1.0 Executive Summary

This report has been prepared for Hammond Care, for the construction of a Single building that will present as two buildings at Nerigah Avenue South, in response to the SSDA General Requirement 8.0 – Ecologically Sustainable Development (ESD).

The report provides an overview of how the proposed design is responding to sustainable planning, through all stages of design, construction, and operation of the facility.

For the current design stage, please refer to **Section 6** - In demonstrating 'as a minimum', the intended compliance with 5 Star Green Star Buildings and WELL Building standard Bronze rating.

2.0 Project Background

2.1 Scope of Project

The scope of the project is as follows:

- Demolition of the Neringah Hospital building, kiosk, and existing at-grade carparks.
- Clearing of existing vegetation on the proposed development areas.
- Bulk earthworks including basement excavation; and
- Remediation works where necessary across the site.
- Construction and use of an integrated seniors housing and health services facility across two buildings ranging from 4-5 storeys above ground, comprising:
 - 2 basement levels containing 145 car parking spaces and service dock
 - 12 residential aged care facility beds (extension to existing Stage 1 provision)
 - 18 palliative care hospice beds (Schedule 3 health services facility)
 - Community healthcare services, including outpatient palliative care, centre for positive aging and Hammond at Home
 - 57 seniors housing dwellings
 - \circ On-site administration, amenities, and ancillary operations spaces
 - Ground level and on-building landscaping works, including the provision of a through site pedestrian link connecting Archdale Park and Balcombe Park
 - Public domain works, specifically, regrading of part of the pedestrian walkway known as 'Archdale Walk' to provide accessible connection; and
 - Extension and augmentation of infrastructure and services as required.

2.2 Site description

This ESD Report is submitted to the Department of Planning and Environment (DPE) in support of a State Significant Development Application (SSD-45121248) for the redevelopment of part of the site at 4-12 Neringah Avenue South, Wahroonga for the purposes of delivering additional health services, seniors housing, as well as upgraded palliative care facilities that will contribute to the broader operation of 'Neringah Hospital.' The extent of the site is shown below. The development is bordered by:

- Woonona Avenue to the West;
- Neringah Avenue South to the East.
- Sydney Water Reservoir to the North.

Outline of the site, with the portion of the site subject to the SCC shaded dark red (R4 zone)

STEENSEN VARMING

3.0 Introduction

3.1 Response to SEARs

This report has been prepared to respond to the Secretary's Environmental Assessment Requirements (SEARs) for SSD-45121248 that were issued on 24 June 2022. A table referencing responses has been provided below.

Table 1 – SEARs Requirement 8.0 and Relevant Reference

SEARs Items		Project Response to SEARs
A)		The ESD initiatives proposed for the project aims to reduce the environmental impacts typically associated with buildings during the construction and ongoing operation of the building. The project utilises a resource hierarchy approach, with emphasis on avoiding, then reduction of energy, water, waste, materials etc. The outcome of the resource hierarchy approach is to ensure the project aligns with the ecological sustainable development principles (Section 193) of the Environmental Planning and Assessment Regulation 2021
B)	Outline how the concept development will meet or exceed the relevant industry recognised building sustainability and environmental performance standards.	The strategies in response to this have been captured in Section 6.0 and Section 3.2 of this report. The project is targeting design principles in alignment with requirements from Green Star Buildings and WELL rating systems. Primary principles include light, air quality, comfort, noise, water, energy, landscape, and materials are discussed in the following section and will be applied to the relevant space types. The strategies in response to this have been captured in Section 4.0 & 6.0 or this document.

Mechanical Engineering Lighting Design Sustainable Design Electrical Engineering Copenhagen London Sydney Canberra Hong Kong New York Level 8, 9 Castlereagh Street Sydney, NSW, 2000, Australia ABN 50 001 189 037 t : +61 / 2 9967 2200 e : info@steensenvarming.com

STEENSEN VARMING

SEARs Items	Project Response to SEARs	
C) Outline how the concept development minimises greenhouse gas emissions (reflecting the Government's goal of net zero emissions by 2050) and consumption of energy, water (including water sensitive urban design) and material resources.	Consumption of energy, water (Including water sensitive urban design) and material resources have been addressed in Section 6.0 of this Report.

