

# Centennial Coal Western Coal Services ANNUAL REVIEW

March 2022

### **Annual Review Title Block**

| Name of Operation                                       | Western Coal Services (WCS)  |
|---|--|
| Name of Operator  | Springvale Coal Pty Ltd  |
| Development Consent/ Project Approval #                 | SSD-5579   |
| Name of holder of Development Consent/ Project Approval | Springvale Coal Pty Ltd  |
| Mining Lease #  | ML 204, ML 564, ML<br>1319, ML 1448, CCL 733,<br>CL 394, CL 361, PLL 133 |
| Name of Holder of Mining Lease                          | Centennial Springvale Pty<br>Limited and Boulder<br>Mining Pty Ltd       |
| Water License #   | Not Applicable   |
| Name of Holder of Water License                         | Not Applicable   |
| MOP/RMP Start Date                                      | 1 January 2020   |
| MOP/RMP End Date  | 31 December 2024   |
| Annual Review Start Date                                | 1 January 2021   |
| Annual Review End Date                                  | 31 December 2021   |

I, <u>MICHAEL CLARK</u> certify that this audit report is a true and accurate record of the compliance status of Centennial Western Coal Services for the period 1 January to 31 December 2021 and that I am authorised to make this statement on behalf of Springvale Coal Pty Ltd.

#### Note:

- a) The Annual Review is an 'environmental audit' for the purposes of \$122B(2) of the Environmental Planning and Assessment Act 1979. Section 122E provides that a person must not include false or misleading information (or provide information for inclusion) in an audit report produced to the Minister in connection with an environmental audit if the person knows that the information is false or misleading in a material respect. The maximum penalty is, in the case of a corporation, \$1 million and for an individual, \$250,000.
- b) The Crimes Act 1900 contains other offences relating to false and misleading information: section 192G (intention to defraud by false or misleading statement maximum penalty 5 years imprisonment); sections 307A, 307B and 307C (False or misleading applications/information/documents –maximum penalty 2 years imprisonment or \$22,000,or both).

| Name of Authorised Reporting Officer      | WICHAEL CLARK |

# 1 STATEMENT OF COMPLIANCE

**Table 1-1: Statement of Compliance** 

| Were all conditions of the relevant approval(s) complied with?   |     |  |
|--|-----|--|
| Development Consent SSD-5579                                     | Yes |  |
| Environmental Protection Licence 21229                           | Yes |  |
| Mining Lease Number  | Yes |  |
| ML 204, ML564, ML1319, ML 1448, CCL 733, CL 394, CL 361, PLL 133 |     |  |
| Radiation License  | Yes |  |
| Statement of Commitments   | Yes |  |

During the reporting period no new non-compliances were identified.

# Table 1-2: 2021 Non-Compliances

| Relevant<br>Approval | Condition # | Condition summary | Compliance Status | Comment | Where Addressed in Annual Review |
|----------------------|-------------|-------------------|-------------------|---------|----------------------------------|
| N/A                  | N/A         | N/A               | N/A               | N/A     | N/A                              |

# Note: Compliance Status Key for Table 1-2

| Risk Level     | Colour Code   | Description   |  |
|----------------|---------------|---|--|
| High           | Non-Compliant | Non-compliance with potential for significant environmental consequences, regardless of the likelihood of occurrence  |  |
| Medium         | Non-Compliant | Non-compliance with:     Potential for serious environmental consequences, but is unlikely to occur; or     Potential for moderate environmental consequences, but is likely to occur |  |
| Low            | Non-Compliant | Non-compliance with:     Potential for moderate environmental consequences, but is unlikely to occur; or     Potential for low environmental consequences, but is likely to occur     |  |
| Administrative | Non-Compliant | Only to be applied where the non-compliance does not result in any risk of environmental harm (e.g. submitting a report to government later than required under approval conditions)  |  |

## **2 INTRODUCTION**

Western Coal Services (WCS) is located to the west of the Blue Mountains in the Lithgow Local Government Area in New South Wales approximately 125 kilometres (km) from Sydney, 15 km north of city of Lithgow, 5 km north-northwest from the township of Wallerawang, and 4 km northwest of the village of Lidsdale.

The WCS includes the operation of infrastructure for the receipt, handling and processing of coal and reject materials from Springvale Mine (SSD-5594), Angus Place Colliery (SSD 06\_0021) and other Centennial Coal Company Limited (Centennial) operations; and the transportation of this coal to Mount Piper Power Station (MPPS) (DA80/10060) and Lidsdale Siding (Development Consent 08\_0223). WCS also receives and emplaces residual waste from the Springvale Water Treatment Project (SWTP) (SSD-7592). This waste stream is generated by the removal of suspended solid materials from raw mine water treated by SWTP and can be up to 2% solids.

Springvale Coal Services Site (SCSS) is a coal processing and storage facility that forms part of WCS. It is used for run-of-mine (ROM) coal handling and stockpiling, ROM coal beneficiation (washing), emplacement of coal reject material and emplacement of residual waste material from the SWTP. It connects to a network of conveyors which can transfer coal between Springvale Mine, Wallerawang Power Station (now closed), MPPS and Lidsdale Siding. The site is approved to receive and process up to 9.5 million tonnes per annum (Mtpa) of coal from Angus Place Colliery, Springvale Mine and other Centennial operations.

