higher trip rates the intersections continue to operate satisfactorily, with a LoS D or better. Therefore, the proposed mitigation measures are considered appropriate even with the more conservative trip rates of 0.23 and 0.24 trips per 100m² GFA in the AM / PM peak and no further mitigation is warranted (refer to **Appendix C** for detailed SIDRA movement summaries).

8 Preliminary Construction Traffic Management Plan

A detailed CTMP will be provided as part of detailed construction planning and in response to a suitable Condition of Consent (CoC). For the purposes of this TA, the following general principles for managing construction traffic have been assumed and provide an understanding of the likely traffic impacts during the construction period.

8.1 Potential Haulage Routes

The primary potential haulage route to and from the Site would be via the M7 Motorway, Wallgrove Road, Mini Link Road, Old Wallgrove Road and Milner Avenue, as shown in the figure below. Obviously, this is subject to further liaison with the proposed contractor and can be finalised later and prior to the CC phase.

Figure 22: Potential Construction Travel Route to / from the Site

8.2 Proposed Working Hours

The construction work would vary depending on the phase of construction and associated activities and includes both construction and design personnel. The size of the on-site workforce has not been finalised and

as a result, the peak working population on-site at any given time during the construction period may vary. Construction works would be undertaken during standard construction-working hours, which are likely to be as follows. The exact hours will be confirmed in the consent conditions:

- Monday to Friday: 7.00 AM to 6.00 PM
- Saturday: 8.00 AM to 1.00 PM
- Sunday and Public holidays: No planned work.

It may (on occasion) be necessary to undertake night works to minimise disruption to traffic or for oversize deliveries under a special permit.

8.3 Anticipated Construction Program Traffic Generation

Light vehicle traffic generation would be generally associated with contractor movements to and from the Site. Contractors would be comprised of project managers, various trades and general construction personnel. Over the full construction period, the peak workforce represents the worst-case scenario for vehicle movements during the AM or PM road network peak hour. The workforce arrival and departure periods represent the peak construction traffic generation periods.

Light vehicle construction trips are expected to arrive in the morning and depart in the evening and the number of trips would be based on the workforce numbers. Parking for this construction related-vehicles would be provided on-site.

Heavy vehicle traffic would mainly be generated by activities associated with the delivery of construction equipment and delivery of material for construction works.

Notwithstanding, majority of the deliveries are likely to occur outside of the peak road network traffic periods and would have limited (if any) impact onto surrounding road network. Again, it is emphasised that a detailed CTMP will be provided in response to a suitable CoC for the Proposal.

Importantly, it is highly likely that the construction traffic volumes are lower than the operational traffic volumes. Therefore, recognising that the key intersections are anticipated to perform satisfactorily once the Site is completed, it can be assumed that the intersection would satisfactorily accommodate the lower volumes of construction traffic.

8.4 Construction Mitigation Measures

While the traffic impacts of construction of the development are likely to be less than the operational phases, the following measures will be undertaken to minimise the impacts of the construction activities of the development:

- Traffic control would be required to manage and regulate traffic movements into and out of the Site during construction; and
- Disruption to road users would be kept to a minimum by scheduling intensive delivery activities outside of peak network hours.

9 Design Commentary

9.1 Relevant Design Standards

The elements of the proposed Precinct 1 expansion and Precinct 3 demonstrate general compliance for Site access, car parking and loading procedures in line with the following relevant Australian Standards:

- AS/NZS 2890.1:2004 for car parking spaces
- AS2890.2:2018 for commercial vehicle loading areas; and
- AS/NZS2890.6:2009 for accessible spaces.

It is expected that any detailed construction drawings in relation to the car park or Site access would comply with these Standards, and moreover that compliance with the above Standards is anticipated to form a standard CoC to any development approval.

9.2 Design Vehicles

The Precinct 1 expansion hardstand area can accommodate up to 20.0 metre Articulated Vehicles (AVs). Precinct 3 can accommodate up to 30.0 metre Super B-Doubles limited to side load and up to 20.0 metre Articulated Vehicles (AVs) for recessed dock access and rear loading at RSD positions.

