Executive summary

Background

The Kurnell Terminal (the Site) is located at 2 Solander Street, Kurnell within the Sutherland Shire Local Government Area (LGA), approximately 17 kilometres (km) south of Sydney's Central Business District (CBD) (as presented on **Annexure A, Figure F1a**).

In 2012, Ampol Refinery (NSW) Pty Ltd (Ampol) decided that the oil refinery and fuel terminal would be converted to a finished product terminal (the approved project), ceasing refinery operations in 2014. Currently, the operational infrastructure is primarily located in the northern part of the Site (Zones 1 and 1A). Other parts of Ampol's landholdings at Kurnell include largely vacant areas of previously developed land (Zones 2 and 3) and areas of undeveloped land containing extensive native vegetation (Zones 4 and 5).

To support the continued viable, safe, reliable, and sustainable operation of the Kurnell Terminal, Ampol intends to consolidate operational infrastructure, remove redundant assets, and undertake targeted remediation of legacy ground contamination. The location within the Site that these works would occur is referred to as the Project Area. The Site, Zones, and Project Area are presented on **Annexure A, Figure F2**.

A Modification Report was prepared to support a modification application to State Significant Development (SSD)-5544 Modification 7 (MOD-7) and was placed on public exhibition for 23 days from Thursday 10 July 2025 until Friday 1 August 2025 in accordance with the *Environmental Planning and Assessment Act 1979 (NSW)* (EP&A Act).

A Conceptual Remedial Action Plan (Conceptual RAP) for the proposed modification (prepared by AECOM) was one of a number of technical documents that formed part of the Modification Report.

This Remedial Action Plan (RAP) has been developed as an update to the Conceptual RAP to address submissions received during the exhibition of the Modification Report (MOD-7) and refinements to the proposed modification. The RAP has been prepared to support the Submissions Report.

Following review of the submissions, grading and capping activities proposed under MOD-7 have been removed from the scope of the proposed modification. Under the proposed modification works, the landform at the Site would remain the same. Grading and capping activities would instead form part of Ampol's SSD application for the Kurnell Energy and Industry Precinct (KEIP) (SSD-86799993), which focuses on preparing the land to support uses consistent with the land use zoning.

Capping had originally been proposed as part of the MOD-7 application as the primary remedial strategy to address asbestos contamination in soils by creating a physical barrier that mitigates exposure to asbestos and, where required: as a vapour barrier to prevent the migration of volatile vapours into buildings, and as a barrier to surface water infiltration to mitigate the leaching of contaminants in soil to groundwater. This remedial approach was proposed to help prepare Zones 2 and 3 for future land uses consistent with the zoning. Capping as a remedial approach is not required for the current terminal land use due to the limited occupation of Zones 2 and 3, and the ongoing management practices in place within these Ampol controlled portions of the Site, which include: Site specific controls (e.g. site personnel inductions, health and safety management controls) and routine groundwater monitoring. Therefore, the capping approach is no longer part of the proposed modification application.

Capping will, however, be included in the SSD application for the KEIP. This is because the KEIP application will subdivide the land and prepare it for future land uses consistent with the land use zoning at the Site. In addition, the KEIP would require the regrading of parts of Zones 2 and 3; from a delivery perspective, it is more efficient and requires less material handling to complete the capping and regrading at the same time.

As such, consent for capping activities will not be sought as part of the proposed modification but will be sought under the KEIP application instead. Nevertheless, in order to present a holistic and transparent remedial strategy for the Site, capping is discussed as a future remedial strategy in this RAP.

The planning and approvals process relevant to this RAP is detailed in **Section 1.3** of this report. Remedial works presented in this RAP would be supported by one or more Remedial Work Plan(s) (RWP) following further detailed investigations within the Project Area and receipt of relevant conditions of consent if the modification application is approved.

Remediation objectives

Ampol has developed the following objectives for the Project Area (presented on **Annexure A, Figure F2**):

- Remediate the soil and manage groundwater within the Project Area to address legacy ground contamination identified in specific locations across the Site, to support the ongoing viable, safe, reliable, and sustainable use of the Terminal in Zone 1.
- Remove the remaining former refinery infrastructure within the Audit Boundary (legacy oily water sewer (OWS)).
- Ensure approved remediation that is implemented adheres to applicable regulatory requirements, minimising potential environmental, human health, and operational risks.

Site audit

An independent NSW EPA Accredited Site Auditor (Mr Andre Smit) (Site Auditor) has been engaged to provide independent review of this RAP and future RWP(s) and Site Validation works within the Audit Boundary, presented on **Annexure A, Figure F3**). The Audit Boundary excludes Zone 1 areas which would continue to operate as the Kurnell Terminal and the asbestos contaminated soil (ACS) containment cell located in Zone 2.

Site understanding

A significant number of soil and groundwater investigations have been conducted on the Site since the 1990s, particularly following the decommissioning of the lubricating oils refinery in 2010, and the oil refinery in 2014. In 2019, Ampol (formerly Caltex) developed a Remedial Action Strategy (RAS) for the Site, presenting Areas of Environmental Concern (AECs), and results from environmental site assessments completed at the Site to understand data gaps within the former refinery process unit areas, pipeways, and redundant tank bunds. In 2025, AECOM was engaged by Ampol to complete a comprehensive historical data review and develop the scope for a data gap investigation (Sampling Analysis and Quality Plan [SAQP]). The data gap investigation is currently underway at the Site. The findings of the historical data review have improved the understanding of the distribution of impacts, which has facilitated the preparation of this RAP, with particular emphasis on the Site History (**Section 3.0**), and conceptual site model (CSM) (**Section 3.4.10**). Based on the Site's historical activities, the following contaminants of potential concern (COPCs) have been considered primary based on their known use or presence at the Site:

- Asbestos
- Petroleum hydrocarbons (PHC) comprising:
  - Total recoverable hydrocarbons (TRH)
  - Benzene, toluene, ethylbenzene, xylenes, and naphthalene (BTEXN)
- Polycyclic aromatic hydrocarbons (PAHs)
- per and poly-fluoroalkyl substances (PFAS).

A range of secondary COPCs (e.g. chlorinated compounds, refinery process chemicals, as defined in **Section 4.2.1**) have also been either identified onsite within discrete areas based on historic investigations, or are considered to have potential to be used historically at the Site.

Areas of known impact are discussed in **Section 3.3**, **Section 3.4**, and **Section 3.4.10** and presented on **Annexure A, Figure F4**. The primary source of asbestos is related to legacy building and plant materials (in the form of gaskets, lagging, fibre boards, among others) with secondary sources from recycled building derived fill materials, and in the case of RPIP mountain, fill materials received from other onsite areas. The PHC soil and groundwater impacts are likely associated with smaller losses to ground that occurred over the refinery's operational history, as opposed to a notable release from a single localised source. The primary source of PFAS is related to the storage and historical use of fluorinated firefighting foam at the Site.

Remediation overview

Remediation and/ or management of ground contamination would be required to address identified areas of impact within the Project Area, and where legacy refinery infrastructure is still present.

The RAS (2019) presented a remediation assessment for the identified AECs based on the CSM that indicated whether further assessment or remediation was required based on the usage of the land. Where remediation was assessed as required, a prioritisation for these remedial activities was provided.

Numerous additional investigations and remedial activities have been conducted between 2019 and 2025 at the Site, in part guided by the RAS (Ampol, 2019). These investigations have resulted in remediation within numerous areas of the Site.

The 2025 AECOM data gap investigation and SAQP also provided an updated assessment in the form of a comprehensive historical data review. The findings of the historical data review have improved the understanding of the distribution of impacts, which has facilitated the preparation of this RAP. While the available historical information has been sufficient to complete this RAP and the remedial approach and technologies remains unchanged from the Conceptual RAP, further intrusive investigations are currently being completed to refine the proposed remedial extents and estimated remediation volumes. RWPs would be informed by the conditions of consent for MOD-7 and the completion of this data gap investigation.

The proposed remedial works would predominantly address PHC and PFAS impacts (primary COPCs). Remediation of asbestos in fill soils (also a primary COPC) will predominantly be addressed through a subsequent development application, however discrete remediation of two asbestos contamination areas which represent as a source of asbestos will be addressed under MOD-7 as they present management challenges for terminal operations. Secondary COPCs are also considered as part of this RAP from a risk (and remediation/ management) perspective.

The RAP has included a remedial options assessment, which considered a wide range of treatment options. The outcome of this assessment has concluded that bioremediation of PHC (primary COPC) and chlorinated impacted soils (secondary COPCs) (via excavation and biopiling) would be most effective approach for the Site. PFAS impacted soils would be excavated, disposed of offsite and resultant excavations backfilled with suitable fill. Consideration to the onsite management of asbestos contaminated soils would be made as part of future grading and capping activities.

Offsite disposal of untreated soils to landfill would be considered when soils are not suitable for bioremediation or where onsite management is not practicable. This decision is formed based on a cost-benefit assessment of disposal versus treatment as well as consideration of risk as part of the remedial option selection.

The excavation for remedial purposes would be vertically limited by the groundwater table, generally less than 4 metres below ground level (mbgl). The excavations would generally target identified shallow impacts and would therefore be focused on horizons within 1 m of soil or light non-aqueous phase liquid (LNAPL), and likely contaminated sludges in the redundant OWS network. Temporary groundwater management (dewatering) may be required during excavation within zones of saturated soil. In areas with LNAPL impacts, the overlying saturated soils would be removed to the extent practicable to reduce the PHC concentrations. If LNAPL is visually present on the excavation pit water, it would be removed and transferred for treatment at the onsite waste water treatment plant (WWTP) or disposed offsite. Historical data forms the basis for determining the extent of soil remediation required, as discussed in **Section 6.0**.

Where required, areas of the Site that have been remediated in line with the approaches detailed in this RAP would be backfilled with appropriate material and geospatially recorded.

The groundwater conditions at the Site are expected to improve following soil / fill / LNAPL remediation in Zone 2 and Zone 3 once potential primary and secondary sources related to the former refinery operations and the associated infrastructure within the Audit Boundary have been removed. Remediation works will permanently reduce COPC mass onsite and, over time, COPC leaching and migration to groundwater. Following soil remediation, groundwater monitoring would continue to confirm that the soil remediation works were effective in mitigating future impacts to groundwater. The soil remediation process itself will significantly improve groundwater conditions over the long term, assisted by natural attenuation (this process involves allowing naturally occurring micro-organisms in the ground to biodegrade hydrocarbon contamination). Any residual groundwater impacts requiring management would be addressed as part of an Environmental Management Plan (EMP).

A separate RAP will be produced to support the subsequent SSD application for the KEIP. This RAP will detail the scope of capping works required to bring the Site to its targeted commercial / industrial endpoint.

At the completion of the remediation works proposed under MOD-7, an interim remediation report would be prepared and interim auditor advice provided by the Site Auditor. The final Validation Report for the Audit Boundary would be prepared following the completion of subsequent capping works.

Ongoing management plans would be required to support the remedial works, to help ensure that the Site continues to meet commercial / industrial end points and other regulatory requirements.

Conclusion

This RAP has been prepared to meet the relevant requirements of the NSW EPA endorsed guidelines including the NSW EPA (2020) *Contaminated Sites: Guidelines for Consultants Reporting on Contaminated Sites* and provides a framework for regulatory compliance. It also addresses submissions received during the exhibition of the Modification Report for MOD-7 by updating the Project description to remove capping from the proposed modification and including additional site contamination data that has been used to refine and confirm the CSM, and extent of remediation and management required.

1.0 Introduction

1.1 Background

The Kurnell Terminal (the Site) is located at 2 Solander Street, Kurnell within the Sutherland Shire Local Government Area (LGA), approximately 17 kilometres (km) south of Sydney's Central Business District (CBD) (as presented on **Annexure A, Figure F1a**).

In 2012, Ampol Refineries (NSW) Pty Ltd (Ampol) decided that the oil refinery and fuel terminal would be converted to a finished product terminal (the approved project). The refinery ceased operations in 2014. Development consent was received to complete the approved project under State Significant Development (SSD) application reference 5544 (SSD-5544). The objective of SSD-5544 was and remains 'to establish a viable, safe, reliable, and sustainable finished product import terminal at Kurnell.' Ampol has modified SSD-5544 six times to facilitate the conversion and demolition works.

Currently, the operational infrastructure is primarily located in the northern part of the Site (Zones 1 and 1A). Other parts of Ampol's landholdings at Kurnell include largely vacant areas of previously developed land (Zones 2 and 3) and areas of undeveloped land containing extensive native vegetation (Zones 4 and 5).

To support the continued viable, safe, reliable, and sustainable operation of the Kurnell Terminal, Ampol intends to consolidate operational infrastructure, remove redundant assets, and undertake targeted remediation of legacy ground contamination. These works would be completed under modification application (the proposed modification, MOD-7) to SSD-5544. The location within the Site where these works would occur is referred to as the Project Area. The Site, Zones, and Project Area are presented on **Annexure A, Figure F2**.

Previously, a Modification Report was prepared to support the MOD-7 application and was placed on public exhibition for 23 days from Thursday 10 July 2025 until Friday 1 August 2025 in accordance with the *Environmental Planning and Assessment Act 1979 (NSW)* (EP&A Act). A Conceptual Remedial Action Plan (Conceptual RAP) for the proposed modification (prepared by AECOM) was one of a number of technical documents that formed part of the Modification Report.

The previous modification report included activities which prepared the Site for future use, in preparation for Ampol's proposed Kurnell Energy and Industry Precinct (KEIP), including grading and capping. Following public exhibition, and the receipt of stakeholder submissions, one key change in the updated description of the proposed modification is the postponement of grading and capping activities which are being completed to facilitate future use of the Site. Grading and capping of the Site will therefore not be proposed as part of MOD-7 and will be proposed instead in the KEIP application under SSD-86799993.

This Remedial Action Plan (RAP) has been developed as an update to the Conceptual RAP to address submissions received during the exhibition of the Modification Report (MOD-7) and refinements to the proposed modification. It has been prepared to support the Submissions Report for MOD-7.

This RAP would be support by one or more remedial works plans (RWP) following further detailed investigations within the Project Area and receipt of relevant conditions of consent if the modification application (if consented). The differences between this RAP and the RWP are presented in **Section 1.5** of this report.

This RAP has been developed in general accordance with the applicable legislation, policy and guidelines, including:

- *Contaminated Land Management Act 1997 (NSW)* (CLM Act)
- *Protection of the Environment Operations Act 1997 (NSW)* (POEO Act)
- *Environmental Planning and Assessment Act 1979 (NSW)* (EP&A Act)
- State Environmental Planning Policy (Resilience and Hazards) 2021 (in force from 1 March 2022)
- National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended 2013 (NEPC 2013)

- PFAS National Environmental Management Plan 3.0 (PFAS NEMP 3.0), National Chemicals Working Group of Heads of EPAs Australia and New Zealand, 2025 (NEMP, 2025)
- Guidelines for the Assessment and Management of Groundwater (DEC, 2007)
- Guidelines for the NSW Site Auditor Scheme (3rd edition), (NSW EPA, 2017)
- Contaminated Land Guidelines, Sampling Design (NSW EPA, 2022)
- Contaminated Land Guidelines, Assessment and Management of Hazardous Ground Gases (NSW EPA, 2020a).

The structure of this RAP is in accordance with relevant sections of the Consultants reporting on contaminated land: Contaminated Land Guidelines (NSW EPA, 2020b).

1.2 Objectives

Ampol's overarching objective is to prepare the Site for the proposed KEIP development, recognising that the MOD-7 scope of works relate to the continued viable, safe, reliable, and sustainable operation of the Kurnell Terminal. In line with this Ampol has developed the following objectives for the Project Area as part of this MOD-7 RAP:

- Remediate the soil and manage groundwater within the Project Area that are relevant to the proposed modification, to address legacy ground contamination identified in specific locations across the Site, to support the ongoing viable, safe, reliable, and sustainable use of the Kurnell Terminal.
- Remove the remaining former refinery infrastructure within the Audit Boundary (legacy oily water sewer, OWS).
- Ensure approved remediation process that is implemented adheres to applicable regulatory requirements, minimising potential environmental, human health and operational risks.

1.3 Planning context

The proposed modification would involve the 'use of land,' the 'carrying out of work' and the erection and/ or demolition of a building or work. On this basis, these works would be considered 'development' under Section 1.5 of the EP&A Act. Unless excluded by an Environmental Planning Instrument (EPI), the carrying out of development typically requires development consent under Part 4 of the EP&A Act. This is the case for the proposed modification. Ampol are proposing to secure development consent for the proposed works as a modification to SSD-5544 under section 4.55(2) of the EP&A Act. This section of the EP&A Act allows for modifications to development consents that involve "other modifications" given that the type and nature of some of the potential impacts may be different to those previously assessed.

A Modification Report was prepared to support the application for the changes to SSD-5544. In line with the requirements of Section 4.55 of the EP&A Act, the Modification Report provided the information required by Section 100 of the *Environmental Planning and Assessment Regulation 2021* (EP&A Regulation). A Conceptual Remedial Action Plan (Conceptual RAP) for the proposed modification (prepared by AECOM in accordance with Ampol instructions) was one of a number of technical documents that formed part of the Modification Report.

The modification application (including the Modification Report and Conceptual RAP) was placed on public exhibition for 23 days from Thursday 10 July 2025 until Friday 1 August 2025 in accordance with the EP&A Act. Submissions were received from government organisations and the community. A Submissions Report has been prepared to respond to stakeholder submissions. This RAP is one of a number of technical documents prepared to support the Submissions Report for MOD-7.

This RAP has been signed off by Certified Environmental Practitioner Site Contamination Specialist Jonathan Ho (No. SC40062) from AECOM and has been reviewed by Registered Environmental Assessment Practitioner, William Miles (No. R80018) from AECOM.

1.4 Site audit

An independent NSW EPA Accredited Site Auditor (Mr Andre Smit) (Site Auditor) has been engaged to provide independent review of this RAP and future RWP(s) and Site Validation works within the Audit Boundary, presented on **Annexure A, Figure F2**). The Audit Boundary excludes two portions of the Project Area: Zone 1 areas which would continue to operate as the Kurnell Terminal and the asbestos contaminated soil (ACS) containment cell located in Zone 2.

1.5 RAP and Remedial Work Plan scopes

This document has been produced in accordance with relevant sections of the Consultants reporting on contaminated land: Contaminated Land Guidelines (NSW EPA, 2020b). **Table 1** below demonstrates which components have been included in this RAP and which would be included in the RWP(s). Some sections within this document have deviated from the specific structure suggested in the guidance document (and these are identified accordingly).

The principal differences between the RAP and the RWP(s) relate to the intent of the documents. The RAP sets the objective, acceptance criteria, remediation and validation approach, defining what success looks like. The RWP(s) packages the RAP into practical steps that can be followed to meet the RAP objectives, detailing how success will be achieved. The RAP will be provided to regulators, Site Auditor, and stakeholders as part of the planning approval documentation, whilst RWP(s) would be developed following development consent, to support remedial actions, for review and input from project team (including principal contractors, contractors, and sub-contractors), Site Auditor, and Ampol.

Table 1 RAP and RWP(s) scopes

Scope	RAP	RWP(s)
Set **remediation goals** that ensure the land to be remediated would be suitable for the proposed use and would pose no unacceptable risk to human health or to the environment.	✓ Refer to **Section 1.2** and **Section 7.0**	In line with RAP
Identify the necessary **approvals and licences** required by regulatory authorities.	✓ Refer to **Section 1.3**	In line with RAP
Provide information on the **nature and extent of impact** based on the available data.	✓ Refer to **Section 3.3, Section 3.4,** and **Section 3.4.10**	✓
Remediation Options Assessment: Evaluate remedial techniques and/or management measures that are required to reduce risks to acceptable levels for the proposed land use of the Project Area, protecting human health and the environment. A decision on **remediation methods** has been provided to inform the modification application.	✓ Refer to **Section 7.0** and **Section 7.3**	✓ (If required based on findings of additional investigations)
Identify remaining nature and extent of impact **data gaps**, where additional works are required (to facilitate the preparation of RWP, contractor specification, and remediation execution).	✓ Refer to **Section 6.5**	✓ If required based on findings of additional investigations)Developed with consideration to the)

Scope	RAP	RWP(s)
Undertake a **Data Gap Assessment (DGA)** to address data gaps and refine current remediation volumes and extents.	✓ based on outcomes of desktop data gap assessment discussed in **Section 3.0.** Refer to **Section 6.5** for data gaps to be investigated prior to RWP development.	✓ developed with consideration to the findings of the additional investigations
Nature and extent of impact following data gap investigation(s).	✓ Refer to **Section 6.5**	✓
Preparation of a detailed remediation design (**Remedial Design**) to inform contractor specification for the remediation. Day-to-day plans to achieve the RAP outcomes.	X	✓
Preparation of a **Human Health and Ecological Risk Assessment (HHERA)** (including the DGA data) to derive risk-based **validation criteria** for the remedial works, (if required) to ensure the remediation has been executed to the appropriate standard to mitigate future risk to human health or the environment.	X	✓ (if required)
Contingency measures should these be required to meet remediation objectives. Contingency measures are included in the RAP but would be revisited in the RWP(s) once the final design is confirmed.	✓ Refer to **Section 7.6**	✓
Establish **Management Plans** to complete the remediation in an acceptable manner including the remediation documents listed in **Section 1.6**.	Acid sulfate soils management plan (ASSMP) framework to be included in RAP at the request of NSW Department of Planning, Housing, and Infrastructure (NSW DPHI). Refer to **Section 7.5.3.3.1**.	✓

1.6 Remediation documentation

Supporting Management Plans and Work Procedures that would be prepared prior to commencement of the remediation works are detailed in **Table 2**.

Table 2 Remediation documentation

Project plans	Prepared by:	Approved by:
SSD- 5544 MOD-7 Modification Report and Submissions Report	Environmental Impact Assessment Consultant	Ampol
Project Management Plan including a Community and Stakeholder Engagement Plan (CSEP)[1], Occupational Health and Safety Plan, Quality Management Plan and Emergency Response and Contingency Plan.	Validation Consultant/ Contractor	Ampol
RWP(s) including Excavation Plans for the contractor, including a Validation Sampling and Analysis Quality Plan(s) (SAQP) and Material Tracking Plan.	Validation Consultant/ Contractor	Ampol/ Auditor
MOD-7 Construction Environmental Management Plan (CEMP) (**Section 9.0**), including but not limited to: • Soil and Water Management Plan (inclusive of ASSMP) • Erosion and Sediment Control Plan • Groundwater Management Plan (GWMP) • Air Quality Management Plan (AQMP) • Waste and Resource Management Plan (WRMP) • Noise and Vibration Management Plan (NVMP) • Construction Traffic Management Plan (CTMP) • Aboriginal Cultural Heritage Management Plan (ACHMP) • Asbestos Management Plan (AMP) • Contamination Management Plan (CMP)	Validation Consultant/ Contractor	Ampol
Waste Classification and Imported Fill assessment letters	Validation Consultant/ Contractor	Ampol/ Auditor
Environmental Management Plans (EMPs) including restrictions on land use (such as intrusive works) and a groundwater monitoring requirements (if required).	Validation Consultant/ Contractor	Ampol /Auditor

[1] Note an overarching CSEP has been prepared that sets out the approach and method(s) for engaging the community and stakeholders for certain Ampol projects at the Site . This plan would be updated to include any specific requirements for the remedial works..

Relevant conditions of consent resulting from the modification application process would be incorporated in the preparation of the above documentation.

[2] Based on aerial photo review – Nearmap May 16, 2021

2.0 Site condition and surrounding environment

2.1 Site identification

The location of the Site is shown on **Annexure A, Figure F1a**. The Project Area is shown on **Annexure A, Figure F2** and is wholly contained within the Site. The Site is located within the Sutherland Shire Council and is zoned as E5 Heavy Industrial. The Project Area comprises portions of a number of existing allotments as shown in **Table 3** and on **Annexure A, Figure F1b**.

Table 3 Allotments within the Project Area

Zone	Lots/ DP
Zone 1 (Operational fuel terminal)	**Lot 25* (DP 776328),** Lots 56*, 57*, and 62* (DP 908), Lot 1 (DP 1044690), Lots 283* and 570 (DP 752064), Lot 1 (DP 132055)
Zone 1A (Eastern Right of Way)	Lots H, J, and K (DP 362655), Lot D, F, and G (DP 361103), Lots 43-46, 77-79, 122-125 (DP 8135), Lot B (DP 338897)
Zone 2 (Former refinery process areas and scrap yard)	**Lot 25* (DP 776328),** Lots 56*, 57*, and 62* (DP 908), Lot 283* (DP 752064)
Zone 3 (Former Caltex Lubrication Oil Refinery [CLOR])	Lot 1 (DP 215819), Lots 1 and 2 (DP 126647), Lot 2 (DP 215818)

*Notes: * = partial lot / DP, contained within Zone 1 to Zone 3, **bold**=partial lot not contained within Zone 1 to Zone 3.*

2.2 Current site condition

The Site consists of a largely developed and fenced area encompassing the Kurnell Terminal and the fenced Eastern Right of Way that pass through the Kurnell Township. Ampol also owns land to the south of the Site and a part of Marton Park along the northern boundary (refer to **Annexure A, Figure F1a**). The Site is typically accessed off Solander Street which connects to Captain Cook Drive. Access is also available from Sir Joseph Banks Drive, but this access point is typically closed for security reasons unless required.

Between 1956 and 2014, the Site was used as both an oil refinery and a fuel terminal. Since refining ceased in 2014, the Site has been primarily used as a finished fuel import and storage terminal. The former refinery uses at the Site means that an ongoing program of targeted remediation activities, in line with the NSW Environment Protection Authority (EPA) approved Kurnell Remediation Action Strategy (Ampol, 2019), are being completed.

2.2.1 The Project Area

The Project Area consists of the majority of Zones 1 and 1A and with the exception of the ACS containment cell, the entirety of Zones 2 and 3. The Project Area, and key Site features have been presented as **Annexure A, Figure F2**.

Zone 1 is the main operational area of the Terminal. The Project Area portion of Zone 1 includes the northern tank farm, office buildings (including the Supply Operations Buildings (SOB), Central Operations Buildings (COB) and Terminal Operations Building (TOB) and extends along the northern boundary with Marton Park and Solander Street. The Zone 1 Project Area excludes the majority of the western and north-eastern tank farms as no modifications are proposed to these areas. Zone 1A is the Eastern Right of Way, which is used by the operational fuel terminal and connects the Kurnell Wharf to the terminal. Remediation is not required in Zone 1A and this area is not considered further in this report.

Zone 2 is where the majority of the processing units and associated buildings related to the Former Caltex Oil Refinery were located. It is defined by Pipeway A to the north, Road 3 to the east, the Pipe Track C and the edge of the vegetation in Zone 4 to the south and Road 9 to the west. This Zone currently sits largely vacant, with some remaining facilities on the northwest quadrant such as the Main Workshop, Central Control Building (CCB), Storehouse and several electrical substations. The southeast and east quadrant is characterised by substantial level changes and retaining wall structures which form terraces leading up to the remaining fuel storage tanks along the eastern side of Road 3 (the Eastern Tank Farm within Zone 1). The southeast corner of Zone 2 is characterised by the former waste treatment area, former landfarm, ACS containment cell, and former limestone pits. The southern boundary of Zone 2 also includes the former fire training area (FFTA).

Zone 3, the former Caltex Lubrication Oil Refinery (CLOR) area, is bounded by Sir Joseph Banks Drive to the west, Road Q and Pipe Track C to the north, Road 15 to the east and Road W to the south. This Zone is currently a large vacant area with access to Sir Joseph Banks Drive and with some short term leases currently operating in the northwest portion of the land. Zone 3 contains a former tank farm, land farm, and former process unit area. The southeast corner on Zone 3 is characterised by an asbestos impacted former landfill area known as Refining Process Improvement Project (RPIP) Mountain, which has through its history received soils from onsite areas. RPIP Mountain is currently an asbestos exclusion zone, where vegetation (low and regenerating conditions) has established.

The location of Project Area in the context of the Site is shown in **Annexure A, Figure F2**.

2.3 Surrounding land use

The Site is bounded by Captain Cook Drive, Solander Street, Marton Park and the community of Kurnell to the north and Sir Joseph Banks Drive and existing and former industrial activities to the west. It is bounded to the south and east by Kamay Botany Bay National Park.

Surrounding land uses are detailed in **Table 4**. Surrounding land uses are displayed on **Annexure A, Figure F1a**.

Table 4 Surrounding Land Uses

Zone	Direction from Zone	Description of Surrounding Land Use	Distance from Site
Zone 1 (Project Area)	North	Marton Park followed by the Kurnell Township (includes local shopping centre, Kurnell Public School)	Marton Park: adjacent northern Site boundary Kurnell Township: west of Marton Park and north of Captain Cook Drive, east of Marton Park, the Township extends south of Captain Cook Drive to the Site's northern boundary.
	East	Northern and Eastern Tank farm and Kamay Botany Bay National Park beyond	Immediately adjacent on eastern boundary of Zone 1
	South	Zone 2 – Existing Ampol terminal	Immediately adjacent on southern boundary of Zone 1
	West	Western Tank farm followed by Captain Cook Drive, Ausgrid South Zone Substation, and Towra Point Nature Reserve	Immediately adjacent on western boundary of Zone 1 and 70 m west (Ausgrid)
Zone 2	North	Zone 1 – Existing Ampol terminal followed by Marton Park	Immediately adjacent on northern boundary of Zone 2 and 300 m (Marton Park)
	East	Eastern Tank farm and Kamay Botany Bay National Park beyond	Immediately adjacent on eastern boundary of Zone 2

Zone	Direction from Zone	Description of Surrounding Land Use	Distance from Site
	South	Zone 3 and 4 and onsite wetland and natural retention basin	Immediately adjacent on southern boundary of Zone 2
	West	Western Tank farm followed by Captain Cook Drive and Ausgrid South Zone Substation	Immediately adjacent on western boundary of Zone 2 and 70 m west (Ausgrid)
Zone 3	North	Zone 2 and the Western Tank farm	Immediately adjacent on northern boundary of Zone 3
	East	Onsite wetland and natural retention basin followed by Kamay Botany Bay National Park	Onsite wetland and natural retention basin: Immediately adjacent on eastern boundary of Zone 3 Kamay Botany Bay National Park: 710 m
	South	Vacant Land followed by Kamay Botany Bay National Park	Vacant land: Immediately adjacent on southern boundary of Zone 3 Kamay Botany Bay National Park: 730 m
	West	Sir Joseph Banks Drive followed by Sydney Desalination Plant (SDP)	Immediately adjacent on western boundary of Zone 3 and 10 m (SDP)

2.4 Topography

The Site is situated on the Kurnell Peninsula, an elevated plateau of Hawkesbury Sandstone, approximately 18 km in length. The Kurnell landscape is described as gently undulating to rolling coastal dune-fields and relict dunes, with local relief to 15 m; slope gradients 1-10%. North-south oriented dunes with convex narrow crests, broad (1,000-2,000 m) gently inclined concave swales and isolated swamps, extensive heathland (NSW Government Environment and Heritage). Surface elevations across the Kurnell Township range from 0 meters Australia Height Datum (mAHD) within swamplands at Quibray Bay, to 55 m Australian Height Datum (AHD) within the Kamay Botany Bay National Park to the south east of the Site. Elevations within the Site range from 4 mAHD within Zone 1 and Zone 2 up to ~30 mAHD along the eastern Site boundary of Zone 1 (close to the Kamay Botany Bay National Park). Zone 3 elevations are around 10 mAHD (Spatial Services, 2016). The local topography has been presented on **Annexure A, Figure F1a**.

2.5 Geology

According to published geological information (Sydney 1:100,00 geological service sheet), the Site is underlain by Quaternary (Pleistocene) wind-blown medium to fine grained well-sorted marine quartz sand. The sandstone is described as medium to coarse-grained, composed predominantly of quartz with minor lithic fragments, feldspar, mica and clay pellets. The Site lies on the aeolian Kurnell landscape unit, composed of gently undulating to rolling coastal dune field and relict dunes (NSW Soil Conservation Service Soil Landscape Series, Wollongong – Port Hacking).

From historical investigations at the Site the bedrock surface elevation rises toward the east and south of the Site, with sandstone outcrops mapped at the northeast and southeast boundaries. Intrusive investigations have identified sandstone bedrock in Zone 3 to be generally shallower in the northern portion with depths ranging from 0.5 meters below ground level (mbgl) to 3.0 mbgl and deeper in the southern portion, generally from 5.5 mbgl to as deep as 14.0 mbgl. Depth to top of bedrock unit in Zone 2 generally ranges between 0.3 mbgl to 19 mbgl, increasing in depth towards the north-west (recorded greater than 30 mbgl at one location)(AECOM, 2025d).

2.6 Acid sulfate soils

Acid sulfate soils (ASS) are naturally occurring sediments commonly found along the NSW coast. Left undisturbed, they do not present any risk, however when ASS are exposed to air (during activities such as excavation) they react with oxygen to create sulfuric acid, which poses a wide range of environmental hazards (Water Quality Australia, 2018), including:

- Severe acidification of soil and drainage waters
- Mobilisation of metals, nutrients, and rare earth metals
- Deoxygenation of waterways and wetlands
- Production of noxious gases
- Production of greenhouse gases
- Scalding of landscapes.

Review of the NSW Acid Sulfate soil (ASS) risk mapping indicates that the Project Area across Zone 1, Zone 2 and the northern portion of Zone 3 is listed as disturbed terrain above 4 mAHD. The southern portion of Zone 3 is mapped as Low Probability above 3 m below ground surface, as shown in **Figure 1** (Acid Sulfate Soils Risk Map, NSW DCCEEW, 2024).

ASS planning maps are included in the LEP for each local council, and in information contained within the online Australian Soil Resource Information System (ASRIS) database. These maps do not provide actual occurrences of ASS at a site or the severity of the conditions. However, they do provide some indication of depth and severity of ASS. From review of LEP ASS Map, the Project Area resides within the Class 4 areas. Class 4 areas require the development of an ASSMP if they meet the following conditions: works at depths beyond 2 m below existing ground level or works by which the water table is likely to be lowered beyond 2 m below existing ground level. Based on the proposed modification works, this requires the development of an ASS management plan (ASSMP, Included as Appendix E2 of the Submissions Report).

A recent investigation within Zone 1 related to an upgrade of surface water infrastructure included an ASS assessment to support excavation and trenching works. Soil testing for ASS found no indicators of actual ASS, though potential ASS (PASS) materials, presenting grey staining and sulphurous odours were encountered within areas mapped as L2 low probability areas on the western boundary of the Site, (AECOM, 2024a). It is therefore considered possible that ASS/PASS may be encountered during intrusive works. The appropriate management of ASS is discussed further in **Section 7.5.3.3.1**.

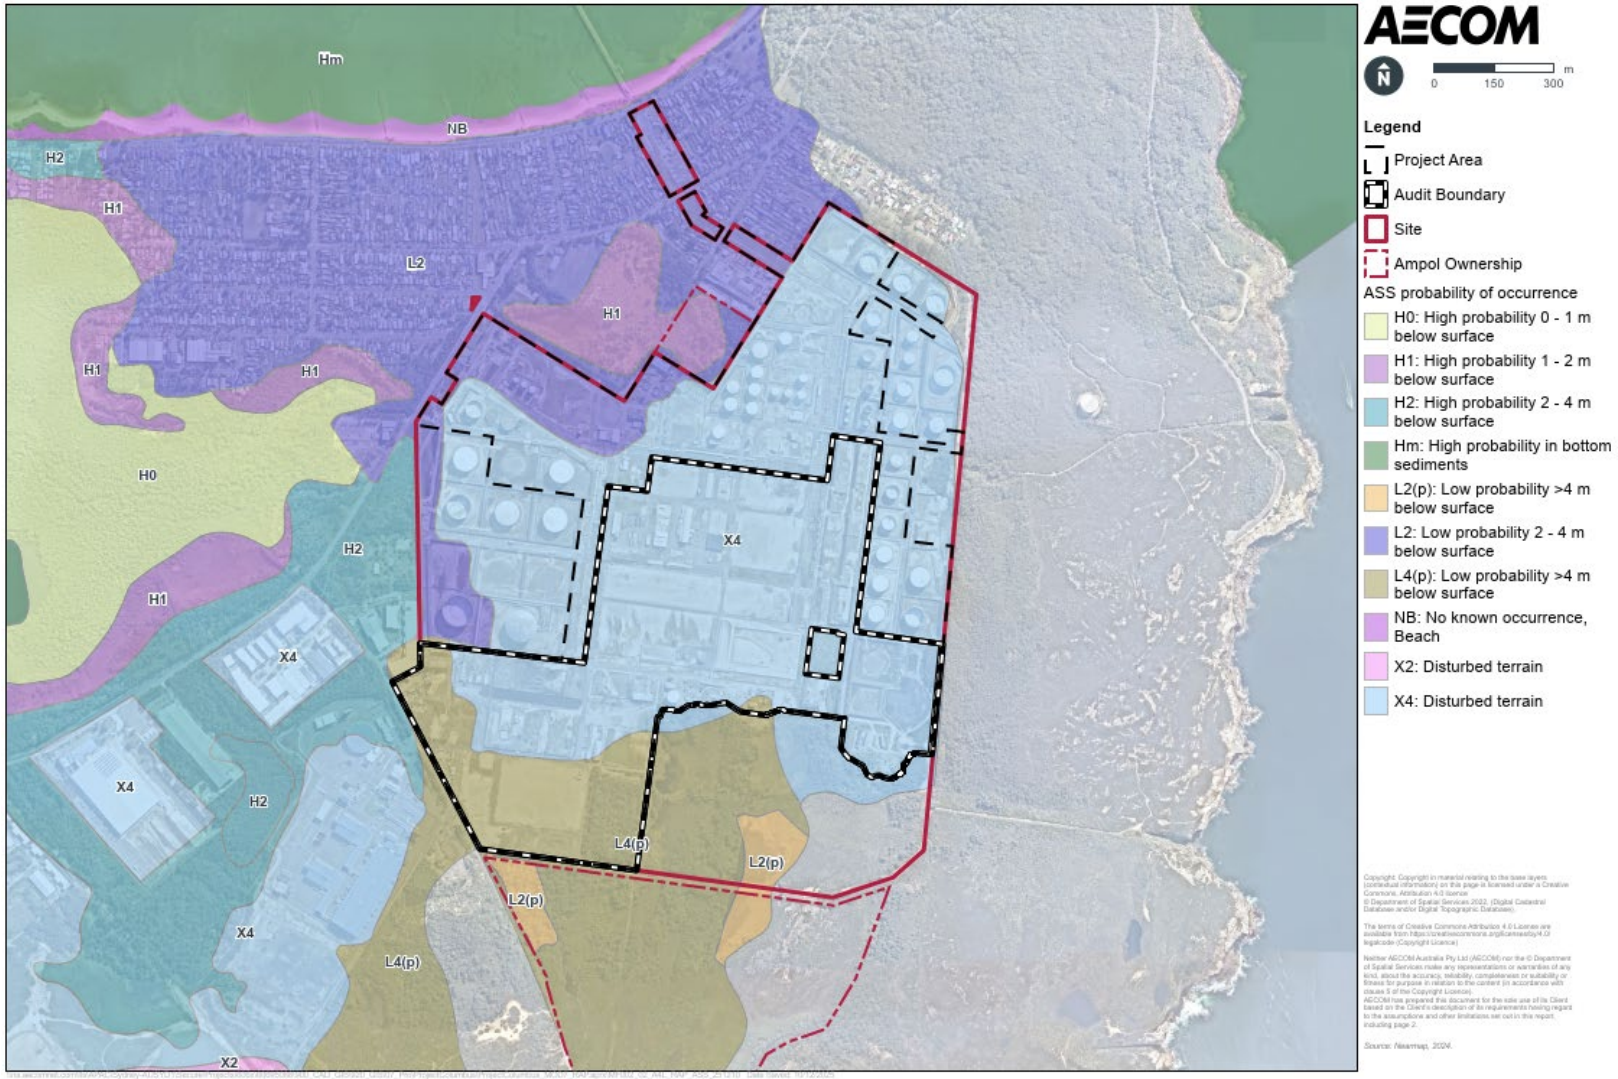

Figure 1 Acid Sulfate Soils Risk Map, NSW DCCEEW, 2024

2.7 Hydrology

The Site is located on the Kurnell Peninsula. The land area of this peninsula, as well as the surrounding marine and estuarine waters, constitute the receiving environment for surface water discharges from the Site. The Kurnell Township's low lying topography and localised depressions can make it vulnerable to flooding dominated by runoff from rainfall. The flooding is characterised by slow moving floodwaters, which can be slow to recede (WMA Water, 2017).