STEENSEN VARMING

3.2 Project Response to Section 193 of the EP&A Regulation 2021

The ESD initiatives proposed for the Wahroonga Stage 2 Project aim to reduce the environmental impacts typically associated with buildings during the construction and ongoing operation of the building. The project utilises a resource hierarchy approach, with emphasis on avoiding, then reducing the use of energy, water, materials etc.

To ensure a sustainable outcome, the following are key strategies that are addressed within the proposed design:

- Design high quality spaces to promote comfortable and healthy environments, while supporting the functional demand of the building, i.e. health/living activities. Key design emphasis is on achieving optimised Indoor Environmental Quality (IEQ) and occupant comfort (including optimised indoor air quality, thermal, acoustic and visual comfort)
- Incorporate a high-performance building envelope, to ensure energy efficiency as well as occupant comfort (including thermal, visual, and acoustic comfort)
- Incorporate appropriate passive and active design strategies to ensure a lowenergy as well as low-maintenance design outcome
- Adopt water sensitive urban design principles
- Adopt practices to minimise demolition, construction and operational waste including recycling of demolition and construction waste.
- Utilise environmentally preferable materials

The outcome of the resource hierarchy approach is to ensure the Hospital and Seniors housing project aligns with the ecological sustainable development principles (Section 193) of the Environmental Planning and Assessment Regulation 2021 and the four key principles and our response is listed below.

Mechanical Engineering Lighting Design Sustainable Design Electrical Engineering Copenhagen London Sydney Canberra Hong Kong New York Level 8, 9 Castlereagh Street Sydney, NSW, 2000, Australia ABN 50 001 189 037 t : +61 / 2 9967 2200 e : info@steensenvarming.com

STEENSEN VARMING

Principle	Project Response
The precautionary principle If there are threats of serious or irreversible environmental damage, lack of full scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation. Decisions should be guided by: (i) Careful evaluation to avoid, wherever practicable, serious or irreversible damage to the environment. (ii) An assessment of the risk-weighted consequences of various options.	The landscape strategy has been developed to enhance the environmental performance of the land, including integration of native plant species and incorporation of water sensitive urban design features to passively manage storm water falling on the site and enhance biodiversity.
Inter-Cenerational Equity The present generation should ensure that the health, diversity and productivity of the environment are maintained or enhanced for the benefit of future generations.	 The project will minimise the impact on the environment through: Resource efficiency measures and selected low embodied carbon materials and using recycled materials where possible Energy, water and waste reduction and conservation measures to reduce consumption of resources. Landscape strategies and WSUD features to enhance biodiversity and the site's ability to passively control stormwater Connection to country – Integration of indigenous and aboriginal design considerations and features.
Conservation of Biological Diversity and Ecological Integrity Conservation of biological diversity and ecological integrity should be a fundamental consideration.	The landscape strategy considers the protection of existing ecological features, and the design will maintain the overall biodiversity and ecological performance of the site through conservation measures.
Improved Valuation, Pricing and Incentive Mechanisms Environmental factors should be included in the valuation of assets and services, such as: (i) Those who generate pollution and waste should bear the cost of containment, avoidance, or abatement, (ii) The users of goods and services should pay prices based on the full life cycle of costs of providing goods and services, including the use of natural resources and assets and the ultimate disposal of any waste, (iii) Environmental goals, having been established, should be pursued in the most cost-effective way, by establishing incentive structures, including market mechanisms, that enable those best placed to maximise benefits or minimise costs to develop their own solutions and responses to environmental problems.	A sustainability strategy has been developed for the project comprised of a wide range of sustainability initiatives, to be addressed by the design team and project stakeholders. Strategies have been developed to achieve the highest sustainability and environmental performance, while aiming to minimise high costs.