Although Precinct 3 can accommodate 30.0m Super B-doubles, it is noted that based on the operational information provided by the immediate tenant for Precinct 3, the largest truck required for operation is a 26.0m B-double. As such, the assessment undertaken for 30.0m Super B-doubles is deemed conservative and has been undertaken to future proof the Site.

9.3 Access Design

The future freight line corridor, labelled as an SP2 Infrastructure zone on the Masterplan, runs through the Estate, passing south of Precinct 5. It is understood that the proposed freight line will be at a higher elevation than the proposed Estate roadway leading to Precinct 5, hence the intersection would be grade separated. This facilitates independent access to / from Precinct 5 without interaction with the future freight line.

For Site levels and similar details, refer to the Civil documentation prepared separately. For outcomes of the consultation, refer to the Planning documentation prepared separately.

9.4 Commercial Hardstand Area

The design review indicates that access and egress to recessed docks and roller shutter doors can generally occur noting that hardstand operational management would effectively facilitate the movements of trucks within the hardstand area.

All commercial vehicles can enter and exit the site in a forward direction. Consideration shall be given to the design commentary and RSD vehicle size limitations included in **Appendix D**.

9.5 Estate Roads

All Estate Roads, intersections and junctions thereof have been designed to accommodate trucks mainly up to 26.0 metre B-doubles (designed by AT&L). The specific travel route to be adopted is shown in the figure below (prior to the SLR connection).

Figure 23: Specific Travel Route to / from the Site – Prior to Potential Future SLR Connection

Ason Group has been advised that “No Parking” and “No Stopping” restrictions would be proposed on all future public roads within the OEE.

9.6 Car Parking Design

Staff and visitor parking – situated in proximity to tenancies – is demonstrated to generally comply with AS2890.1:2004 in line with User Class 2 which is superior to the minimum User Class 1/1A required for staff parking. Accessible spaces generally comply with AS2890.6:2009.

9.7 Fire Service Appliance Circulation

In line with Fire and Rescue NSW (FRNSW) Guidelines, circulation around the Site and through the fire path perimeter has been tested for a 12.5 m HRV, demonstrating sufficient access for ‘General and ‘Specialist’ fire appliances, as demonstrated in **Appendix D**.

9.8 Internal Circulation

The proposed circulation route for the Precinct 1 expansion is shown in the figure below. It is noted that heavy vehicles entering / exiting from the Precinct 1 expansion will do so by utilising the proposed heavy vehicle access driveway.