Stormwater generated onsite is collected in the Site's stormwater system (SWS) and discharged to the following receiving environments:

- Quibray Bay
- Botany Bay
- Marton Park Wetland.

The Site is located within the Botany Bay catchment, which extends across a land area of 1,165 km^2. The catchment is part of the Greater Sydney Local Land Services region. The Botany Bay Catchment has four main sub-catchments, based on the major rivers which drain to it. These are the:

- Georges River catchment
- Cooks River catchment
- Woronora catchment
- Botany Bay catchment.

A substantial part of the receiving catchment is highly developed, with almost 40% of its area being used for urban industrial, or commercial purposes (AECOM, 2023f).

The Site has a Waste Water Treatment Plant, to address water that is or may be impacted by petroleum products. Treated water effluent from the Site is discharged via outfall to the Tasman Sea at Yena Gap under the Environment Protection Licence 837.

2.8 Hydrogeology

During recent intrusive works (WSP, 2023d), groundwater levels were observed to vary between 0.7 mbgl and 2.65 mbgl across the areas of investigation in Zone 2 and Zone 3. Groundwater was found to be shallower within Zone 3 and the northern half of Zone 2, and deeper in the southern half of Zone 2. No perched groundwater was identified within Zone 2 and Zone 3, though temporary perched conditions could occur above relatively impermeable horizons following rainfall events, until the water has infiltrated into the underlying units.

During groundwater gauging (WSP 2024f, 2025d, 2025i), shallow groundwater at the Site has a gauged median depth of 2.4 mbgl and ranges between surface and 9.67 m bgl and ranges between 0.44 mAHD and 16.46 mAHD, within an unconfined aquifer in Quaternary sands (the Botany Sands Aquifer). Groundwater flow direction at the Site is influenced by an east-west groundwater divide that runs through the northern portion of Zone 3. To the north of the divide, groundwater flow direction is generally to the northwest. To the south of the divide, groundwater flow direction is generally to the southwest.

The Quaternary aquifer properties (mainly literature values) had been reported by Coffey historically (1996), though an updated assessment was completed by AECOM in 2024 (AECOM, 2024e), this listed aquifer permeability between ~15 to 45 m/d.

The thickness of the Quaternary aquifer is controlled by the underlying Hawksbury sandstone profile, which predominantly acts as imperial flow boundary (aquitard) at the base of the Quaternary sands (Ampol, 2019).

Surface water infiltration is the predominate source of groundwater recharge. As such, the majority of recharge within the Quaternary sands results from infiltration of direct rainfall, as well as increased runoff from areas where the less permeable Hawksbury sandstone outcrops. Groundwater discharge is understood to occur as a combination of:

- Surface water groundwater interaction
- Discharge to the Botany Bay (including Quibray Bay passing beneath Kurnell Village and the Towra Point Nature Reserve), the Marton Park Wetland area and the onsite wetland and natural retention basin south of the FFTA.

2.9 Meteorology

Kurnell, located in southern Sydney, experiences a temperate climate characterised by mild, dry winters and warm, wet summers. This coastal suburb benefits from its proximity to the ocean, which moderates its temperatures throughout the year. The prevailing southeast winds influence the local climate significantly, bringing maritime air masses that contribute to the area's humidity and precipitation levels. Given its geographic position on the Botany Bay headland, Kurnell is exposed to both land and sea breezes which can vary the local weather conditions daily. From climate statistics taken from the nearest weather station (The Bureau of Meteorology [BOM], Sydney Airport AMO, weather station: 066037, 8.5 km north of the Site, data accessed May 2024) rainfall is highest between January and June (average 110.6 mm per month) before drying up from July through to December (average 71.9 mm per month). Average maximum temperatures are highest in January (26.7°C) and lowest in July (17.2°C).

3.0 Site history and previous investigations

3.1 Site history

Prior to the construction of the 'Australian Oil Refinery' between 1953 and 1956, the Kurnell peninsula was used for farming and timber in the 1800s, and for sand extraction in the early 1900s.

The Project Area has been subject to significant historical disturbances including construction of the Australian Oil Refinery in the 1950s, as well as its ongoing use over the past seven decades. These include:

- Construction of several vehicle tracks across the peninsula prior to 1943
- Near complete clearance of native vegetation within the Project Area prior to 1956, including clearing scrub and draining and filling swamps
- Bulk earthworks to excavate and shape the Site to install various refinery infrastructure in late 1950s
- Commencement of the Australian Oil Refinery (the Kurnell Refinery) operations in 1956
- Establishment of large bunds to separate the refinery from the surrounding landscape
- Expanded over the following decades to include the CLOR (then the Australian Lubricating Oils Refinery) in 1961
- Further vegetation clearance and installation of refinery infrastructure around 1970 resulting in the complete removal of existing vegetation across the Project Area
- Ongoing development of the Site, including construction of new and removal of refinery infrastructure from the 1970s to present.
- Construction of FTA around 1998, south of the fuel refinery.

Australian Oil Refinery (the Kurnell Refinery) was the largest oil refinery in NSW and the second largest of the seven oil refineries in Australia up to the 2000s, based on crude oil processing capacity. The Kurnell Refinery received and stored refined products and crude oil for refining into other petroleum products. The Site boundary includes the former operational areas of the Australian Oil Refinery and the CLOR.

The CLOR was in operation through to 2010, whilst the Kurnell Refinery was in operation from 1956 to 2014. Ampol received development consent for the Kurnell Refinery Conversion Project in January 2014 (SSD-5544). Cessation of refining operations occurred in Q4 of 2014.

The Kurnell Terminal now has development consent to manage the following products:

- Gasoline – Unleaded Petrol (ULP), Premium Unleaded Petrol (PULP) and Super Premium Unleaded Petrol (SPULP)
- Diesel
- Jet Fuel.

For further information on the history of the Site, refer to the Updated Heritage Impact Assessment (Appendix K of the Submissions Report), or the Heritage Management Strategy (Australian Museum Consulting, 2014) or Appendix H of the EIS for the Kurnell Refinery Conversion Project (SSD 5544) (URS, 2013).

The current operations at the terminal are managed under the Operational Environmental Management Plan (OEMP) Kurnell Terminal, Final Stage 2 (Ampol, 2021). This OEMP helps Ampol comply with its requirements under the development consent for the Kurnell Terminal (SSD 5544), Environment Protection Licence No. 837 (EPL 837) and the Major Hazard Facility licence for the terminal.

3.2 Historical aerial photo review

Historical aerial photographs of the Site from 1947 to 2024 were reviewed using the NSW Government's Historical imagery viewer database and Nearmap Ltd. A summary of the review is provided in **Table 5** below, with detailed review by individual decision units (DU) (as described in **Table 8**, **Section 4.1**) and copies of the aerial photos included as **Annexure B**.

Table 5 Historical Aerial Photograph Review

Photograph Year	Description
1947	The Site is undeveloped and comprises scrubby vegetation. The surrounding area is similar, however to the west the suburb of Kurnell is visible.
1956	The Kurnell Refinery has commenced development and operation, tank farms are visible to the east and north within the Site, and building structures are present within the central portion of the Site, i.e. within Zone 2. The eastern tank farm has tanks present. To the west, the Site appears to still be in development, cleared land is present, however no structures appear to be present in Zone 3. In the surrounding area the township of Kurnell has further developed, with more pronounced roads and residential structures present.
1961	Further development of the Site is evident with a tank farm present to the west of the Site north of the CLOR area (Zone 3). Zone 3 appears to be undeveloped at this point in time, comprising cleared land and evidence of vegetation. The Eastern Tank farm on the boundary of Zone 2 shows more tanks present. The surrounding area in all directions except west remains undeveloped, the township of Kurnell is present to the north.
1979	Zone 2 appears largely the same as the previous decade. Zone 3 has now been developed with numerous tanks and structures present in this area. The CLOR tank farm is now evident. The area known as RPIP Mountain is evident, appears to be vegetated to the north and south, and cleared within the central portions. The surrounding area appears to be similar to last photo, although commercial developments are present to the south west.
1990	The Site appears similar to previous photo with the layout of tanks and structures roughly similar. The CLOR Process Unit Area is more evident, as this is the first colour photo so structures in this area are now discernible. The surrounding area shows further development with the area currently occupied by the Sydney Desalination Plant (SDP) appearing to have a development in place.
1998	No major changes are noted onsite with exception of the south east corner where it is apparent that storage in the landfarm area is occurring. The Former Fire Training Area now has structures on it, a large tank and shed are visible. The surrounding area also appears similar, with no major changes.
2002	No major changes are noted onsite, the structures appear the same as previous decade. The surrounding area also appears similar, however further developments are noted to the west of the Site.
2010	The Site appears similar to previous decade. The surrounding area shows the development of the current Sydney Desalination Plant (SDP) adjacent to the Site to the south west. Further commercial development is apparent to the west of the site.
2015	The Site appears to be undergoing change as some of the tanks are noted to be open, i.e. the tops have been removed. This is likely associated with the conversion works at the site. Major changes in Zone 3 (the CLOR area) are noticeable, all the infrastructure from the previous photo has been removed and the area looks to be cleared. Zone 2 appears similar to previous photo. The surrounding area appears similar to the previous decade.

Photograph Year	Description
2020	Significant changes to the Site are apparent, major fuel infrastructure and support buildings have been removed, particularly in the centre of the Site (Zone 2). Large, cleared areas are observed in Zone 2, adjacent to the eastern tank farm and south of the bunker building. Large tanks have also been removed in the eastern, northern and western tank farms. RPIP mountain looks to be fully vegetated. The surrounding area appears similar to the previous decade.
2024	Minor changes to the Site, as some areas look to be cleared such as the flare geobag area located west of the asbestos cell. In Zone 3 north of RPIP Mountain the CLOR landfarm area appears to be cleared which is evidence of remediation having occurred in this area. The surrounding area appears similar to the previous decade, however more development is apparent to the south west of the Site where Dicker Data is currently situated.

3.3 Historical sources of contamination

From review of the historical uses of Zone 2 and Zone 3 within the Audit Boundary, historical contamination source types have been identified and defined in **Table 6** below.

Table 6 Zone 2 and 3 sources of contamination

Source type	Description
Lubricating oils operations	Crude oil refining and hydrocarbon processing, involving distillation, and other thermal/chemical treatment units (e.g. hydrotreating, solvent extraction, and solvent dewaxing). Handling, blending, packaging, and storage of feedstock and refined products. Includes product transfer through pipework, tanks, and pumps, with potential for historical leaks and spills.
Lubricating oils storage	Handling, storage, or transfer of lubricating oil products or feedstocks. Potential for historical leaks and spills.
Refinery operations	Crude oil refining and hydrocarbon processing, involving distillation, cracking, catalytic reforming, and other thermal/chemical treatment units. Handling, blending, packaging, and storage of feedstock and refined products. Includes product transfer through pipework, tanks, and pumps, with potential for historical leaks and spills.
Equipment operations	Use of mobile or fixed equipment such as pumps, excavators, forklifts, and maintenance gear. Includes fuel handling and lubricant use.
Workshops	Maintenance workshops (mechanical and electrical) and their associated activities, including parts degreasing, metalwork, lubrication, small-scale solvent use, and battery storage.
Road	Construction and demolition of roads onsite may present or release COPCs within and under the footprint.
Power supply	Substations, transformers, switchgear, and other electrical infrastructure.
Waste water treatment / OWS service	Onsite effluent or oily water treatment facilities (e.g. interceptors, separators, clarifiers, biotreatment systems) receiving process wastewaters and contaminated surface waters. Includes OWS services which transfer effluent across the Site to the treatment facilities.
Stormwater system	Stormwater systems may have been constructed out of asbestos containing materials historically. Stormwater services also contain stormwater which could contain COPC and may release, either through leaks, or during demolition.

Source type	Description
Oil supply	Where oil supply pipelines are present outside of a lubricating oils operations or storage area, the oil supply source type has been defined. Oil supply piping may have had a metals and asbestos associated with its construction, which might be released to surface during maintenance or demolition. The piping also transported oil and fuel refinery products which had the potential to release to ground in the event of a leak or releases (none recorded).
Steam supply	Service steam systems require insulation which may have contained asbestos through the Terminal's history. Metals associated with paint coatings are also a possible surface soil contaminant.
Water supply	Water supply piping may have had heavy metal based paints / coatings that could transfer to underlying surface soils.
Hydroblast / washdown bay	Designated areas for washing vehicles, machinery, or parts, often with sumps and discharge into wastewater treatment systems.
Stockpiling	Temporary or historical storage of fill, product residue, or construction materials as aboveground stockpiles.
Landfilling	Temporary or historical burial of fill, product residue, or construction materials.
Landfarming	Bioremediation of hydrocarbon-impacted soils through aeration and treatment in dedicated areas.
Landscaped areas	Grassed or planted areas, often near office or open space zones. May receive runoff from adjacent hardstand or be affected by past pesticide/herbicide use.
Civil / construction works / demolition	Removal or decommissioning of buildings, tanks, and infrastructure. May involve excavation, concrete breaking, or hazardous material removal.
Fire training grounds	Designated Site areas historically used for emergency response training, involving controlled hydrocarbon fires and application of fire-fighting foams. Activities likely included repeated burning of mock-up vessels or tanks. Training historically may have included aqueous film forming foam (AFFF) applications, though later AFFF was not used in training exercises at the Terminal.
AFFF storage	Designated areas for the storage of AFFF
Limestone pit remediation area	Historical trenches used for the disposal of spent phosphoric acid (SPA) catalyst waste. Waste was chemically neutralised with limestone before emplacement. This activity generated a legacy waste of partially stabilised phosphate-rich material. This led to a legacy phosphate in the surrounding area, which was treated through stabilisation, encapsulation, and phytoremediation to treat the phosphate plume in groundwater.
Bund walls	Bund walls (particularly for bunds from the initial refinery construction) may contain undocumented fill with little to no information about their origins and potential COPCs. From various investigations these generally contain sand, which was likely site derived or locally sourced during initial construction. This can be considered as uncontrolled fill which requires characterisation.
Office buildings	Administrative or operations buildings with low-risk activities but may involve legacy materials.

3.4 Previous investigations

The following subsections provide details on scopes of work historically undertaken at the Site. They are generally presented based on the type of activity completed (e.g. desktop review, groundwater assessments, soil vapour assessments), or the target source area (e.g. former process unit). Within each subsection, works completed have been presented chronologically where possible.

3.4.1 DGA for Sampling, Quality and Analysis Plans (AECOM, 2025e)

To support the development of this RAP and subsequent RWP(s), AECOM was engaged by Ampol to complete a DGA SAQP (AECOM, 2025e), which included the completion of a historical investigation review and assessment of relevant data for the purposes of data gap identification. To support this process, Zones 2 and 3 were subdivided into 16 decision units (DUs) that reflected past and present site activities and physical characteristics, enabling more accurate assessment of source types and associated COPC. An additional decision unit (DU17) was established to evaluate groundwater and soil vapour conditions across the audit boundary. The decision units for the Site are presented spatially on **Annexure A Figure F3**.

Data relevance was assessed based on representativeness and appropriateness in the context of the current Site setting. AECOM completed a review of available historical environmental investigation reports for the Project Area. A total of 71 reports and associated datasets were reviewed and relevant data has been carried forward for interpretation within the DGA SAQP and used to inform this RAP. The reviewed reports have supported the development of the objectives of this RAP (**Section 1.2**) and the remedial options assessment (**Section 7.0**).

The DGA SAQPs produced were reviewed by the Site Auditor and have been used by Ampol to commission further investigation into identified data gaps.

The following investigations (**Section 3.4.2** to **Section 3.4.9**) are considered pertinent to the Site's contamination history and remedial works.

3.4.2 Quarterly Groundwater Monitoring reports – Q1 Q2 and Q4 2023 (WSP, 2023a) (WSP, 2023c) (WSP, 2024b), Q1, Q2, Q3, and Q4 2024 (WSP, 2025d) (WSP, 2024f) (WSP, 2024c) (WSP, 2025i)

The quarterly groundwater monitoring reports detailed groundwater conditions across the Site and have been used to inform the groundwater status in the areas pertinent to the Project Area. PFAS monitoring data collected during this mobilisation is reported under a different program (see **Section 3.4.4**). The report compared results against relevant investigation levels and also monitoring triggers which comprised the following: Tier 1 exceedance, Non-Aqueous Phase Liquid (NAPL) or NAPL indicator concentration recorded, NAPL thickness or contaminant concentration >10x since last Groundwater Monitoring Event (GME), Mann-Kendall analysis indicating an increasing trend, monitoring locations found to be damaged or lost, and change in land use that may change the risk profile.

The information from the latest monitoring report (Q4 2024) indicated that wells located in Zones 1, 2 and 3 show the following results:

- Northern tank farm (within Project Area but outside Audit Boundary) – PHC and metals, LNAPL (and LNAPL indicator concentrations) present within areas of the former tank farms. Concentrations in groundwater at boundary wells were below adopted criteria along the northern and western boundaries.
- North Western tank farm (within Project Area but outside Audit Boundary) – LNAPL and TRH concentrations are present within areas of the former tank farm.. The report noted the pattern of metals in groundwater appears to be unrelated to site activities.
- Eastern Tank farm (within Project Area but outside Audit Boundary) – wells have remained within historical ranges with a number of wells (including the newly installed PU94-PU98) having NAPL or concentrations that indicate NAPL.
- Former CLOR – Tier 1 exceedance for heavy metals, marginally above the screening criteria, and generally within historical concentration ranges. No clear association between the spatial distribution of heavy metals in this monitoring zone and former or current site activities.

- Former fuels refinery – NAPL or NAPL indicator concentrations were present in the central part of this area.
- RPIP Mountain – One monitoring well was assessed at this point in time (PMW64) and no triggers were noted.

3.4.3 CLOR Landfarm (WSP, 2021c, WSP, 2025g [interim])

The CLOR landfarm was remediated via excavation between September 2021 and June 2022. Characterisation works were completed prior to excavation to define the nature and extent of contamination present within the former landfarm. Remediation involved the excavation and offsite disposal of 30,720 t of soils. Validation sampling was completed following excavation and prior to backfill with VENM. The interim validation report concluded that the remediation was successful in removing hydrocarbon and asbestos impacted materials from the area. At the time of drafting this RAP, re-establishment of ground cover in this area is still in progress. .

3.4.4 Soil, groundwater and soil vapour investigation, Former Southern Process Unit and Old Garage Areas (WSP, 2025f)

The purpose of the investigation was to update the assessment on nature and extent of contamination, and refine the CSM of the former Southern Process Unit (SPU) and Old Garage areas of the former Refinery within Zone 2. A scope for a detailed site investigation was undertaken inclusive of soil, soil vapour, and groundwater. Groundwater assessments found no LNAPL, including no exceedances solubility limits. Concentrations of chlorinated hydrocarbons (CHC) were identified in groundwater. Some soil samples recorded PHC exceedances of relevant HSL D commercial / industrial (vapour intrusion) and management limit criteria. No concentrations of CHC were recorded above commercial / industrial criteria in soil. In soil vapour, exceedances of PHC (14) and CHC (six) were present for relevant commercial / industrial criteria. For PHCs these were all in the vicinity of the former SPU. CHC exceedances were present in four locations; adjacent the former hydroblast wash-bay, adjacent the main workshop in the old garage area, in addition to within two PHC exceedance areas in the former SPU.

3.4.5 Soil Vapour Monitoring Program – November 2023 (WSP, 2024a), May 2024 (WSP, 2024e), November 2024 (WSP, 2025e)

The soil vapour monitoring reports detailed soil vapour conditions across the Site and have been used to update the potential for vapour intrusion risk due to soil vapour concentrations in the areas pertinent to the Project Area. The locations relevant to the proposed modification indicated potential soil vapour intrusion risks in vicinity of SV05. SV05 is located within the central area of Zone 2 in the former storage and process areas. The report concluded for this location that as it was in outside open areas the vapour risk level was considered acceptable.

Location SV04 on the south boundary of Zone 1 and north boundary of Zone 2 had concentrations of benzene and TRH F1 exceeding HSL criteria for commercial land use in the November 2023 round and historically. Two additional wells SV203 and SV204 were installed in March 2022 to delineate the impact at SV04 and based on the 2023 soil vapour monitoring, concentrations have been below criteria indicating the area of higher soil vapour around SV04 may be limited in extent.

3.4.6 Asbestos in Soil Investigation – RPIP Mountain Area (AECOM, 2023d) and Soil contamination assessment (AECOM, 2025c)

AECOM completed an asbestos in soil investigation at the RPIP area which included an ecological inspection, establishment of approved access paths through the area and completion of soil sampling though test pitting to provide an in-situ waste classification of soils in the area. The findings indicated that the extent of asbestos contamination within the area was more widespread than suggested by historical sampling.

AECOM followed up these investigations with supplementary soil sampling during geotechnical investigations within RPIP Mountain area. These works focused on assessment of Site COPC at depths up to the water table. During these works, field indicators of ASS were identified at three locations at depths between 2.5 and 3.5 mbgl (depth to water at ~3.0mbgl) within materials logged as natural sands. Subsequent laboratory analysis confirmed these areas as ASS.

3.4.7 Fire Training Area Concrete Slab Assessment Report (Enviropacific, 2022), Historical Investigations Summary – Former Fire Training Area (WSP, 2025c)

The Enviropacific report documented the findings from an assessment of a concrete slab in the fire training area for PFAS. The results of the assessment indicated PFAS was below General Solid Waste (GSW) thresholds in the concrete slab and could be disposed as GSW (with respect to PFAS).

The WSP report summarised the results of five investigations completed at the former fire training area and surrounds between 2016 and 2024. The investigations included soil, sediment, groundwater and surface water results. The investigation found soil results below relevant human health criteria. Groundwater results found PFAS levels above ecological criteria, and recreational criteria at some locations. The report presented an updated exposure assessment in its conclusions and noted possible source pathway receptor (SPR) linkages for human health receptors interacting with groundwater and surface water. Possible SPR linkages for adjoining ecological receptors were also noted as exceedances of ecological indirect exposure criteria were recorded at 10 soil locations.

3.4.8 Ampol Kurnell Terminal PFAS SAQP 2022-2023 Investigation: Summary Report (WSP, 2024db), CLOR South PFAS Soils investigation (WSP, 2024h)

The PFAS Sampling Analysis and Quality Plan (SAQP) summary report's overall objective was to assess the degree and extent of PFAS contamination in surface and groundwater at and in the vicinity of the Site based on results from sampling completed in 2022 and 2023. Ongoing PFAS monitoring and management works are being completed in accordance with the Site's EPL. The SAQP reported on concentrations of PFAS across the site, and provided an update to the PFAS CSM, updated the status of identified data gaps in the PFAS CSM, and made the following conclusions about PFAS understanding:

- PFAS in groundwater and surface water was stable or decreasing
- Remediation being undertaken for PFAS in surface water was under review, with improvement to the system planned
- Data gaps identified in the 2022 PFAS SAQP had been addressed.

Investigations of soils within the Audit Boundary were completed in the CLOR South area in May 2024, targeting areas of elevated PFAS concentrations in groundwater. These works did not detect concentrations of PFAS within soils above the standard laboratory limit of reporting at a total of 79 primary samples collected between surface and 2.0 mbgl (vertical extent of investigation)..

3.4.9 BESS Kurnell Terminal – Geotechnical Interpretative Report (WSP, 2023j)

This report comprised a desktop review of the Site, and site assessment of the Zone 2 and Zone 3 areas, to provide geotechnical advice relevant to design and construction of a proposed BESS and its auxiliary structures. The report provided discussion on the variable stratigraphy underlying the Site, the high groundwater table observed, the extensive and variable nature of fill soils within the Project Area, and the compressible / settlement prone nature of the loose sands at the Site.

3.4.10 Terminal Scrap Yard Environmental Site Assessments (WSP, 2021f, WSP, 2023d and 2023g) and RAP (WSP, 2023h)

Investigations between 2021 and 2023 were conducted at the scrapyard to develop a CSM for the area and understand the risks (if any) to human and environmental receptors. The ESAs concluded that there are localised impacts of PHC, PFAS, and metals in soils, and asbestos is also present within fill materials.

A subsequent RAP was developed setting out proposed activities to reduce the potential impact of these localised impacts on the surrounding environment. The RAP proposed the installation of capping to reduce the potential for impacts in soil to leach into local groundwater.

3.4.11 Remediation Validation Report – CLOR AREA (WSP, 2021h), Soil Vapour Investigation at the former CLOR area (WSP, 2023f)

The validation report detailed the remediation undertaken within the footprint of the former CLOR process unit to address petroleum hydrocarbon (PHC) contamination. The works comprised excavation and offsite disposal of PHC impacted soils, the removal of LNAPL from the excavation, followed by backfilling, and follow-up monitoring. The excavation area[2] is in the south west portion of the former CLOR process unit (DU03), and spanned ~1,480 m^2 . The soil vapour investigation in Zone 3 has been used to refine the assumptions regarding the potential vapour intrusion risk, and includes areas which were remediated. The results showed current vapour data indicating acceptably low risk for slab-on-grade Industrial land use.

3.4.12 Eastern Tank Farm - DSI (WSP, 2020c), recovery of wells and groundwater assessment (WSP, 2022b), groundwater assessment and bi-annual report (WSP, 2023b and 2023e)

Investigations in 2022 focused on the recovery of existing groundwater monitoring features present in the Zone 2 eastern tank farm dating back to remedial and monitoring works in the 1990s. “W” series wells were successfully recovered, and their construction conditions recorded.

Subsequent investigations were conducted to characterise the groundwater and LNAPL present within the area, aimed at confirming the source of groundwater contamination and source of LNAPL, to inform management and remediation strategies. Works included groundwater monitoring and LNAPL sampling for fingerprinting, as well as soil sampling to depths of 6.0 mbgl. LNAPL was present at two of 35 monitoring wells at thicknesses of 0.195 m and 0.576 m. The LNAPL present was likely 30 to 50 years old. The work identified potential interaction between groundwater and the local OWS, which was investigated and discounted as a source in the subsequent investigation. Soil sampling for depth profiling confirmed that PHC contamination was predominantly in deep samples within or directly above the groundwater level. Methyl tert-butyl ether (MTBE) was detected in two of 36 groundwater samples.

An additional round of groundwater monitoring completed in March 2023 investigated natural attenuation processes in groundwater within the eastern tank farm. These works indicated that the natural degradation process currently resides within the anaerobic range, with iron and sulfate reduction indicators observed, whilst oxygen and nitrate had been consumed.

3.4.13 Supplementary Asbestos in Soil Assessment – CLOR Pipeway Area (AECOM, 2023c)

AECOM completed an asbestos in soil investigation within the CLOR pipeway area which included completion of soil sampling through test pitting to provide an in-situ waste classification of soils in the area. The findings indicated that asbestos contamination was present to a depth of 0.4 mbgl (extent of investigation) within the investigation area.

3.4.14 Remediation Action Strategy Report (Ampol, 2019) and Update reports, November 2021 (Ampol, 2021b), 2022 (Ampol, 2022), and 2023 (Ampol, 2023)

The initial RAS report outlined the strategy for management and / or remediation of contamination identified at the Kurnell Terminal with the exception of per and poly-fluoroalkyl substances (PFAS) (discussed in **Section 3.4.4**) and was endorsed by the NSW EPA. The management and / or remediation strategies presented in the RAS are based on the current land use as a Terminal. The RAS broke up the Site into a number of areas of environmental concern (AECs) based on specific Site uses and contaminants encountered. Several of these AECs are located in the Project Area within Zone 1, Zone 2 and Zone 3. Where these historic AEC’s are within the Audit Boundary, they have been incorporated into the Decisions Units (defined in **Section 3.4.1**) and the corresponding DU reference has been included in **Table 7** below, noting the DU boundaries do not necessarily align with AECs from the RAS 2019. An overview of AECs relevant to this RAP are presented in Table 7 below and are presented spatially on **Annexure A, Figure F2**.

[2] Based on aerial photo review – Nearmap May 16, 2021

Following the completion of the RAS, annual update reports were produced, which provided updates on the progress of remedial actions being taken under the Site's RAS.

Table 7 Areas of Environmental Concern

Zone	DU Ref.	AEC Details
Zone 1 and Zone 2	**DU16**	Eastern Tank Farm The eastern tank farm is located in the eastern portion of Zones 1 and 2. The area includes both active and former aboveground storage tanks (AST). There is LNAPL present within this AEC which is the result of a historic spill of product within the tank farm in the early 1990s. The LNAPL plume was remediated through hydraulic removal, however residual LNAPL is still present within the area (WSP, 2018). Based on the age and lack of primary source for the LNAPL, the contamination is not expanding (Ampol, 2019). The eastern portion of this AEC is not within the Audit Boundary, however it is located hydraulically up-gradient of Zone 2 and has the potential to impact within the Audit Boundary.
Zone 1	**NA**	Jet Fuel Remediation Area The Jet Fuel Remediation Area is located within Zone 1, east of the Terminal Operations Building (TOB) within the Contractors Carpark area. There is ongoing groundwater remediation being undertaken at this AEC (Ampol, 2019). Boundary monitoring (PMW22, PMW45) shows primary contaminants in groundwater are limited to the source area (WSP, 2024c). This AEC is within the Project Area but not within the Audit Boundary.
Zone 1	**NA**	North Western Tank Farm The north western tank farm (and the adjacent Tank 124 area to the north) is located in the north of Zone 1. The north western tank farm contains a series of active ASTs, whilst the Tank 124 area is the footprint of now decommissioned cooling water storage tanks and hydrocarbon storage tanks (WSP, 2018). Quarterly groundwater monitoring within this area has identified contamination consistent with the historic fuel storage activities, however concentration trends are stable and there are no exceedances of relevant screening criteria at boundary wells for PHCs (WSP, 2024c). This AEC is within the Project Area but not within the Audit Boundary.
Zone 1	**NA**	Northern Tank Farm The northern tank farm is in the northern most corner of the Site within Zone 1. The area contains residual LNAPL and dissolved phase hydrocarbon contamination. There is a bioventing remediation system installed down hydraulic gradient of the northern tank farm, to treat groundwater. The groundwater contamination within the AEC is subject to ongoing management. This AEC is within the Project Area but not within the Audit Boundary.
Zone 1	**NA**	Former LPG Area The Former LPG Area is located on the north western portion of the Site immediately west of the main entrance, within Zone 1. The Former LPG Area previously contained the LPG loading area, LPG storage, and a weighbridge, which were all removed during the terminal conversion. There is currently one active aboveground storage tank (AST) containing petroleum product within this AEC. Whilst there are no PHC impacts of concern within this area (WSP, 2018), investigations into the presence of asbestos have identified impacts within surface soils which require management or remediation (AECOM, 2023e). This AEC is within the Project Area but not within the Audit Boundary.

Zone	DU Ref.	AEC Details
Zone 2	**DU14**	FFTA The FFTA is located on the southern boundary of Zone 2. It consists of a bunded concrete slab with aboveground props which were historically set alight for firefighting exercises. The FFTA is no longer in use. Assessments into the FFTA concrete slab have been completed (Enviropacific, 2022, discussed in **Section 3.4.7**) and have confirmed the presence of PFAS within the concrete but below the General Solid Waste (GSW) classification (NSW EPA, 2014). Additional works in this area characterised the nature of PFAS in soil and groundwater in this area (WSP, 2025c). These studies concluded that PFAS is present in soils below relevant criteria. PFAS is also present in groundwater and surface water as a result of leaching from soil and concrete. Impacts in groundwater are migrating with the hydrogeological gradient, whilst PFAS impacted surface water has been observed to travel through the Site's adjacent stormwater channel.
Zone 3	**DU02**	Tank 282, Tank 331, and Flare Compound Geobag Areas The Site has been historically identified as having three geobag areas (each located within Zone 2), which were used for storage and processing of geobags containing tank sludge removed from bases of tanks during the refinery decommissioning and demolition works. Geobags were removed from all three compounds between 2019 and 2023. Subsequent validation sampling has confirmed that the areas are suitable for ongoing industrial use (Ampol, 2023) as defined by the ASC NEPM.
Zone 3	**DU02**	CLOR Tank Farm This area has been used to store hydrocarbon impacted soil waste temporarily. Removal of this waste commenced in 2023 and was completed in 2024. In 2025 OWS services within the former tank farm were partially removed. Sampling has been undertaken following the completion of these works, and at the time of drafting this RAP, reporting was underway.
Zone 3	**DU02**	CLOR Landfarm The former CLOR landfarm within the eastern portion of Zone 3 contained hydrocarbon and asbestos waste. This area was used for landfarming prior to construction of a replacement landfarm in the south east corner of Zone 2. The CLOR landfarm was remediated as part of DA20/0104, commencing in 2021 (Ampol, 2023). As part of this work, all former landfarm waste was excavated and disposed offsite. This was followed by validation and backfilling of excavated areas with Virgin Excavated Natural Material (VENM).
Zone 3	**DU03**	CLOR Process Unit Area The CLOR process unit area was initially identified as requiring remediation due to the presence of LNAPL (Ampol, 2019). The area was remediated in 2021 through the excavation and offsite disposal of hydrocarbon contaminated soils, removal of a redundant stormwater basin, as well as two areas of asbestos impacted soils. A validation report was prepared and submitted to Sutherland Shire Council and the NSW EPA in November 2021 (Ampol, 2021b). Subsequent groundwater monitoring at this AEC has found that LNAPL is no longer present and PHC contamination in groundwater did not exceed tier 1 screening criteria (WSP, 2024c).

Zone	DU Ref.	AEC Details
Zone 3	**DU01**	RPIP Mountain Refining Process Improvement Project (RPIP) Mountain is an area in the south east of Zone 3 which has stored stockpiles of soils from other onsite areas containing asbestos and other contaminants. Over time, the stockpiles have been naturally revegetated in low to regenerating condition. Sampling completed by AECOM in 2022 identified asbestos impacts from surface to 2.0 mbgl. Other analytes test (PFAS, metals, PHC) where below human health criteria (commercial / industrial) (AECOM, 2023d). Additional soil sampling was completed in 2025 to investigate the nature of deeper soils within RPIP. Fill was noted to vary between 0.1 and 1.5 m in thickness. Chemical analysis identified similar COPC as the shallower investigations. Within soils between 2 and 3 mbgl (soils noted to be wet from ~2.0 m), ASS was identified at three of 12 investigation locations.
Zone 2	**DU15**	Former Limestone Pits This area is located in the southeastern corner of Zone 2. Remedial works were completed in 2012, with remediation completed through stabilisation and containment onsite, and managed through an EMP. Groundwater management is ongoing through a phytoremediation system. It is noted in the Quarterly GME report (November 2023) that the Limestone pits area is monitored on a biannual basis. A 2018 review of groundwater data (GHD, 2018) found no exceedances of assessment criteria present.