Mechanical Engineering Lighting Design Sustainable Design Electrical Engineering Copenhagen London Sydney Canberra Hong Kong New York

STEENSEN VARMING

4.0 Targets / Benchmarks

In addition to the Secretary's Environmental Assessment Requirements (SEARs), the following environmental targets are aspired by this project:

- Exceed the requirements of Section-J of the National Construction Code (NCC) for energy-efficiency in building fabric and building services / systems
- Seniors living dwellings are designed to meet the requirements of Class 9c building classification of the NCC, hence, will not require any BASIX assessment or certificate
- Incorporate appropriate and sensible sustainable design initiatives that would align with the building's functional and operational requirements, for a highquality indoor environment. Seek guidance from the experience within the design team, and of local and international Environmental Rating Standards / Best Practice Guidelines
- Demonstrate good design through early-stage analysis and guidance, in general accordance with best practice industry recognised standards such as Green Star and WELL;
- For the recreational pool, review against pool specific design requirements and recommendations from standards such as:
 - CIBSE GPG 219 Energy efficiency in swimming pools;
 - Sport England swimming pool;
 - City of Sydney swimming pool design guides.
- Align with the model of care and sustainable strategies provided by Hammond Care.

4.1 NCC Section-J

Section-J of the National Construction Code (Previously known as the Building Code of Australia) 2019 relates to "energy efficiency of buildings". Section J is a minimum performance target for standard buildings and specifies minimum performance targets known as deemed-to-satisfy (DTS) requirements, for building fabric and services.

The proposed Hospital and Seniors Housing project aims to exceed the DTS requirements of Section-J where practical. A JV3 methodology is being applied for the project to demonstrate the improvement beyond DTS.

4.2 Green Star

As a minimum, target design aligns with the requirements with a Green Star 4 Star Buildings Rating. This is defined by Green Star as the following:

"A 4 Star rated building is a Best Practice environmental performer. It builds on the minimum expectations to deliver a building that is either net zero carbon in operations or a higher performer in energy, water, and health related issues.".

STEENSEN VARMING

5.0 Sustainability Approach

Sustainable building design involves a holistic and integrated design approach, which builds on an increased awareness of site opportunities, form and function, to encompass and target a broad range of sustainable design initiatives.

The project will endeavour to demonstrate through all aspects of design a strong commitment to sustainability, through adhering to the following overarching sustainable design initiatives:

- Healthy (Indoor air quality & access to natural daylight)
- Comfortable (Thermal Visual and Acoustic Comfort)
- Efficient (Energy, Material & Water)
- Easy to maintain and operate
- Environmentally responsive (To changing climatic conditions)

 Safe and secure: for staff, occupants and visitors

Correctly

(System optimisation / Ensure building performance)

commissioned

Be of stimulating

(Invoke a sense of

architecture

pride)

 A community resource

STEENSEN VARMING

In expanding on some of those initiatives outlined previously:

The promotion of natural daylight – There is a direct correlation between access to daylight, productivity, and general wellbeing. The project will aim to maximize daylight availability while taking into consideration heat gains and glare concerns.

Excellent Indoor Air Quality (IAQ) – In a similar manner to daylight, there is proven correlation between occupant health, wellbeing, and staff retention. Principle strategies considered include:

- Increased levels of outside air through the promotion of mixed mode or natural ventilation strategies and increased outdoor air allowances.
- Mould prevention through the avoidance of thermal bridges, condensation and effective strategies in ventilation, odour, and pollution control.
- Low pollutant emitting materials selections such as low VOC paints, adhesives, sealants, composite woods etc.

Excellent Thermal, Visual and Acoustic comfort:

- Thermal comfort: To ensure the occupants and staff are not subject to unacceptable extremes in temperature.
- Visual comfort: To ensure the quality of light is supportive of visual tasks such as reading. In design for natural daylight, consideration must be given to daylight uniformity, penetration depth, solar heat ingress and glare control.
- Acoustic comfort: To ensure effective communication can always be achieved, noise from ventilation systems, external and internal disruptive noise affecting rooms is minimised.