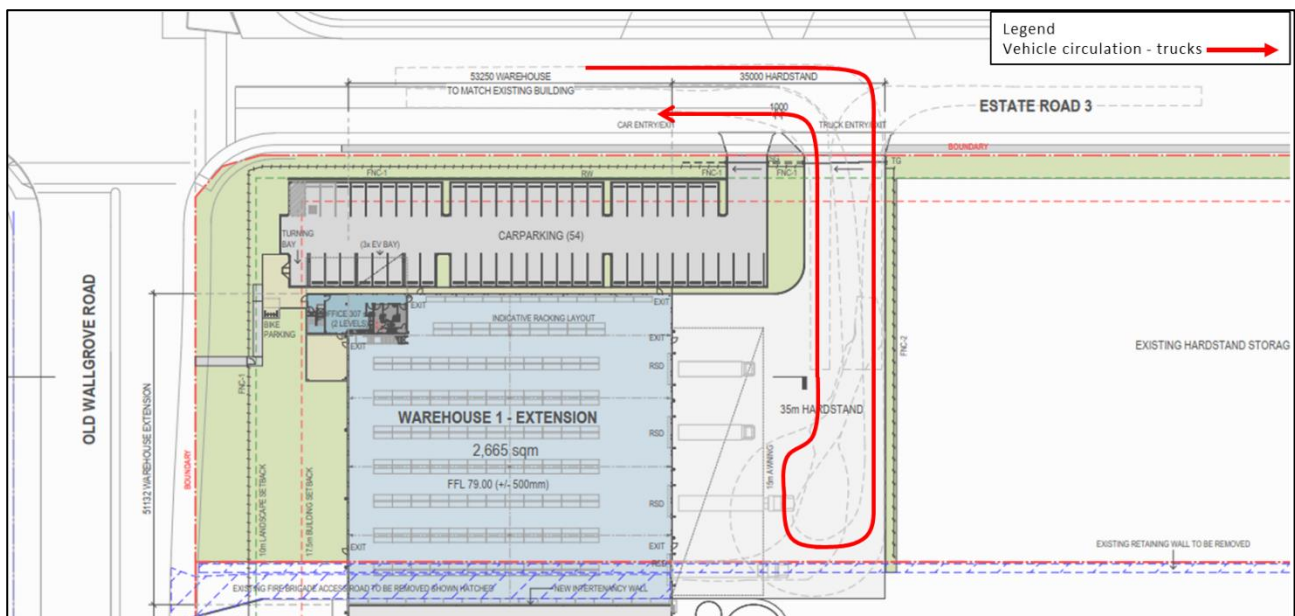

Figure 24: Heavy Vehicle Circulation Route within Precinct 1 – Design for 20m AV

A one-way clockwise circulation route is proposed for all heavy vehicles making inbound deliveries to Precinct 3.

As for heavy vehicles making outbound deliveries, a one-way counterclockwise circulation route is proposed. This is shown in the following figure.