3.4.15 Pre-lease Assessment Reports and Lease Assessment reports for the leased areas (WSP, 2020a) (WSP, 2021b) (WSP, 2021e) (WSP, 2021g) (WSP, 2022a)

The pre-lease assessment reports were prepared for the leased areas along the western boundary of Zone 3. The assessments included intrusive works facilitating broad sampling for asbestos in soils, and targeted sampling for chemical contaminants (related to former operations and process building footprints), and review of available groundwater monitoring data. The reports indicated that the areas to be leased were suitable for industrial land use at the time.

3.4.16 Caltex Kurnell Asbestos Contaminated Soils Modification Works – Pipeways Closure Report (AECOM, 2020)

AECOM was commissioned by Caltex to validate the removal of asbestos contaminated soils from areas termed the pipeways at the Caltex Kurnell Terminal. The objective of the asbestos removal works was to remove the need for works to be completed under the Exemption Order by demonstrating that no asbestos hazard exists to workers undertaking routine work within the pipeways. This work was completed by removing the areas identified as containing asbestos to a depth of between ~ 0.2 m and 0.5 m. Validation sampling was undertaken to confirm if asbestos had been remediated. If asbestos was still present after 0.5 m of excavation, a marker layer was installed, and a minimum of 0.2 m of clean fill placed on top.

Pipe Track C and the CLOR pipeway which are located within Zone 2 and Zone 3, respectively had the following conclusions from the validation report:

- Pipe Track C (referred to as Area W in validation report) – As there was no asbestos lagging used in Area W and the results returned negative for asbestos presence in 20 samples across 28 locations and with crushed concrete fill laid to a depth of 0.2 – 0.3 m above, it was considered that there was sufficient evidence to leave the soil in-situ, and to remove the exemption order.
- CLOR pipeway (referred to as Area Y east and west in validation report) – As there was no asbestos lagging used in Area Y west and the cladding and insulation used in Area Y East was well preserved, and the results returned negative for asbestos presence in 21 samples across 10 sample locations it was considered that there was sufficient evidence to leave the soil in-situ and to remove the exemption order.

It is noted that asbestos still exists within fill soils in the pipeways, beneath the market layer.

3.4.17 Environmental Site Assessment DGA, Caltex Kurnell Terminal (WSP, 2018)

The overall objective of the investigation was to close data gaps in relation to potential sources of contamination within the former refinery process unit areas, pipeways of the Site and redundant tank bunds. The areas investigated for this report of relevance to this RAP are in Zone 1 and Zone 2 only.

The report concluded that of the 12 sections that the investigation was broken up into (5 of which were located within Zone 2, and 2 of which were in Zone 1), WSP deemed that the information from this investigation coupled with previous investigations closed all known data gaps in the areas, with exception of 2 minor data gaps, one of which was related to Zone 2 (none in Zone 1) and noted to be in vicinity of the former support buildings for the power plant area. The data gap related to parts of this area being inaccessible at the time due to demolition works, and as a result, no soil or groundwater data was obtained from these areas at the time.

Soil and groundwater results from the areas relevant to Zone 2 (the Former Fuels Refinery Process Units) indicated exceedances of Health Screening Levels (HSL) Commercial / Industrial -D for total recoverable hydrocarbon (TRH) F1 criteria which may indicate vapour intrusion risk to enclosed spaces, but as the current use at the time was open space this was not deemed applicable. Exceedances of fresh water ecological protection criteria were also noted in groundwater for benzene, xylene and naphthalene. In vicinity of the eastern tank farm it was noted that solvent type odours were observed from several test pits despite only minor hydrocarbon detections in soil samples. The report indicated that potentially other volatile organic compounds (VOC), outside the total recoverable hydrocarbon (TRH) C6-C40 fractions that were tested for, may be present in this area and recommended further soil sampling for VOCs.

The information from this report was used as the basis for the Caltex Refinery Kurnell Special Condition E9: Data Gap investigation Plan, Caltex Kurnell Remediation Action Strategy (RAS) (Ampol, 2019).

4.0 Conceptual Site Model

A CSM provides a spatial and temporal overview of the contamination at a Site and its surroundings. The CSM highlights contamination sources, potential receptors, and the potential exposure pathways between the sources and receptors (SPR linkages). Robust CSMs provide both known and potential SPR linkages and may include the following elements:

- Source and mechanism of chemical release
- A transport medium (or media where contaminants are transferred between media; i.e., air, dust, water, sediment)
- A point of potential human or ecological contact with the contaminated media
- An exposure route (e.g. ingestion, inhalation) at the point of exposure.

Where one or more of the above elements is missing, the exposure pathway is considered incomplete and therefore, there is considered to be no direct risk to the receptors. Where an incomplete exposure pathway is identified, further assessment is not warranted. Where a linkage may exist or has the potential to exist, the exposure pathway is considered further in terms of risk assessment.

Based on the results of the previous investigations and in accordance with the *National Environment Protection (Assessment of Site Contamination) Measure 1999*, amended 2013 (ASC NEPM) (National Environment Protection Council (NEPC), 2013) (herein referred to as the ASC NEPM), a preliminary CSM has been developed for the Project Area. The CSM includes a summary of potential contaminant sources in soil and groundwater, exposure pathways and human and/or ecological receptors. The CSM is outlined in the sub-sections below.

4.1 Sources

The two types of sources of contamination across Zone 1, 2, and 3 which are considered include:

- **Primary Sources**, which include current/historic infrastructure, containers used for the bulk storage or transport of chemicals, and current/historic site activities (e.g. refuelling, or firefighting training)
- **Secondary Sources**, which include soil (including reworked fill and fill from other on Site areas within RPIP mountain) and groundwater (including LNAPL) impacted by PHC, chemical solvents, and other chemicals.

The ongoing storage of PHC would continue at the Site within Zone 1 for the foreseeable future. Bulk storage of PHC, within above ground storage tanks, occurs in the north eastern, eastern and western portions of the Site. Finished fuels are supplied to the Kurnell Wharf on the south side of Botany Bay by tankers and piped through the eastern right of way to the terminal. These fuels are stored at the Kurnell Terminal until needed and then transferred through pipes back through the eastern right of way under Botany Bay and on to other terminals and Sydney Airport.

The fuel storage and transfer infrastructure at the Kurnell Terminal is managed through ongoing operation and maintenance activities. The historical petroleum storage and refinery activities at the Site within Zones 1, 2 and 3 served as primary sources for asbestos within soils, due to the presence of asbestos within building and plant materials (in the form of gaskets, lagging, fibre boards, among others). Asbestos secondary sources are related to RPIP Mountain where fill materials which contained asbestos were stockpiled, and from recycled building materials originating from the Site, potentially containing asbestos, was used as fill at the Site.

The primary source of PFAS is related to the storage and historical use of fluorinated firefighting foam at the Site. The locations include the FFTA where firefighting training was conducted, the foam deluge system associated with the former process areas and storage tanks across the Site and within the CLOR area on the western side of the former process units adjacent to Road 16 where a temporary foam storage trailer was stored. Secondary sources have been identified through prior environmental investigations of the Site, primarily focussed on redundant areas of the Site, the relevant areas in Zone 2 and Zone 3 include the former fire training area, former fuels refinery, and the former CLOR.

The above information has been organised into general source types introduced in **Table 6**, **Section 3.3** to support the development of a robust CSM. As discussed in **Section 3.4.1**, as part of the AECOM DGA SAQP (AECOM, 2025e), the investigation boundaries were revised to ensure all current and historical sources had been considered. To aid this exercise, Zone 2 and Zone 3 were divided into 16 decision units (DUs) that considered historical and current Site uses and physical Site features, allowing for more accurate review and assignment of source types and COPC. One additional decision unit was defined to allow for the consideration of groundwater and soil vapour across the Audit Boundary (DU17). The decision units for the Site are presented spatially on **Annexure A Figure F3**, and the decision units are identified in **Table 8** below. Where historical assessments have identified an exceedance of screening criteria, the relevant COPC / contaminated area within the DU has been listed (AECOM, 2025e).

Further to **Table 8** the potential sources of contamination for each Zone and DU are presented in **Table 9**, **Table 10**, and **Table 11**. In this review, where a COPC was known to be present or used based on the given source / activity, it has been considered primary (P), whilst if it had the potential to be present or used, it has been considered secondary (S). Additionally, where historical data was not available for a COPC, these have also been retained and listed..

Table 8 Decision Unit identification and potential sources

DU ID	Title	Area (ha)	Potential Sources	Contaminated areas - COPC	Current status
DU01	RPIP Mountain	3.6	• RPIP area (stockpiling, landfilling, civil / construction / demolition works, equipment operations) • Stormwater system • Aboveground services (steam supply, water supply, oil supply) • Roads	RPIP area – Asbestos	Source area excavation (SAE) to manage potential asbestos migration risk (see **Section 7.5.3.2**)
DU02	Former CLOR Tank Farm	9.1	• Former CLOR Tank Farm (lubricating oils storage, equipment operations, stockpiling, landfarming, civil / construction works / demolition works) • Pipeways (lubricating oils storage, OWS services, stormwater system, civil / construction works / demolition works) • Tank Truck Loading Rack (TTLR) (Lubricating oils storage, equipment operations, civil / construction / demolition works) • TTLR former landscaped areas (landscaped areas, equipment operations, civil / construction works / demolition works) • OWS services • Roads • Stormwater system	DU wide fill – Asbestos	Currently managed through site specific controls, discussed in **Section 4.4.1**.
DU03	Former CLOR Process Unit	3.9	• Former CLOR Tank Farm (lubricating oils storage, equipment operations, stockpiling, landfarming, civil / construction works / demolition works) • Parking area • Roads • Stormwater system • OWS transfer pit	Former CLOR Tank Farm – Asbestos, total recoverable hydrocarbons (TRH) (non-volatile fractions)	Currently managed through site specific controls, discussed in **Section 4.4.1**..**4.4.1**.
DU04	Former CLOR Waste Water Treatment Plant (WWTP)	0.8	• Fill soils (stockpiling, civil / construction works / demolition works, equipment operations) • Former WWTP • Power supply • Roads • Stormwater system • Water supply	DU wide fill – Asbestos	Currently managed through site specific controls, discussed in **Section 4.4.14.4.1**.
DU05	Southern set-down area	0.8	• Fill soils (stockpiling, washdown bay, landfarming, equipment operations) • Roads • Stormwater system • Former building footprints (office buildings, civil / construction works / demolition works) • Aboveground services (steam supply, water supply)	DU wide fill – Asbestos	Currently managed through site specific controls, discussed in **Section 4.4.1**.**4.4.1**

DU ID	Title	Area (ha)	Potential Sources	Contaminated areas - COPC	Current status
DU06	Former Office Areas	3.7	• Unsealed areas (stockpiling, civil / construction works / demolition works, equipment operations) • Roads • OWS services • Stormwater system • Washdown bay • Office buildings • Workshops • Landscaped areas • Water supply	DU wide fill – Asbestos	Currently managed through site specific controls, discussed in **Section 4.4.1**.
DU07	Warehouse and set-down area	2.7	• Emergency response yard (equipment operations, workshops, AFFF storage) • Material management yard (equipment operations, stockpiling, civil / construction works / demolition works) • Stockpile (fuel refinery operations, lube oil refinery operations, office buildings, power supply) • Earthmoving yard and 'sieve shed' (equipment operations, workshops, civil / construction works / demolition works, AFFF storage) • Roads, • OWS services • SWS • Aboveground services (steam supply, water supply, oil supply)	DU wide fill – Asbestos	Currently managed through site specific controls, discussed in **Section 4.4.1**.
DU08	Former CLOR Landfarm	1.4	• Former landfarm (landfarming, equipment operations) • Truck wash bay (equipment operations, washdown bay) • Roads • Aboveground services (steam supply, water supply, oil supply)	1. Former landfarm – TRH (F2) 2. Roads – Asbestos	1. Impacts exceed management limits. Further investigation as part of DGA detailed site investigation (DSI). 2. Currently managed (physical barriers installed (WSP, 2025g)).
DU09	Western Lease Areas (north and south)	1.6	• Supply yard (equipment operations, civil / construction / demolition works) • Skip bin rental yard (equipment operations, civil / construction / demolition works, stockpiling) • Earthmoving yard and workshop (Equipment operations, workshops, civil / construction / demolition works, stockpiling) • Roads • Stormwater system • Landscaped areas	1. Landscaped areas – Asbestos 2. Diffuse fill soils – Asbestos	1. Currently managed through site specific controls and capping within specific landscaped areas (WSP, 2025b). 2. Fill soils are currently sealed, and managed through site specific controls, as discussed in **Section 4.4.1**.
DU10	Southern Process Unit	9.1	• Diffuse fill soils (refinery operations, equipment operations, stockpiling) • Roads • Power supply • OWS services • Stormwater system • Civil / construction works / demolition works	1. DU wide fill – Asbestos 2. Diffuse fill soils – PHC	1. Currently managed through site specific controls, as discussed in **Section 4.4.1**. 2. SAE (see **Section 7.5.3.2**)
DU11	Former Workshop, CCB & Power Plant	7.6	• Fill soils (stockpiling, civil / construction works / demolition works, equipment operations) • Hydroblast area • Roads • Stormwater drains	DU wide fill – Asbestos	Currently managed through site specific controls, as discussed in **Section 4.4.1**.

DU ID	Title	Area (ha)	Potential Sources	Contaminated areas - COPC	Current status
			• OWS services • Power supply • Former workshop		
DU12	Central Process Units	6.7	• Fill soils (refinery operations, stockpiling, civil / construction works / demolition works, equipment operations) • Roads • Stormwater drains • OWS services • Power supply	1. DU wide fill – Asbestos 2. Former refinery areas – PHC	1. Currently managed through site specific controls, as discussed in **Section 4.4.1**. 2. Impacts exceed HSL D (VI[3]) and management limits. SAE (see **Section 7.5.3.2**). Refinement of SAE volume and extent as part of DGA DSI.
DU13	Former Flare Area	3.5	• Fill soils (refinery operations, stockpiling, civil / construction works / demolition works, equipment operations) • Roads • Stormwater drains • OWS services	1. DU wide fill – Asbestos 2. Former flare – metals, PHC	1. Currently managed (capped) 2. Currently managed through site specific controls, as discussed in **Section 4.4.1**.
DU14	Former Fire Training Area	1.0	• Fill soils (fire training grounds, landscaped areas) • Roads • Power supply • AFFF storage and use • Office buildings • OWS services •	1. DU wide fill – Asbestos 2. Limited PFAS exceedances of ecological (indirect exposure) soil criteria. The area is a noted PFAS source area.	1. Currently managed through site specific controls, as discussed in **Section 4.4.1**. 2. SAE (see **Section 7.5.3.2**)
DU15	Waste Management Area	7.4	• Fill soils (landfilling, landfarming, stockpiling) • Roads • Waste water treatment (oily water) • Stormwater system • Landscaped areas • Tank farm • Limestone pit • Washdown bay	1. Fill soils (scrap yard) – lead, PFAS 2. Fill soils (landfarm) – PHC, B(a)P 3. DU wide fill – Asbestos	1. No SPR linkage. 2. Currently managed through site specific controls, as discussed in **Section 4.4.1**. 3. Currently managed through site specific controls, as discussed in **Section 4.4.1**.
DU16	Main Pipeway and Eastern Tank farm	10.0	• Fill soils (Fuel refinery operations, equipment operations) • Bund walls • Roads • Power supply • OWS services • Stormwater system	DU wide fill – Asbestos	Currently managed through site specific controls, as discussed in **Section 4.4.1**.
DU17*	Zone 2 and Zone 3 Groundwater and Vapour (excluding asbestos containment cell)	73.1	• As per those identified within individual decision units for soil	DU10 Former refinery areas – PHC and CHC in groundwater and soil vapour	SAE (see **Section 7.5.3.2**). Refinement of SAE volume and extent as part of DGA DSI.
				DU11 Workshop and former hydroblast - CHC in soil vapour	SAE (see **Section 7.5.3.2**). Refinement of SAE volume and extent as part of DGA DSI.
				DU12 Former refinery areas – PHC in groundwater	SAE (see **Section 7.5.3.2**). Refinement of SAE volume and extent as part of DGA DSI.
				DU16 Former tank farm - PHC in groundwater (including LNAPL)	SAE (see **Section 7.5.3.2**). Refinement of SAE volume and extent as part of DGA DSI.

Note: Sources listed within brackets "( )" are standard source types which contribute to a unique or DU specific source.

[3] VI – vapour intrusion

4.2 COPCs

Based on the known sources presented in **Table 8**, COPC for the Project Area and Audit Boundary have been presented in **Table 9**, **Table 10** and **Table** 11 below based on each Zone.

Table 9 COPC by Zone and Media

Zone	Media	COPC
Zone 1	Soil Groundwater	• Asbestos (soil only) • TRH • Benzene, toluene, ethylbenzene, xylenes and naphthalene (BTEXN) • Polycyclic aromatic hydrocarbons (PAHs) • PFAS • Heavy metals (8 metals and expanded metals)[1] • Organochlorine and Organophosphorus Pesticides (OCP and OPP) • Herbicides • Phenols • Polychlorinated Biphenyls (PCBs) • VOCs including CHC[1] • Semi Volatile Organic Contaminants (SVOCs). • Fuel refinery additives[1]
Zone 2	Soil Groundwater	• Asbestos (soil only) • TRH • BTEXN • PAHs • PFAS • Heavy metals (8 metals and expanded metals)[1] • OCP and OPP • Herbicides • Phenols • PCBs • VOCs including CHC[1] • SVOCs • Fuel refinery additives[1] • Refining by-products[1] • Refinery process chemicals (landfarm areas only)[1]
Zone 3	Soil Groundwater	• Asbestos (soil only) • TRH • BTEXN • PAHs • PFAS • Heavy metals (8 metals and expanded metals)[1] • OCP and OPP • Phenols • PCBs • VOCs including CHC[1] • SVOCs • Fuel refinery additives (landfarm / landfill areas only)[1] • Refining by-products[1] • Refinery process chemicals[1]

*Note: 1 – COPC groupings details provided in **Section 4.2.1***

4.2.1 COPC definitions

COPC presented as groupings in **Table 9**, **Table 10**, and **Table 11** have been defined in **Table 12** below.

Table 12 COPC constituents

COPC Groups	Detailed Constituents
PHC	Petroleum hydrocarbons includes: BTEXN: benzene, toluene, ethylbenzene, xylene, naphthalene TRH: total recoverable hydrocarbons
PAH	Includes 16 PAHs most commonly reported for contaminated site (WHO 1998). This considers the presence of carcinogenic PAHs and naphthalene (the most volatile PAH, notably also included within the BTEXN grouping).
PFAS	Includes PFAS compounds with published NEMP 3.0 guideline values: Perfluorooctane sulfonic acid (PFOS), Perfluorooctanoic acid (PFOA) and Perfluorohexane sulfonic acid (PFHxS), recognising that other PFAS including other long-chain perfluoroalkyl acids (PFAAs), precursors to PFAS, and some cyclic fluorochemicals where relevant, would be considered.
8 metals	NEPM Schedule B metals: As, Cd, Cr, Cu, Ni, Pb, Zn, Hg
Expanded metals	Expanded metals suite, notably including additional metal analytes which may be present in a fuel and oil refinery setting: • Co: catalyst in hydro-processing. May be present in residues. • Mn: may appear from fuel additives • Se: may be present in trace quantities in crude, accumulating in sludges. • V: present in crude, and accumulates in waste residues, and spent catalysts • Mo: Present in hydro-cracking catalyst
OCP and OPP	Includes OCPs related to potential pest control treatments that might have been applied to legacy buildings at the Site. These commonly include: • DDT, DDE, DDD • Aldrin and dieldrin • Chlordane • Heptachlor • Endrin OPPs began to replace OCPs in the 1970s, and whilst less persistent than OCPs would also be considered where relevant, including: • Bifenthrin • Chlorpyrifos
Herbicides	Includes herbicides related to routine weed management at the Site, including phenoxy herbicides.
Phenols	Includes phenol, cresols, chlorophenols, and nitro-phenols
PCBs	Includes both dioxin-like and non-dioxin-like PCBs given the presence of potential sources (transformers) at the Site.
CHC	Target compounds are chlorinated solvents historically used as degreaser. Includes: • trichloroethene (TCE), • tetrachloroethene (PCE), • 1,1,1-trichloroethane (TCA), • carbon tetrachloride (CT), • chloroform. Additionally, consider daughter products: • vinyl chloride (VC), • 1,1-dichloroethene (DCE),

COPC Groups	Detailed Constituents
	• cis-1,2-DCE (cis-DCE), • trans-1,2-DCE (trans-DCE),
Refinery process chemicals	Furfural and Methyl Ethyl Ketone (MEK) – used in the CLOR refinery process, but potential to occur in landfarm soils.
Fuel refinery additives	Methyl tert-butyl ether (MTBE), tetraethyl lead (TEL). It is noted that MTBE was not imported as an unmixed additive, but may have been present in blended fuels received at the former refinery or terminal. Its presence is considered to be limited to a potential minor component (up to ~ 1 %) within imported fuels stored at the terminal.
Refining by-products	total cyanide, sulphur, nitrogen compounds

4.3 Receptors

Potential receptors for the Project Area include[4]:

Onsite

- Onsite workers (commercial / industrial occupants)
- Onsite intrusive maintenance workers

Offsite

- Offsite residents (north of the Project Area)
- Offsite commercial / industrial workers (industrial workers outside the Project Area, within the Ampol site boundary, and areas outside Ampol ownership, north west and south west of the Site)
- Offsite intrusive maintenance workers
- Offsite ecological receptors (surrounding the Project Area, includes the Ampol owned wetlands to the south of Zone 3, and areas outside Ampol ownership as discussed in **Section 2.3**).
- Offsite surface water users (within the Botany Bay, Marton Park Wetland, and Quibray Bay, as discussed in **Section 2.7**).

4.4 Exposure pathways

The following exposure pathways may apply for human health and ecological receptors:

i. Dermal contact and incidental ingestion of soil/groundwater/surface water

ii. Inhalation of soil derived dust or fibres in indoor and/or outdoor air

iii. Inhalation of soil vapours within a trench

iv. Inhalation of soil vapours within indoor air and/or outdoor air.

Rationale for each pathway mechanism is presented in **Table 13** below.

[4] For the purpose of this source pathway receptor assessment, onsite/ offsite relate to the Project Area boundary.

Table 13 Exposure pathway mechanisms

Matrix	Pathway and exposure mechanism
Soil	**Human health receptors** Human health receptors (e.g. intrusive maintenance workers or future Site users) may be exposed to COPC in shallow, unsealed soil during ground disturbance activities. These activities may result in dermal contact and incidental ingestion of impacted soils. Additionally, disturbance of shallow soil may lead to the generation of dust or fibres that could be inhaled by receptors in both indoor and outdoor settings. For soils impacted by volatile COPC (e.g. PHC, PAHs, CHCs), there is a potential for vapour migration into indoor or confined outdoor spaces, such as utility trenches. As such vapour inhalation has been included as a pathway for occupied buildings (current and future) and trench environments (when present). **Ecological receptors** Are unlikely due to the predominantly disturbed and developed nature of the Site; though potential for ecological exposure may be considered in less-disturbed areas (e.g. RPIP mountain), where exposure to impacted shallow soils may occur. Other onsite areas that may require consideration to potential ecological receptors are along the southern Zone 2 and Zone 3 boundary, which are adjacent Ampol owned vegetated areas.
Groundwater	**Human health receptors** Groundwater is present at a variety of depths across the Site, from near surface to 9.8 mbgl (discussed further in **Section 2.8**) within the Audit Boundary, indicating that direct contact, and incidental ingestion of COPC in groundwater is plausible during subsurface intrusive works, such as trenching, piling, or excavations. Additionally, the potential for incidental ingestion and dermal contact during these activities exists, primarily affecting human health receptors. In areas that groundwater contains volatile COPC, vapour intrusion into occupied buildings (existing or future) represents a potential inhalation exposure pathway for human health receptors. Similarly, vapour inhalation within trench environments may occur during maintenance works. Per NSW Health recommendations, people within urban areas should use the public drinking water supply for consumption, food preparation, and personal hygiene. The Kurnell area is serviced by a reticulated water supply. A groundwater bore search indicates the presence of registered groundwater abstraction bores within the residential area to the north of the Site. Offsite residential groundwater bore use has been surveyed as part of historic works (WSP, 2024d). Surveys identified that bore water use was limited to recreational purposes (irrigation of lawns and vegetables, filling of pools, washing of surfaces). **Ecological receptors** Ecological receptors associated with groundwater dependent ecosystems (downgradient) may potentially be exposed via contaminant migration. Groundwater migration to surface water (aquatic) ecosystems may also be relevant offsite
Surface water	Surface water may act as both a transport and receiving medium for sediments and COPC, particularly during heavy or prolonged rainfall events. The Site's local drainage characteristics, receiving catchments, and discharge points are summarised in **Section 2.7**, which outlines that stormwater from the Site is ultimately discharged to receiving environments such as Quibray Bay, and Botany Bay, as well as to Marton Park Wetland. These environments may support recreational or ecological receptors, for whom dermal contact and

Matrix	Pathway and exposure mechanism
	incidental ingestion of contaminated surface water represent plausible exposure pathways, particularly where surface water is accessible. In addition to surface water infiltration facilitating downward contaminant migration to shallow groundwater, there is potential for groundwater to discharge to surface water via upward flux or baseflow contributions, especially in low-lying or tidally influenced areas.

4.4.1 Site specific controls

The Site currently has a OEMP developed to provide management solutions for potential environmental impacts arising from the operation of the Kurnell Terminal. This plan is a live document, which is progressively reviewed and updated to align with Site operations and conditions as they evolve. The scope of the OEMP includes the operational activities undertaken by Ampol employees, contractors and subcontractors at the Site and any area under the Site's operational control. The implementation of the plan enables Ampol to achieve its aim to "operate in such a way as to minimise adverse impacts on the environment and communities in which it operates."

The OEMP is supported by a number of management sub plans, to address specific environmental aspects of the Terminal, including:

- Noise management plan
- Air quality management plan
- Soil and water management plan
- Waste and resource management plan
- Traffic management plan
- Biodiversity, pest and weed management plan
- Biosecurity incident response management plan
- Asbestos contaminated soil containment cell – Long-term environment management plan.

It also sets out the Kurnell Terminal Approvals Register, and identifies the current licences, permits, and consents obtained by Ampol for the Site. The OEMP includes references to the Permit to Work system which covers cold, hot, excavation and confined space work at the Site and enacts site-specific controls for each of these activities.

The OEMP is supported by the Site's Asbestos management plan. Given the Site's history and the known use of asbestos containing materials within the former refinery, intrusive works undertaken at the Site are governed by the Terminal's permitting process, which requires the engagement of an licensed asbestos assessor to ensure works are completed in accordance with relevant legislation.

4.5 SPR Linkage assessments

Based on the information detailed in **Section 4.1** to **Section 4.4** , SPR linkage assessments for the Project Area have been completed, and presented as **Table 14** below. CSM and its linkage assessments would be updated following the completion of additional site investigation, as per Table 2.3 and Table 2(a) of the Contaminated Land Guidelines: Consultants Reporting on Contaminated Land (NSW EPA, 2020b).

Table 14 Source-Pathway-Receptor linkages

Zone Areas (zone 1) or DU (zone 2 and 3)	Media	COPCs	Receptors[4]	Complete or potential complete pathway
Zone 1 **Areas include:** **LPG Area** **Eastern Tank farm** **north western tank farm**	Soil	• Asbestos • TRH • BTEXN • PAHs • PFAS • Heavy metals (expanded metals) • OCP and OPP and herbicides • Phenols • PCBs • VOCs (including CHCs) • SVOCs • Fuel refinery additives	• Onsite workers	Incomplete, managed by OEMP protocols
			• Onsite maintenance workers	Incomplete, managed by OEMP protocols
	Groundwater	• TRH • BTEXN • PAHs • PFAS • Heavy metals (expanded metals) • OCP and OPP and herbicides • Phenols • VOCs (including CHCs) • SVOCs • Fuel refinery additives	• Onsite workers	• Incomplete, managed by OEMP protocols
			• Onsite maintenance workers	• Incomplete, managed by OEMP protocols
			• Offsite residents (north of the Site)	• Potentially Complete for PFAS related to the use of extracted groundwater for purposes such as irrigation and recreational use.*
			• Offsite commercial workers	• Potentially Complete for PFAS related to the potential use of extracted groundwater for purposes such as incidental ingestion*
			• Offsite intrusive maintenance workers	• Potentially Complete for PFAS related to the potential for incidental ingestion of groundwater during intrusive works*
			• Offsite ecological	• Potentially Complete for PFAS related to the potential for ingestion of groundwater in groundwater dependant ecosystem* or where a groundwater to surface water connection exists.
Zone 2 and Zone 3 **Areas include:** **DU01: RPIP Mountain** **DU02: Former CLOR Tank Farm** **DU03: Former CLOR Process Unit** **DU04: Former CLOR WWTP** **DU05: Southern Set-down Area** **DU06: Western Office Areas** **DU07: Warehouse and set-down area** **DU08: Former CLOR Landfarm** **DU09: Western Lease Areas** **DU10: Former southern process unit** **DU11: Workshop and garage area** **DU12: Former central process unit** **DU13: Former flare** **DU14: FFTA** **DU15: Waste management area**	Soil	• Asbestos • TRH • BTEXN • PAHs • PFAS • Heavy metals (expanded metals) • OCP and OPP and herbicides • Phenols • PCBs • VOCs (including CHCs) • SVOCs • Fuel refinery additives • Refinery by-products • Refinery process chemicals	• Onsite workers	• Incomplete, managed by OEMP protocols
			• Onsite maintenance workers	• Incomplete, managed by OEMP protocols
	Groundwater	• TRH • BTEXN	• Onsite workers	• Incomplete, managed by OEMP protocols
			• Onsite maintenance workers	• Incomplete, managed by OEMP protocols

Zone Areas (zone 1) or DU (zone 2 and 3)	Media	COPCs	Receptors[4]	Complete or potential complete pathway
DU16: Former eastern tank farm		• PAHs • PFAS • Heavy metals (expanded metals) • OCP and OPP and herbicides • Phenols • VOCs (including CHCs) • SVOCs • Fuel refinery additives • Refinery by-products • Refinery process chemicals	• Offsite ecological (Wetlands to south of Zone 2 boundary, nature reserves east of Zone 2, Ampol owned vegetated areas south of Zone 3)	• Potentially Complete for PFAS related to the potential for ingestion of groundwater in groundwater dependant ecosystem* or where a groundwater to surface water connection exists.
			• Offsite intrusive maintenance workers	• Potentially Complete for PFAS related to the potential for incidental ingestion of groundwater during intrusive works*
			• Offsite commercial workers	• Potentially Complete for PFAS related to the potential use of extracted groundwater for purposes such as incidental ingestion*

** Potentially complete pathway relates to PFAS contaminants which are present in groundwater at the nearest relevant down-hydraulic gradient Site boundary transect.*

4.6 LNAPL CSM

The NSW EPA *Information Technical note –Light non-aqueous phase liquids (LNAPL) Assessment and Remediation,* (2015) requires that when LNAPL is identified, a LNAPL Conceptual Site Model (LCSM) is developed that integrates Site data and interpretations in order to identify and assess potential risks from LNAPL to receptors.

Collection of groundwater, soil and vapour data has historically been conducted to assess petroleum hydrocarbon impacts and based on the available data, there is currently no complete pathway for the LNAPL to present a risk to human health at this the Site. The following sub-sections summarise the developed LCSM.

4.6.1 Source information

Given the current and historical use of the Site as a fuel and oil terminal and refinery, primary sources of hydrocarbon contamination are associated with hydrocarbon fuel and oil storage and distribution. Secondary sources of contamination include contaminated soil and groundwater.

Historical LNAPL has been observed within the onsite monitoring well network in the following areas:

- Zone 1: Northern Tank Farm
- Zone 1: North western Tank Farm
- Zone 2 (DU16): Eastern Tank Farm
- Zone 3 (DU02): CLOR process unit area

For current observations of LNAPL are limited to the eastern tank farm and north west tank farm. The depth to LNAPL has been recorded as follows:

- eastern tank farm ranges from 3.151 to 3.665 mbgl
- north western tank farm range from 1.482 to 2.499 mbgl.

LNAPL in the CLOR process unit area was remediated in 2021 (WSP, 2021h). LNAPL has not been detected in groundwater monitoring completed following remediation, and PHC contamination in groundwater does not exceed tier 1 screening criteria (WSP, 2024c, WSP, 2023f).

LNAPL within the northern tank farm has not been detected in the 2023 or 2024 monitoring years. PHC concentrations in groundwater in this area do however remain above the ASC NEMP (2013) saturation limits.

It is understood that LNAPL is also present within Zone 1 in the vicinity of the Contractor's Car Park. The area is referred to as the Jet Remediation Area and is under a program of remediation preceding the 2019 RAS. There are proposed modifications to the firewater system (FWS) in this area and the existing remediation system and activities in this area would be considered during these works.

Fingerprint testing from wells exhibiting LNAPL within Zone 1 in the Northern Tank Farm and Northwestern Tank Farm indicated that the LNAPL was the result of historical release and based on age (greater than 10 years in the environment [Ampol, 2019]) and lack of a current source, it is considered in the 2023 RAS update that the LNAPL footprint in this area was likely to be stable. Given these LNAPL plumes are delineated, stable, and down hydraulic gradient from the Audit Boundary, they are not expected to impact remediation.

Within the Audit Boundary, LNAPL as of 2024 groundwater monitoring is limited to Zone 2, at monitoring wells W14, W15 and W16 within the eastern tank farm. These LNAPL observations are presented on **Annexure A, F4**. Historically LNAPL has also been observed in W05 (WSP, 2018). This LNAPL is linked to a spill of approximately 495 kL of light fraction Catalytic Naphtha within the eastern tank farm in the early 1990's (WSP, 2022b). Within the broader Project Area, there is additionally LNAPL present within the north western tank farm (WSP, 2025i), and historically within the northern tank farm.

4.6.2 Transport

Once product such as fuel or oil is released at the ground surface or from shallow infrastructure (for example, pipelines or aboveground storage tanks), it migrates vertically through the vadose zone under gravity. During this initial vertical migration, LNAPL may partially partition to soil vapour or adsorb to soil particles, although the dominant movement pathway is downward infiltration until the capillary fringe is encountered. At the capillary fringe, capillary forces promote lateral spreading and the formation of a mobile LNAPL body.

Fluctuations in groundwater level strongly influence LNAPL distribution. During drought or extended dry periods, lowering of the water table can allow LNAPL to migrate further vertically, increasing the thickness of the mobile interval. When groundwater levels rise during wetter periods, the ascending water table can trap LNAPL as discontinuous residual product within the newly saturated zone, forming a vertical ‘smear zone’. Further lateral movement may also occur along the capillary fringe during these periods. Over time, a portion of the LNAPL dissolves into groundwater, contributing to the dissolved phase plume.

At the Site, the current distribution of LNAPL from observations from groundwater monitoring wells, indicates three distinct areas of LNAPL presence (WSP, 2025i) that are delineated within the Site boundary. This distribution is consistent with historical release locations.

Changes in hydrological and hydrogeological conditions, including prolonged rainfall or drought, may continue to influence the mobility and extent of both LNAPL and the associated dissolved phase plume.

During remediation, there is potential for increased rainfall or flooding to mobilise LNAPL. Mitigation measures would be implemented, including maintaining the Site’s stormwater diversion channels and OWS, and applying the Site’s surface water management plan to limit inflow of water to the excavations, as discussed in **Section 7.5.2, Section 7.5.3.8** and **Section 7.5.3.10**. Additionally, where excavation is occurring, groundwater monitoring would be completed at nearby wells, to monitor for changes in LNAPL mobility should conditions change. This monitoring requirement would be set out in the specific RWP(s).

4.6.3 Risks to receptors

The relevant potential receptors for exposure pathways from LNAPL are limited to onsite commercial/ industrial workers and short term intrusive maintenance workers as the LNAPL is delineated onsite (WSP, 2024c, WSP, 2024f, WSP, 2025d, WSP, 2025i). Potential risks that LNAPL exposure pathways may present are as follows:

- If ground disturbance works are undertaken and penetrate the subsurface, groundwater could be encountered and could result in dermal contact or incidental ingestion to onsite workers
- Additionally, LNAPL in groundwater and vadose zone soils may present a vapour intrusion risk to intrusive maintenance workers (shallow trench and confined space workers)
- Soil vapour intrusion risks may be present under the current zoned land use scenario should buildings be constructed above areas with identified LNAPL.

Risks to onsite workers from potential LNAPL in vadose zone soils and groundwater are managed by the Site’s health and safety control systems.

LNAPL in groundwater is not expected to be encountered through extraction, as there are no identified bore water users within the Site boundary / extent of the LNAPL plumes.

5.0 Tier 1 screening assessment

5.1 Introduction

Historical soil and groundwater data from the Project Area have been considered in the context of the current regulatory framework as part of the DGA historical data review, and the available soil, groundwater, and soil vapour data set has been evaluated against current Tier 1 screening values. The objective of this screening exercise is to identify impact that may present a risk based on a specific end use (i.e. the zoned commercial / industrial use for Zone 2 and 3, based on current or future activities, and the on-going use of Zone 1 for terminal operations).

This Tier 1 screening assessment supports identification of areas for additional assessment, or where the conditions require it, development of a remedial approach to address the issue.

Additional assessment may be beneficial in refining the risk profile (refer to **Section 6.5**) where data gaps exist. Refining the risk profile may also refine the volume and extent of remediation (which would feature in the RWP[s]). Where screening assessment levels are exceeded, certain areas may benefit from a detailed risk assessment that considers both the specific soil, groundwater, and soil vapour conditions/parameters as well as the proposed end use for the area.