Resource conservation (energy, water, and waste) – In delivering on the functional demands of an aged care building (high levels of daylight, thermal comfort, visual comfort, and IAQ), incurs resource use through the optimisation of these attributes. These are to be supported with minimal consumption of energy and water resources, or the generation of waste and pollution in demolition, construction, and operation of the building. Our approach to resource conservation is based on applying a "hierarchy" methodology as outlined in the following sections.

The creation of an integrated community resource – The building can play a role within the local community using shared facilities.

The above approach has been taken to ensure the ESD strategies proposed meet the SEARs and targets/benchmarks discussed in the previous section.

The following sections provide a high-level overview of some of the strategies being considered.

Mechanical Engineering Lighting Design Sustainable Design Electrical Engineering Copenhagen London Sydney Canberra Hong Kong New York

Level 8, 9 Castlereagh Street Sydney, NSW, 2000, Australia ABN 50 001 189 037 t : +61 / 2 9967 2200 e : info@steensenvarming.com

STEENSEN VARMING

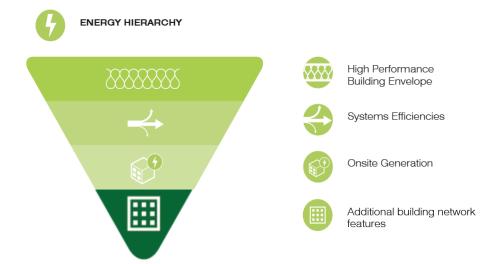

6.0 Resource Conservation

In reflecting the Covernment's goal of net-zero emissions by 2050 and consumption of energy, water (including water sensitive urban design) and material resources. This section provides a further breakdown of our approach to resource conservation.

6.1 Energy

The proposed approach to sustainability and energy related systems is based on applying an "energy hierarchy" methodology.

This methodology has the reduction of energy use as its priority, and then seeks to meet the remaining energy demand by the most efficient means available, before the inclusion of on-site generation and importation of green power.

The following energy initiatives have been proposed and their individual merits will be assessed further during future design stages:

- Building Form has been designed with consideration of façade access for greater access to natural daylight and opportunity for natural ventilation, within the constraints of the site.
- Passive design principles will be employed to respond to environmental conditions of the building including orientation, solar access, prevailing winds, seasonal and diurnal temperatures changes.
- Building envelope performance (airtightness and thermal) will be enhanced by prefabrication where possible.
- A Mixed Mode Ventilation strategy will be assessed for improved indoor air quality, whilst also reducing energy consumption associated with airconditioning. When external and internal conditions are favourable, external windows to each building / space can open to facilitate natural ventilation.

Mechanical Engineering Lighting Design Sustainable Design Electrical Engineering Copenhagen London Sydney Canberra Hong Kong New York

Level 8, 9 Castlereagh Street Sydney, NSW, 2000, Australia ABN 50 001 189 037 t : +61 / 2 9967 2200 e : info@steensenvarming.com

STEENSEN VARMING

- Building energy performance improvement Energy modelling will be performed in development of a design that betters current minimum standards.
- Energy efficient LED lighting, zoning, controls and site co-ordination for both internal and external lighting systems are to be designed.
- Occupancy controls will be provided to spaces so that AV, lighting and mechanical systems can be shut down both manually and automatically when unoccupied where appropriate.
- Performance glazing Glazing should be selected to optimise performance, admitting as much daylight as possible, while controlling the transmission of solar heat and thermal conduction
- Clazing ratio Glazing ratios need to achieve an equilibrium between allowing daylight to enter buildings while reducing solar and conductive heat gains
- Clazing position Windows should be positioned to block unwanted solar radiation, while allowing visible light and possibility for natural ventilation
- External Shading Helps restrict unwanted heat gains within spaces, while allowing daylight access. Deciduous trees can also help shade direct solar ingress
- Building air tightness Doors should be designed to close automatically to reduce unwanted heat transfer during peak summer and winter conditions. Consider revolving doors where applicable to maintain air tightness
- Thermal Mass Exposed thermal mass can reduce the rate of change of temperatures within buildings and reduce the peak heating and cooling demands
- A Solar photovoltaic (PV) array can be located on rooftops. Energy generated onsite can be reused onsite.
- High efficiency HVAC (Heating, Ventilation & Air-conditioning) systems to be incorporated.
- Energy Recovery: Through both air and water-based systems, energy recovery and reuse will be a priority.
- **CO2 monitoring** in the appropriate control of outdoor air provisions.
- Metering and Monitoring of energy, water and air quality to promote healthy environment and save energy and resources.
- Building Management Systems to link to sensors and meters, with the ability to control lighting, hydraulic and mechanical systems and reduce energy usage.
- Comprehensive System Commissioning to ensure the building functions as designed.
- **Promote** the switch to renewable energy and building electrification.