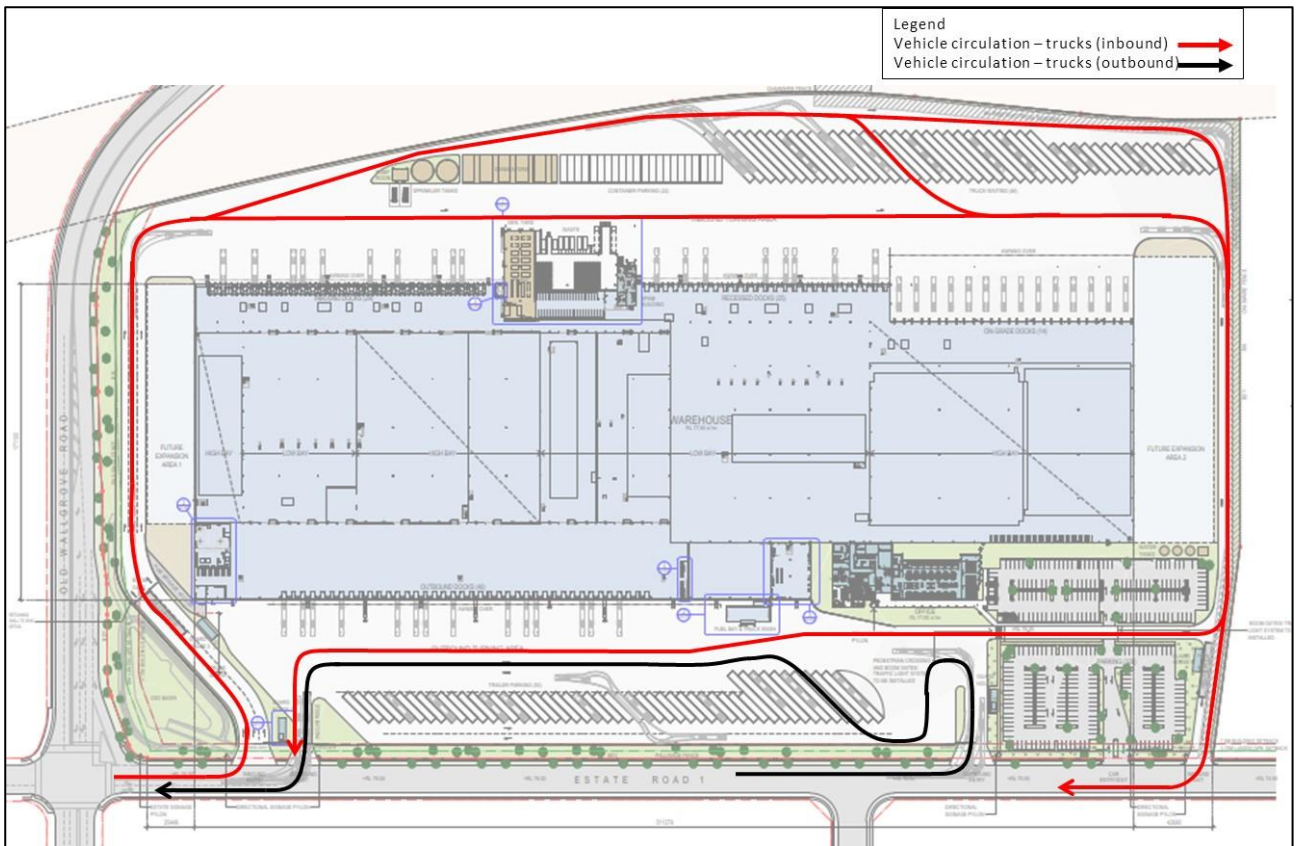

Figure 25: Heavy Vehicle Circulation Route within Precinct 3

10 Summary and Conclusions

Ason Group has been engaged by Goodman Property Services (Aust) Pty Ltd (Goodman) to prepare a TA to assess the traffic and parking implications associated with the development of the Precinct 1 expansion and Precinct 3 within the Oakdale East Estate (OEE).

10.1 Key Findings

The key findings of this TA are:

- Based on survey evidence conducted by Ason Group for vehicle trip generation rates at Oakdale Central Estate (OCE), Oakdale South Estate (OSE) and the First Estate Precinct, the adopted trip generation rates of 0.18 and 0.16 trips per 100m² GFA in the AM and PM Peaks is considered to be appropriate.
- The estimated proposed SSD traffic generation having regard for the adopted rates of 0.18 / 0.16 / 2.43 trips per 100m² GFA (AM / PM / Daily) is shown in **Table 27**:

TABLE 27 TRAFFIC GENERATION FOR THE ENTIRE OAKDALE EAST ESTATE

Precincts	GLA (m ²)	AM Peak	PM Peak	Daily
1 to 5	303,330	546	485	7,371

- SIDRA modelling was undertaken for the following scenarios:
 - Existing;
 - 2026 Base Case;
 - 2026 Project Case;
 - 2026 Project Case + Mitigation;
 - 2031 Project Case; and
 - 2036 Project Case.
- Mitigation measures were proposed to ensure that the modelled intersections continued to operate at a satisfactory Level of Service. The mitigation measures at the following intersections is explained below:
 - Old Wallgrove Road / Lenore Drive
 - Widening of the southern side of the intersection to accommodate a second departure lane, allowing for a continuous flow from the East approach; and
 - Widening and extension of the existing left-turn slip lane from the South approach from the existing 35 metres to 140 metres.
 - Old Wallgrove Road / Millner Avenue
 - Widening of the northern side of the intersection to accommodate an additional 100 metres left turn slip lane into Estate Road 02 (eastern arm of intersection); and
 - Extending the kerbside lane of the East approach from 50 metres to 140 metres (i.e. through No Stopping restrictions or similar).
 - In the 2026 model year, the intersections operate at a LoS C or better in both peak periods, post-mitigation.
 - In the 2031 model year, the intersections operate at a LoS D or better in both peak periods, without any further mitigation.
 - In the 2036 model year, the intersections operate at a LoS D or better in both peak periods, without any further mitigation.