In selecting the Tier 1 criteria the following assumptions were made about the Site:

- The contaminant profile of the Project Area is consistent with a typical mixture of petroleum contamination and the Health Screening Levels (HSLs) are appropriate for a screening assessment
- Sample depth, while it is understood that there are plans for future development that may change the final finished levels of Zones 2 and 3, this assessment has considered the data based on current ground levels
- It is assumed that future intrusive/development works at the Project Area would be undertaken utilising appropriate safety protocols, including personal protective equipment (PPE) and following the relevant CEMP(s)
- Groundwater is generally not shallower than 1 mbgl across the Project Area and therefore direct contact with groundwater in a typical commercial / industrial use scenario is unlikely and would not be subject to remediation for this potential exposure pathway
- The predominant soil type across the Project Area is sand
- Groundwater in the Project Area would continue to not be abstracted for any use other than environmental monitoring following remediation.

The Tier 1 criteria for the identified COPCs (**Section 4.2**), for a commercial/ industrial end use are defined by the ASC NEPM, and where no criteria is presented, hierarchy for screening are defined (see **Table 15**, **Table 17**, and **Table 19**).

The overarching national guidance document for PFAS screening and management in Australia is the PFAS National Environmental Management Plan (NEMP), version 3.0 (endorsed December 2024 and published March 2025) developed by the Heads of Environmental Protection Agencies (EPAs) Australia and New Zealand (HEPA).

The PFAS NEMP 3.0 provides a nationally consistent PFAS, risk-based framework for assessment of PFAS in land, groundwater, surface water and other receiving environments. In this version of the NEMP, the criteria are designed to be adaptive to emerging scientific evidence.

The NEMP document presents criteria for three PFAS compounds only: Perfluorooctane sulfonic acid (PFOS), Perfluorooctanoate acid (PFOA) and Perfluorohexane sulfonic acid (PFHxS). Both the Australian and NSW State position on the use of PFAS screening criteria continues to evolve and is subject to change. While the NSW EPA's position remains under consideration (particularly in relation to finalisation of NHMRC drinking water guidelines), the NSW EPA is currently taking a staged, risk based approach to the implementation of NEMP 3.0[5]. In addition, the same three PFAS compounds are listed as prohibited chemicals under the Industrial Chemicals Environmental Management Standard (iChEMS) register. Implementation and regulation of PFAS under iChEMS is currently being developed by NSW EPA. Subsequent regulatory developments will be monitored and material changes that would affect this RAP would be considered in the RWP or as a RAP addendum, if required.

The below sections define the current applicable Tier 1 criteria for:

- soil, groundwater and soil vapour for human health receptors in a commercial/ industrial land use scenario and intrusive maintenance workers
- soil and groundwater criteria for ecological receptors for a commercial/ industrial land use scenario and offsite ecological receptors, noting the limited extent of identified ecological receptors onsite discussed in **Section 4.3**
- PHC management limits for soil, non-health-based upper values applied alongside health and ecological screening to manage risks of LNAPL, fire and explosion, damage to buried infrastructure, and aesthetics, expressed by TRH criteria.

Where there is no Tier 1 criteria (e.g. furfural) laboratory protocol LOR would be applied as a screening criteria. Results reported below the LOR would be considered as non-exceedances.

5.2 Soil assessment criteria

5.2.1 Human health

The adopted soil criteria for commercial/ industrial workers and intrusive maintenance workers are listed in **Table 15**. Where future surface levels are not known, soil data will be assessed the most conservative screening depths (i.e. 0-1m depth)

Table 15 Human health – soil criteria

Compound	Exposure pathway	Relevant criteria
PHC		
TRH fractions, BTEX, and naphthalene 0-1 m depth, 1-2 m depth, 2-4 m depth and >4 m depth	Vapour inhalation – commercial/ industrial worker	Soil Health Screening Levels for Vapour Intrusion (HSL D) Sand. Source: Table 1A (3) ASC NEPM (NEPC, 2013).
TRH Fractions, BTEX, and naphthalene	Direct soil contact – commercial/ industrial worker	Health Screening Levels HSL D Direct Contact. Source: CRC Care 2011, Technical Report 10, Part 2 - Table B4.
TRH fractions, BTEX, and naphthalene All depths where trenching may occur. Noting that deep trenches are likely to require specific health and safety procedures.	Direct contact/ ingestion – intrusive maintenance worker[1]	Soil HSL Direct Contact (Int. Main. Worker) Sand. Source: CRC Care 2011, Technical Report 10, Part 2 - Table B4.

[5] Reference: NSW EPA position statement on NEMP 3.0. Updated June 2025. Via epa.nsw.gov.au

Compound	Exposure pathway	Relevant criteria
TRH Fractions, BTEX, and naphthalene 0-<2 m depth, 2-<4 m depth, 4 m + depth	Vapour inhalation - intrusive maintenance worker[1]	Soil HSL for Vapour Intrusion (Int. Main. Worker – Shallow Trench) Sand. Source: CRC Care 2011, Technical Report 10, Part 2 - Table B3.
Other COPC		
Metals, PAHs, Phenols, Organochlorine Pesticides, PCBs	Direct contact/ingestion – commercial/ industrial worker	Health Investigation Levels Commercial/ industrial (HIL D) Source: Table 1A(1) ASC NEPM (NEPC, 2013).
Asbestos	Inhalation - commercial/ industrial/ maintenance worker	Asbestos in soil screening levels Source: ASC NEPM (2013) Table 7 Comm / Ind D HSL for asbestos in soil and Table 3 Western Australia (WA) Department of Health (DoH) guidelines (2021)
VOCs and SVOCs (without criteria)	Inhalation/direct contact - commercial/ industrial worker	Where there are no criteria in ASC NEPM, the results are compared to the laboratory protocol limit of reporting (LOR). Where the LOR is exceeded or elevated, the results are to be screened against the US EPA Regional Screening Levels (RSLs) for industrial soil. Source: US EPA, November 2024, Regional Screening Levels – Industrial Soil
PFAS – Sum of PFOS and PFHxS and PFOA	Direct contact - commercial/ industrial worker[2]	HIL D Source: Table 2, NEMP 3.0 (HEPA, 2025)

Notes:
1. For intrusive maintenance workers it is assumed that the activities being undertaken align with the exposure assumptions presented in CRC Care Technical Report 10 (including activities occurring for less than 1 year).
2. The industrial/ commercial criteria assume 8 hours is spent indoors and 1 hour spent outdoors at a location such as a shop, office, factory or industrial site. If the typical exposure for a site is predominantly outdoors with significant earthen areas, recalculation of a site-specific value is recommended. As future development of a site is not anticipated to likely comprise significant earthen areas and due inherent conservatisms built into the criteria (e.g. assuming 20 % of the tolerable daily intake), the Amended National Environment Protection (Assessment of Site Contamination) Measure (2013) (ASC NEPM) commercial/ industrial criteria are deemed appropriate for this RAP.

5.2.2 Ecological receptors

Ecological Screening Levels (ESLs) and ecological investigation levels (EILs) for soil listed in **Table 16**. The ESLs and EILs have limited application under the current Site use scenario (**Section 4.3**), however would be applicable to future garden and landscaped areas should they be present within a future development (within a commercial/ industrial context). The below apply to soil less than 2 metres in depth as root zone and habitation of many species typically within 0-2 m depth only.

Table 16 Ecological – soil criteria

Compound	Relevant criteria
TRH Fractions, BTEX and benzo(a)pyrene in Soil:	ESLs for Commercial/ Industrial, Coarse Soil Source: Table 1B (5) ASC NEPM (NEPC, 2013). Typically applicable to top 2 m of soil.
Lead, naphthalene, arsenic	Generic Added Contaminant Limit (ACL) (Lead) and EILs (naphthalene, arsenic) for commercial/ industrial land use Source: Table 1B(4) and 1B(5) ASC NEPM (NEPC, 2013).
Chromium (III), copper, zinc, and nickel	Site specific EILs for commercial/ industrial land use (ACL+ Ambient Background Concentration (ABC) = EIL) Source: ACLs in Table 1B(1), Table 1B(2) and Table 1B(3) ASC NEPM (NEPC, 2013). ABCs for old suburb and high traffic in NSW (Olszowy et al. 1995) in ASC NEPM Schedule B5c.
PFAS – PFOS and PFOA	Ecological direct and indirect exposure values* Source: Table 3, NEMP 3.0 (HEPA, 2025) *It is acknowledged that the soil ecological criteria presented in the NEMP are interim values. The NEMP states that indirect exposure value may be over-protective where the area of exposed soil is too small to have any material impact on food chain transfer to secondary consumers, for example if: • the site is intensively developed with greater than 80% of each hectare covered by hard surfaces (to be applied separately to each hectare). • secondary consumers are effectively absent from the site • the site is situated in an extensively built-up urban setting • the site is not in close proximity to waterways, drainage networks or groundwater As the site has not been demonstrated to meet the above, the more stringent criteria has been selected (0.003 mg/kg for PFOS) as a conservative screening measure.

5.2.3 Management limits

Beyond the screening assessment against human health and ecological criteria, other adverse effects of PHC contamination may be a consideration. The effects include:

- free phase formation
- fire and explosive hazards
- effects on buried infrastructure.

Management limits (MLs) have been derived to assess for these effects and are typically applied after consideration of the relevant HSL and ESL criteria. The ML criteria for coarse soil for a commercial/ industrial scenario have been adopted from Table 1B (7) ASC NEPM (NEPC, 2013).

5.2.4 Aesthetics

Any residual aesthetic issues identified would be considered in the appropriateness of the remediation or the suitability of a site in accordance with the NSW Auditor Guidelines 3rd Edition (2017) and the ASC NEPM. For example, highly malodours or discoloured soils or extracted groundwater or large deposits of refuse material requires balanced consideration of the quantity, type and distribution of foreign material or odours in relation to the specific land use and its sensitivity.

5.3 Groundwater assessment criteria

5.3.1 Human health

The adopted groundwater criteria for commercial/ industrial workers, intrusive maintenance workers and offsite recreational receptors are listed in **Table 17**.

Direct contact with groundwater may also occur if an excavation intercepts the water table. This pathway has not been considered in this section. These works usually require health and safety procedures to be followed. Excavation works proposed for remedial purposes may intercept shallow groundwater, either during SAE or utility removal. Potential risks related to these instances are to be managed under health and safety protocols during the remediation, as per management plans outlined in **Section 1.6**.

Direct contact exposure with residual groundwater impacts following the proposed modification would be managed by the controls defined by one or more EMP(s) including restriction on groundwater abstraction and health and safety protocols for intrusive maintenance works.

Table 17 Human health – groundwater criteria

Compound	Exposure pathway	Relevant criteria
TRH Fractions, BTEX, and naphthalene in groundwater. <2 m[1], 2-4m, 4-8 m, 8m+ depths	Vapour intrusion/ inhalation – commercial/ industrial land use scenario[2]	Groundwater HSL (HSL-D) (Sand) Source: Table 1A(4) ASC NEPM (NEPC, 2013) or measurement of soil vapour (refer to **Section**).
TRH Fractions, BTEX, and naphthalene in groundwater: All depths where trenching may occur. Noting that deep trenches are likely to require specific health and safety procedures.	Vapour intrusion/inhalation – intrusive maintenance worker[3]	Groundwater HSL (Int. Main. Worker) Sand. Source: CRC Care 2011, Technical Report 10, Part 2 - Table A2 or measurement of soil vapour (refer to Section)

Compound	Exposure pathway	Relevant criteria
PFAS All depths	Human Health – recreational users[4]	Recreational water quality guideline value Source: Table 1, NEMP 3.0 (HEPA, 2025), to be applied to monitoring wells at the down hydraulic gradient boundary of the Site, protective of offsite recreational water users including incidental ingestion during garden watering.
BTEX, metals, VOCs and SVOCs (including CHCs) All depths	Human Health – recreational users[4]	To be applied to monitoring wells at the down hydraulic gradient boundary of the Site, protective of offsite recreational water users. ADWG values multiplied by a factor of 10 Source: Australian Drinking Water Guidelines (ADWG), (National Health and Medical Research Council (NHMRC), 2011, updated June 2025) Where there is no guideline value is available, the laboratory protocol LOR is applied as a screening value. Where the protocol LOR is exceeded, the concentration is compared to the US EPA RSLs for drinking water (with 10 fold factor applied).
TRH Fractions, BTEX, and naphthalene in LNAPL	Vapour inhalation	Not assessed as HSLs are not applicable, and site specific risk assessment may be required. Risk via vapour intrusion can be assessed through soil vapour, provided LNAPL is shown to be stable and not spreading. LNAPL needs to be remediated to such an extent that further removal or treatment of LNAPL no longer reduces the level of risk. In general, LNAPL clean-up would continue if the LNAPL (or associated dissolved phase) is still spreading. This is not observed to be the case within the Project Area based on extensive remediation and monitoring completed at the Site to date, as evidenced in the groundwater monitoring data and associated reports (refer to **Section 3.4**).

1. For shallow groundwater (<2 m), measurement of soil vapour, or a site-specific risk assessment is recommended because of the sensitivity of the derived HSL to the depth of the groundwater. Small variations in water level (such as those related to rainfall or tidal influence) can change the HSL significantly, and can also affect the potential for direct contact with the contaminated groundwater (e.g. by utility trench workers).
2. The industrial/commercial HSL criteria assumes activities being undertaken align with the exposure assumptions presented in CRC Care Technical Report 10 including adult person working at premises for eight hours per day, five days per week for thirty years.
3. For intrusive maintenance workers it is assumed that the activities being undertaken align with the exposure assumptions presented in CRC Care Technical Report 10 including activities occurring for less than 1 year.
4. Recreational criteria for offsite receptors have been adopted as a conservative screening criteria. The recreational criteria are the NHMRC (2011, updated June 2025) ADWG with a factor of 10 applied. Drinking water criteria has not been adopted as groundwater is not used for potable water in the area.

5.3.2 Ecological receptors

Groundwater results at adjacent down hydraulic gradient Site boundaries identified offsite ecological receptors (presented in **Section 2.3** and **Section 4.3**) would be screened against the appropriate ecological criteria which are listed in **Table 18**. The primary document in Australia for the consideration of ecological criteria is the Australian and New Zealand Guidelines for Fresh and Marine Water Quality (Australian and New Zealand and Australian State and Territory Governments (ANZG), August 2018). The ANZG 2018 presents criteria for both freshwater and marine systems for four levels of species protection (99%, 95%, 90% and 80%).

There are a range of aquatic environments surrounding the Site including Marton Park Wetland, mangroves in Quibray Bay and surrounding estuarine creeks including within Towra Point Nature Reserve which ultimately discharge into Botany Bay and the Tasman Sea. These environments range from slightly to moderately disturbed to highly disturbed. The ANZG 2018 guidelines recommend the most conservative criteria from fresh and marine criteria are adopted for estuarine environments as salinity levels vary.

The Water Quality Guidelines (ANZG, 2018) advise to apply 95% species protection default guideline values (DGVs), or 99% species protection for highly bioaccumulating toxicants in slightly to moderately disturbed systems. This approach is generally adopted for chemicals that bioaccumulate and biomagnify in wildlife.

Table 18 Ecological – groundwater criteria

BTEX, Metals, PAHs, Phenols, VOCs/SVOCs (including CHCs), OCs, OPs, PCBs, pesticides in groundwater.	Groundwater migration to offsite ecological receptors	Marine and freshwater ANZG criteria (most conservative value) with 95% species protection and 99% for bio-accumulative compounds. Source: ANZG, 2018
PFAS – PFOA and PFOS	Groundwater migration to offsite ecological receptors	95% and 99% interim marine/freshwater for PFOS and PFOA* based on discharge points being the Sir Joseph Banks Drive channel (95%) and onsite wetland (99%) Source: Table 5, NEMP 3.0 (HEPA, 2025)

5.4 Soil vapour assessment criteria

Soil vapour criteria is listed in **Table 19**.

Table 19 Human health – vapour criteria

Compound	Exposure pathway	Relevant criteria
TRH Fractions, BTEX, and naphthalene	Vapour inhalation	Soil vapour HSLs (HSL D) Sand. Source: Table 1A(5) ASC NEPM (NEPC, 2013).
VOCs including CHCs	Vapour inhalation	Interim HILs for VOCs[6] Source: Table 1A(2) ASC NEPM (NEPC, 2013). For VOCs detected above LOR, but not included in the NEPM, USEPA RSLs for industrial air will be used as a basis for deriving Tier 1 criteria based on NEPM attenuation factors.

[6] For individual VOCs where interim HILs are not available (or considered overly conservative), site specific criteria may be derived based on a quantitative risk assessment.

6.0 Extent of remediation and management required

6.1 Overview

For the current operational use of the Site as a fuel terminal, the remediation objectives are set out in the RAS and are met through the completed and ongoing remedial activities detailed in this strategy and through the Site's management controls. Under the proposed modification, remediation is proposed in particular areas or focused on specific activities, including:

- Addressing legacy refinery contamination to reduce mass of PHC and VOCs contamination and remove ongoing sources
- Removing LNAPL within SAEs opportunistically where present to mitigate potential future vapour intrusion risk, and subsequent groundwater monitoring to confirm reduction in dissolve phase PHC and VOCs in groundwater
- Removing PFAS impacted shallow soils from source areas (such as the FFTA) and disposing of them offsite, to permanently reduce PFAS mass onsite and, over time, PFAS leaching and migration to groundwater and surface water thereby improving groundwater quality.

As LNAPL has been delineated onsite and does not present an offsite migration risk, the removal of LNAPL or volatile COPC (PHC and VOC) within SAEs would be undertaken to mitigate any potential vapour intrusion risks that the LNAPL presents. This approach is consistent with the overall remediation strategy and is devised to maximise, to the extent practicable, its potential future uses as commercial industrial land.

As part of the management and maintenance of surface water flows during MOD7 works, there will also be excavation to increase the onsite stormwater detention (OSD) capacity of the open drainage channel present on the western boundary of RPIP (shown on **Annex A, Figure F2**). The drainage channel will be reinstated in line with any existing EPL conditions. Further reference to the OSD works in this Report will be grouped with activities related to the consolidation of operational infrastructure (e.g. OWS and FWS removal). Further information relating to the OSD can be found in SSD-5544 MOD7 Appendix I – Technical Report – Surface Water, Wastewater and Flooding.

It is noted that data gap investigations at the Site are ongoing, and may affect the nature and extent of identified remediation areas. Where changes to remediation required are minor and are sufficiently addressed by the methodologies and volumes set out in this RAP, the required amendments would be addressed in the subsequent RWP(s). If the required remediation approach is not covered by this RAP, further development consent would be sought.

6.2 Soil / Fill / LNAPL

The remedial excavations targeting LNAPL and PHCs would predominantly be limited by the depth of groundwater, typically less than 4 mbgl, with excavation to target the smear zone within 1 m of the groundwater table. Excavations would be generally focused on horizons within 1 mbgl, including soil impact, LNAPL (in limited areas), and possible soils/sludges in the OWS system and surrounds. In areas with LNAPL impacts, the overlying unsaturated soils would be removed to the extent practicable to reduce the mass of PHC contamination. If free phase LNAPL is visually present on the excavation pit water, it would be removed and transferred to dedicated containers for offsite disposal.

Measurable LNAPL presence based on the 2024 quarterly groundwater monitoring (WSP, 2025d; WSP, 2024f; WSP, 2024c; WSP, 2025i) was observed within nine wells within the Project Area, three of which (W14, W15 and W16) were within the Audit Boundary, within the eastern portion of Zone 2 (DU16 eastern tank farm). LNAPL thickness varies between 1 mm and 50 mm. Depth to LNAPL in this location ranges from 3 to 4 mbgl. If feasible, excavation in this area would continue into the water table, removing up to one metre of the saturated zone to target secondary source smear zone soils which likely contain residual LNAPL. It is noted that excavation in loose grounds such as that within the terraced areas (DU16, eastern tank farm) may not be feasible due to poor ground stability. Additional geotechnical feasibility assessments would further inform the RWP development.

The six other LNAPL wells are located within the north western tank farm within Zone 1, outside of the Audit Boundary. Proposed trenching works for the FWS may intersect this area. Groundwater in the north western tank farm is at depths ranging from 1.4 to 2.5 mbgl, with LNAPL thicknesses varying between 1 mm and 0.75 m. **Annexure A, Figure F4** displays the locations of LNAPL, dissolved phase exceedances of saturation limits (PHC), soil exceedances of HSLs (PHC and CHC), and soil vapour exceedances of HSLs (PHC and CHC).

Excavation at the FFTA is proposed to reduce the residual mass of PFAS in soils at the Site. The soil in this area has been characterised (WSP, 2025c), and the excavation extents will be guided by those findings. Whilst soil PFAS concentrations in this area only have limited exceedances of Site criteria (ecological indirect exposure), leaching from the soils has been identified as a source of PFAS in groundwater at the Site, whilst there is also a potential risk to offsite ecological receptors. Addressing these PFAS impacts in soil will reduce the mass PFAS leaching from the Site, which will in turn improve the groundwater condition and reduce risk to off-site ecological receptors.

6.3 Groundwater

Groundwater exceedances of HSLs (PHC and CHC) are presented in **Annexure A, Figure F4**, and introduced in **Table 8** of **Section 4.1**.

The groundwater conditions at the Site are expected to improve following soil / fill / LNAPL remediation on the basis of the following:

- Primary sources: With the removal of the OWS in Zone 2 and Zone 3, all potential primary sources related to the former refinery operations and the associated infrastructure within the Audit Boundary would be removed
- Secondary sources: residual LNAPL impacts would be addressed as part of the soil remediation works through excavation to the extent practicable. As part of these works, impacted water may accumulate in these excavations; this would be managed via pumping (sent to the Site's existing WWTP (Zone 1) for treatment, outlined in **Section 7.5.3.2**
- Secondary sources: residual PFAS impacts in soil would be addressed as part of the soil remediation works through source area excavation and offsite disposal, which will permanently reduce PFAS mass onsite and, over time, PFAS leaching and migration to groundwater
- Ongoing monitoring: Following soil remediation, groundwater monitoring would continue to confirm that the soil remediation works were effective in mitigating future impacts to groundwater. The soil remediation process itself will significantly improve groundwater conditions over the long term, assisted by natural attenuation (this process involves allowing naturally occurring micro-organisms in the ground to biodegrade hydrocarbon contamination). Any residual groundwater impacts requiring ongoing management would be addressed as part of an EMP.

While active groundwater remediation is currently taking place within Zone 1 (Jet Fuel Remediation and Northern Tank Farm AECs), active groundwater remediation is unlikely to be necessary within Zone 2 and 3 following source area excavation and OWS removal as historical primary sources associated with the refineries would have been removed. In the unlikely event that groundwater contamination presents a risk following completion of soil and LNAPL remediation, contingency measures as outlined in **Section 7.6** would apply and further remedial options, including but not limited to remedial capping works would be used to manage residual risks. For residual groundwater contamination that requires engineering controls and/or management (but not active remediation) this would be address as part of an EMP. If required, additional active remedial actions would be covered under a future development application and/or SSD modification.

6.4 Source areas to be remediated

The determination of the extent of soil and LNAPL remediation required is based on existing data summarised in **Table 20** below, with data locations presented spatially on **Annexure A, Figure F4**. The remedial extents are shown on **Annexure A, Figure F5**. As a conservative measure, all historical exceedances have been screened against the shallowest depth profile. This approach was taken to provide flexibility and a degree of conservatism for future remediation and development stages, as future land surface levels will not be known until the submission of the subsequent KEIP application.

Table 20 Summary of Source Areas requiring remediation

Source Area	Area / (depth)	Data	Action / Details	Proposed Treatment Method
Project Area				
OWS and FWS trenches and OSD excavation for RPIP	32,400 m^2 (1 to 4.5 m)	Refer to **Annexure A, Figure F2** for locations of infrastructure relocations and removal trenching in Zone 1, and areas of noted LNAPL presence / criteria exceedance (groundwater, soil vapour, and soil). **Exceedances of HSL D are present at seven locations within the northwest and northeast tank farm (WSP, 2024c, 2024f, 2025d, 2025i).**	These materials will be excavated during trenching for the removal and augmentation of services including modification of existing drainage channel at RPIP. Worst case assumption, the entire footprint of trenching assumed to be potentially impacted with asbestos and PHC. The depth listed is guided by proposed trenching works based on estimated depth of services.	Excavated soils will be tested and where required, soils will be biopiled. Soils will be either reused onsite where suitable or scheduled for offsite disposal.
Zone 1 (Outside of Audit Boundary)				
Former LPG Area	9,200 m^2 (up to 0.15 m)	**Soil** Asbestos has been detected in surface soils at concentrations that present as an operational safety risk if disturbed.	To address potential risk to current terminal workers, a surface scape of 150 mm of the asbestos impacted shallow soil is proposed, to remove the direct contact risk to operational Site users. It is noted that this area is within Zone 1, an area that will not be subject to the subsequent KEIP RAP and its associated capping works.	Scheduled for offsite disposal.
Zones 2				
SAE 1 (PHC) DU12: Former Central Process Units	4,000 m^2 (up to 3.0 m)	**Soil** DGA (WSP, 2018) found exceedances of HSL D of TRH F1 at 18 locations across DU12. These results are from 2018, and PHC has likely attenuated further since the primary sources were removed in 2016. **LNAPL** Not present, and saturation limits not exceeded (WSP, 2024c, 2024f, 2025d, 2025i).	Allowance for excavation to remove smear zone soils has been made. Pre-remediation assessment will be undertaken to confirm the 2018 results, and refine remedial requirements (data gaps discussed in **Section 6.5**).	Where possible, biopiled, and made suitable for onsite reuse, otherwise scheduled for offsite disposal.

Source Area	Area / (depth)	Data	Action / Details	Proposed Treatment Method
		Groundwater Exceedances of HSL D are present at two locations within DU12 (WSP, 2024c, 2024f, 2025d, 2025i). **Soil Vapour** Limited data is available. No HSL VI risk has been identified, though if more conservative HSLs are applied (0-1m depth) one exceedance is present. Additional investigation required to confirm requirement for remediation.		
SAE 2 (PHC) DU16: Former Eastern Tank Farm	10,050 m^2 (up to 4.9 m)	**Soil** Exceedances of TRH F1 for HSL D at eight locations. All exceedances found during depth profiling exercise, at depths between 4.5 and 9.0 mbgl, within the saturated zone (WSP, 2023b and 2023e). **LNAPL** Present in three locations, W14, W15, W16. Saturation limits exceeded at 12 locations (WSP, 2024c, 2024f, 2025d, 2025i). Average depth to water at these locations is 3.9 mbgl. **Groundwater** Exceedances of HSL D are present at 14 locations within DU16 (WSP, 2024c, 2024f, 2025d, 2025i).	Excavation to remove LNAPL and smear zone soils. Pre-remediation assessment would be undertaken to refine the volume and extent of excavation and confirm ground stability (**Section 6.5**).	Where possible, biopiled, and made suitable for onsite reuse, otherwise scheduled for offsite disposal.
SAE 3 (PHC and CHCs)	8,800 m^2 (up to 2.8 m)	**Soil** DSIs in the area have identified 17 exceedances of PHC for HSL D (WSP,	Excavation of soils from the footprints of the LNAPL / groundwater / CHC exceedances, targeting extents of highest concentration.	Where possible, biopiled, and made suitable for onsite reuse,

Source Area	Area / (depth)	Data	Action / Details	Proposed Treatment Method
DU10: Former Southern Process Unit		2018 and WSP, 2025f) at depths between 0.5 mbgl and 2.0 mbgl. No CHC's have been detected in soils. **LNAPL** LNAPL not present. Saturation limits exceeded at 4 locations (PU101, PU08, PU59, PU111)(WSP, 2024c, 2024f, 2025d, 2025i). Average depth to water at these locations is 1.8 mbgl. **Groundwater** An exceedance of HSL D is present at one location within DU10 (WSP, 2024c, 2024f, 2025d, 2025i). Exceedances of HH criteria for CHC are present in 10 locations (WSP, 2025f). **Soil Vapour** 14 exceedances of HH criteria for PHCs, five of which also exceed HH criteria for CHCs.	Pre-remediation assessment would be undertaken to refine the volume and extent of excavation.	otherwise scheduled for offsite disposal.
SAE 4 (CHC) DU11: Former Workshop	1,000 m^2 (up to 2.8 m)	**Soil** No exceedances of HH criteria detected for CHC in soil (WSP, 2025f) **Groundwater** Exceedances of HH criteria for CHC are present in 10 locations (WSP, 2025f). **Soil Vapour** Three exceedances of HH criteria for CHC area present within DU11, two of which are located within the footprint of the	Excavation of soils from the footprint of the former hydroblast bay, from sub-slab to smear zone. Pre-remediation assessment would be undertaken to refine the volume of excavation in order to address the vapour intrusion exceedances (**Section 6.5**).	Where possible, biopiled, and made suitable for onsite reuse, otherwise scheduled for offsite disposal.

Source Area	Area / (depth)	Data	Action / Details	Proposed Treatment Method
		hydroblast bay. The third location is located down hydraulic gradient from the hydroblast bay.		
SAE 5 (PFAS) DU14: FFTA	5,000 m^2 (up to 2 mbgl)	**Soil** PFAS is detected in 54 of 91 samples in the FFTA, in concentrations ranging from 0.02 mg/kg to 1.78 mg/kg (total PFAS). The PFAS CSM has identified the FFTA as a soil source of PFAS at the Site (WSP, 2025c). This includes eight exceedances of indirect ecological criteria (all land uses) in soil (WSP, 2025c) **Groundwater** PFAS in monitoring wells south of the FFTA exceed recreational criteria. Surface water monitoring of the adjacent Ampol owned wetland also exceed recreational criteria in the nearest monitoring location.	Excavation of soils from the FFTA footprint to reduce the Site's total PFAS mass in soils.	Scheduled for offsite disposal.
Zone 3				
SAE 6 (ACS) DU01: RPIP Mountain	32,500 m^2 (based on depth of root mass, estimated 1.0 mbgl)	**Soil** Asbestos contamination, both friable and non-friable, found throughout the area from surface through to the maximum depth of investigation (1.8 mbgl), with a larger cluster of asbestos contamination found in test pit samples between depths of 0.1 - 0.5 mbgl in the south east portion. (AECOM, 2023d).	Management of surface asbestos and asbestos impacted root zone, involving root zone removal, and surface treatment to address the asbestos contaminated fill within an uncontrolled vegetated setting. Refer to **Section 7.5.3.3.1** for further details.	Soil segregation with asbestos and organic matter scheduled for offsite disposal.

6.5 Data gaps to be addressed prior to remediation

This RAP has been prepared through review of historical information that has been deemed reliable and representative. This data is consolidated in **Table 8** of **Section 4.1**, which presents all recorded exceedances of site assessment criteria, and in **Table 20** in **Section 6.4** and the corresponding figure **Annex A Figure F4** which presents all exceedances which have been considered to require remedial excavation. The data is considered sufficient to develop this RAP. It is recognised that data gaps in knowledge do exist. These are presented in **Table 21** below. These data gaps would be addressed through additional investigations completed to inform the development of the RWP(s). These works would allow for the refinement of SAEs (i.e. soil extents and volumes) and excavation method / staging.

Table 21 Focus areas for additional assessment

#	Focus areas
1	**PHC data set:** Further data collection would support the refinement of identified areas of contamination, and address data gaps. Data includes soil, groundwater, or soil vapour. It is also recognised that structures occupy the central portion of Zone 2. As a result there are some limitations associated with characterisation of ground conditions beneath buildings.
2	**Other COPCs:** Further sampling for COPC that may have been used at the Site, such as specific process chemicals (such as MTBE, TEL, and MEK), and chemicals used in the operation of a refinery (such as chlorinated cleaning agents, and PFAS containing foams / concentrates). Where historical data for other COPC does not satisfy density requirements, a focus area for additional assessment would include the sampling for these specific chemicals within discrete historical source areas.
3	**Services removal and relocation condition:** As part of the MOD-7 works the removal and / or relocation of services such as the oil water sewer, firewater and electrical assets would be undertaken. The condition of materials and soils at these locations would be further investigated as historical targeted investigations are limited due to safety restrictions associated with sampling beneath live services. This is of particular importance for OWS, which may present a source for PHC contamination to surrounding materials in the event of a break in containment. The fill surrounding the OWS pipes has also not been fully characterised and a pre-demolition hazardous material survey is required for substations and any other structures.
4	**Validation of historical results:** Generally, the condition of soils across the Project Area have been investigated to varying extents. In areas, the condition of these soils have been subject to change since the completion of these investigations, either through ongoing site maintenance and continued use, or through distinct management activities such as; levelling, capping, and/or remediation, or through natural processes. The completed DGA for SAQP (AECOM, 2025e) considered the relevance and reliability of historic results against these local factors. Through this review, data was assessed and select data was determined to be representative and reliable, whilst some investigation results have been excluded from assessment. Additional assessments would support data gaps (spatial, temporal) which might have arisen from the outcomes of this review.

7.0 Remediation action plan

7.1 Introduction

Historically, Zones 2 and 3 supported fuel refinery (from 1956) and lubricants refinery (from 1963) operations, until their eventual closures (2010 and 2014 respectively) and decommissioning (with regrading of the former footprints completed in 2018). Ampol is proposing to remediate the soil and manage groundwater within the parts of the Project Area, to support the ongoing viable, safe, reliable, and sustainable use of the Kurnell Terminal. Ampol's overall objective is to make the Site suitable for future commercial/industrial land use.

In order to meet the remediation objectives outlined in **Section 1.2**, the following actions must be taken:

- Refine through additional investigation the volume and extent of soil impacts that require remediation
- Remediation of soil impact extents identified within the Audit Boundary and Project Area to a level that meets the relevant remedial objectives, organised as follow based on source type:
  - Volatile COPC: Reduce contamination such that vapour intrusion does not prevent the land being deemed suitable for use as per its approved zoning
  - Asbestos in soils: Remove targeted sources of asbestos impacted soil where presence might impact the ongoing viable, safe, reliable and sustainable use of the Kurnell Terminal
  - PFAS in soils: Reduce total contaminant mass at the Site and potential leaching to groundwater
- Removal of legacy OWS infrastructure within the Project Area.

7.2 Hierarchy of remedial options

In accordance with the ASC NEPM (2013), the preferred hierarchy of options for site remediation and management of soil contamination is:

1. Onsite remediation of soil contamination, so that the risk associated with the contaminant is reduced to an acceptable level.
2. Offsite remediation of excavated soil, so that the risk associated with the contaminant is reduced to an acceptable level, after which it is returned to the site.

If it is not possible for either of the above options to be implemented, then other options for consideration can include:

1. Containment of the contamination onsite either in-situ with appropriate controls that reduce the risk to an acceptable level, or in an appropriately designed and managed containment facility.
2. Removal of contaminated soil to an approved site or facility, and replacement with clean fill where necessary.
3. Adoption of a less sensitive land use or controls onsite activities that would reduce the need for remedial works.

As part of the identification and selection of remediation options, consideration has been given to the hierarchy above so that remedial options are selected that provide a permanent solution without the need for ongoing control, where feasible.

7.3 Remedial options assessment

Remedial measures can be used to effectively remove or mitigate exposure pathways to human health or the environment. For the Project Area, the application of a single remediation technique is not appropriate or able to be scaled accordingly based on the character and volume requiring treatment. Remediation of the Project Area is complex based on the CSM which consists of a number of COPCs and the potential for a range of concentrations and source media. Therefore, multiple remedial approaches are required to achieve the remediation objectives.

The soil remedial options assessment consisting of the remedial method, description, merits, and disadvantages of each soil remediation technology applicable for the Project Area were assessed as shown in **Annexure D**.

The shortlisted remediation options that were carried forward for this RAP include:

- No remediation and site management plan only
- Excavation and onsite treatment via passive or mechanical biopiling
- Onsite management of asbestos impacted materials (in accordance with the Site's OEMP and AMP as detailed in **Section 4.4.1**)
- Excavation and offsite disposal to licenced landfill
- Onsite containment by capping (not part of the proposed modification and subject to separate approval under KEIP).

Some remediation technologies were excluded at this stage as they were:

- Unlikely to achieve the objectives within an acceptable timescale (e.g., passive remediation methods unlikely to be effective at meeting remedial validation criteria)
- Impractical to implement such as in-situ remedial technologies that have less certainty based on the uniformity of soil treatment such as homogenising the media and directly amending biodegradation parameters and/or adsorption rates. Ex-situ treatment is preferred given the soils would be excavated and managed aboveground.
- High in cost without delivering corresponding benefits in implementability, operation, or effectiveness..

Preferred remediation approaches were selected based on the feasible remedial soil options identified (remedial option assessment included as **Annexure D**). Some components of the remediation have been deferred to a subsequent development application (i.e. capping) as future development works are likely to comprise civil earthmoving works which would take place in concert with the capping.

Groundwater impacts at the Site are centred around historical primary sources. Exceedances of relevant onsite human health criteria are limited and have been presented on **Annexure A Figure F4**, and in **Annexure C Table T03**. The exceedances are generally isolated to those areas already identified in soil and LNAPL source areas that are the subject of remedial excavation works. A groundwater remediation options assessment was not undertaken as this RAP contemplates the consequential improvement in groundwater conditions expected as a result of the planned soil remediation. Depending on the outcomes of the post soil remediation groundwater monitoring, the effectiveness of the remediation in achieving the stated groundwater remedial objectives would be assessed. Where required, further groundwater investigation including risk assessment and plume stability modelling would be conducted as part of the DGA. These works would further inform the need for direct remediation of groundwater.