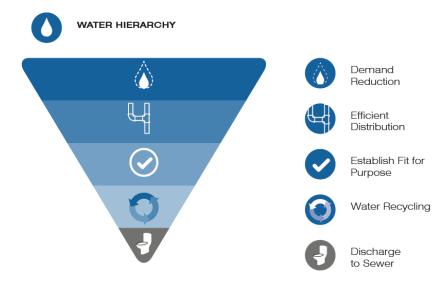

Mechanical Engineering Lighting Design Sustainable Design Electrical Engineering Copenhagen London Sydney Canberra Hong Kong New York

STEENSEN VARMING

6.2 Water

The following hierarchy and strategies will be applied:

The following water initiatives have been proposed and their individual merits will be assessed further during future design stages:

- Water efficient fixtures / fittings will be specified. These include fittings such as taps, showerheads, toilets, zip taps, dishwashers etc certified under the WELS rating scheme.
- Rainwater Reuse Rainwater collection and reuse systems will be incorporated. Reuse options include landscape irrigation.

Mechanical Engineering Lighting Design Sustainable Design Electrical Engineering Copenhagen London Sydney Canberra Hong Kong New York

Level 8, 9 Castlereagh Street Sydney, NSW, 2000, Australia ABN 50 001 189 037 t : +61 / 2 9967 2200 e : info@steensenvarming.com

STEENSEN VARMING

6.3 Materials and Construction Waste

Selection of environmentally preferable materials is a key priority for the project, because building materials consume energy and natural resources during its manufacture and for their transportation to the construction site. Choices of materials and construction methods can significantly change the amount of energy embodied in the structure of a building.

Low-impact construction methods such as offsite prefabrication/preassembly shall be applied where applicable. Prefabricated structures built in purpose-built factories are less labour intensive, more time efficient, and produce less waste compared to traditional onsite construction methods. Raw materials and construction elements are not exposed to the elements, which ensures high quality in the final building, and the construction process is less weather dependant.

Preference will be given to materials that contain high-recycled content and/or are highly recyclable. The following water initiatives have been proposed and their individual merits will be assessed further during future design stages:

- Use sustainable timber Timber products used for concrete formwork, structure, wall linings, flooring and joinery will be sourced where possible from reused, post-consumer recycled or FSC-certified, or PEFC certified timber.
- Steel will be specified to meet specific strength grades, energy-reducing manufacturing technologies, and off-site fabrication. Steel will also be sourced with a proportion of the fabricated structural steelwork via a steel contractor accredited by the Environmental Sustainability Charter of the Australian Steel Institute.
- Recycled concrete The project aims to reduce the use of Portland cement through substitutions. Fine and coarse aggregate inputs are to be sourced from

Mechanical Engineering Lighting Design Sustainable Design Electrical Engineering Copenhagen London Sydney Canberra Hong Kong New York

Level 8, 9 Castlereagh Street Sydney, NSW, 2000, Australia ABN 50 001 189 037 t : +61 / 2 9967 2200 e : info@steensenvarming.com

STEENSEN VARMING

manufactured sand or other alternative materials, and the amount of Portland cement will be reduced within the concrete mix.

- High recycled content or recyclability Furniture items with high recycled or recyclability content to be considered.
- Site waste management plan. During the demolition and construction phase, a project-specific site waste management plan (WMP) will be developed and implemented, for recycling of demolition and construction waste.