- In summary, the projected traffic associated with the OEE can be satisfactorily offset by the proposed mitigation measures.
- Further to this, sensitivity analysis, adopting higher trip rates (recommended by TfNSW) of 0.23 and 0.24 trips per 100m² GFA in the AM and PM peaks, finds the proposed mitigation measures are suitable even under the elevated trip rate and no additional mitigation is warranted as a result.
- On-site parking provisions for Precinct 1 under this SSD meets and exceeds the requirements of the OEE DCP 2022. On-site parking provisions for Precincts 3 under this SSD are lower than the requirements of the OEE DCP 2022, however based on the known tenant's operational requirements, the proposed provision of 328 spaces accommodates their expected parking demand.
- Detailed design of each individual building is deferred to their respective DA assessment. However, the Site access, car park and loading areas for all buildings are expected to comply with the following relevant Australian Standards:
 - AS 2890.1:2004 for car parking areas,
 - AS 2890.2:2018 for commercial vehicle loading areas and
 - AS 2890.6:2009 for accessible (disabled) parking.
- It is expected that any detailed construction drawings in relation to the car park or Site access would comply with these Standards. Furthermore, compliance with the above Standards would be expected to form a standard condition of consent to any development approval.

10.2 Conclusions

In summary, the proposed OEE Concept Plan, including the Stage 2 works of the Precinct 1 expansion and Precinct 3 warehouse developments, is deemed supportable on traffic and transport planning grounds and is not expected to result in any adverse impacts on the surrounding road network.

Site Level of Service (LOS) Method: Delay (RTA NSW). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Delay Model: SIDRA Standard (Geometric Delay is included).

Queue Model: SIDRA Standard.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (RTA NSW). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Delay Model: SIDRA Standard (Geometric Delay is included).

Queue Model: SIDRA Standard.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (RTA NSW). Site LOS Method is specified in the Parameter Settings dialog (Site tab).

Vehicle movement LOS values are based on average delay per movement.

Intersection and Approach LOS values are based on average delay for all vehicle movements.

Delay Model: SIDRA Standard (Geometric Delay is included).

Queue Model: SIDRA Standard.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

* Critical Movement (Signal Timing)

Appendix D. Swept Path Analysis and Design Commentary

NOTE:

1. THE DESIGN OF DESIGN OF PRECINCT 3 IS SHOWN BETWEEN AG02 AND AG14. THE DESIGN OF THE PRECINCT 1 EXPANSION IS SHOWN BETWEEN AG15 AND AG22.
2. THE CURRENT DESIGN OF PRECINCT 3 CAN ACCOMMODATE THE LARGEST EXPECTED VEHICLE, THE 26.0m B-DOUBLE. THE SWEEP PATH ASSESSMENT FOR THIS VEHICLE IS SHOWN FROM AG02 TO AG05.
3. TO FUTURE PROOF THE SITE, VEHICLES UP TO 30.0m SUPER B-DOUBLES CAN ALSO ACCESS PRECINCT 3. THE SWEEP PATH ASSESSMENT FOR 30.0m SUPER B-DOUBLES IS SHOWN FROM AG06 TO AG09.
4. VEHICLES UP TO 20.0m AVs CAN REAR LOAD WITHIN THE PROPOSED RSDs AND RECESSED DOCKS FOR PRECINCT 3. THEY CAN ALSO ACCESS THE TRUCK PARKING, AS REQUIRED. THIS IS SHOWN WITHIN AG10 AND AG11.
5. FIRE TRUCKS WILL BE ABLE TO CIRCULATE THE SITE AND REVERSE INTO THE DEDICATED BOOSTER LOCATIONS FOR PRECINCT 3. IT IS SHOWN WITHIN AG12 AND AG13.
6. THE CLASS OF CAR PARKING SPACES HAS BEEN ASSESSED AND IT IS USER CLASS 2 (GREATER THAN USER CLASS 1/1A AS REQUIRED BY AS2890.1:2004). MINOR AMENDMENTS WILL BE REQUIRED AT THE CAR PARK (OF PRECINCT 3). THIS IS SHOWN WITHIN AG14.

GENERAL NOTES

This drawing is provided for information purposes only and should not be used for construction.
Base Plan prepared by SBA Architects, received 18.05.2022.
Swept path assessments completed at 10 km/h and 300mm clearance.