7.4 Preferred remediation approach and rationale

A combination of remediation technologies for soils is preferred at the Project Area to achieve the remediation objectives. These are as follows:

- Primary source removal: removal of remaining OWS in Zone 2 and Zone 3, following which all potential primary sources related to former refinery operation and related infrastructure within the Audit Boundary will have been removed.
- Secondary source remediation: Excavation of impacted soils followed by either onsite treatment or offsite disposal to landfill which is consistent with the preferred soil remediation hierarchy:
    - Onsite treatment would comprise ex-situ bioremediation by mechanical biopiling (e.g. controlled aeration using extraction systems) for the reduction of PHC, CHC, and VOC constituents in soils. This is the preferred approach over alternatives like mechanical tilting of soils with an excavator, which would otherwise disturb the material and increase the potential for releasing residual asbestos fibres.
    - Offsite disposal would be considered where contaminated soils cannot be treated and reused or managed in situ. The untreated and tested contaminated soils would be disposed offsite to an appropriately licenced facility by licenced contractors.
    - As friable asbestos has been identified to be present within fill soils at the Site, biopiling would involve appropriate design features (e.g. vacuum-assisted negative pressure systems to manage airborne fibres) and be undertaken under appropriate occupational health and safety controls.

The soil remediation works within the Project Area would be complemented with management controls where comprehensive remediation is not deemed as practicable. Management measures can also be useful where clean-up to the extent practicable has been achieved (e.g., post LNAPL removal during remediation, restriction on groundwater abstraction whilst natural attenuation continues to reduce concentrations of dissolved phase hydrocarbons).

7.5 Remedial strategy and staging

To support the continued viable, safe, reliable, and sustainable operation of the Kurnell Terminal the remedial strategy will be delivered in the following stages:

- **Stage 1 – Preparation works**: Preparing the Project Area for proposed modification works.
- **Stage 2 – Removal, relocation and/or augmentation of infrastructure**, including:
    - Relocation and/ or augmentation of FWS and OWS systems and construction of new operational facilities, including replacement warehouses
    - Decommissioning and removal of non-operational assets, redundant structures and electrical assets
- **Stage 3 – Remediation**: Addressing legacy ground contamination in specific locations across the Site
- **Stage 4 – Demobilisation**: Demobilisation of construction and remediation equipment.

The works completed under this RAP will be complemented by the future KEIP RAP, and together the two documents will facilitate works to make the site suitable for commercial / industrial use. The division of these approvals is shown in **Figure** 2 below.

It is noted that remediation is likely to progress by areas, either by DUs based on given sources, or based on areas that reflect future development footprints (yet to be defined). Depending on where different works are required across the Site these stages may be completed sequentially or concurrently. The remedial works would be undertaken guided by the implementation of the RAPs, RWPs, and the CEMP, in order to achieve commercial / industrial end point.

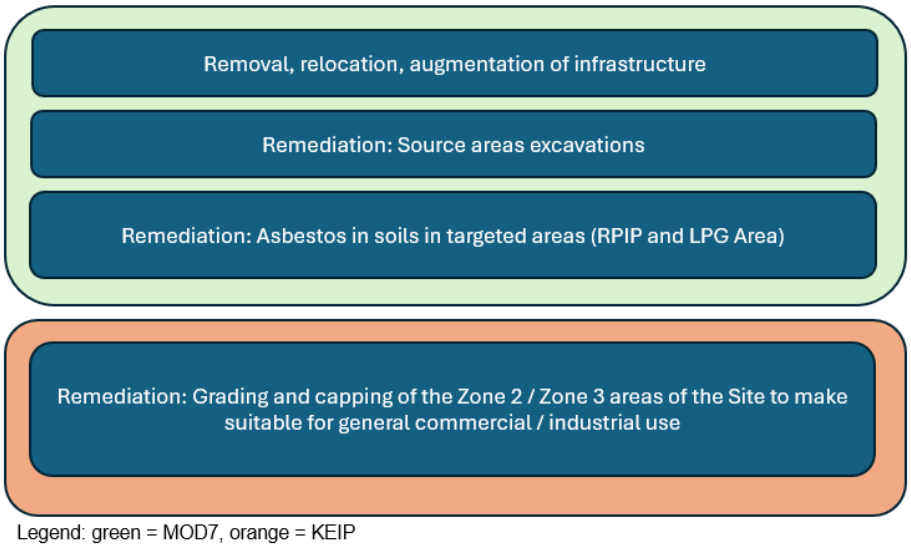

Figure 2 Remedial approvals strategy

7.5.1 Stage 1 – Preparation works

In order to prepare the relevant parts of the Site for the proposed modification and associated remedial works, the following activities would be completed:

- Installation of fencing and signage to separate terminal activities and parts of the Site outside the Project Area from where the proposed modification works would occur
- Establishment of temporary facilities (e.g. site offices) and parking for construction workers within the Site
- Removal of vegetation, where permitted and required
- Installation of temporary erosion and sediment controls for the proposed modification works
- Establishment of access to services/ utilities
- Service locating would be undertaken across the Project Area to confirm the location and type of active services.

These activities are discussed in the Modification Report.

7.5.2 Stage 2 – Removal and/or relocation of infrastructure

Following preparation works, certain structures and infrastructure would either be permanently demolished and removed or reconstructed in Zones 1 and 1A, or augmented. The proposed infrastructure removal, relocation, and/or augmentation works are described in the sections below. Further details of these activities are discussed in the updated description of the proposed modification (Appendix B of the Submissions Report).

7.5.2.1 Oily water sewer

The proposed modification works include the removal of the OWS (including all pits and pipework) from Zones 2 and 3, except for a connection to the ACS Containment Cell wastewater sump and a proposed OWS diversion line from west of the ACS Containment Cell toward Zone 1 (presented on **Annexure A, Figure F2**).

The works to remove the redundant sections of the OWS in Zones 2 and 3 would be undertaken progressively so that the OWS can help support the remediation activities described in in **Section 7.5.3** (Stage 3 – Remediation). During remediation activities, surface water could potentially enter excavations where remediation activities are occurring and become contaminated. Potentially contaminated water from surface water flows or excavations, would be sent to the OWS and on to the WWTP for treatment. Potentially contaminated surface water flows would be captured by the existing OWS until a time that contamination sources are removed and soil remediation and treatment is undertaken in each area. As such, some sections of the OWS in Zones 2 and 3 may only be removed following certain remediation activities (Stage 3).

Prior to the removal of the relevant sections of the OWS from Zones 2 and 3, the surface water flows from areas serviced by the OWS would be either:

- Intercepted or diverted to the remaining sections of OWS via modifying interception infrastructure (such as existing pits, manholes, storages) or the installation of temporary pipes, pits, and pump stations; or
- Captured/ contained and transported directly to the WWTP.

Where the relevant area is unlikely to result in contaminated surface water (e.g. due to remediation activities being complete), these surface water flows would continue to be directed to the Site's existing SWS.

To assist with the transition of parts of the Site from the OWS to the SWS and to help ensure that the OWS can support remediation activities, the OWS would be augmented in the south eastern part of Zone 2. A new permanent pump station would be installed to support the upgraded OWS in capturing flows and directing them towards the WWTP. The new pump station would operate intermittently, following periods of heavy rainfall. In addition, an emergency storage tank would be installed adjacent to the pump station to provide additional storage in case of pump failures or a loss of power. The pump would have a well of 20 kilolitres (kL) in capacity, whilst the emergency storage tank would have a volume of 130 kL.

The pumps at the pump station would be installed in a sealed chamber below the existing ground level, at a minimum water level and therefore permanently submerged. The emergency storage tank would be installed next to the pumps below ground. A benched pit[7] of around 12 m by 31 m would be required. Excavations of approximately 4.5 mbgl would be required, based on a 4 m deep pit, and an additional 0.5 m concrete slab, which would be installed at the base of the pit. Two options for the location of the new pump station and emergency storage tank are being considered. Only one option would be constructed, which would be confirmed during detailed design.

The selected option would be connected to the existing OWS in Zone 1, to the north west of the ACS Containment Cell. The pipeline would function via gravity; as such, it would lie above and belowground, depending on the topography of the land. For belowground sections, excavations of up to 3.5 mbgl would be required. For aboveground sections, 0.5 m deep footings would be required every 4 m.

The OWS that services the ACS Containment Cell would not be removed. Leachate would continue to be collected by the existing sumps and directed to the OWS in Zone 1 via the retained OWS.

The removal of OWS infrastructure may require excavation work of up to 3 mbgl for removal of below ground pipework and pits. Where complete removal is not feasible due to proximity to existing infrastructure or other considerations (e.g. geotechnical), existing pipes and/or pits would be cleaned, infilled with stabilised sand, cement slurry, or equivalent, and left in-situ. Underground infrastructure left in place would be documented in an EMP(s), which would fall under the Site's existing OEMP.

[7] The pit itself would be 5 m by 25 m. Benches of about 3 m either side of the pit have been assumed.

Excavated soil from below ground sections of OWS services and footings would be stockpiled based on visual and olfactory evidence, field screening, and laboratory data. Contaminated soils would be stockpiled separately depending on the type and concentrations of contamination present and the remediation technology required. Soils would be temporarily stockpiled in vicinity of the work zone whilst being characterised and either transferred to the waste management area for remediation, if required, or if suitable, reinstated within the Project Area. Once removed, redundant pipes and materials from the OWS would be sent offsite for recycling or disposal based on material type and waste classification. If present, any seepage water accumulating into the excavations would require characterisation and where required, its suitability assessed for disposal to the WWTP (or alternative treatment/disposal method).

7.5.2.2 Firewater systems

In order to align the FWS with the current terminal footprint, the FWS infrastructure in Zones 2 and 3 would be augmented or removed and, where necessary, replaced or augmented in Zone 1. These works would include:

- Installation of new firewater pipelines, relocated pumps, and the construction of a new three megalitre (ML) firewater tank in the FWS Relocation Area in Zone 1
- Augmentation of FWS infrastructure within Zone 1 and the south of Zone 2
- Commissioning of the upgraded FWS to confirm it meets operational requirements
- Isolation, disconnection, and removal of redundant FWS infrastructure in Zones 2 and 3.

The fill surrounding the firewater pipes has not been tested (as this infrastructure is still currently in use and providing a critical safety control for the Site); however, given the location and history of the Site, it is possible that the fill material may contain asbestos, as well as PHC impacts, and/or other COPCs where the service transects source areas.

Excavated soil from belowground sections of FWS pipes and footings would be managed in the same manner as described above in **Section 7.5.2.1** for the OWS works.

Once removed, redundant pipes and materials from the FWS would be sent offsite for recycling or disposal based on material type and waste classification, where appropriate.

7.5.2.3 Electrical assets

During the closure of the Kurnell Refinery, high voltage electrical substations, power distribution rooms, and electrical infrastructure (such as buried cables) were redesigned to meet the requirements of the terminal. Following an electrical audit, existing substations / switchboard rooms in Zones 2 and 3 have been deemed to be no longer required and are therefore proposed for demolition.

All above-ground redundant electrical assets in Zones 2 and 3 would be decommissioned and removed. Below ground cables would be de-energized and either retained for potential future use or removed in accordance with AS/NZS 3000:2018 *Electrical installations*.

The fill beneath the electrical substations and surrounding cables has not been tested (as this infrastructure is still currently in use), however given the location and history of the Site, it is likely that the fill material may contain asbestos, PHC impacts and /or other COPCs.

Excavated soil from cable trenches and substation footings would be managed in the same manner as described above for the OWS works.

Prior to demolition a hazardous material survey would be completed for substations and any identified hazardous substances (such as asbestos, PCBs, lead paint) would be removed by a licenced contractor. Once removed, redundant electrical cables and materials from the electrical assets would be sent offsite for recycling or disposal based on material type and waste classification.

7.5.2.4 Structures

A number of buildings and other structures are located within Zones 2 and 3. These include small storage structures and larger buildings such as the storehouse, main warehouse, central control building, and the Oil Spill Room. Many of these buildings are no longer fit for purpose for the terminal and are relatively isolated from the terminal footprint. On this basis, and to facilitate the future use of Zones 2 and 3, Ampol are proposing to remove these structures as part of the proposed modification works. These structures are shown in **Annexure A, Figure F2**.

Prior to demolition a hazardous material survey would be completed for relevant structures and identified hazardous substances (such as asbestos, PCBs, lead paint) would be removed by a licenced contractor. Each structure proposed for demolition would be demolished to ground level and, where possible, their slab, foundations, and footings removed. The foundations of buildings and structures previously demolished as part of the approved project within Zones 2 and 3 would be also excavated and removed, where they have not already been removed and where practicable. These activities would require excavation works up to 2 mbgl, depending on depth of footings (generally focused within 1 mbgl).

Once removed, building waste materials from the demolition would be sent offsite for recycling or disposal based on material type and waste classification. Concrete would be crushed within the Waste Management Area and where appropriate, used as backfill during Stages 3 and 4 to reduce the soil deficit and to improve the geotechnical stability of the land. Concrete waste that cannot be used would be taken offsite for sale, recycling or disposal.

Once removed, solid waste materials from the demolition would be either processed for onsite reuse as fill material (dependent on geotechnical properties) or sent offsite for recycling or disposal based on material type and waste classification, where appropriate.

7.5.3 Stage 3 – Remediation

7.5.3.1 Overview

Remediation and/ or management of ground contamination would be required across Zones 2 and 3, and parts of Zone 1, where LNAPL is present and/or where soil and groundwater (expressed via soil vapour) quality does not currently meet the human health based commercial/ industrial land use standard, as defined by ASC NEPC (NEPC 2013).

As part of the proposed modification, where ground disturbance is proposed within Zone 1, contaminated material would be managed in accordance with the terminal's existing OEMP. Excess soil or fill material generated during these works would be categorised and either disposed offsite to landfill (consistent with the OEMP) or potentially incorporated into Zone 2 and 3 remediation activities.

As discussed in **Section 7.3**, to remediate identified areas of impacts within the Project Area, contaminated soils would either be:

- Excavated and treated onsite for reuse
- Excavated and disposed of offsite
- Managed in situ and capped (not part of the proposed modification and subject to separate approval).

Table 23 lists the relevant COPCs that would be remediated using the remediation approach outlined above.

7.5.3.2 Approvals

The *Protection of the Environment Operations Act 1997* (POEO Act) defines Contaminated Soil Treatment (incineration or storage of contaminated soil but excluding excavation for treatment at another site) as a Scheduled Activity (requiring an EPL) if more than 30,000 m^3 or 3 ha of soil onsite would be treated (otherwise than by incineration) and stored onsite. Remediation via biopiling and/or stabilisation is anticipated to exceed this volume, and as such a licence variation to the Site's current EPL is expected to be required. This, along with any requirements to comply with future iChEMS regulations would be managed with Ampol post-approval.

7.5.3.3 Excavation

Excavation volumes have been derived based the areas and depths presented in Section **6.4**. The rationale for the development of the excavation extents for SAE 1 to SAE 4 (PHC and CHC excavations) is based around the spatial extents of available considered historical analytical data and exceedances. For these PHC and CHC excavations, depth of excavation has been determined through review of the depth of the local groundwater table. As the smear zone is being targeted, an excavation depth of 1 m below the expected depth to water has been selected for each excavation area. These SAE depths are expected to range between 2.8 mbgl and 4.9 mbgl.

For the asbestos excavations, these works are guided by the identified extents of the contaminated material unit. For RPIP mountain SAE 6 is targeting areas of known asbestos contamination that have the potential to be disturbed by uncontrolled vegetation growth and potential erosion via surface water flows. For the LPG area, this is guided by the footprint of the identified impacted surface soils, with the excavation depth allowing for the installation of suitable surface covering should validation not be achieved.

For the PFAS excavation SAE 5, the extent of excavation is based on the lateral footprint of the FFTA and the expected depth of fill and natural soils above bedrock in the area.

The approximate area and volume for each of all excavation areas are presented in **Table 22** and shown spatially on **Annexure A, Figure F5**. The asset removal and relocation and excavation areas and volumes are based on the length of the respective services (FWS and OWS). SAE areas are based on available soil, LNAPL, groundwater, and soil vapour data, as discussed in **Section 6.4**.

Additional investigations will inform the volume and extent of excavations in identified SAEs. These data gap works would be accounted for in the RWP(s), prior to commencement of remediation. Additionally, during excavation, ground contamination may vary slightly from plan. An allowance for contingency excavation volume has been included. Depending on the extent of data available, this has been based on nearby contamination results, or a percentage allowance based on the base excavation volume.

Table 22 Excavation Volume and Contingency Estimates

Excavation Area	Base Estimate Volumes[1]	Contingency Volumes[2]	Source
Project Area			
Zone 1 (Infrastructure construction works) Zone 2 and 3 (OWS removal and augmentation) Zone 3 (RPIP OSD)	53,700 m^3	5,370 m^3	FWS and OWS services RPIP drainage channel
Zone 1			
LPG Area (Asbestos)	1,380 m^3	690 m^3	LGP Area fill soils
Zone 2			
SAE 1 (PHC)	-	18,000 m^3	Former Central Process Unit Area.
SAE 2 (PHC)	49,250 m^3	39,550 m^3	Eastern Tank Farm and bulk fuel storage
SAE 3 (PHC + CHC)	24,640 m^3	19,180 m^3	Former Southern Process Unit Area
SAE 4 (CHC)	2,800 m^3	3,360 m^3	Hydro-blast (assumed source)
SAE 5 (PFAS)	10,000 m^3	5,000 m^3	FFTA

Excavation Area	Base Estimate Volumes[1]	Contingency Volumes[2]	Source
Zone 3			
SAE 6 (ACS)	32,500 m^3	16,250 m^3	RPIP Mountain fill soils
Total	**186,270 m^3**	**94,650 m^3**	NA

It may not always be practicable to remediate all localised target impacts (including LNAPL), due to either aboveground obstructions (i.e. the presence of large structures), or limited accessibility presented by factors such as ground stability, or depth to contaminant. Where these conditions be present, they may require revision to the remedial approach. Revision of remedial approach and extent, where minor in nature, would be detailed in the RWP(s).

Excess soil excavated during infrastructure relocation works in Zone 1 requiring remediation would be remediated in line with the approach for contaminated soils in Zones 2 and 3, however, the location of the soil treatment and other remediation works would likely occur within Zones 2 or 3 for efficiency purposes and to minimise potential impacts on nearby environmental and community values. Once remediated, material deemed suitable for reuse (meeting soil validation criteria for all COPCs and reuse guidelines presented in the NEMP 3.0 (HEPA, 2025) for PFAS) would be reused in Zone 2 or Zone 3 where practicable.

Where soil in the Project Area has been assessed as not requiring remediation, this is because the soil and groundwater quality either:

- Already meets the human health based commercial/ industrial standard (refer to **Section 5.0**); or
- The conditions either do not pose a risk to human health or the environment or can be managed and mitigated by implementation of existing environmental management procedures for the Site.

Based on existing investigations, groundwater impacts are unlikely to pose an unacceptable risk to human health or ecological receptors if soil impacts in identified source areas are remediated. Targeted onsite boundary investigations are routinely undertaken at the Site, and would continue to be undertaken before, during and following remediation to assess boundary conditions and potential offsite risks. Should residual contamination present a risk following completion of soil and LNAPL remediation, further remedial options, including but not limited to remedial capping works would be implemented. Additional remedial actions such as these would be covered under a future development application and/or SSD modification.

The preferred soil remediation technologies that are to be utilised under the proposed modification for identified contamination at the Project Area are described in **Section 7.3** and summarised in **Table 23** below.

Table 23 Remedial technology and contaminants matrix

Contaminant	Excavation, onsite biopiling, and onsite reuse	Offsite disposal
Asbestos[8]	N/A	Yes
CHC	Yes	Yes
Hydrocarbons	Yes	Yes
PFAS	N/A	Yes

[8] Where asbestos in soils is the contamination source being addressed (RPIP and LPG area).

Once contaminated soils are excavated, soil sampling and analytical testing would occur within the excavations to validate the remaining soil against a pre-determined validation criteria and in accordance with the specific Validation SAQP (**Section 8.0**).

Impacted soils to be treated ex-situ would be excavated, segregated, and stockpiled based on visual and olfactory evidence, field screening, and laboratory data. Contaminated soils would be stockpiled separately depending on the type and concentrations of contamination present and the remediation technology required within the waste management area. Therefore, soil treatment volumes may be significantly less than the base excavation volumes estimated in above.

Where soils are disposed offsite untreated, this would occur in accordance with the Waste Classification Guidelines (NSW EPA, 2014) to an appropriately licensed facility.

7.5.3.3.1 RPIP remediation

The RPIP Mountain area is located within the southeastern portion of Zone 3, covering an approximate area of 32,000 m^2. Historical disturbance, including extensive storage and filling of soil materials, has occurred across this area and as such, the area is undulating and elevated by several metres above surrounding ground surface levels. Previous assessments have identified asbestos as the primary contaminant of concern within the fill material with zones of subsurface asbestos contamination, both friable and non-friable, located along the northern perimeter, central area and south-eastern corner of the area at up to 2 mbgl and at varying elevations. Screening level exceedances were also noted for heavy metals, in particular lead, apparently most prevalent in the northern portion at varying depths and elevations.

Current management practices are in place to manage exposure and migration risks to Site occupants and the environment. Removal of low and regenerating condition native vegetation is required to ensure that potential migration of surface asbestos through dusts and sediments does not occur in the future (i.e., disturbance via vegetation growth and/or fauna). The proposed remediation would provide a long term reliable solution to the asbestos contamination in this area.

For large trees established within the area, the root system would also require removal to make the area geotechnically suitable and reduce future subsidence. It is assumed that approximately the top 1.0 m (of organic root material likely contaminated with asbestos) would require removal and management. Following excavation of the root zone, and up to 1 m of entrained soils (disposed of offsite as special waste – asbestos), the surface of the area can be managed through the application of a surface treatment (spray grass, gravel) to mitigate the potential for surface asbestos migration. Maintenance of the surface treatment would be managed through the Site's AMP.

7.5.3.4 Biopiling

Following testing, soils requiring remediation due to PHC or CHC impacts, but not impacted to an extent that would make biopiling impractical due to gross contamination would be remediated by biopiling, to the extent practicable with adherence to asbestos management requirements (**Section 7.5.3.7**). The threshold for biopiling practicality will be assessed on a case by case basis within the RWPs, allowing for refinement during treatment to optimise the volume of soil to be treated while considering project timelines and other drivers (e.g. sustainability, cost etc).

Grossly impacted soils may pose practicability constraints associated with the time required to meet remedial objectives. Under normal conditions, naturally occurring bacteria in the ground slowly degrade hydrocarbon contamination to compounds that do not pose a risk to human health or the environment. Biopiling promotes and facilitates this natural process (through the addition of nutrients etc.) expediting the remediation process. Based on ground investigations, it is assessed that biopiling would be suitable for the remediation of soils from SAE 1 to SAE 4.

Biopiles would be established within areas shown on **Annexure A, Figure F5**. There are four areas identified, detailed as follows:

- Zone 2 former flare geobag area
- Zone 2 former land farm
- Zone 2 workshop area (identified as the MOD7 waste management area)
- Zone 3 waste management slab.

Three of these areas have historically been utilised for waste management at the Site. As such they are connected to the Site's OWS, and have electricity connections. The workshop area also has connection to these services. Three of these areas have concrete slabs (Zone 2 former flare geobag area, Zone 2 workshop area, and Zone 3 waste management slab). The Zone 3 former land farm does not have a slab present. In this area, prior to setting out the biopiling areas, this area would be prepared with a base clay or high-density polyethylene (HDPE) liner. A compacted sand base would be established over the liner to enable adequate air exchange into the biopile.

When biopiling, nutrients or other soil amendments would be added and placed in the biopile area. The biopiles would be covered with an impermeable material to reduce stormwater ingress and dust creation. Measures to minimise the creation of dust and odour emissions during the construction of the biopiles would include:

- Covering surfaces
- Minimising exposed area
- Wetting down exposed soils
- Treatment of extracted vapours (with respect to both PHCs and asbestos in air)
- Dust monitoring or observations.

The biopile would be maintained under negative pressure with blowers to mitigate fugitive gas emissions to the atmosphere. Off-gas from the process would be passed through a HEPA filter to prevent liberation of asbestos fibres followed by two granulated activated carbon filters to remove volatile hydrocarbons. The first unit provides primary VOC adsorption, and the second acts as a polishing filter to ensure remaining vapours are released. Regular air monitoring of the air emissions would confirm when exchange of air filters is required. Moisture, temperature, nutrients, oxygen, and pH would be monitored regularly and controlled to enhance biodegradation.

The addition of nutrients/ amendments, compost, microbes, and moisture (as appropriate) to the biopile and the movement of air with a blower through the material would stimulate aerobic microbial activity within the soils and promote the biodegradation of hydrocarbons.

The biopiling base would be graded towards a collection point. Leachate from the biopiles would be sent to the WWTP (via the OWS system) for treatment prior to being discharged in line with the EPL 837.

Regular testing of the soil in the biopiles would occur to confirm when the soil has been remediated to an industrial/commercial standard for human health receptors in accordance with the remediation screening criteria outlined in **Section 5.0** and the ASC NEPM (NEPC, 2013). Following remediation of soil to this standard, the biopiles would be deconstructed and the soil would be reused onsite as backfill.

Biopiling would follow the guidelines set out in *NSW EPA's Best Practice Note: Landfarming (2014)*.

Following the completion of soil treatment, if there are residual concentrations of target contaminants remaining at levels above the remediation criteria in soils, that may pose unacceptable risk to future human health receptors, the soils would be assessed for offsite disposal. Soils that do not meet remedial criteria might still be suitable for onsite reuse, provided appropriate additional remedial actions can be undertaken that would address the residual risks. These actions might require a future development consent to be implemented.

7.5.3.5 Offsite disposal (untreated soils)

Where contaminated soils or sludges cannot be treated and reused or managed in situ, they would be captured and/or contained onsite before being disposed offsite to an appropriately licenced facility by licenced contractors. Approximately 51,635 m^3 of contaminated soil or fill (in-situ volume) material and a contingency allowance of 48,775 m^3 (excavated from source areas as set out in **Table 20** and **Table 22)** would require offsite disposal (total of up to 100,410 m^3). This material (soil or sludge) may be treated or untreated prior to offsite disposal. These volumes are set out in **Table 24**.

Table 24 Offsite soil disposal volumes

Source	Expected volume	Contingency volume	Rationale
Infrastructure construction / removal / augmentation works (OWS, FWS, RPIP OSD	5,370 m^3	5,370 m^3	Based on assumption that 10% of excavated soils cannot be treated to meet site validation criteria. Contingency allowance for an additional 10%.
LPG Area	1,380 m^3	690 m^3	Offsite disposal proposed as remedial approach.
SAE 1 – Former CPU	400 m^3	3,600 m^3	Based on an assumption that 10% of saturated zone soils (0.1 m) cannot be treated to meet site validation criteria, with a contingency that all saturated zone soils (1.0 m) cannot be treated to meet site validation criteria.
SAE 2 – Former ETF	1,005 m^3	9,045 m^3	
SAE 3 – Former SPU	880 m^3	7,920 m^3	
SAE 4 – Former Workshop	100 m^3	900 m^3	
SAE 5 – FFTA	10,000 m^3	5,000 m^3	Offsite disposal proposed as remedial approach.
SAE 6 – RPIP mountain	32,500 m^3	16,250 m^3	Offsite disposal proposed as remedial approach.
Total	**51,635 m^3**	**48,775 m^3**	**Combined volume 100,410 m^3**

Note: in-situ volumes presented

Soils to be disposed offsite would be excavated and either directly transported offsite or transported to a dedicated section of the waste management area for temporary storage or containment (depending on their characteristics) pending further testing for waste classification. Further testing and waste classification in accordance with the Waste Classification Guidelines (NSW EPA, 2014) would be undertaken prior to disposing of stockpiled materials offsite.

Where materials soils being disposed offsite are classified as special waste – asbestos, or hazardous waste, these must be tracked via the NSW EPA's Integrated Waste Tracking Solution (IWTS). Tracking of transport and disposal of high-risk or hazardous waste minimises potential harm to the environment and human health.

7.5.3.6 Acid Sulphate Soils management

An important part of ASS management is to correctly identify the ASS materials and accurately quantify the hazards these materials may pose if disturbed.

Given the LEP ASS Risk Map assessment for the Project Area, and historical observations for ASS at the Site (discussed in **Section 2.6**), a draft framework for an ASS management plan has been developed and included as Appendix E2 of the Submissions Report. It provides details on field identifiers, sampling and analysis guidance, treatment options and methodologies, and management controls for ASS.

Further investigation to assess for ASS within the proposed excavation extents would be completed, as part of the development of the RWP(s), and if/where ASS is identified, ASSMP(s) would be developed accordingly.

7.5.3.7 Asbestos Management

The completion of the proposed modification will involve the handling, excavation and movement of asbestos contaminated fill materials. The completion of these works will be based on the requirements provided in Work Health and Safety Act 2011 and the NSW Work Health and Safety Regulation 2025.

This would include preparation and update of the Site's existing asbestos register and associated asbestos removal control / management plan as outlined in NSW Work Health and Safety Regulation 2020.

Excavation and movement (including construction/ dismantling of static biopiles) of asbestos contaminated fill materials would be carried out in adherence to *NSW's Guidance on Managing Asbestos in or on Soil (SafeWork NSW, 2014)* and the *Guidelines for the Assessment, Remediation and Management of Asbestos Contaminated Sites in WA* (WA DoH, 2021). Appropriate management controls would also be applied during operation of the biopiles (i.e. capture and filtering of extracted vapours and dusts) to prevent liberation of VOC and asbestos fibres into the atmosphere.

7.5.3.8 Groundwater management

As excavation of source areas would target smear zone soils within 1 m of the of the groundwater table, dewatering of groundwater may be required to facilitate excavation. Dewatering is currently managed onsite as wastewater in accordance with SSD-5544 and EPL-837. The Site's OWS is a continuous operation system designed to direct waste water to the onsite WWTP for treatment. Groundwater that that cannot be treated at the WWTP would either be pre-treated by another method or disposed to an appropriately licenced liquid waste facility. Once wastewaters are treated, this wastewater is discharged under EPL-837 via the Yena Gap pipeline to an ocean outfall in the Tasman Sea. A project specific Groundwater Management Plan would be developed as part of the CEMP for MOD-7. This plan would outline the specific dewatering requirements for the proposed modification, given the proposed maximum excavation extents.

7.5.3.9 Surface water management

Surface water flows and stormwater would be managed by segregating clean water from impacted water and preventing the inflow of surface water to excavation areas using surface bunds, silt fences and drainage diversions. The preferred hierarchy for management of water onsite is as follows:

- **Minimise:** minimise volume of surface water that is contaminated during the works wherever possible by directing surface water away from excavations, depressions, pits and stockpiles by the construction of drainage systems such as bunds and diversion drains. These measures would minimise the flow of clean surface water into areas of the Project Area that contain contaminated materials.
- **Recycle:** recycling surface water where possible by using it onsite as dust suppression for other operations on the Project Area including wheel washing and truck washing.
- **Dispose:** discharge of surface water to the onsite WWTP, with or without treatment, as per regulatory guidelines.

Two primary sources of surface water contamination during the remedial works come from the exposed impacted soils, which are present within the excavations and within the biopiles. Reduction in the amount of impacted water requiring treatment would be achieved by:

- covering the biopiles and unremediated stockpiles to limit the interaction between surface waters and these soils during the works
- completing the remediation in a staged manner to minimise the extent of open excavations at any one time, reducing area that surface water could flow into, which would subsequently require dewatering.

Testing for relevant COPCs would be undertaken to confirm that this water can be appropriately treated in the WWTP. It is anticipated that the system, including the WWTP, would have sufficient capacity during remediation activities as the WWTP was originally designed to service the refinery which is no longer in operation. It is understood that on a flow and contaminant concentration basis the current loading is well below the WWTP design capacity. Groundwater that that cannot be treated at the WWTP would either be pre-or post-treated by another method or disposed to an appropriately licenced liquid waste facility.

7.5.3.10 Oily water management

The existing oily water management system would continue to operate during the early stages of the proposed remediation. However, as the modification works progress, the OWS system would be progressively isolated. As discussed above in **Section 7.5.3.9**, excavated areas would be bunded and diversions put in place (e.g. temporary drainage channels) to minimise the volume of surface water that comes into contact with the excavation..

Further, during the removal of OWS services, extents of the fill material surrounding the OWS itself may be contaminated and may require excavation. If required, during excavation, these excavations would be isolated from the wider OWS system. These excavations would be treated as SAE, and stormwater and surface water would be diverted away in a similar manner. The channels would be filled with imported fill or remediated soils suitable for re-use after excavation of contaminated materials and validation.

In some areas, the existing Zone 2 and Zone 3 OWS infrastructure is required to support the proposed modification (e.g. the designated biopiling areas in each zone). The remediation and OWS removal works would be carefully planned and staged such that OWS infrastructure is only removed once dependant activities (e.g. remediation activities) have been completed, or until a modified system is established for the diversion of these flows.

In lieu of oily water drainage (where its removal is required due to contamination), the remediation areas including for biopiling would be bunded to contain incidental rainfall, with drainage directed to a sump which would allow for water removal as necessary. The collected runoff would be transferred either directly to the WWTP or transferred to the residual OWS by temporary pipeline. In either case the oily water would be treated in the existing WWTP and discharged in line with the Site's EPL. The preferred system would be selected taking into account site specific characteristics, e.g. location, proximity to residual OWS, duration of works etc.

Leachate is likely to be generated during biopiling. As the treatment areas are proposed to be covered, and the soils being treated will be excavated from within a dewatered area, the leachate quantities estimated to be small. Leachate would also be captured by the drainage system, and sent to the WWTP, following the management practices described in **Section 7.5.3.9**. This management approach is consistent with historic waste management at the Site.

7.5.3.11 Soil Reuse, import fill, and excavation backfill

Remediated soils and crushed clean concrete slabs from the works described above would be used as backfill where practicable. Crushed concrete would be validated prior to reuse. Given that some of the below ground infrastructure/drainage infrastructure would be removed and that potentially some soils would be disposed offsite, additional fill may be required to maintain current levels. The ground level of the Project Area is not proposed to change as part of the proposed remediation under MOD-7. Minor amendments (such as powdered or granulated activated carbon) may be blended with backfill materials as a polishing technique, where appropriate to support the Site's remedial objectives. Such amendments are considered ancillary measures only and would not be relied upon to provide contaminant mass reduction or risk mitigation.

When required, additional fill would be brought to the Site from offsite sources for use in the Project Area. Soils from offsite sources brought onto the Site will be limited to the following:

- virgin excavated natural material (VENM),
- excavated natural material (ENM) as defined by the ENM Order, 2014,
- or material covered under an NSW EPA specific Resource Recovery Order (RRO).

The soils would be managed in line with this order as well as a specific Validation Plan (outlined in **Section 8.0**), which would outline acceptance criteria, and sampling and analytical requirements. For materials subject to a RRO, once material is validated (using the criteria outlined in the Validation Plan), the soil would be reused onsite under an NSW EPA approved Resource Recovery Exemption.

The imported fill would be stockpiled and tracked separately to the onsite materials that have been tested/validated to confirm they have been remediated for reuse on the Project Area. There is a risk that asbestos may be present in imported recycled fill materials. Imported materials will be inspected and tested accordingly. This will be set out in the Materials Tracking Plan (MTP) (see **Section 9.3**).

7.5.4 Stage 4 – Demobilisation

Demobilisation from the Project Area would include:

- Offsite disposal of soils not being reused
- Validation of working surfaces where relevant (unsealed stockpile and biopiling footprints)

- Removal of plant and equipment
- Ensuring Zones 2 and 3 are secured
- Removal of temporary environmental controls and waste management areas
- Removal of offices, temporary structures etc. installed within the Project Area as part of Stage 1.

7.6 Contingency plan

7.6.1 Approach

The following unexpected events have been identified as having the potential to occur during the remediation works described in **Section 7.5.3**:

- Identification of greater amounts of source material than presently anticipated
- Identification of unexpected impacts from unidentified secondary COPCs
- Identification of contaminated groundwater or saturated conditions at depths less than anticipated
- Drums or underground storage tanks with unknown contents (i.e. either contained or potentially leaked into the surrounding soils)
- Flooding of the Site
- Generation of unacceptable dust during excavation and reinstatement works
- Release of unacceptable fugitive emissions during the excavation works
- Generation of excessive and unexpected odours from the excavation works
- Spills and leaks of hazardous materials.
- Change in design levels which may affect the contamination risk profile

Contingency mitigation measures for these items are described in the following sections.

7.6.2 Management of unexpected conditions

7.6.2.1 Actions required

Table 25 below details the actions that would be followed in response to unexpected events. Contingency measures which may then be implemented are detailed in the section below and trigger thresholds will be defined in the RWP(s). **Table 25** focuses on contaminant related changing conditions, other change variables (e.g., relating to health and safety, heritage, local stakeholders, etc.) would be considered under the relevant impact assessment in the Modification Report. The management of these issues would be detailed within a series of management plans that would be developed along with the RWP(s).

Table 25 Actions required for managing unexpected conditions

Scenario	Actions required
Impacted soils beyond the anticipated characterisation (concentrations, extent or volumes) are encountered.	Work in the vicinity of the soils would be suspended until the environmental consultant can further assess the impacted soils/ materials. Once assessment is completed a decision on updates to the remediation approach would be issued for review by the Site Auditor prior to implementation. An increased volume of soil to be excavated has the potential to adversely impact on traffic (if disposed of off-site), material management, schedule and cost. Depending on the magnitude of the changes (extent and volumes of contamination/ excavation required), additional imported fill may be required to achieve final re-instatement levels commensurate with current levels.