Mechanical Engineering Lighting Design Sustainable Design Electrical Engineering Copenhagen London Sydney Canberra Hong Kong New York

Level 8, 9 Castlereagh Street Sydney, NSW, 2000, Australia ABN 50 001 189 037 t : +61 / 2 9967 2200 e : info@steensenvarming.com

STEENSEN VARMING

6.4 Healthy

The following initiatives have been proposed and their individual merits will be assessed further during future design stages:

Key strategies included:

- Regulate air, thereby having a positive health impact on people.
- Account for circadian rhythms with regards to lighting.
- Reduce harmful exposure to toxins from building materials and finishes.
- Maintain acoustic levels that reduce physical and mental stress.
- Provide dedicated rooms that maximise amenity and convenience for occupants.
- Foster connection with nature through the instillation of greenery or through nature-inspired design Building massing and space planning optimization.

Operational Activities:

- Minimise the pollutants and provide a high level of fresh air.
- Provide great artificial lighting and access to daylight.
- Carry out an acoustic comfort strategy.
- Low VOC paints and products.
- Provide good views and indoor plants.

Mechanical Engineering Lighting Design Sustainable Design Electrical Engineering Copenhagen London Sydney Canberra Hong Kong New York

Level 8, 9 Castlereagh Street Sydney, NSW, 2000, Australia ABN 50 001 189 037 t : +61 / 2 9967 2200 e : info@steensenvarming.com

STEENSEN VARMING

6.5 Resilience

The project will seek to identify and develop strategies to increase the resilience of the Campus in response to potential risks arising from climate change. The latest available global climate models show that in the coming decades,

Australia is projected to experience the following:

Summary diagram of climate projections for Australia. CSIRO and Bureau Meteorology. Source: <u>CSIRO</u>

The below climatic variables will be considered to develop a resilience strategy for the project:

- Temperature
- Precipitation
- Fire weather/Bushfires
- Drought
- Flood
- Solar Radiation
- Relative Humidity
- Evapotranspiration
- Soil Moisture
- Wind
- Sea-level rise
- Cyclones

Mechanical Engineering Lighting Design Sustainable Design Electrical Engineering Copenhagen London Sydney Canberra Hong Kong New York

Level 8, 9 Castlereagh Street Sydney, NSW, 2000, Australia ABN 50 001 189 037 t : +61 / 2 9967 2200 e : info@steensenvarming.com

STEENSEN VARMING

Considering the above, the project will analyse key risks arising from climate change projections for the parts of the project affected, as well as mitigation strategies to eliminate or reduce such risks as much as possible.

Key strategies to consider include:

- Passive Design Optimisation for buildings. (Increasing insulation R-values / Clazing ratios and performance / Shading / Air tightness / Heat recovery / etc.)
- Allow for natural ventilation and good air flow in indoor and outdoor areas to allow for some increase in temperatures during peak times while maintaining comfortable conditions.
- Increase in plant capacity in buildings to accommodate increased temperatures.
- Provision of trees and covered walkways for shading to connect outdoor spaces with buildings.
- Use of soft landscape to reduce the heat island effect and improve outdoor thermal comfort. Were possible include cool paving with high albedo surface and hardscaping and roofing materials with high Solar Reflectance Index (SRI) being mindful of glare.
- Include planting around parking and other areas adjacent to hardscaped areas to improve shading and to reduce the heat island effect.
- For landscaping, select native species with low water requirements.
- Include Water Sustainable Urban Design features such as bioswales, raingardens, permeable paving, and attenuation tanks in paving systems to contribute towards natural absorption and water detention against potential increased storm events.
- Collect and reuse rainwater from roofs to be used for irrigation and potentially other uses if possible.
- Reduce Water consumption through efficient irrigation systems and efficient water fixtures.
- Design hardscape levels to allow for passive irrigation.
- Selection of robust materials.
- Include shading around external plant areas for improved cooling performance.
- Maximise landscaping to provide passive filtration and removal of air contaminants through absorption of CO2 and release of O2.
- Include onsite energy generation where possible (On roofs and other structures such as shading).