Scenario	Actions required
Larger volumes of contaminated water than anticipated (i.e. dissolved phase or LNAPL) is identified during the modification works (e.g. due to flooding and/or higher groundwater levels).	**Flooding:** Surface water management including minimising the water inflow to excavation reducing contaminated water is outlined in **Section 7.5.3.9**. **High Groundwater:** A groundwater assessment has been completed to assess the dewatering efforts required for excavation and address potential impacts. This assessment used highest observed groundwater levels for the respective excavation areas. If groundwater conditions encountered during excavation exceed these levels, mitigation measures in the GWMP would be undertaken (e.g. altering construction schedules to avoid wet periods, reducing excavation size, or using engineering controls to limit water recharge). If changes to the remedial extent are required, these would be issued for review by the Site Auditor prior to implementation.
Excessive vapours emanating from excavated and stockpiled soil or excavation pits.	Should elevated levels of contamination or odour (i.e. levels above those expected for in the relevant location) be present in ambient air, work related to the excavation would be suspended until a suitably qualified environmental consultant can investigate the source and instruct on how best to proceed to manage contamination, or vapour, or odour risks and achieve work health and safety and environmental compliance requirements. Measures that would be considered include • the movement of contaminated materials (based on visual observations or elevated photo-ionisation detector (PID)/lower explosive limit (LEL) meter measurements) that are exposed to a more distant location from adjacent properties and workers, • additional features to control emission from the treatment area such as odour suppressants and neutralisers. Thresholds for elevated vapour levels based on the relevant receptors would be defined in the Work Health and Safety Management Plan (WHSMP) (**Section 9.2.1**). Controls for dust and odour will be provided in the Air Quality Management Plan (**Section 9.1.2**). Once the assessment of the excessive vapours is completed, if a decision on changes to the remediation approach has been made, this would be issued for review by the Site Auditor prior to implementation.

Scenario	Actions required
The chemical classification for soil proposed for offsite disposal fails to meet “General Solid Waste” soil classification criteria under the Waste Classification Guidelines, NSW EPA 2014.	Conduct toxicity characteristics leaching procedure (TCLP) of contaminants exceeding General and/or Restricted Solid Waste, and/or Hazardous Waste chemical classification to assess the leachable concentration and whether the chemical classification of waste can be reduced. If the chemical classification of waste soil is still anything other than General Solid Waste, then onsite remediation (or onsite management) methods may be considered in the first instance.
Impacted soils are not suitable for treatment using the technologies detailed in this RAP.	If treatment is required via a methodology that has not been approved under the proposed modification, a separate development application or further modification may be required.
Excessive dust generated during remediation works	Dust mitigation measures have been identified in the modification report and would be implemented during the modification works. Acceptance thresholds and mitigation measures would be defined in the Air Quality Management Plan. Should excessive and unexpected levels of dust be detected during the remediation works, an investigation would be conducted to determine the source of the dust and evaluate the appropriate measures to be implemented. Use of temporary sheeting to cover exposed stockpiles, and additional dust suppression measures including water sprays would be used to minimise the mobilisation of dust and other airborne contaminants.
Spills and leaks of hazardous materials	A spill response plan would be developed and implemented as part the Emergency Response Plan (ERP) detailing procedures for responding to spills and leaks. Spill response materials equipment such as oil adsorbent pads, booms, and biodispersants would be allocated at accessible areas in the Project Area.
Noise and/or vibration levels detected during the remediation works	Noise and vibration impacts have been assessed in the modification report and submissions report within the updated Noise and Vibration Impact Assessment (NVIA) and mitigation measures would be implemented during the modification works based on the guidance set out in the Noise and Vibration Management Plan. Should unacceptable noise and/or vibration levels be detected during the remediation works, specific works would be discussed with Ampol, the Site Auditor (if required) and an acoustic consultant (if required) to advise on the appropriate approach to complying with noise management levels.

7.6.2.2 Contingency measures

Contingency measures are essential for remediation activities. This is particularly pertinent for contaminated soils with heavier end hydrocarbons and other contaminants (such as PFAS), or recalcitrant contaminants, that may not be conducive to the initial options proposed or where discrete portions of unidentified non-hydrocarbon impact are encountered. As such the following measures would be considered in accordance with the hierarchy of remediation options in **Section 7.2**:

- Modification of biopiling setup: Should turning biopiles be ineffective, thermal enhancement (involving the injection of heat into the biopiles through the ventilation system) may be considered to enhance the remediation process.
- Onsite management of unexpected finds may be appropriate as long as administrative measures are put in place (i.e. on-going EMP(s)). Onsite management is most useful where it is not practicable to remediate soils such as where soils are not suitable for bioremediation (such as areas of asbestos impact in soils).
- Offsite disposal (untreated soils) of unexpected finds: Offsite disposal of untreated soils to landfill would typically be considered when soils are not suitable for the remediation techniques described above or where onsite management is not practicable or desirable.
- In-situ treatment of groundwater: If the site requires further remediation to achieve zoned commercial/industrial land use suitability, in-situ treatment (e.g. injection of chemical oxidants, bioremediation enhancers, or immobilisers) may be considered if warranted based on a risk assessment. If required, active groundwater remediation would be subject to a separate development approval or modification of the existing SSD-5544 consent.

7.7 Waste management

Redundant infrastructure would be cleaned, processed and stored prior to reuse or removal from Site. Infrastructure and waste materials would be tracked in line with a Material Tracking Plan (**Section 9.3**).

A waste management area would be established in an area shown on **Annexure A, Figure F5** for surface and subsurface materials removed (e.g. concrete, metals/reinforcement bar, drainage lines). Once material is removed or excavated it would be sorted and stockpiled separately in this area prior to reuse or removal from Site. The waste management area would remain in place for the duration of the proposed modification works.

It is estimated that the proposed modification would involve the processing of approximately 40,000 m^3 of concrete predominantly from slabs and asphalt. Concrete would be crushed within the waste management area and where appropriate, used as backfill during Stage 3 to reduce the soil deficit and to improve the geotechnical stability of the land. Concrete waste that cannot be used would be taken offsite for recycling or disposal.

Contaminated soils encountered during Stage 2 would be managed in line with the processes outlined in **Section 7.5.3**. Where contaminated liquids could be encountered (for example potentially where OWS pipework is being removed), appropriate containment/spill mitigation measures would be employed (e.g. physical removal via vacuum extraction). LNAPL and/or impacted water would be directed to the WWTP or contained and disposed offsite by a licenced contractor as discussed in **Section 7.5.3.97.5.3.8**.

8.0 Validation plan

This section provides a summary of the validation works which would be conducted to confirm that the remediation works have achieved the remediation objectives and to confirm the suitability of soils for reuse in the Project Area in accordance with NSW EPA endorsed guidelines.

Further details on the proposed validation strategy would be included in the RWP(s).

8.1 Validation principles

The soil validation data obtained from remediation would be assessed in accordance with the ASC NEPM (NEPC, 2013) and the NEMP 3.0 (HEPA, 2025). This would involve demonstrating that relevant validation criteria (established in **Section 5.0** or as amended in the future RWP(s)) have achieved the remediation objectives through the:

- Use of systematic sampling patterns, and appropriate validation sampling methodologies
- Collection of an appropriate number of samples for estimation of the arithmetic average concentration of contaminant(s) within relevant environmental media and exposure areas
- Estimation of the 95% Upper Confidence Limit (UCL) of the arithmetic average concentration for soils.

Where applicable, the above statistical analysis would be applied to separate areas of the Project Area due to the nature of the staged remediation and validation works to be conducted. This would also apply if different strata (i.e. fill materials and natural soils) are excavated and are proposed to be reused onsite as part of the Project. Consequently, the analytical data obtained from the validation of materials to be reused onsite would be assessed separately as per the requirements of the ASC NEPM (NEPC, 2013) and the NEMP 3.0 (HEPA, 2025).

8.2 Soil validation sampling and analysis

It is anticipated that specific Sampling Analytical and Quality Plan (SAQP)s would be prepared as part of the validation Data Quality Objectives (DQOs) program for each stage of remediation works by a suitably qualified environmental consultant and reviewed by the Site Auditor prior to commencement of the remedial works.

The validation SAQPs would be prepared based on the actual sequence of remediation works and preferred remediation option that is implemented for each remedial excavation. They would detail specific requirement for demonstrating that the remediation works have been undertaken in accordance with the requirements of this RAP and the RWP(s).

The Validation SAQPs would include DQOs and Data Quality Indicators (DQIs) which would incorporate field quality control and laboratory analysis, methods and information on laboratory quality control data that would be used to validate the field and analytical data for the validation works. In general, the minimum requirements for validation of specific material types are outlined below.

8.2.1 Reusable fill materials

Backfill materials may be sourced from material that has been generated from the Site and assessed and validated as suitable for reuse, including concrete. Validation sample density would vary depending on the source. Samples shall be analysed for BTEXN, TRH, PAHs, heavy metals (defined in **Section 4.2.1**), soil pH, asbestos, and including analysis for additional COPC where local contamination sources are present and relevant to the reused material (e.g. testing for PFAS at the FFTA concrete slab). All material proposed for re-use onsite must meet the adopted site validation criteria. A detailed and systematic inspection would be completed of the material to assess the potential presence of visible ACM prior to final placement.

8.2.2 Imported fill

Import materials such as VENM/ ENM or those sourced from quarries that will be used as backfill on Site typically do not require validation sampling upon receipt to the Site. VENM must meet the definition outlined in POEO (1997) Schedule 1. Other suitable engineer, quarried or other material granted an application EPA Exemption under POEO (Waste) Regulation 2014 and accompanied by NSW EPA certification. If VENM/ENM materials are not certified by Ampol's appointed environmental consultant, confirmation testing would be undertaken upon delivery to the Site.

For confirmation testing, the import material will be field screened by visual inspection for anthropogenic material or signs of contamination and PID for presence of volatiles. If it is to be sampled and validated, sampling density will be a minimum of 3 samples for materials <75 m^3. Sample density for imported materials will be guided by the ENM POEO order 2014, Table 1 Sampling of Stockpiled Material, presented as **Table 26**. For quantities greater than 4,000 tonnes, a rate of 1:400 t will be used. The provided sample density would be considered a minimum requirement. Where imported materials are not homogeneous, sampling densities would need to be increased.

Table 26 Sampling of Stockpiled Material - ENM POEO Order 2014

Quantity (tonne)	Number of samples
<500	3
500 – 1,000	4
1,000 – 2,000	5
2,000 – 3,000	7
3,000 – 4,000	10

Samples shall be analysed for BTEXN, TRH, PAHs, heavy metals (defined in **Section 4.2.1**), soil pH and asbestos in combination with consideration of the source location and material inspection. POEO exemption material would need to be appropriately validated.

8.2.3 Waste classification

Materials designated for off-site disposal would be sampled for waste classification in accordance with the NSW EPA Waste Classification Guidelines – Part 1: Classifying waste (NSW EPA, 2014; including 2016 PFAS addendum) and at a rate sufficient to characterise the materials in accordance with the NSW EPA Contaminated Land Sampling Design Guidelines – Part 1: Application. This shall be determined by the field scientist / engineer on the basis of the volume of materials and any potential heterogeneity occurring within the materials.

8.3 Soil sampling methodology

Soil sampling methods appropriate for the relevant task would be determined by the appropriately trained and experienced field scientist / engineer as part of sampling design during the development of the SAQP. Changes to sampling methodology may be required due the Site conditions. Should this occur, and the methodology not be present within the contingency sections of the SAQP, the Site Auditor would be consulted for review and approval. It is expected that the proposed soil sampling methods would include:

- Test pits / grab samples using an excavator bucket for in-situ material characterisation and validation of deep excavations.
- Boreholes completed by hand or using mobile plant.
- Stockpile sampling using a shovel, trowel, or excavator bucket.

It is also acknowledged that soil sampling for soil characterisation might be supplemented with soil vapour sampling and analysis.

Reference would be made to the general requirements for sampling using various types of equipment as outlined in ASC NEPM (NEPC, 2013) and the NEMP 3.0 (HEPA, 2025). In all instances care would be taken to minimise the disturbance of material during sampling such that volatile contaminants may not be lost during sampling. Stockpile samples are to be collected at a minimum depth of 0.5 m below the surface of the stockpile, in accordance with ASC NEPM (NEPC, 2013). To support soil sampling, vapour sampling might be implemented, discussed in **Section 8.4.1**. Re-useable sampling equipment would be thoroughly decontaminated using phosphate and PFAS free detergent and distilled water between each sampling location.

Collected soil being sampled should be immediately transferred to laboratory provided sample containers of appropriate composition (glass / Teflon free jars). 500 ml sub-samples shall be additionally collected and placed in zip lock bags where asbestos analysis is required. During the collection of soil samples, features such as seepage, discolouration, staining, odours, and other indications of contamination shall be noted on field reporting sheets / borelogs.

Sample labels would record sample identification number and date and time of sampling. Sample containers would be transferred to a chilled ice box for sample preservation prior to and during shipment to the testing laboratory. A chain-of custody (COC) form would be completed and forwarded with the samples to the testing laboratory. The form would contain the following information:

- Sample identification
- Signature of sampler
- Date and time of collection
- Type of sample
- Number and type of containers submitted
- Inclusive dates of possession
- Signature of receiver.

National Authorities Testing Australia (NATA) accredited laboratories would be used for all analysis of samples. Appropriate methods and laboratory LORs are required for comparison to relevant criteria. Laboratory methods and laboratory LORs proposed to be adopted for analysis of soil samples collected during remediation / validation activities would be finalised in the RWP(s).

8.4 Validation inspections

Validation data is required to be collected to verify the effectiveness of the remedial works and document the final Site condition as being suitable for the proposed future use. Given the range and extent of remediation works to be completed under this RAP, the validation sampling design is summarised below for a range of anticipated activities, which will be supported by specific guidance in the RWP(s). Where validation programs are required to be designed for additional unexpected finds, consideration would be given to the validation sampling requirements identified below.

8.4.1 Treated soils

Following treatment, soils would be subject to validation testing against a pre-determined validation criteria and in accordance with a specific validation plan. Soils which have been validated to meet the commercial/ industrial standard (including any validated imported materials) would be stockpiled separately from soils requiring remediation.

Validated soils would be placed in excavations as soon as practicable following removal of contaminated soils and subsurface infrastructure. At the completion of the remediation works, areas used for stockpiling contaminated soils would be validated appropriately in accordance with the validation plan. Tracking documentation would be completed for each excavation and stockpile in accordance with the Materials Tracking Plan (outlined in **Section 9.3**).

8.5 Quality assurance / quality control

The pre-determined Data Quality Indicators (DQIs) to be adopted for all material characterisation and validation works are discussed below in relation to precision, accuracy, representativeness, comparability and completeness (PARCC parameters) as follows:

- Precision – measures the reproducibility of measurements under a given set of conditions. The precision of the data and sampling techniques is assessed by calculating the relative percent difference (RPD) of duplicate samples.
- Accuracy – measures the bias in a measurement system. The accuracy of the laboratory data that is generated during this study is a measure of the closeness of the analytical results obtained by a method to the 'true' value. Accuracy is assessed by reference to the analytical results of laboratory control samples, laboratory spikes and analyses against reference standards.
- Representativeness – expresses the degree to which samples data accurately and precisely represents a characteristic of a population or an environmental condition. Representativeness is achieved by collecting samples on a representative basis across the Site, and by using an adequate number of sample locations to characterise the Site to the required accuracy.
- Comparability – expresses the confidence with which one data set can be compared with another. This is achieved through maintaining a level of consistency in techniques used to collect samples, ensuring analysing laboratories use consistent analysis techniques and reporting methods.
- Completeness – is defined as the percentage of measurements made which are judged to be valid measurements. The completeness goal is set at there being sufficient valid data generated during the study.

Listed below in the table are predetermined DQIs including the QA/QC requirements.

Table 27 DQIs and QA/QC requirements

DQI	Field	Laboratory	Acceptability limits
Completeness	All critical locations sampled All critical samples collected SOPs appropriate and complied with Experienced sampler Documentation corrects	All critical samples analysed and all analytes analysed according to SOPs Appropriate methods Appropriate LOR Sample documentation complete Sample holding times as per ASC NEPM (2013)	As per ASC NEPM (2013) < nominated criteria
Comparability	Sample SOPs used on each occasion Experienced sampler Climatic conditions Same types of samples collected	Same analytical methods used (including clean-up) Sample LORs Same laboratories (NATA accredited) Same units	As per ASC NEPM (2013) < nominated criteria

DQI	Field	Laboratory	Acceptability limits
Precision	SOPs appropriate and were complied with: Collection of blind and split duplicate samples	Analysis of: Blind duplicate samples (1 in 20 samples non-PFAS) (1 in 10 for PFAS) Split duplicate samples (1 in 20 samples non-PFAS) (1 in 10 for PFAS) – excluding vapour Laboratory duplicate samples	Relative percentage difference (RPD) <10x LOR = No Limit 10-20x LOR = RPD 0% - 30% >20x LOR = RPD 0% - 30%
Accuracy	SOPs appropriate and were complied with: Collection of rinsate blanks (soil / water) Collection of trip blanks (soil / water) Recording of receipt and dispatch pressure (vapour) Completion of leak testing (vapour) Collection of atmospheric gases (vapour)	Analysis of: Rinsate Blanks (1 per sampling event) – excluding vapour Trip Blanks (1 per laboratory batch) – excluding vapour Method blanks Matrix spikes Matrix spike duplicates Surrogate spikes Laboratory control samples (LCS) Laboratory prepared spikes	Non-detect for CoPC Non-detect for CoPC Non-detect for CoPC 70 to 130% 70 to 130% 70 to 130% 70 to 130% 70 to 130%
Representativeness	Appropriate media sampled according to SOP All relevant media sampled	All samples analysed according to Sampling Plan	Appropriately selected samples analysed.

8.6 Validation criteria

8.6.1 Soils

Soils validation criteria to be applied in the validation of the Project Area as identified in the decision rules, based on the applicable human health and ecological investigation levels published in ASC NEPM (NEPC, 2013) and the NEMP 3.0 (HEPA, 2025). Validation criteria for the remedial works would be selected from assessment criteria that has been presented in **Section 5.0**. The relevant validation criteria will be dependant on the location of the SAE, considering relevant receptors within the Site. This would be finalised in the RWP(s)).

8.6.2 Imported materials

In accordance with the current EPA policy, only material that does not represent an environmental or health risk at the receiving site may be considered for resource recovery. Imported materials would only be accepted to the Site if they meet the definition of:

- Virgin excavated natural material (VENM) as defined in the POEO Act, 1997 Schedule 1.
- ENM as defined by the Resource Recovery Order under Part 9, Clause 93 of the POEO (Waste) Regulation 2014

- Any other suitable material granted an applicable exemption or order under the NSW EPA resource recovery framework.
- Extractive materials sourced from legal quarries (not considered a waste as defined under the POEO Act, Schedule 1, clause 19).

All material imported onto the Site is to be accompanied by appropriate documentation that has been verified by the appointed environmental consultant.

8.6.3 Validation of soil placement areas

Soils which are to be moved to another area on the Site for reuse would be subject to the following data recording process for future reference purposes, and detailed in the Material Tracking Plan (MTP):

- A location plan of the placed materials with co-ordinates based on unified grid system for the Site
- The levels in m AHD of the base of the placement location(s) prior to the material placement
- The surface levels in m AHD of the placement locations once all materials have been placed
- The levels in m AHD of any defining layers, such as marker layers
- The total placed volume of materials.

8.6.4 Validation of treated soils

Validation of individual biopiles would be carried out progressively via collection of soil and vapour samples from treated stockpiles/biopiles prior to reinstatement.

The methodology adopted for soil vapour validation of stockpiles would be via the use of stainless steel implants/probes buried a minimum of 500 mm beneath the surface of the consolidated stockpile. Direct vapour samples would be collected from stockpiles with the sampling methodology similar to standard subsurface soil vapour sampling. The collection of soil vapour samples for the validation of treated soil stockpiles should consider all of the same limitations that impact the use of the methodology when used to assess in-situ Site conditions, including: equilibrium timing, potential for atmospheric ingress, moisture interference, and the impact of atmospheric pressure and temperature. CRC Care Technical report number 23 sets out the Australian guidance for petroleum hydrocarbon vapour intrusion assessment.

Guidance on the minimum number of samples recommended for characterisation of homogenous soil stockpiles is provided in Table 3 and Table 4 of Section 5.4.6 of the NSW EPA Sampling design part 1 - application (2022).

For stockpiles <75m^3, a minimum of 3 samples is required, for stockpiles >75m^3 but <200m^3, one sample for each additional 25 m^3 is required up to 200 m^3.

For stockpiles over 200 m^3, a reduced frequency using a 95 % upper confidence limit (UCL) of the mean (this does not apply for asbestos): minimum 10 samples up to 2,500 m³; then ≥ 3,000 m³ use ~1 per 250 m³.

Soil vapour sampling would be carried out at a density 1 sample per 250 m^3 as a supplementary verification method to ensure the material is adequately characterised and validated prior to reinstatement into excavations.

Qualitative soil vapour measurements (with a PID as well as with a landfill gas analyser) would be collected in addition to the laboratory analytical samples, and vapour measurements.

8.6.5 Validation of crushed concrete

Where crushed concrete generated from onsite materials is proposed for reuse as a backfill materials it will require assessment and validation as with soils, to confirm its suitable for reuse. Validation sample density and analysis schedule would vary depending on the source area that the concrete originated from. At a minimum samples shall be analysed for BTEXN, TRH, PAHs, heavy metals (defined in **Section 4.2.1** and asbestos in combination with consideration of the source location. A detailed and systematic inspection would be completed of the material to assess the potential presence of visible ACM or anthropogenic prior to final placement.

8.6.6 Asbestos clearance

Where it is proposed that remediation of asbestos in soils is undertaken, and the intent is to validate the area as asbestos free (e.g. the LPG area), this will require the issue of an asbestos clearance certificate, issued by a licensed asbestos assessor (LAA) following the completion of remedial works. The validation of clearance will involve inspection of the area, and quantitative validation sampling. In lieu of local NSW government guidance covering validation of asbestos contaminated soils, this will be completed in accordance with the Guidelines for the Assessment Remediation and Management of Asbestos Contaminated Sites in Western Australia (WA DoH, 2021). Given the known presence and extent of asbestos at the Site, in line with Table 4 of the WA DoH, 2021, the Site should be considered as “likely” to contain asbestos, utilising sampling densities double the minimum sampling rate stated in Table 5. It is noted that the WA Asbestos Guidelines are not wholly consistent with the regulatory framework in NSW. Refer to NSW EPA online article *Managing asbestos in and on land* for up to date guidance while it explores any changes that could be made to the regulatory framework.

8.7 Groundwater assessment

Where further assessment of groundwater contaminant conditions is required, there would be a program of groundwater monitoring completed. This would include situations where:

- Prior to remedial works, to ensure the baseline groundwater conditions are known
- During remedial works, to ensure groundwater conditions do not change as a result of the disturbance
- Following the completion of remedial works, to assess the ongoing post remedial groundwater condition, as discussed in **Section 9.5**

Requirements for decommissioning and reinstallation of groundwater monitoring wells destroyed during remedial activities are introduced in **Section 8.7.3** and would be included in detail with relevant remedial work plan documentation. Groundwater gauging and sampling methodology are outlined below.

8.7.1 Groundwater gauging methodology

Target monitoring wells as defined in the RWP will have their headspace measurements collected immediately after opening the well cap, using a PID. Following this, the well will be gauged for absence / presence (and where present, depth) of LNAPL, and depth to groundwater below top of casing using an oil/water interface probe. New appearances of LNAPL, or changes in expected thickness of LNAPL outside of historical fluctuations will be confirmed visually with a bailer.

8.7.2 Groundwater sampling methodology

Where groundwater sampling is required, it will be completed utilising no-purge method using HydraSleeve^{tm} samplers, in line with the Site’s quarterly groundwater monitoring methodology, and in accordance with the Australia and New Zealand Standard for Groundwater Sampling (AS/NZS 5667.11.1998. Groundwater gauging as discussed in the subsection above would be completed prior to commencement of groundwater sampling.

Reference would be made to the general requirements for groundwater sampling using various types of equipment as outlined in NSW EPA Sampling Design Guidelines (2022), ASC NEPM (NEPC, 2013) and the NEMP 3.0 (HEPA, 2025). In all instances care would be taken to minimise the disturbance of groundwater during sampling such that volatile contaminants may not be lost.

Groundwater physiochemical properties would be collected in the field using down well multi-probe water quality meter immediately following the retrieval of the HydraSleeve^{tm} and collection of the groundwater sample, consistent with the quarterly groundwater monitoring methodology at the Site.

One primary sample is to be collected from each target well. Groundwater sampling equipment would be PFAS free (i.e. non-Teflon coated bailers). All sampling equipment would be thoroughly decontaminated using phosphate and PFAS free detergent and distilled water between each sampling location.

Sampled groundwater would be immediately transferred to laboratory provided sample containers of appropriate composition (glass / Teflon free jars). During the collection of groundwater samples, features such as colour, oil sheen, odours, and other indications of contamination shall be noted on field reporting sheets.

Sample labels would record sample identification number and date and time of sampling. Sample containers would be transferred to a chilled ice box for sample preservation prior to and during shipment to the testing laboratory. A chain-of custody (COC) form would be completed and forwarded with the samples to the testing laboratory. The form would contain the following information:

- Sample identification
- Signature of sampler
- Date and time of collection
- Type of sample
- Number and type of containers submitted
- Inclusive dates of possession
- Signature of receiver.

National Authorities Testing Australia (NATA) accredited laboratories would be used for all analysis of samples. Appropriate methods and laboratory LORs are required for comparison to relevant criteria. Laboratory methods and laboratory LORs proposed to be adopted for analysis of groundwater samples collected pre- and post-remediation would be finalised in the RWP(s).

Changes to sampling methodology may be required due the Site conditions. Should this occur, and the methodology is not present within the contingency sections of the SAQP, the Site Auditor would be consulted for review and approval.

8.7.3 Groundwater monitoring well network maintenance

It is acknowledged that remedial excavations are proposed in areas that are currently serviced by groundwater monitoring wells. The standard for installation and decommissioning of groundwater monitoring wells in NSW are set out in the Minimum Construction Requirements for Water Bores in Australia (MCR), National Uniform Drillers Licensing Committee 2020. If an excavation will overlap with an existing groundwater monitoring well, the monitoring well should be decommissioned prior to the commencement of excavations that would otherwise destroy the monitoring feature.

Following the completion of excavation works and backfill, the installation of new replacement groundwater monitoring wells may be required within the boundaries of the completed remedial excavation to provide spatial coverage of the post-remedial conditions. The location of these installations would be based on the works completed and the extent of coverage required to monitor the area following remediation. These will be set out in the remedial works plan and in the subsequent update to the Site's ongoing management plan (introduced in **Section 9.5**).

8.8 Soil vapour assessment

Where further assessment of soil vapour conditions are required, a program of soil vapour monitoring would be completed. This may be required in situations including:

- Prior to remedial works, to ensure baseline soil vapour conditions are understood and recorded.
- Following completion of remedial works, to assess post-remediation soil vapour conditions and the effectiveness of remedial measures where exceedances of Tier 1 criteria for soil and groundwater remain and are not proposed to be addressed through engineering controls..

Soil vapour monitoring, sampling, and details relevant to the maintenance of monitoring features are provided in **Section 8.8.1** and **Section 8.8.2** below.

8.8.1 Soil vapour probe / well installation

Installation of soil vapour monitoring features (probes and wells) should follow methodologies set out in Appendix D of CRC CARE technical report 23 – Petroleum Hydrocarbon vapour intrusion assessment.

The choice of method should depend upon the site, access, geology (texture, moisture and stratigraphy) and the project goals. For limited-access areas, a temporary probe may be all that is applicable. Where repeat sampling is required, a permanent well offers advantages.

Target sampling points for soil vapour assessment will be set out in the RWP. Notable site specific constraints relating to soil vapour assessment include the unsealed surface condition and the shallow groundwater. The selection of sampling points would consider and record the current condition of the surface (sealed / unsealed), as well as the depth to water taken from the nearest available groundwater monitoring well.

8.8.2 Soil vapour probe / well monitoring and sampling methodology

Where soil vapour sampling is required, samples will be collected from selected soil vapour monitoring points. Sampling methodology will be completed via a preferred method, active or passive, per Appendix F of CRC CARE technical report 23. Analysis schedule should refer to the target volatile COPC being assessed within the given work zone (provided within the relevant RWP).

As part of ongoing maintenance of soil vapour monitoring features, leak testing should be undertaken prior to each round of quantitative sampling and analysis. These procedures are set out in Appendix F1.1 of CRC CARE technical report 23.

8.9 Reporting

Following the completion of the remediation works, a Validation Report would be prepared in accordance with the NSW EPA Consultants reporting on contaminated land: Contaminated land guidelines (NSW EPA, 2020). Works within the relevant Site Audit Boundary would be reviewed and endorsed by the Site Auditor, via Interim Audit Advice (IAA). The Validation Report may include progressive validation reports for separate portions of the Project Area to enable progressive validation of these areas.

The report would be prepared to include:

- An overview of the remediation works carried out for each validation area
- Update relevant portions of the Site description and CSM as prepared in this RAP
- A summary of the Site history and basis for the remediation approach for the validation areas
- Surveyed figures outlining the extent of the remediation works
- The location of validation and characterisation samples
- Descriptions of sampled materials (including visual and olfactory observations)
- Field equipment calibration certificates/records
- Photographic documentation of the validation works
- Details of imported material used at the Project Area
- Waste classification certificates and landfill waste disposal information
- Summary of the tracking and fate of materials including materials excavated for onsite treatment, reuse onsite or offsite disposal
- Landfill weighbridge dockets (if required)
- Summary tables for soil (and groundwater, if required) analytical results
- Confirmation that the Project DQOs and DQIs have been appropriately met
- National Association of Testing Authorities registered laboratory analytical certificates

- Undertake assessment to the decision rules and identify environmental data which causes decision rules to be failed
- Conclusions as to the suitability of the Project Area specifically for on-going Terminal use and in future to enable the land to be used for commercial/ industrial purposes
- Recommendations (if required) for further works
- Identify the requirements for any EMP(s) including inclusion of a survey clearly identifying the extent of material management areas .

At the completion of the remedial works under the proposed modification, one or more IAA documents would be prepared by the Site Auditor in accordance with the Guidelines for the NSW Site Auditor Scheme (3rd edition). Multiple IAAs may be required depending on the progress of remediation and validation activities within the Audit Boundary in Zone 2 and Zone 3.

9.0 Site management

9.1 Environmental management

9.1.1 Preparation of a remediation environmental management plan

Demolition, excavation and remediation works would occur as part of the proposed modification. A MOD-7 Construction Environment Management Plan (CEMP) would be prepared alongside the RWP(s). This CEMP would aim to:

- Ensure appropriate environmental management practices are followed during the modification works to avoid and minimise adverse impacts on environmental receptors
- Achieve the overall environmental objectives
- Ensure legal and contractual compliance.

9.1.2 Required elements / procedures

The MOD-7 CEMP aims to address a number of Site management controls as required by the NSW EPA (2020) Contaminated Land Guidelines: Consultants Reporting on Contaminated Land, and include discussions regarding the activities and procedures that are to be applied and set out management structure and responsibilities, including:

- Soils and Water Management Plan (SWMP), including:
  - Surface Water Management Plan
  - Erosion and Sediment Control Plan (ESCP)
  - Acid Sulfate Soils Management Plan (ASSMP)
- Groundwater Management Plan (GWMP)
- Contamination Management Plan (CMP)
- Asbestos Management Plan (AMP)
- Waste and Resource Management Plan (WRMP)
- Aboriginal Cultural Heritage Management Plan (ACHMP)
- Construction Traffic Management Plan (CTMP)
- Noise and Vibration Management Plan (NVMP)
- Air Quality Management Plant (AQMP)
- Biodiversity and Weeds Management Plan (BWMP).

Alongside the CEMP and RWP(s), the following existing Site management plans and documents would be updated to incorporate the proposed modification:

- Work Health and Safety Management Plan (WHSMP)
- Community and Stakeholder Engagement Plan (CSEP)
- Emergency Response and Preparedness Plan(s).

The precise names of these plans and documents may change depending as a result of discussions with stakeholders during the modification application process. Consent conditions may allow for plans to be brought together or combined as required.

9.2 Health and safety

9.2.1 Work Health and Safety Management Plan

Prior to commencement of the remediation works, the Principal Contractor and / or Remediation Contractor would develop a WHSMP that defines health, safety and emergency management processes and procedures such that a safe working environment is maintained during the works including:

- Responsibilities, controls, procedures and systems of work for the anticipated works that are, so far as is practicable, safe and minimise risks to health, environment and infrastructure
- Information and instructions to parties involved in the works as necessary to enable the works to be undertaken in a manner that is safe and with minimal risks to health and environment
- Procedures to manage health, and safety risk for activities that cannot be planned in detail prior to enabling works
- Health and safety procedures required for reporting a near miss, unforeseen events or incident situations (including Notifiable Incidents to the Regulator)
- Safe Work Method Statements (SWMS) to identify key tasks, the associated hazards and mitigation measures to control the hazards.

The Principal Contractor and / or Remediation Contractor undertaking the works at the Site is required, at a minimum, to complete the Ampol online induction course, general contractor inductions at the Site in addition to project specific requirements.

9.2.2 Decontamination and PPE

9.2.2.1 Asbestos

An Asbestos decontamination area would be established onsite for the use of the personnel conducting the remediation works when working with soils contaminated or potentially contaminated with asbestos. The asbestos decontamination area would comprise a segregated area where the contaminated work clothing and respirators are removed and discarded. This area would be connected to the wet decontamination unit and access to and from work area would be via this ‘Change Room’ area.

The Change Room is the area in which potentially contaminated PPE must be removed prior to leaving the Designated Work Area. It is to be located at the exit to the Designated Work Area. It must not be used for purposes other than decontamination. It must not be used as a materials storage area. All personnel leaving the Designated Work Area must use the Change Room prior to leaving. Personnel would remove disposable protective clothing prior and would be required to ensure that no asbestos soiled clothes or PPE leave the decontamination area to the ‘clean end’ of the area.

PPE is to be provided to all personnel working in the Designated Work Areas and would be available within the decontamination area. The PPE would be to the standards required for the asbestos removal work and for protection from other contaminants (e.g. VOCs).

Where personnel are working on the ground within the designated asbestos areas and are required to handle, or are likely to come into direct contact with asbestos material the following minimum PPE is required:

- High visibility vests / shirts
- Disposable coveralls
- Disposable booties or safety gumboots which can be decontaminated
- Safety boots with rubber soles
- Safety glasses
- Gloves (cut proof and disposable)
- Respirators - half (P2) or full face (P3) including organic vapour filter (where other contamination is identified in the soil).

The protective clothing would be required to be provided daily to employees at the commencement of their work shift at the Change Area. Protective clothing is only for use in the Designated Work Area and would not be used outside of this area.

Once workers are inside the Work Zones, they are not permitted outside of that area without proceeding through the appropriate decontamination procedures.

No employee is permitted to remove any disposable protective clothing from the Site. Contaminated overalls and PPE are to be disposed of with the asbestos contaminated waste materials in appropriately labelled waste bins or bags.

9.2.2.2 Other contaminants

Decontamination and PPE requirements for other chemical COPC would be based on the particular COPC being remediated. Generally, chemical decontamination of equipment would occur when equipment has come into contact with heavily contaminated soil or groundwater. Where feasible, the equipment would be washed-down with a suitable decontamination solution, in a dedicated wash-zone with suitable wastewater drainage. In the likely event that chemical decontamination is required for equipment that was also exposed to asbestos in soils, and assuming the chemical decontamination cannot occur within the area that the equipment was used, the asbestos decontamination and clearance process should be completed first, prior to delivering the equipment to the chemical decontamination area.

For chemical contaminants, personnel working on the ground that are required to handle, or are likely to come into direct contact with contaminated material, the following minimum PPE is required:

- High visibility vests / shirts
- Long sleeve shirt and pants
- Safety boots with rubber soles
- Safety glasses
- Gloves (nitrile and/or cut resistant).

Based on the COPC, personnel might also require the use of:

- Respirators - half or full face P3 with relevant applicable vapour filter (selected based on the contaminant identified present).

Personnel would consult with their activity specific SWMS or other relevant guidance.

9.2.2.3 Activity specific PPE

Personnel would consult the WHSMP or SWMS for advice on activity specific PPE such as hard hats and hearing protection.

9.3 Materials tracking plan

All materials handled during the remediation works would be tracked in order to allow verification of the correct movement and handling. The material tracking plan would track materials from cradle-to-grave and would provide detailed information on the location and quantity of all material movements, both for onsite treatment and offsite disposal, so that the material being handled can be identified and accounted for. The tracking system would include accurate tracking of stockpiles throughout the entire material handling stage and would include confirmation of stockpile locations. This is to reduce the risk of cross-contamination between stockpiles.

A field manager would be assigned by the Principal Contractor and / or Remediation Contractor, who would be responsible for filling out the materials tracking forms, implementing the field procedures, and coordinating with field personnel who are collecting samples. As part of this process, accurate records would be kept ensuring that backfilling of excavations and reuse of material only occurs following the successful validation as described in the **Section 8.4**. A register of all analytical results for stockpiles and excavations would be maintained throughout the validation works.

9.4 Interim site management

It is anticipated that interim site management measures would be maintained during various remediation stages to mitigate and minimise the migration of potentially contaminated materials at the Site during the remediation and infrastructure removal/relocation works.

9.4.1 General site

Dependent upon remediation and infrastructure removal / relocation works being completed, the final surface of the works footprints would be completed in a manner which prevents exposure of Site personnel to contaminants if present, and mitigates environmental considerations such as erosion and stormwater runoff. These measures would be implemented in accordance with the Site OEMP and contained EMP(s). This may include installation of a suitable validated asbestos-free backfill layer. These layers would be maintained and / or replaced following disturbance.

9.4.2 Site boundaries

Remediation and infrastructure removal / relocation works may require temporary battering to ensure the stability of the surface and surrounding areas.

Given that in some instances the batter could include retention of un-remediated areas adjoining the remediated areas, the following may be installed at either the lateral extent of either the remediated area, or the lateral extent of the current works stage, as appropriate:

- Geofabric across the exposed batter face to minimise the potential for migration of contaminated material from the batter onto the interim cap
- 0.15 m capping profile overlying the batter to provide a working surface during infrastructure installation activities
- Site fencing to restrict access to adjoining areas so as to minimise the potential for vehicular/ plant transfer of contaminated material from the development sites onto the remediated areas
- Sediment and dust control measures attached to / adjoining the fencing to minimise the transfer of potentially contaminated material from the remediation area via wind / sediment migration. It is anticipated that existing pavement / gravel / road base ground covers would be maintained within the Project Area prior to the commencement of remediation to further reduce the potential for migration of contaminated material from one area to another.

9.4.3 Interim validation documentation requirements

Where the remediation works are completed in a number of stages across the Project Area, validation works and associated reports may be prepared for specific stages/portions of the Project Area. The extent of the Project Area addressed by each report would be identified via survey with appropriate plans included in the relevant validation report(s).

9.5 Ongoing management

In addition to the requirements of the validation plan presented in **Section 8.0**, the proposed remediation would require ongoing management following completion of the works.

Where relevant, following remediation and where further management of contamination is required within the Audit Boundary, one or more EMP(s) would be prepared. These plans would fall under and be administered by the Site's existing OEMP. The OEMP would be updated as required to incorporate new EMP(s). The EMP(s) would be prepared in general accordance with the NSW EPA EMP Guidelines (2022) and NSW EPA Consultant Guidelines (2020) and would be provided to the appointed Site Auditor for endorsement.

The precise nature and extent of the management requirements would not be known until remediation / management works are conducted and the validation data obtained.

The EMP at a minimum would include groundwater management, which would detail groundwater monitoring requirements for the land where it applies. It is anticipated that a number of existing groundwater wells around the Site would be lost during excavation works. The well network coverage would need to be re-assessed, and if not sufficient, the destroyed wells would be replaced following the completion of reinstatement works. Monitoring of other media, such as soil vapour and/or surface water, may also be required.

Ongoing management requirements for various portions of the Project Area would be dependent upon the remediation measures and end use.

The EMP(s) would include:

- A statement of the objectives of the EMP
- Description of responsibilities and timeframes for implementation of the EMP requirements
- Specific additional health and safety requirements for intrusive activities
- Appropriate monitoring locations and depth within and down-gradient of residual contamination
- Environmental monitoring and reporting requirements (as required)

10.0 Community and stakeholder engagement

A CSEP would be produced to notify stakeholders (including occupiers of neighbouring properties and other contractors performing works onsite) of the proposed modification works. The CSEP would be integrated with existing community consultation / communication planning, and provide an outline of the stakeholders, engagement risks and mitigation measures, tools and activities to implement to deliver an appropriate engagement approach.

11.0 Conclusions

This RAP has been prepared to meet the requirements of the relevant NSW EPA endorsed guidelines including the NSW EPA (2020) *Contaminated Sites: Guidelines for Consultants Reporting on Contaminated Sites* which provides a framework for regulatory compliance.

Key tasks for finalising the RWP(s):

- Completion of DGAs at the Site to address known data gaps.
- Refine remediation extent and volumes.
- Finalise Supporting Management Plans and Work Procedures (**Section 1.6**).

The remedial strategy (and extents) discussed in this RAP are subject to the findings of the DGA.

12.0 Limitations

This Report is provided strictly in accordance with and subject to the following limitations and recommendations:

a. This Report should be read in full and no excerpts are to be taken as representative of the findings. No responsibility is accepted by AECOM Australia Pty Limited (AECOM) for use of any part of this Report in any other context.

b. This Report has been prepared for the sole benefit of Ampol Australia Petroleum Pty Ltd and neither the whole nor any part of this Report may be used or relied upon by any party other than Ampol Australia Petroleum Pty Ltd.

c. This Report is dated 07 March 2025. AECOM accepts no responsibility for any events arising from any changes in Site conditions or in the information reviewed that have occurred after the completion of the Site monitoring.

d. A site which appears to be unaffected by contamination at the time the Report was prepared may later, due to natural phenomena or human intervention, become contaminated.

e. Except as specifically stated above, AECOM makes no warranty, statement or representation of any kind concerning the suitability of the Site for any purpose or the permissibility of any use, development or re-development of the Site.

f. Use, development or re-development of the site for any purpose may require planning and other approvals and, in some cases, environmental regulatory authority and accredited Site Auditor approvals. AECOM offers no opinion as to whether the current use has any or all approvals

g. Except as required by law, no third party may use or rely on, this Report unless otherwise agreed by AECOM in writing. Where such agreement is provided, AECOM will provide a letter of reliance to the agreed third party in the form required by AECOM.

h. To the extent permitted by law, AECOM expressly disclaims and excludes liability for any loss, damage, cost or expenses suffered by any third party relating to or resulting from the use of, or reliance on, any information contained in this Report. AECOM does not admit that any action, liability or claim may exist or be available to any third party.

i. It is the responsibility of third parties to independently make inquiries or seek advice in relation to their particular requirements and proposed use of the relevant property.

j. The ongoing use of the Site and/or the use of the Site for any different purpose may require the owner/user to manage and/or remediate Site conditions, such as contamination and other conditions, including but not limited to conditions referred to in this Report

Annexure B1: DU1 Historical aerial review

Year	Source	Coordinates	Comments	Imagery
1955	Historical Imagery Spatial NSW	-34.023815, 151.212638	Land appears cleared or wetland. Disused. A sand track transects the northern portion .	
1972	Historical Imagery Spatial NSW	-34.023815, 151.212638	Much of the DU has been cleared or disturbed. Some vegetative cover remains. A track runs from the east to the west before diverting to the south. The track is connected to the original sand track forming the southern boundary. A stormwater culvert now runs north to south along the western boundary of the DU. A shed like structure is located on the north-western boundary. A boundary track has formed along the eastern and southern boundaries. An aboveground pipeline runs along the eastern face of the boundary track.	
1979	Historical Imagery Spatial NSW	-34.023815, 151.212638	No major changes to the DU. Vegetative cover has increased in some areas and decreased in others. The stormwater culvert appears to have widened.	
1984	Historical Imagery Spatial NSW	-34.023815, 151.212638	Vegetative cover has increased within the DU and now extends to the central portion.	

Annexure B1: DU1 Historical aerial review

1998	Historical Imagery Spatial NSW	-34.023815, 151.212638	Vegetative cover has decreased markedly across the DU.	2005	Historical Imagery Spatial NSW	-34.023815, 151.212638	Extensive earthmoving appears to have taken place in the eastern portion of the DU. Machinery and stockpiles are visible in the vicinity. Two above ground tanks/structures are visible in south-eastern corner of the DU. A second straight pipeline has been added adjacent the original along the eastern DU boundary.	
Jun 15, 2010	Nearmap	-34.023815, 151.212638	Where present, vegetation is much denser. A large portion of the DU is still visibly disturbed. Surface elevation does not appear consistent, and mounds are present within the central and south-eastern portions.	Jul 11, 2012	Nearmap	-34.023815, 151.212638	Vegetative cover in the northern portion of the DU has been largely removed. What appears to be roadbase has been installed along the northern boundary (~3,000 m2). The two above ground tanks/structures in south-eastern corner of the DU have been removed. Shed like structure in north-western part of the DU appears to have been removed/demolished.	
Annexure B1: DU1 Historical aerial review

Aug 3, 2013	Nearmap	-34.023815, 151.212638	Machinery and two shipping containers, along with a large collection of Bulka bags (used for storage of asbestos containing soils (ACS)), are placed along the southern part of the roadbased area.	
Jun 27, 2015	Nearmap	-34.023815, 151.212638	The northern roadbased area is almost entirely covered with Bulka bags (approximately 1,000). Vegetation has recovered throughout the rest of the DU.	Jun 16, 2016	Nearmap	-34.023815, 151.212638	The majority of the Bulka bags have been removed and are now stored behind fencing along the eastern boundary in the northern portion. Ponding is evident at the northern boundary. Vegetation has increased further south of the roadbased area. The original pipeline on the eastern boundary has been removed.	
Jun 24, 2017	Nearmap	-34.023815, 151.212638	Additional Bulka bags are present on the northern portion. Increased vegetative cover across remainder of DU.	

Annexure B1: DU1 Historical aerial review

Jul 1, 2019	Nearmap	-34.023815, 151.212638	Bulka bags remain present. Drainage infrastructure has been installed in the south-western corner of the DU at the southern end of the stormwater culvert along the western boundary.	
Jun 17, 2021	Nearmap	-34.023815, 151.212638	No Bulka bags present. Fencing has been removed. Some material storage remains at the northern boundary cleared area.	
Jun 18, 2024	Nearmap	-34.023815, 151.212638	Vegetative cover has returned to the former cleared area in the northern portion.	
Apr 2, 2025	Nearmap	-34.023815, 151.212638	No major changes to the DU.	

Annnexure B2

DU2 Historical aerial review

Annexure B2: DU2 Historical aerial review

Year	Source	Coordinates	Comments	Imagery
1955	Historical Imagery Spatial NSW	-34.021231, 151.210606	Cleared land or wetland. Numerous tracks traverse the DU. Sand dunes are evident in south-eastern and north-western portion of DU.	
1972	Historical Imagery Spatial NSW	-34.021231, 151.210606	Extensive tank infrastructure and associated bunds have been installed within the DU, particularly in the central portion. A tranker truck loading rack (TTLR) has been constructed on the western portion of the DU with connection to the pipeways to its east, and with vehicle access from Sir Joseph Banks Drive through what later becomes the western lease areas (DU9).	
1979	Historical Imagery Spatial NSW	-34.021231, 151.210606	Expansion of tank infrastructure to the west of the tankfarm has taken place. A building has been built at the western boundary of the DU.	
1984	Historical Imagery Spatial NSW	-34.021231, 151.210606	No significant changes within the DU noted. Roadways appear sealed. Pipelines are more evident in this aerial image.	
1998	Historical Imagery Spatial NSW	-34.021231, 151.210606	Building at the western boundary has been demolished. Otherwise, no significant changes within the DU noted.	
2005	Historical Imagery Spatial NSW	-34.021231, 151.210606	Footprint of former western building within the north-western corner of the DU hosts above ground storage tanks on concrete slab. Otherwise, no significant changes within the DU noted.	

Annexure B2: DU2 Historical aerial review

Jun 15, 2010	Nearmap	-34.021231, 151.210606	Vegetation has been removed from the north-western portion of the DU. Otherwise, no significant changes within the DU noted.	
Jul 11, 2012	Nearmap	-34.021231, 151.210606	No significant changes within the DU noted.	
Aug 3, 2013	Nearmap	-34.021231, 151.210606	Tanks within the north-eastern and south-eastern portions of the DU have been removed. The bund and concrete slab remains.	
Jun 27, 2015	Nearmap	-34.021231, 151.210606	All visible tank infrastructure has been removed from the DU, except the eastern tanks located across the road in the eastern bunded compound and tanks located in the north-western portion. Pipework has been removed from the pipeways. Black soils, present throughout much of the central northern bunded portion of the DU are landfarm soils from CLOR where were stored here during the broader demolition. The eastern half of this bund inundated with water. In the south-western bunded portion of the DU, mounds of material are visible. To the east of the two remaining north-eastern tanks, five geobags have been positioned. The TTLR and building nearby south have been removed.	
Jun 16, 2016	Nearmap	-34.021231, 151.210606	Black landfarming soils within the central northern bunded portion remains evident. The geobags in the north-eastern bunded portion have been removed and the surface has been scraped back. These soils have been transferred as stockpiles onto the landfarming soils in the central northern bunded area (black on dark brown). The central pipeway area is inundated with water (dark). In the southern portion of the DU, surface colour has lightened and is generally consistent across the southern portion. Mounds in the south-eastern bunded portion are no longer visible, and former tank footprints are less evident. A roadway and a concrete slab have been installed in the south-western bunded portion and the slab is being used as a biopiling area (Calsoil). Sheds and shipping containers are situated directly north of the slab.	
Jun 24, 2017	Nearmap	-34.021231, 151.210606	Black landfarm soils within the central northern bunded portion remains evident, and the geobag waste stockpiles have decrease or been spread into this surface. Water is again inundating the central pipeway. Stockpiles are now present within the south-eastern bunded portion, and an aboveground road connects this area to the south-western bunded portion. Tanks have been removed in the north-western portion of the DU. Geobags are now present again in the north-eastern bunded portion.	

Annexure B2: DU2 Historical aerial review

Jul 1, 2019	Nearmap	-34.021231, 151.210606	Black landfarm soils within the central northern bunded portion remains evident. Central pipeway apears drier than usual. The two tanks within the north-eastern bunded portion have been removed, in addition to the geobags. Black staining is visible in the south-western corner of the north-eastern bunded portion, though some surface scraping appears to have occured. Vegetation now covers stockpiled materials in the south-eastern bunded portion. Stockpiles have been cleared from the south-western portion.	
Jun 17, 2021	Nearmap	-34.021231, 151.210606	Black staining within the central northern bunded portion remains evident, including across the central pipeway. Stockpiles are now present within the northern central bunded portion. A white material, possibly a collection of Bulka bags, covered in black geofab, is being stored in the southern pipeway, immediately south of the bridge noted in the eastern portion, just south of the former central pipeway.	Jun 18, 2024	Nearmap	-34.021231, 151.210606	Black landfarmed soils within the central northern bunded portion have reduced markedly. It appears in this portion that stockpiles have been stored and subsequently removed, and water is pooling throughout. There is a stockpile with orange geofab stored on the concrete slab in the north-western portion of the DU. There is an increased number of stockpiles in the southern portion.	
Apr 2, 2025	Nearmap	-34.021231, 151.210606	Trenches have been excavated in the central northern bunded portion. Stockpile in the north-western portion has been removed. No other significant changes within the DU noted.	

Annexure B3

DU3 Historical aerial review

Annexure B3: DU3 Historical aerial review

Year	Source	Coordinates	Comments	Imagery
1955	Historical Imagery Spatial NSW	-34.023298, 151.210665	Cleared land or wetland. Numerous tracks traversing the DU. Sand dunes evident in the northern portion of the DU.	
1972	Historical Imagery Spatial NSW	-34.023298, 151.210665	Refinery infrastructure including tanks and pipework are evident in the DU. Groundcover and roads along boundary appears sealed.	
1979	Historical Imagery Spatial NSW	-34.023298, 151.210665	No significant changes within the DU noted.	1984	Historical Imagery Spatial NSW	-34.023298, 151.210665	A new tank / structure is present in the southeast corner of the DU. No other significant changes noted.	

Annexure B3: DU3 Historical aerial review

1998	Historical Imagery Spatial NSW	-34.023298, 151.210665	The structure in the southeast corner is no longer present.	
2005	Historical Imagery Spatial NSW	-34.023298, 151.210665	No significant changes within the DU noted.	
Jun 15, 2010	Nearmap	-34.023298, 151.210665	Concrete pads constructed on the central north and central east boundaries.	Jul 11, 2012	Nearmap	-34.023298, 151.210665	Most refinery infrasture within the DU has been removed. Several metal structures remain in the southern portion. There are numerous stockpiles throughout.	

Annexure B3: DU3 Historical aerial review

Aug 3, 2013	Nearmap	-34.023298, 151.210665	The ground surface across the DU visually appears consistent and is being used for storage. The nature of the materials stored is not clear. A pump pit has been installed in the north-western corner of the DU, to facilitate transfer of oily water from Zone 3 to the Sites primary WWTP in Zone 1, following the decommissioning of the Zone 3 WWTP (DU4).	
Jun 27, 2015	Nearmap	-34.023298, 151.210665	The DU is being used to store a large quantity of scrap metal materials from the refinery decommissioning in the eastern and south-western portion. Fencing has been installed in the eastern portion.	Jun 16, 2016	Nearmap	-34.023298, 151.210665	The DU contains a large quantity of metal materials, primarily suspected to be scrap metals. Eight stockpiles situated in the north-western portion of the DU appear to contain shredded metal materials. Materials stored in the north-eastern and south-eastern corners appear to include small white tanks/drums.	
Jun 24, 2017	Nearmap	-34.023298, 151.210665	Stockpiles within the DU have grown in size. The northern portion of the DU hosts four large stockpiles of suspected metal material. Four smaller stockpiles containing more varied materials are located in the south-eastern portion of the DU.	

Annexure B3: DU3 Historical aerial review

Jul 1, 2019	Nearmap	-34.023298, 151.210665	The DU is clear of all stockpiles and metal materials. The ground surface has been regraded, and capped with crushed concrete, visually appears consistent in colour. Groundwater monitoring wells (small black dots), present throughout the area. Shed at the southern boundary has been removed.	
Jun 17, 2021	Nearmap	-34.023298, 151.210665	An excavation has taken place in the south-western portion of the DU which has flooded. The excavated material is stored directly adjacent to the excavation to the south. The area has been enclosed by fencing. Vehicles are present to the east of the fencing. Machinery and/or equipment is present in the north-eastern corner of the DU.	
Jun 18, 2024	Nearmap	-34.023298, 151.210665	The excavation previously observed in the south-western portion of the DU has been filled. Increased density of machinery and equipment are present in the north-eastern portion. One stockpile (VENM) is present in the south-eastern portion.	
Apr 2, 2025	Nearmap	-34.023298, 151.210665	With the exception of one additional stockpile (VENM / sandstone) to the north of the existing stockpile, no significant changes within the DU were noted.	

Annexure B4

DU4 Historical aerial review

Annexure B4: DU4 Historical Aerial Review

Year	Source	Coordinates	Comments	Imagery
1955	Historical Imagery Spatial NSW	-34.024299, 151.209779	The DU appears to comprise wetland.	1972	Historical Imagery Spatial NSW	-34.024299, 151.209779	A wastewater treatment plant is present. Two tanks are situated in the western portion of the DU. Pipeline infrastructure is evident along the northern boundary. Some small structures are present on the eastern boundary of the DU.	
1979	Historical Imagery Spatial NSW	-34.024299, 151.209779	There appears to be some disturbance to the ground around the aeration basins. Some additional structures or materials are now present on the eastern boundary.	
1984	Historical Imagery Spatial NSW	-34.024299, 151.209779	No significant changes within the DU were noted with the exception of material storage on the eastern boundary.	

Annexure B4: DU4 Historical Aerial Review

Year	Source	Coordinates	Comments	Imagery
1998	Historical Imagery Spatial NSW	-34.024299, 151.209779	Potential changes within the DU cannot be ascertained due to poor resolution of the image.	
2005	Historical Imagery Spatial NSW	-34.024299, 151.209779	An additional white structure is present, south of the aeration basins. No other significant changes within the DU were noted.	
Jun 15, 2010	Nearmap	-34.024299, 151.209779	The retention basin has been removed and rebuilt. An additional structure, possibly a shipping container, is situated immediately east of the retention basin. Bunds are clearly evident in this image around the two tanks in the western portion of the DU.	
Jul 11, 2012	Nearmap	-34.024299, 151.209779	The suspected shipping container has been removed from the DU. No other significant changes within the DU were noted.	

Annexure B4: DU4 Historical Aerial Review

Year	Source	Coordinates	Comments	Imagery
Aug 3, 2013	Nearmap	-34.024299, 151.209779	Tanks, aerations basins and associated infrastructure have been removed. The retention basin remains. Some metal materials are stored within the western portion of the DU.	
Jun 27, 2015	Nearmap	-34.024299, 151.209779	Two white rectangular structures are present along the eastern side of the retention basin, suspected to be demountables. The western portion of the DU stores what appears to be rubble.	
Jun 16, 2016	Nearmap	-34.024299, 151.209779	The suspected demountables have been removed from the DU. The stockpile of rubble has grown in size. The retention basin appears to have drained by approximately a third.	
Jun 24, 2017	Nearmap	-34.024299, 151.209779	The retention basin appears to have drained entirely. The ground surface of the eastern portion has been significantly disturbed. Dark VENM stockpiles are present on the eastern portion of the site.	

Annexure B4: DU4 Historical Aerial Review

Year	Source	Coordinates	Comments	Imagery
Jul 1, 2019	Nearmap	-34.024299, 151.209779	The majority of the rubble in the western portion of the DU has been removed. Several stockpiles of material, including one underlined with a white sheet, are present in the central northern portion. Excess soils in the eastern portion have been graded, and vegetation (sparse) is visible.	
Jun 17, 2021	Nearmap	-34.024299, 151.209779	The retention basin has been removed entirely; a visible footprint remains. A demountable office structure is present in the north-western corner. Stockpiles of concrete rubble from the removal of the retention basin are present in the south-western portion of the DU.	
Jun 18, 2024	Nearmap	-34.024299, 151.209779	All rubble has been removed from the DU. Only one structure remains in the north-western portion. Minor vegetative ground cover has extended westward from the eastern boundary of the DU. Most of the DU appears to be covered in gravel. Some vegetation has been cleared in the south-eastern corner of the DU.	
Apr 2, 2025	Nearmap	-34.024299, 151.209779	Vegetation has been cleared entirely along the southern boundary of the DU. No other significant changes within the DU were noted.	

Annexure B5

DU5 Historical aerial review

Annexure B5: DU5 Historical Aerial Review

Year	Source	Coordinates	Comments	Imagery
1955	Historical Imagery Spatial NSW	-34.024477, 151.211094	Sand tracks traverse the DU, surrounded by some cleared land and wetland.	1972	Historical Imagery Spatial NSW	-34.024477, 151.211094	A building is present in the north-western portion of the DU. One half of a building lies within the DU on the western boundary. The ground cover does not appear sealed. A road runs east to west along the southern boundary.	
1979	Historical Imagery Spatial NSW	-34.024477, 151.211094	An additional structure is present immediately south-west of the primary building within the DU. Materials of some form appear to be stockpiled south-east of the primary building.	
1984	Historical Imagery Spatial NSW	-34.024477, 151.211094	A pipeline has been installed in the western portion of the DU, running from the northern boundary to the southern boundary, and then joins a pipeline that runs eastward along the southern boundary of the DU.	

Annexure B5: DU5 Historical Aerial Review

1998	Historical Imagery Spatial NSW	-34.024477, 151.211094	It is not possible to determine if there have been any significant changes within the DU due to poor resolution of the image.	
2005	Historical Imagery Spatial NSW	-34.024477, 151.211094	There appears to be materials or equipment storage within the DU, specifically south of the primary building and in the eastern portion, but poor resolution prevents further assessment.	
Jun 15, 2010		-34.024477, 151.211094	Materials, suspected to be scrap metal, surround the primary building within the DU. Shipping containers are partially within the boundary of the DU in the south-western corner.	
Jul 11, 2012		-34.024477, 151.211094	The pipeline that traversed the DU and the primary building have been removed. The pipeline running along the southern boundary remains. The eastern portion of the DU contains small mounds of material. There is some water pooling along the eastern boundary. A fenceline running north of and parallel to the southern pipeline is evident.	

Annexure B5: DU5 Historical Aerial Review

Aug 3, 2013	-34.024477, 151.211094	All structures have been removed from the DU with the exception of the fenceline that clearly runs along the southern, eastern and northern boundaries of the DU. The ground surface is generally consistent in colour throughout the DU.	
Jun 27, 2015	-34.024477, 151.211094	The area has been utilised by the Calsoil biopiling trial. A bund has been installed along the north, east and southern boundaries. Four smaller bunded areas have been installed in the northern portion. Stockpile in the south-western smaller bunded area is covered with HDPE. The north-western smaller bunded area appears to be filled and the material is covered in a white geofabric. Two white tanks are situated along the southern boundary of the outer bund wall, within a smaller bunded area.	
Jun 16, 2016	-34.024477, 151.211094	Bunded tanks from the southern boundary have been removed from the DU. One small stockpile is located in the south-western portion of the DU.	
Jun 24, 2017	-34.024477, 151.211094	A grey/ black VENM material stockpile covers much of the DU, and appears to have been pushed into the DU from the west and is spread throughout by earth-moving vehicles.	

Annexure B5: DU5 Historical Aerial Review

Jul 1, 2019	-34.024477, 151.211094	The western portion of the DU has been cleared of material; however, black material stockpile remains in the eastern portion. An excavator is present on the eastern boundary and other earth-moving vehicles in the central portion of the DU.	
Jun 17, 2021	-34.024477, 151.211094	The DU has been cleared of the stockpiled material. A dark colouring remains on the surface, likely due to residual materials from the former stockpiles.	
Jun 18, 2024	-34.024477, 151.211094	Grass cover is now present throughout much of the DU. Approximately 15 small mounds are visible in the north-eastern portion. Vegetation has been cleared on the southern boundary.	
Apr 2, 2025	-34.024477, 151.211094	The mounds are still visible in the north-eastern portion of the DU. The southern boundary of the DU is completely clear of vegetation. No other significant changes within the DU noted.	

Annexure B6

DU6 Historical aerial review

Annexure B6: DU6 Historical aerial review

Year	Source	Coordinates	Comments	Imagery
1955	Historical Imagery Spatial NSW	-34.023066, 151.208952	Cleared land or wetland. Numerous tracks traversing the DU. Sand dunes evident in the northern and southern portions of the DU.	1972	Historical Imagery Spatial NSW	-34.023066, 151.208952	Buildings situated within the northern and central southern potions of the DU.	1979	Historical Imagery Spatial NSW	-34.023066, 151.208952	No significant changes within the DU noted.	1984	Historical Imagery Spatial NSW	-34.023066, 151.208952	No significant changes within the DU noted.	

Annexure B6: DU6 Historical aerial review

1998	Historical Imagery Spatial NSW	-34.023066, 151.208952	Three additional buildings constructed within the DU: one in northern portion, one in the central southern portion, and one in the southern portion.	
2005	Historical Imagery Spatial NSW	-34.023066, 151.208952	Some areas in vicinity of buildings appear sealed for parking, and a new building is present in the north east.	
Jun 15, 2010		-34.023066, 151.208952	L-shaped building removed from the northeastern portion, its former footprint has been grassed. Building in the north east has been extended.	
Jul 11, 2012		-34.023066, 151.208952	No significant changes within the DU noted.	

Annexure B6: DU6 Historical aerial review

Aug 3, 2013	-34.023066, 151.208952	Presence of two shipping container like structures are evident within the northern grassed area. Metal structures are stored in the southern tip of the DU.	
Jun 27, 2015	-34.023066, 151.208952	The building situated within the north-eastern portion of the DU has been demolished. There has been some earthworks in the northwestern corner. The metal structures in the southern tip of the DU have been removed.	
Jun 16, 2016	-34.023066, 151.208952	Rubble has been stockpiled in the southern tip of the DU.	
Jun 24, 2017	-34.023066, 151.208952	Two buildings in the southern portion of the DU, and one in the central portion of the DU have been demolished. Scrap metal and small mounds of material are stockpiled in the central southern portion of the DU.	

Annexure B6: DU6 Historical aerial review

Jul 1, 2019	-34.023066, 151.208952	All buildings within the DU have been demolished. A suspected skip-bin is located in the southern portion of the CU and appears to contain material covered by black geofabric. Material is stockpiled on a concrete slab including one large stockpile of a gravel-like material and one small stockpile of a bulkier gravel material, immediately north of the suspected skip bin. A temporary fence covered in orange geofabric has been installed within the central southern portion of the DU, within which is a stockpile covered in black geofabric. Grass is visible to the surface in the northern portion. Two suspected skip-bins are situated within the vicinity of the stockpile in the northern portion.	
Jun 17, 2021	-34.023066, 151.208952	Rubble has been stockpiled in the southern tip of the DU. Fencing, skip bins and stockpiles have been removed. There are a number of vehicles and structure on a hard surface in the southern portion. No other significant changes within the DU noted.	
Jun 18, 2024	-34.023066, 151.208952	Rubble within the southern tip of the DU has been removed. No other significant changes within the DU noted.	
Apr 2, 2025	-34.023066, 151.208952	A stockpile covered in black geofabric is situated on a concrete slab within the northern portion of the DU. No other significant changes noted.	

Annexure B7

DU7 Historical aerial review

Annexure B7: DU7 Historical aerial review

Year	Source	Coordinates	Comments	Imagery
1955	Historical Imagery Spatial NSW	-34.021575, 151.212894	The DU comprises sand dunes, tracks and vegetative cover.	1972	Historical Imagery Spatial NSW	-34.021575, 151.212894	Two buildings are situated within the southern portion of the DU. Ground cover disturbance is evident across rest of the DU. A pipeline runs along the eastern boundary of the north-eastern portion.	
1979	Historical Imagery Spatial NSW	-34.021575, 151.212894	A number of structures are evident in the northern portion. It is difficult to identify their purpose. No other significant changes within the DU noted.	
1984	Historical Imagery Spatial NSW	-34.021575, 151.212894	A shed like structure is present on the western boundary. No other significant changes within the DU noted.	

Annexure B7: DU7 Historical aerial review

1998	Historical Imagery Spatial NSW	-34.021575, 151.212894	Poor resolution of the image limits assessment; however, it appears an additional roadway connects the buildings situated within the south-western portion of the DU to the eastern road.	
2005	Historical Imagery Spatial NSW	-34.021575, 151.212894	Buildings have been constructed in the north-eastern portion of the DU. The DU appears mostly used for storage of building materials and includes several red shipping containers in the central and southern portion of the DUs.	
Jun 15, 2010		-34.021575, 151.212894	The buildings/structures (suspected to be sheds) have been removed from the central eastern portion of the DU. There appears to be more building materials stored across the DU. A defined fenced area has been installed within the central portion as a storage yard.	
Jul 11, 2012		-34.021575, 151.212894	No significant changes within the DU noted. Changes only relate to variation of materials stored across the DU.	

Annexure B7: DU7 Historical aerial review

Aug 3, 2013	-34.021575, 151.212894	No significant changes within the DU noted. Changes only relate to variation of materials stored across the DU.	
Jun 27, 2015	-34.021575, 151.212894	No significant changes within the DU noted. Changes only relate to variation of materials stored across the DU.	
Jun 16, 2016	-34.021575, 151.212894	The southern portion of the DU has been blocked off to the north with shipping containers; access is available via roadway from the west. The central western portion has been cleared and a roadbase installed. The fenced storage yard situated in the central portion of the DU now appears to contain rubble. One of the aboveground pipelines on the eastern boundary has been removed.	
Jun 24, 2017	-34.021575, 151.212894	The central western portion contains what appears to be metal waste. Several small stockpiles of what appears to be a gravel or sand material are located in the central eastern portion of the DU.	

Annexure B7: DU7 Historical aerial review

Jul 1, 2019	-34.021575, 151.212894	Metal waste and rubble have been removed. Shipping containers and the fencing within the central portion of the DU have been removed. The stockpiles within the central eastern portion have been consolidated into one stockpile. At two locations within the central portion of the DU, black geofabric is visible - stockpiles are suspected due to visible weights used to hold the geofabric in place. Seven skip bins are present within the central portion of the DU.	
Jun 17, 2021	-34.021575, 151.212894	Stockpiles and skip bins have been removed from the central portion of the DU.	
Jun 18, 2024	-34.021575, 151.212894	No significant changes within the DU noted.	
Apr 2, 2025	-34.021575, 151.212894	No significant changes within the DU noted.	

Annexure B8

DU8 Historical aerial review

Annexure B8: DU8 Historical aerial review

Year	Source	Coordinates	Comments	Imagery
1955	Historical Imagery Spatial NSW	-34.022348, 151.213056	The DU comprises a sand dune and light vegetative cover in the north-western portion, and grass or wetland in the southern and eastern portions.	
1972	Historical Imagery Spatial NSW	-34.022348, 151.213056	The DU appears generally disused. A pipe runs along the eastern boundary.	
1979	Historical Imagery Spatial NSW	-34.022348, 151.213056	A circular track within the DU in the western portion is visible. Other tracks are also visible.	
1984	Historical Imagery Spatial NSW	-34.022348, 151.213056	No significant changes within the DU noted.	

Annexure B8: DU8 Historical aerial review

1990	Historical Imagery Spatial NSW	-34.022348, 151.213056	clearer visability of the inner and outer landfarm bunded areas.	
1998	Historical Imagery Spatial NSW	-34.022348, 151.213056	Poor resolution prevents assessment. A black area is visible in the north-western corner of the DU. Truckwash footprint visible in south west landfarm boundary.	
2002	Historical Imagery Spatial NSW	-34.022348, 151.213056	Last aerial that shows the surface of the landfarm as turned soil.	
2005	Historical Imagery Spatial NSW	-34.022348, 151.213056	The circular tracks are no longer visible. The northern portion of the DU appears to be used for storage along the northern and western boundary's. An area in the central southern potion is cleared of vegetation with an access track to the south. In the south west there is a bunded truckwash.	

Annexure B8: DU8 Historical aerial review

Jun 15, 2010	-34.022348, 151.213056	The northern portion of the DU continues to be used for storage of materials. The truckwash and access track are more evident on the south.	
Jul 11, 2012	-34.022348, 151.213056	The inner bunded area has expanded north- and eastward. The western wall of the bund appears less prominent.	
Aug 3, 2013	-34.022348, 151.213056	The western bund wall appears to have eroded further. A metal skip like structure is in the southern portion. Ponding is evident at the south-eastern boundary.	
Jun 27, 2015	-34.022348, 151.213056	Materials stored within the northern portion of the DU have been removed. Suspected metal waste has been stockpiled in the north-eastern corner of the DU. Greater areas of ponding are evident along the southern boundary.	

Annexure B8: DU8 Historical aerial review

Jun 16, 2016	-34.022348, 151.213056	The eastern wall of the inner bunded area has been disturbed, with all grass cover removed and gravel-like material visible. Less vegetation is visible on the outer eastern wall of the DU.	
Jun 24, 2017	-34.022348, 151.213056	Grass cover has been restored across the DU. The suspected metal materials remain in the north-eastern corner of the DU.	
Jul 1, 2019	-34.022348, 151.213056	Grass cover has been lost across the entire DU including the inner and outer walls. A dark patch is located in the central southern portion, suspected to be moisture noting large water pooling along the southern perimeter of the DU. Metal materials have been removed from the north-eastern portion. A suspected drum and vehicles are situated on the central western boundary.	
Jun 17, 2021	-34.022348, 151.213056	Grass cover has returned across the DU including the bund walls. The suspected drum on the central western boundary remains.	

Annexure B8: DU8 Historical aerial review

Jun 18, 2024	-34.022348, 151.213056	The DU has been levelled and all grass cover has been lost. Only one tree remains on the southern boundary. The ground surface of the DU is visually highly inconsistent, with areas of suspected saturation.	
Apr 2, 2025	-34.022348, 151.213056	The ground surface within the DU is visually more consistent. Patches suspected to be associated with saturation have receded in some locations.	

Annexure B9

DU9 Historical aerial review

Year	Source	Coordinates	Comments	Imagery
1955	Historical Imagery Spatial NSW	-34.021631, 151.207483	The DU comprises a sand dune and light vegetative cover in the southern portion, and a large sand track and light vegetative cover in the northern portion.	1972	Historical Imagery Spatial NSW	-34.021631, 151.207483	Land has been cleared and the sand track is no longer evident. The southern portion of the DU is being used as a car park. Tracks are evident in the northern portion.	
1979	Historical Imagery Spatial NSW	-34.021631, 151.207483	Additional trees are present in the northern portion. Otherwise, no significant changes within the DU noted.	1984	Historical Imagery Spatial NSW	-34.021631, 151.207483	No significant changes within the DU noted.	

1998	Historical Imagery Spatial NSW	-34.021631, 151.207483	There is a shed-like structure in the central portion and a part of the northern portion and southern portions have been sealed.	
2005	Historical Imagery Spatial NSW	-34.021631, 151.207483	No significant changes within the DU noted, with the exception that the shed-like structure has been removed and vegetation cover in the central portion has increased.	
Jun 15, 2010		-34.021631, 151.207483	No significant changes within the DU noted.	
Jul 11, 2012		-34.021631, 151.207483	No significant changes within the DU noted.	

Aug 3, 2013	-34.021631, 151.207483	Materials have been stored in the northern portion of the DU. It is difficult to ascertain from the imagery what the materials comprise.	
Jun 27, 2015	-34.021631, 151.207483	The number of stockpile of unknown materials in the northern portion of the DU has increased.	
Jun 16, 2016	-34.021631, 151.207483	The stockpile of unknown materials in the northern portion of the DU has reduced in size. Most vegetation within the northern and central portions have been removed.	
Jun 24, 2017	-34.021631, 151.207483	Large pipes are stored within the car park in the southern portion of the DU. Unknown materials stockpiled within the northern portion remain. An unidentified structure is present within the central car park of the DU.	

Jul 1, 2019	-34.021631, 151.207483	Materials stockpiled in the northern and southern portions of the DU have been removed, and the unidentified structure in the central cark park of the DU has been removed.	
Jun 17, 2021	-34.021631, 151.207483	A section within the northern portion of the DU has been fenced off with a separate entrance to the roadway to the west. Shipping containers are stored in the fenced off area. Metal type materials are stored across the carpark area within the southern portion of the DU.	
Jun 18, 2024	-34.021631, 151.207483	The fenced area in the northern portion has expanded, encompassing the entire northern portion of the DU and part of the central portion and used for storage of metal type containers.	Apr 2, 2025	-34.021631, 151.207483	The storage area in the northern portion of the DU has extended into the central portion, with storage of different types of material.	

Annexure B10

DU10 Historical aerial review

Annexure B10: DU10 Historical aerial review

Year	Source	Coordinates	Comments	Imagery
1955	Historical Imagery Spatial NSW		The northern portion of the DU contains approximately 20 rows of stockpiled materials suspected to be building materials. In the central portion of the DU, several small structures are visible, resembling shipping containers. In the central and eastern portions of the DU, four buildings are visible. The southern portion of the DU includes part of a bunded area in the south-western corner and vegetation throughout much of the remainder of the southern portion.	
1972	Historical Imagery Spatial NSW		Vegetation has been mostly cleared from within the DU. A roadway transects the DU from east to west. The southern portion appears generally disturbed, with the exception of a vegetated area in the south-western portion. A structure now stands in the central northern portion, and infrastructure is present in the north-eastern portion of the DU. Several small structures, possibly sheds, are visible in the western portion of the DU. Pipelines are visible along the northern and southern boundaries. Two large buildings are visible along the western boundary.	
1979	Historical Imagery Spatial NSW		Refinery infrastructure is now present throughout the DU, including tall structures and buildings, with exception of south eastern portion, where a sub-station is present. The ground cover appears mostly sealed beneath the refinery infrastructure. Pipeline infrastructure along the northern (pipeway B) and southern perimeters (pipe track C) appears to have developed, particularly along the northern boundary. Road along the western boundary appears sealed.	
1984	Historical Imagery Spatial NSW		No significant changes within the DU noted, except that the road along the eastern boundary appears sealed.	

Annexure B10: DU10 Historical aerial review

1998	Historical Imagery Spatial NSW	A suspected small building in now visible in the north-western portion of the DU. There is an increased volume of material storage adjacent to buildings on the western boundary.	2005	Historical Imagery Spatial NSW	Increased activity across the DU appears to be construction of new refinery infrastructure. A new building is visible in the north-western portion. New sub-station E is now present in south eastern portion. The Bensat plant is under construction in southern portion of the DU.	
15-Jun-10	NearMap	No significant changes within the DU noted, with the exception that construction equipment has been removed and the Bensat plant has been completed.	
11-Jul-12	NearMap	No significant changes within the DU noted.	

Annexure B10: DU10 Historical aerial review

3-Aug-13	NearMap	Infrastructure appears unchanged except for the addition of a large yellow item (appears metallic) in the central southern portion of the DU. In the central point of the DU, there are several red containers. A collection of crates containing unknown materials is located partially within the south-western portion of the DU on the western side of the road.	
27-Jun-15	NearMap	Infrastructure remains unchanged except the apparent removal of the yellow item identified in 2013 image. Only one red container in the central point of the DU remains. Crates in the south-western portion have been completely moved westward from DU10.	16-Jun-16	NearMap	Infrastructure remains unchanged. The majority of infrastructure is now enclosed within fencing.	
24-Jun-17	NearMap	All process infrastructure in the DU and pipeline in the southern portion has been removed. Several buildings and stack remain in the northern portion, and in the south east sub-station E is still present. Concrete underlying former infrastructure has also been removed. Stockpiles of what appear to be a gravel-like material or concrete rubble are present in the north-western, north-eastern and south-western portions of the DU. Several smaller stockpiles of a brown gravel-like material are present within the northern portion of the DU. Of these, three are contained with what appear to be booms. In the north-eastern portion of the DU, a small section has been fenced, containing what appears to be a pipe; the area can be accessed from the eastern road. Water has pooled in the central southern portion of the DU in an area of earthworks (noting tire tracks, mounds and the presence of an excavator).	

Annexure B10: DU10 Historical aerial review

1-Jul-19	NearMap	The stack has been removed, while the south-eastern buildings (including sub-station E) and adjacent concrete slab remain. The ground surface throughout the DU appears to have been regraded. None of the previous stockpiles remain. Two new stockpiles exist in the north-western corner of the DU and comprise dark gravel material. Earthmoving equipment is evident adjacent to the largest stockpile. It appears that sediment is been washed from the western area of the central track towards the southern portion of the DU. Earthworks appear to have taken place in the former pipeway along the southern portion.	
17-Jun-21	NearMap	The stockpile in the north-eastern portion of the DU has been removed. The central track appears to have been capped with mostly dark grey material. No other significant changes within the DU were noted.	
18-Jun-24	NearMap	Visible water flow across the DU is much more pronounced. What is suspected to be a series of gabion baskets, black in colour, have been placed across the junction of the southern pipeway and the broader area of the DU in the south-western portion of the DU. Additional gabion baskets have been installed within the pipeway immediately east of the junction. Additional loose stones are present in the immediate vicinity within the pipeway. Moisture within the pipeway is generally more apparent; however, vegetation has decreased. Asbestos works related equipment is visible along the northern edge of the southern pipe track including IBCs, fencing, rope and a dedicated decontamination area surrounded in orange geofabric.	2-Apr-25	NearMap	No significant changes within the DU noted.	

Annexure B11

DU11 Historical aerial review

Year	Source	Coordinates	Comments	Imagery
1955	Historical Imagery Spatial NSW		Several buildings are present within the DU, with a section of refinery infrastructure located within the northern portion. The ground cover within the DU appears sealed. Materials appear to be stockpiled in the south-western portion of the DU, suspected to be pipes.	
1972	Historical Imagery Spatial NSW		Buildings previously in the north-eastern portion of the DU have been replaced by larger buildings. The central building has been extended to the south and the building to the east has been extended to the east. The building on the western boundary has been extended to the south-east. A building previously located along the southern boundary of the DU has been demolished.	
1979	Historical Imagery Spatial NSW		No significant changes within the DU noted, with exception of density of pipework along southern boundary.	
1984	Historical Imagery Spatial NSW		An additional building has been constructed along the western boundary of the DU. In the south-eastern portion of the DU, adjacent to the southern pipeway the hydroblast bay has been constructed.	
1998	Historical Imagery Spatial NSW		Buildings in the western portion have been demolished, with two additional buildings constructed, one west and one south-west of the former building located on the western boundary. There is a new building on the central southern boundary. The building in the south-eastern portion has been demolished and a new building constructed and another one to the north. CCB building has been constructed on the eastern boundary.	
16-Jun-16	NearMap		All infrastructure remains within the DU. The crane previously immediately east of the hydroblast in the south-eastern portion has been removed.	24-Jun-17	NearMap		Powerplant infrastructure has been partially removed in the northern portion of the DU. Several buildings have been demolished and are partially demolished within the same portion of the DU. Piping within pipeway B along the southern boundary has been removed.	1-Jul-19	NearMap		All refinery infrastructure has been removed within the DU. A stockpile is situated within the footprint of the former refinery infrastructure, being used to cap pipeway A to the north-east. The hydroblast in the south-eastern portion of the DU have been dismantled, and footprint is visibly dry. Buildings in the north-eastern portion has been demolished, with concrete slab remaining with material stored atop. The building to its west has also been removed. Sub-station A remains present. Building along central eastern portion and in the centre of the DU have been demolished.	17-Jun-21	NearMap		The stockpile in the northern portion of the DU has been removed and the pipeway A capping works have concluded. There is residual fill on the surface of the DU.	
18-Jun-24	NearMap		No significant changes within the DU noted.	
2-Apr-25	NearMap	No significant changes within the DU noted.	

Annexure B12

DU12 Historical aerial review

Annexure B12: DU12 Historical Aerial Review

Year	Source	Coordinates	Comments	Imagery
1955	Historical Imagery Spatial NSW	151.2075431°E 34.0216525°S	Building in the western-portion of the DU are present, and refinery infrastructure on the eastern portion. Pipeway B runs through the southern portion of the DU, and the main pipeway is visible to the east. Sub-station B is present in the north east portion.	1972	Historical Imagery Spatial NSW		Refinery infrastructure is now present throughout the DU and greater density of pipework across the pipeway B.	1979	Historical Imagery Spatial NSW		No significant changes within the DU noted.	

Annexure B12: DU12 Historical Aerial Review

1984	Historical Imagery Spatial NSW	No significant changes within the DU noted.	
1998	Historical Imagery Spatial NSW	No significant changes within the DU noted.	
2005	Historical Imagery Spatial NSW	Some infrastructure has been removed in the north-western portion of the DU.	

Annexure B12: DU12 Historical Aerial Review

15-Jun-10	NearMap		No significant changes within the DU noted.	
11-Jul-12	NearMap		No significant changes within the DU noted, except for an additional structure in the northern portion covered with green fabric.	
3-Aug-13	NearMap		No significant changes within the DU noted, except for removal of some structures in north-western portion.	

Annexure B12: DU12 Historical Aerial Review

27-Jun-15	NearMap		No significant changes within the DU noted.	
16-Jun-16	NearMap		All refinery infrastructure has been removed, though sub-station B remains present. The northern and central portions have been fenced off independently; the southern portion is separated by the existing pipeline, with some of the pipes in this area removed. Throughout the DU, there are stockpiles of rubble including metal scrap. Metal scrap is concentrated in the central portion to the east. Much of the suspected waste in the southern portion comprises pipes.	24-Jun-17	NearMap		The piping from pipeway B in the southern portion of the DU has been removed. Scrap metals and pipes have been largely removed from the DU. Several stockpiles of a gravel-like material (crushed concrete) are present throughout the DU. No additional buildings have been removed.	

Annexure B12: DU12 Historical Aerial Review

1-Jul-19	NearMap		All stockpiles within the DU have been removed and the area appears to have been regraded. Pipeway B appears inundated with water. Black material from residual material from these stockpiles are apparent in the north-eastern corner of the DU, as well as in the southern portion of the DU, and appear to be dark grey/black gravels of former stockpiles. No additional buildings have been removed.	17-Jun-21	NearMap		No significant changes within the DU noted.	
18-Jun-24	NearMap		No significant changes within the DU noted.	
Annexure B12: DU12 Historical Aerial Review

2-Apr-25	NearMap	No significant changes within the DU noted.	

Annexure B13

DU13 Historical aerial review

Annexure B13: DU13 Historical aerial review

Year	Source	Coordinates	Comments	Imagery
1955	Historical Imagery Spatial NSW	151.2075431°E 34.0216525°S	The DU is primarily covered in vegetation, with sand tracks running throughout and mostly to the central and western portion.	
1972	Historical Imagery Spatial NSW		The DU has been partially cleared and appears sandy. A pipeline runs along the eastern and southern boundaries, and a pipeline branch extends from the southern portion of the eastern piping west halfway through the DU. Two shadows representing the refinery flares are present at the end of this branch, within the DU's south east portion.	
1979	Historical Imagery Spatial NSW		Additional pipework is present along the southern boundary of the DU, and it appears pipe track C (east west alignment) and pipe track 1 (north south alignment) have been constructed.	
1984	Historical Imagery Spatial NSW		No significant changes within the DU noted.	
1998	Historical Imagery Spatial NSW		Suspected earthen bunding, arranged in a series of three curved rows, is present in the north-western portion of the DU. Smaller structures are evident in the southern portion. Additional vegetation clearing is evident within the DU.	

Annexure B13: DU13 Historical aerial review

2005	Historical Imagery Spatial NSW		It appears that additional infrastructure (associated with flare) may have been installed in the southern portion of the DU, with some earthworks evident to the north. Dark areas are now more visible in the western and northern portions of the DU.	
15-Jun-10	NearMap		No significant changes within the DU noted, with the exception of vegetation growth in central portion.	11-Jul-12	NearMap		Noting the loss of one extended shadow in the south-eastern portion of the DU, it appears that one flare stack has been removed from the south-eastern portion.	
3-Aug-13	NearMap		No significant changes within the DU noted. Suspected dark coloured material is particularly visible in the western portion of the DU, and likely to be gravels across this part of the DU.	
27-Jun-15	NearMap		Dark areas again are prominent in the north east and west. There is additional black staining located in the south-eastern portion of the DU.	

Annexure B13: DU13 Historical aerial review

16-Jun-16	NearMap		There are several unidentified objects on the ground surface within the eastern portion of the DU. There appears to be earthworks in the central portion of the DU. What appears to be a fence runs north-east to the south-west within the central portion of the DU.	
24-Jun-17	NearMap		All infrastructure has been removed, including the pipelines in the pipe track C and pipe track 1. Footings remain present within pipe track C. A surface scrape or shallow excavation has taken place in the southern portion of the DU, with a collection of red-brown stockpiles located at the eastern edge of the scrape. A stockpile of a suspected sandy material is situated at the centre of the DU. An arc of what resembles road base is positioned in the north-western portion of the DU. An additional barrier is evident within the northern-most earthen bund.	
1-Jul-19	NearMap		Pipe track C along the southern boundary has been cleared and appears more consistent in surface colour. The broader DU has been contained by a reinforced bund, sloping down northwards and westward. The far western portion has been contained independently with a larger inner bunded section. Within the outer bunded section, a soil stockpile is situated within the eastern portion of the DU. In the eastern portion of the inner bunded section are six geobags. Throughout this inner bunded area, black material is present which may be liner material; fragmenting of the black material surrounding the geobags are visible columns, also suggesting a liner material. Earthmoving equipment is also visible.	
17-Jun-21	NearMap		Geobags and liner material have been removed from within the inner bunded area of the DU. Several stockpiles are present, including one in the central southern portion of the DU and five stockpiles in the north-eastern portion. The eastern stockpile from previous image is no longer present.	
18-Jun-24	NearMap		Two stockpiles have been removed from the northern portion. An additional stockpile is within the south-eastern portion. The north-western portion of the DU, within both the inner out outer bunded sections, are flooded.	

Annexure B13: DU13 Historical aerial review

2-Apr-25	NearMap		Stockpiles have been removed within the northern portion of the DU. Additional stockpiles are present in the south-eastern portion of the DU. Flooding has receded but still present. In the central southern portion, a section of road base has been lain and orange geofabric is visible along the northern edge of the road base.	

Annexure B14

DU14 Historical aerial review

Year	Source	Coordinates	Comments	Imagery
1955	Historical Imagery Spatial NSW	151.2075431°E 34.0216525°S	The DU is primarily covered in vegetation, with sand tracks running throughout.	1972	Historical Imagery Spatial NSW		The land has been cleared and the sand tracks are no longer evident. A pipeline runs parallel to the western boundary external of the DU.	
1979	Historical Imagery Spatial NSW		A suspected carpark has been installed in the northern portion of the DU and a smaller building has been erected along the western boundary of the DU. The vegetation that exists on the southern boundary of the DU has increased.	
1984	Historical Imagery Spatial NSW		The vegetation has been cleared in the southern portion of the DU. A small tank has been installed in the central western portion of the DU.	
1998	Historical Imagery Spatial NSW		The original building on the western boundary of the DU has been replaced with a larger building. To this buildings north sub-station Y has been installed. The small tank in the centra western portion of the DU has been replaced by a larger tank. Vegetation at the southern boundary has re-grown. What is the fire training area (FTA) slab, and its associated on slab features are now visible in the eastern portion of the DU.	

2005	Historical Imagery Spatial NSW		A small tank (understood to have been used for as a prop for training purposes) has been installed in the central eastern portion of the DU on the FTA slab. Additional structures that are shed-like are in the southern portion of the DU.	
15-Jun-10	NearMap		No significant changes within the DU noted.	
11-Jul-12	NearMap		No significant changes within the DU noted, with exception of (red) foam pods installed at the southern boundary on a concrete slab.	
3-Aug-13	NearMap		No significant changes within the DU noted, with exception of 2 shipping containers in the south-eastern corner.	

27-Jun-15	NearMap		No significant changes within the DU noted, with exception of material stored in the south-western portion of the DU.	
16-Jun-16	NearMap		A suspected shipping container and shed were removed from the south eastern portion of the DU.	
24-Jun-17	NearMap		No significant changes within the DU noted.	
1-Jul-19	NearMap		A small suspected tank in the central eastern portion of the FTA slad has been removed. The footprint is still visible.	

17-Jun-21	NearMap		No significant changes within the DU noted.	
18-Jun-24	NearMap		Two small red foam pods have been removed from the southern border of the DU.	
2-Apr-25	NearMap		No significant changes within the DU noted.

Annexure B15: DU15 Historical Aerial Review

Year	Source	Coordinates	Comments	Imagery
1955	Historical Imagery Spatial NSW	151.2075431°E 34.0216525°S	Eastern parcel: The eastern side of the DU comprises a sand dune and light vegetation in the northern portion, and 2 distinct sand tracks with light vegetation cover in the southern portion. Western parcel: The western side of the DU comprises of dense vegetation in the eastern portion and light vegetation with 2 distinct sand tracks in the western portion.	
1972	Historical Imagery Spatial NSW		Eastern parcel: Vegetation has been cleared throughout the DU. In the northern east portion DU is now bordered by a bund wall (from eastern tank farm). Western parcel: All vegetation has been cleared in the western portion of the DU. Some vegetation has been cleared in the eastern portion. A sand track has been made parallel to the eastern boundary.	1979	Historical Imagery Spatial NSW		Eastern parcel: Further vegetation has been cleared in the northern portion. Remaining vegetation appears to be managed. There is material stored randomly across the northern portion of this parcel. Western parcel: Vegetation has been cleared and a medium sized tank has been installed in the eastern portion of the DU.	1984	Historical Imagery Spatial NSW		No significant changes within the DU noted.	
Annexure B15: DU15 Historical Aerial Review

1998	Historical Imagery Spatial NSW	Eastern parcel: The central part of the DU has become a landfarm area, and the southern boundary appears to have been cleared. Limestone pits are constructed to the west. Western parcel: Suspected shipping containers and other storage infrastructure has been installed in the eastern portion of the parcel.	
2005	Historical Imagery Spatial NSW	Eastern parcel: Metal type materials, and small stockpiles are stored along the southern boundary, and the cleared areas are more visible. This areas appears to be used for tempory waste storage. There are vehicles present. There is evidence of material storage along the northern boundary. Western parcel: No significant changes within the DU noted.	
15-Jun-10	NearMap	Eastern parcel: There is pooling water in the southern portion of the landfarm. There is an increased volume of material stored along the northern boundary. Previously mentioned materials along the southern border of the DU have been mostly removed. The southern area appears cleared, flat and graded, with vehicles present. Western parcel: No significant changes within the DU noted.	
11-Jul-12	NearMap	Eastern parcel: There is reduced pooling of water in the landfarm. Metal materials along the southern border of the DU are present again. Earthworks have occurred to the north of this, and the surface now appears to have a consistent capping (limestone pits). Suspected landfarm material is contained in a small bunded area in the northern portion of the DU. Western parcel: No significant changes within the DU noted, with the exception of new building/shed (green roof) constructed in southern central portion.	
3-Aug-13	NearMap	Eastern parcel: The landfarm appears to be spread across the footprint, reducing the height but increasing the lateral impact. This has removed the pooling. Suspected waste bays have been installed in the south western corner of the parcel and there are additional metal sheds in the southern central portion. Previously mentioned landfarm material in the northern portion of the DU appears to be removed and vegetation has replaced it. Western parcel: No significant changes within the DU noted.	

Annexure B15: DU15 Historical Aerial Review

27-Jun-15	NearMap		Eastern parcel: The majority of contents in the landfarm have been removed and suspected pooling of water has occurred. Bunded area in the northern portion has been split in half with the northern half containing suspected landfarm material and the southern half containing pooled water. Western parcel: No significant changes within the DU noted, with the exception of building removed from the southern central portion.	
16-Jun-16	NearMap		Eastern parcel: Suspected pooling in landfarm has been removed and the majority of material has also been removed. Bunded area in the northern portion of the DU is covered with suspected pooling of water. Metal materials along the southern border of the DU has approximately doubled in size. Western parcel: No significant changes within the DU noted.	
24-Jun-17	NearMap		Eastern parcel: Northern tip of the landfarm subject to suspected pooling of water. The southern portion of the landfarm has been divided by an internal bund. Materials stored along the northern boundary have been removed. Western parcel: The tank on the eastern boundary of the parcel has been removed, the bunding remains. Pipes are evident in the southern portion and along the southern boundary.	
1-Jul-19	NearMap		Eastern parcel: Dirt tracks in the northern portion of the DU have been replaced with paved roads. Western portion and southern section of the landfarm appears to be inundated with water. Suspected metal materials in the southern portion of the parcel have been removed. Western parcel: Some metal materials have been removed from the western portion of the parcel. Two stockpiles have been placed in these areas. The larger stockpile in the central part of the parcel contains a light-grey material while the smaller stockpile close to eastern boundary of the parcel contains a black, dark-grey material. A number of structure in the central portion have neem removed. The pipes and material stored along the southern boundary have been removed. The bund in the eastern portion appears fragmented with metal structures apparent.	
17-Jun-21	NearMap		Eastern parcel: Suspected pooling of water has reduced in both sections of the landfarm by approximately 50%. A large amount of the landfarm material appears to have been removed. Vegetation has increased in the southern portion of the DU. Western parcel: Both stockpiles from previous image have been removed.	

Annexure B15: DU15 Historical Aerial Review

18-Jun-24	NearMap		Eastern parcel: The contents of the landfarm has been removed. The base of the landfarm appears to contain sands, likely the material beneath former liner of the landfarm. The suspected pooling of water in the bunded area in the northern portion of the parcel has been drained. Western parcel: No significant changes within the parcel noted.	2-Apr-25	NearMap		Eastern parcel: Vegetation is growing in the northern portion of the old landfarm footprint. Western parcel: No significant changes noted.	

Annexure B16

DU16 Historical aerial review

Annexure B16: DU16 Historical aerial review

Year	Source	Coordinates	Comments	Imagery
1955	Historical Imagery Spatial NSW	151.2075431°E 34.0216525°S	The northern portion of the DU contains 12 tanks of small and medium sizes on sealed ground. Bunding surrounds all tanks and pipework is evident to the west. The southern portion of the DU is covered by vegetation and a sand dune with sand trails exiting through the southern boundary of the DU.	1972	Historical Imagery Spatial NSW		The number of tanks in the northern portion has increased to 21. In the southern portion of the DU a large tank has been installed.	
Annexure B16: DU16 Historical aerial review

1979	Historical Imagery Spatial NSW	An additional two small tanks have been installed in the northern portion of the DU. An additional medium sized tank has been installed in the southern portion of the DU.	1984	Historical Imagery Spatial NSW	No significant changes within the DU noted.	
Annexure B16: DU16 Historical aerial review

1998	Historical Imagery Spatial NSW	No significant changes within the DU noted.	
2005	Historical Imagery Spatial NSW	A small tank in the northern portion of the DU has been removed.	

Annexure B16: DU16 Historical aerial review

15-Jun-10	NearMap		The colour of a medium sized tank in the central part of the DU has changed from rusted to clean white. Tank suspected to have been blasted and painted.	11-Jul-12	NearMap		No significant changes within the DU noted.	

Annexure B16: DU16 Historical aerial review

3-Aug-13	NearMap	No significant changes within the DU noted.	
27-Jun-15	NearMap	No significant changes within the DU noted.	

Annexure B16: DU16 Historical aerial review

16-Jun-16	NearMap		No significant changes within the DU noted.	
24-Jun-17	NearMap		The first two tanks on the north-western corner of the DU have been removed. The first 8 tanks on the north-eastern side of the DU have been removed. There appears to be repairs to some of the western bund walls.	

Annexure B16: DU16 Historical aerial review

1-Jul-19	NearMap		All tanks within the DU have been removed. In the central-eastern side of the DU, where two tanks once stood, geobags are evident.	
17-Jun-21	NearMap		No significant changes within the DU noted.	

Annexure B16: DU16 Historical aerial review

18-Jun-24	NearMap		The geobags have been removed. Vegetation within former tank bunds has increased.	
2-Apr-25	NearMap		No significant changes within the DU noted.

Monitoring Zone **Location Code** **Date** **Field ID** **Sample Type**

#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction.
#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate (refer Shedule B7).
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific bioavailability should be considered where appropriate.
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is present, or suspected to be present.
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc. PAH in sample by its BaP TEF (ref Table 1A(1)) & summing
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (should meet BaP TEQ HIL) & napthalene (should meet relevant HSL)
#9 PCBs: HIL refers to non-dioxin like PCBs only. Where PCB source is known, or suspected at a site, a site-specific assessment of exposure to all PCBs (inc dioxin like PCBs) should be undertaken
#10 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)
#16 Reported Analyte LOR is higher than Requested Analyte LOR

USEPA RSLs Industrial Soil THQ=1.0 (May 2024)					5.1[#10]	47,000[#10]	25[#10]		2,800[#10]	2,500[#10]	35,000[#10]	9,900[#10]	58,000[#10]	24,000[#10]		120,000[#10]

Monitoring Zone	Location Code	Date	Field ID	Sample Type
#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction				

#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is pr
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc.
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (shou
#9 PCBs: HIL refers to non-dioxin like PCBs only. Where PCB source is known, or suspected at a site, a site-specific assessment of exposure
#10 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)
#16 Reported Analyte LOR is higher than Requested Analyte LOR

Monitoring Zone	Location Code	Date	Field ID	Sample Type
#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction				

#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is pr
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc.
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (shou
#9 PCBs: HIL refers to non-dioxin like PCBs only. Where PCB source is known, or suspected at a site, a site-specific assessment of exposure
#10 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)
#16 Reported Analyte LOR is higher than Requested Analyte LOR

Monitoring Zone	Location Code	Date	Field ID	Sample Type
#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction				

#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is pr
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc.
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (shou
#9 PCBs: HIL refers to non-dioxin like PCBs only. Where PCB source is known, or suspected at a site, a site-specific assessment of exposure
#10 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)
#16 Reported Analyte LOR is higher than Requested Analyte LOR

Monitoring Zone	Location Code	Date	Field ID	Sample Type
#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction				

#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is pr
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc.
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (shou
#9 PCBs: HIL refers to non-dioxin like PCBs only. Where PCB source is known, or suspected at a site, a site-specific assessment of exposure
#10 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)
#16 Reported Analyte LOR is higher than Requested Analyte LOR

Monitoring Zone	Location Code	Date	Field ID	Sample Type
#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction				

#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is pr
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc.
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (shou
#9 PCBs: HIL refers to non-dioxin like PCBs only. Where PCB source is known, or suspected at a site, a site-specific assessment of exposure
#10 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)
#16 Reported Analyte LOR is higher than Requested Analyte LOR

USEPA RSLs Industrial Soil THQ=1.0 (May 2024)				600[#10]			2,500[#10]			570[#10]		8,200[#10]					570[#10]

Monitoring Zone	Location Code	Date	Field ID	Sample Type
#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction				

#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is pr
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc.
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (shou
#9 PCBs: HIL refers to non-dioxin like PCBs only. Where PCB source is known, or suspected at a site, a site-specific assessment of exposure
#10 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)
#16 Reported Analyte LOR is higher than Requested Analyte LOR

Monitoring Zone	Location Code	Date	Field ID	Sample Type
#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction				

#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is pr
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc.
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (shou
#9 PCBs: HIL refers to non-dioxin like PCBs only. Where PCB source is known, or suspected at a site, a site-specific assessment of exposure
#10 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)
#16 Reported Analyte LOR is higher than Requested Analyte LOR

Monitoring Zone	Location Code	Date	Field ID	Sample Type
#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction				

#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is pr
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc.
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (shou
#9 PCBs: HIL refers to non-dioxin like PCBs only. Where PCB source is known, or suspected at a site, a site-specific assessment of exposure
#10 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)
#16 Reported Analyte LOR is higher than Requested Analyte LOR

Monitoring Zone	Location Code	Date	Field ID	Sample Type
#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction				

#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is pr
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc.
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (shou
#9 PCBs: HIL refers to non-dioxin like PCBs only. Where PCB source is known, or suspected at a site, a site-specific assessment of exposure
#10 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)
#16 Reported Analyte LOR is higher than Requested Analyte LOR

Monitoring Zone	Location Code	Date	Field ID	Sample Type
#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction				

#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is pr
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc.
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (shou
#9 PCBs: HIL refers to non-dioxin like PCBs only. Where PCB source is known, or suspected at a site, a site-specific assessment of exposure
#10 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)
#16 Reported Analyte LOR is higher than Requested Analyte LOR

Monitoring Zone	Location Code	Date	Field ID	Sample Type
#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction				

#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is pr
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc.
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (shou
#9 PCBs: HIL refers to non-dioxin like PCBs only. Where PCB source is known, or suspected at a site, a site-specific assessment of exposure
#10 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)
#16 Reported Analyte LOR is higher than Requested Analyte LOR

Monitoring Zone	Location Code	Date	Field ID	Sample Type
#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction				

#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is pr
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc.
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (shou
#9 PCBs: HIL refers to non-dioxin like PCBs only. Where PCB source is known, or suspected at a site, a site-specific assessment of exposure
#10 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)
#16 Reported Analyte LOR is higher than Requested Analyte LOR

Monitoring Zone	Location Code	Date	Field ID	Sample Type
#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction				

#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is pr
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc.
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (shou
#9 PCBs: HIL refers to non-dioxin like PCBs only. Where PCB source is known, or suspected at a site, a site-specific assessment of exposure
#10 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)
#16 Reported Analyte LOR is higher than Requested Analyte LOR

Monitoring Zone	Location Code	Date	Field ID	Sample Type
#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction				

#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is pr
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc.
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (shou
#9 PCBs: HIL refers to non-dioxin like PCBs only. Where PCB source is known, or suspected at a site, a site-specific assessment of exposure
#10 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)
#16 Reported Analyte LOR is higher than Requested Analyte LOR

Monitoring Zone	Location Code	Date	Field ID	Sample Type
#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction				

#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is pr
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc.
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (shou
#9 PCBs: HIL refers to non-dioxin like PCBs only. Where PCB source is known, or suspected at a site, a site-specific assessment of exposure
#10 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)
#16 Reported Analyte LOR is higher than Requested Analyte LOR

Monitoring Zone	Location Code	Date	Field ID	Sample Type
#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction				

#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is pr
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc.
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (shou
#9 PCBs: HIL refers to non-dioxin like PCBs only. Where PCB source is known, or suspected at a site, a site-specific assessment of exposure
#10 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)
#16 Reported Analyte LOR is higher than Requested Analyte LOR

Comments

#1 Separate management limits for BTEX & naphthalene are not available hence should not be subtracted from the relevant fractions to obtain F1 & F2
#7 Reported Analyte LOR is higher than Requested Analyte LOR

Comments

#1 Separate management limits for BTEX & naphthalene are not available hence should not be subtracted from the relevant fractions to
#7 Reported Analyte LOR is higher than Requested Analyte LOR

Comments

#1 Separate management limits for BTEX & naphthalene are not available hence should not be subtracted from the relevant fractions to
#7 Reported Analyte LOR is higher than Requested Analyte LOR

Comments

#1 Separate management limits for BTEX & naphthalene are not available hence should not be subtracted from the relevant fractions to
#7 Reported Analyte LOR is higher than Requested Analyte LOR

Environmental Standards

Comments

#1 Separate management limits for BTEX & naphthalene are not available hence should not be subtracted from the relevant fractions to
#7 Reported Analyte LOR is higher than Requested Analyte LOR

Environmental Standards

Comments

#1 Separate management limits for BTEX & naphthalene are not available hence should not be subtracted from the relevant fractions to
#7 Reported Analyte LOR is higher than Requested Analyte LOR

Comments

#1 Separate management limits for BTEX & naphthalene are not available hence should not be subtracted from the relevant fractions to
#7 Reported Analyte LOR is higher than Requested Analyte LOR

Comments

#1 Separate management limits for BTEX & naphthalene are not available hence should not be subtracted from the relevant fractions to
#7 Reported Analyte LOR is higher than Requested Analyte LOR

Environmental Standards

Comments

#1 Separate management limits for BTEX & naphthalene are not available hence should not be subtracted from the relevant fractions to
#7 Reported Analyte LOR is higher than Requested Analyte LOR

Comments

#1 Separate management limits for BTEX & naphthalene are not available hence should not be subtracted from the relevant fractions to
#7 Reported Analyte LOR is higher than Requested Analyte LOR

Comments

#1 Separate management limits for BTEX & naphthalene are not available hence should not be subtracted from the relevant fractions to
#7 Reported Analyte LOR is higher than Requested Analyte LOR

Comments

#1 Separate management limits for BTEX & naphthalene are not available hence should not be subtracted from the relevant fractions to
#7 Reported Analyte LOR is higher than Requested Analyte LOR

Comments

#1 Separate management limits for BTEX & naphthalene are not available hence should not be subtracted from the relevant fractions to
#7 Reported Analyte LOR is higher than Requested Analyte LOR

#2 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction.
#3 Errata 30 April 2014. Naphthalene should not be subtracted from >C
#4 ERRATA Updated 30 April 2014 . Naphthalene should not be subtracted.
#23 Reported Analyte LOR is higher than Requested Analyte LOR

Comments

#1 Aged values apply to arsenic contamination present in soil > 2 years. Refer Schedule B5c for < 2 years.

Monitoring Zone	Location Code	Date	Field ID	Sample Type
#2 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction				

#3 Errata 30 April 2014. Naphthalene should not be subtracted from >C
#4 ERRATA Updated 30 April 2014 . Naphthalene should not be subtracted.
#23 Reported Analyte LOR is higher than Requested Analyte LOR

Comments

#1 Aged values apply to arsenic contamination present in soil > 2 years. Refer Schedule B5c for < 2 years.

NEPM 2013 Table 1B(6) ESLs for Comm/Ind, Coarse Soil													

Monitoring Zone	Location Code	Date	Field ID	Sample Type
#2 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction				

#3 Errata 30 April 2014. Naphthalene should not be subtracted from >C
#4 ERRATA Updated 30 April 2014 . Naphthalene should not be subtracted.
#23 Reported Analyte LOR is higher than Requested Analyte LOR

Comments

#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction.
#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate (refer Shedule B7).
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific bioavailability should be considered where appropriate.
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is present, or suspected to be present.
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc. PAH in sample by its BaP TEF (ref Table 1A(1)) & summing
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (should meet BaP TEQ HIL) & napthalene (should meet relevant HSL)
#9 PCBs: HIL refers to non-dioxin like PCBs only. Where PCB source is known, or suspected at a site, a site-specific assessment of exposure to all PCBs (inc dioxin like PCBs) should be undertaken
#10 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)

Comments

#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction.
#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate (refer Sheq
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific bioavailabi
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is present, or su
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc. PAH in sam
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (should meet Ba
#9 PCBs: HIL refers to non-dioxin like PCBs only. Where PCB source is known, or suspected at a site, a site-specific assessment of exposure to all PCBs (
#10 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)

Comments

#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction.
#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate (refer Sheq
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific bioavailabi
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is present, or su
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc. PAH in sam
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (should meet Ba
#9 PCBs: HIL refers to non-dioxin like PCBs only. Where PCB source is known, or suspected at a site, a site-specific assessment of exposure to all PCBs (
#10 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)

Comments

#1 Separate management limits for BTEX & naphthalene are not available hence should not be subtracted from the relevant fractions to obtain F1 & F2

Comments

#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction.
#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate (refer Shedule B7).
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific bioavailability should be considered where appropriate.
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is present, or suspected to be present.
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc. PAH in sample by its BaP TEF (ref Table 1A(1)) & summing
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (should meet BaP TEQ HIL) & napthalene (should meet relevant HSL)
#9 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)

Comments

#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction.
#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate (refer S
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific bioavai
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is present, o
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc. PAH in s
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (should meet
#9 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)

Comments

#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction.
#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate (refer S
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific bioavai
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is present, o
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc. PAH in s
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (should meet

Comments

#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction.
#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate (refer S
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific bioavai
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is present, o
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc. PAH in s
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (should meet
#9 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)

Comments

#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction.
#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate (refer S
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific bioavai
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is present, o
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc. PAH in s
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (should meet
#9 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)

Comments

#1 Separate management limits for BTEX & naphthalene are not available hence should not be subtracted from the relevant fractions to obtain F1 & F2

Comments

#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction.
#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate (refer Shedule B7).
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific bioavailability should be considered where appropriate.
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is present, or suspected to be present.
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc. PAH in sample by its BaP TEF (ref Table 1A(1)) & summing
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (should meet BaP TEQ HIL) & napthalene (should meet relevant HSL)
#9 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)

Comments

#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction.
#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific l
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is pre
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc. F
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (shou

Comments

#1 Separate management limits for BTEX & naphthalene are not available hence should not be subtracted from the relevant fractions to obtain F1 & F2

Comments

#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction.
#2 Derived soil HSL exceeds soil saturation concentraiton
he
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific bioavailability should be considered where appropriate.
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is present, or suspected to be present.
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc. PAH in sample by its BaP TEF (ref Table 1A(1)) & summing
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (should meet BaP TEQ HIL) & napthalene (should meet relevant HSL)

Comments

#1 Separate management limits for BTEX & naphthalene are not available hence should not be subtracted from the relevant fractions to obtain F

Comments

#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction.
#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate (refer Shedule B7).
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific bioavailability should be considered where appropriate.
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is present, or suspected to be present.
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc. PAH in sample by its BaP TEF (ref Table 1A(1)) & summing
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (should meet BaP TEQ HIL) & napthalene (should meet relevant HSL)
#9 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)

Comments

#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction.
#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate (refer Shedule B7
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific bioavailability sho
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is present, or suspecte
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc. PAH in sample by
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (should meet BaP TEQ
#9 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)

Comments

#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction.
#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate (refer Shedule B7
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific bioavailability shc
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is present, or suspecte
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc. PAH in sample by
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (should meet BaP TEQ
#9 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)

Comments

#1 To obtain F1 subtract the sum of BTEX concentrations from the C6 - C10 fraction.
#2 Derived soil HSL exceeds soil saturation concentraiton
#3 Arsenic: HIL assumes 70% oral bioavailability. Site-specific bioavailability maybe important and should be considered where appropriate (refer Shedule B7
#4 Guideline value for 'Chromium (VI)' adopted
#5 Lead: HILs A,B,C based on blood lead models (IEUBK & HIL D on adult lead model for where 50% bioavailability considered. Site-specific bioavailability shc
#6 Elemental mercury: HIL does not address elemental mercury. a site specific assessment should be considered if elemental mercury is present, or suspecte
#7 Carcinogenic PAHs: HIL based on 8 carc. PAHs & their TEFs (rel to BaP ref Schedule 7) BaP TEQ calc by multiplying the conc of each carc. PAH in sample by
#8 Total PAHs: Based on sum of 16 most common reported (WHO 98). HIL application should consider presence of carcinogenic PAHs (should meet BaP TEQ
#9 USEPA RSLs Industrial Soil THQ=1.0 (May 2024)