## 2.1 Scope

This Annual Review (AR) details the compliance and environmental management performance of WCS Site over the Period 1 January 2021 to 31 December 2021. The AR has been prepared in accordance with the *Annual Review Guideline* (DPIE 2015), and satisfies

- Schedule 5, Condition 4 of the Development Consent SSD-5579
- Schedule 3 Condition 42 of the Development Consent SSD-5579
- Reporting requirements of mining tenements

# 2.2 Mine Contacts

The contact details for the personnel responsible for environmental management and community relations at WCS are provided in Table 2-1.

## 3 APPROVALS

The Western Coal Services Development Consent SSD 5579 was granted in April 2014 and has been modified on 3 occasions.

Modification 1 was approved in June 2017 and included the following scope:

- The receipt of residuals stream from the water treatment plant proposed in the Springvale Water Treatment Plant (WTP) and emplacement within the existing REA at the WCS; and
- Changes to the decommissioning and rehabilitation strategy approved in SSD 5579.

Modification 2 was approved in December 2017 and included the following scope

- Changes to the applicability of noise criteria from noise generated by the operation of the overland coal conveyor, Wallerawang haul road or Mount Piper haul road (no longer applicable to this site); and
- Requirements to prepare and implement a Noise Reduction Study for the overland coal conveyor and SCSS.

Modification 3 was approved in August 2019 and included the following scope

- Enable the transfer of coal from the Lidsdale Rail Siding back to the SCSS using the
  existing overland conveyor system that operates between the Lidsdale Rail Siding and
  the SCSS; and
- Increase the volume of coal that can be received at the SCSS from other sources (other than the Springvale Mine and Angus Place Colliery) from 1 million tonnes per annum (Mtpa) to 1.5 Mtpa.

A summary of Project Approvals, Mining Leases, and other Licences relevant to Centennial Site is provided in Table 3-1.

Current Project Approvals, EPBC Approvals, Exploration Licences, and Mining Leases are available at <a href="https://www.centennialcoal.com.au/operations/springvale-coal-services/">https://www.centennialcoal.com.au/operations/springvale-coal-services/</a>.

Note # Renewal applications have been lodged and acknowledged for these titles however, no renewal offers have been received at the time of writing of this Annual Review.

During the reporting period Springvale Coal prepared a modification report (MOD 4), to change the existing water management system to facilitate the transfer of water between WCS and other operations, and to improve the quality of water discharged to Wangcol Creek. The modification had not been determined at the end of the reporting period.

# 3.1 ANNUAL REPORTING

Table 3-2 provides a checklist of reporting requirements and performance conditions addresses within the Annual Review.

**Table 3-2: Annual Review Requirements** 

| Approval  | Condition No   | Requirement   | Where addressed in<br>Annual Review |
|---|--|---|-------------------------------------|
| Development<br>Consent SSD-<br>5579                                   | Schedule 5<br>Condition 4  | By the end of March each year, or other timing as may be agreed<br>by the Secretary, the Applicant must review the environmental<br>performance of the development to the satisfaction of the<br>Secretary. This review must:   | This Document                       |
|   |  | (a) describe the development that was carried out in the previous calendar year, and the development that is proposed to be carried out over the current calendar year;   | Section 4<br>Section 12             |
|   |  | (b) include a comprehensive review of the monitoring results and complaints records of the development over the previous calendar year, which includes a comparison of these results against the:   | Section 6.0 to<br>Section 10        |
|   |  | <ul> <li>i. relevant statutory requirements, limits or performance measures/criteria;</li> <li>ii. the monitoring results of previous years; the relevant predictions in the EIS;</li> </ul>  |                                     |
|   |  | (c) identify any non-compliance over the past year, and describe what actions were (or are being) taken to ensure compliance;   | Section 1 and 11                    |
|   |  | (d) identify any trends in the monitoring data over the life of the development;  | Section 6 to 10                     |
|   |  | <ul> <li>(e) identify any discrepancies between the predicted and actual<br/>impacts of the development, and analyse the potential cause of<br/>any significant discrepancies; and</li> </ul>   | Section 12                          |
|   |  | (f) describe what measures will be implemented over the next year to improve the environmental performance of the development.  | Section 12                          |
| Development<br>Consent SSD-<br>5579                                   | Schedule 3<br>Condition 42d  | Monitor and report on the effectiveness of waste minimisation and management measures in the Annual Review.   | Section 6.7.1.1                     |
| Environmental<br>Impact<br>Statement –<br>Statement of<br>Commitments | SOC No. 5.11  Surface water, groundwater, geomorphology, and aquatic | To better understand the groundwater linkages, within 12 months of Project Approval, a baseline groundwater monitoring program will be established for the Springvale Coal Services Site. The baseline groundwater monitoring program will include:  i. Quarterly monitoring of water levels from a network of monitoring bores following the completion of construction;  ii. Six monthly sampling of monitoring bores for field analysis of pH, EC and temperature and laboratory analysis on major ions, pH, EC, TDS, dissolved arsenic, cadmium, chromium, copper, iron, lead, manganese, nickel, and zinc; and  An annual review so that its capacity as an accurate predictive tool can be assessed and maintained. | Section 7.2                         |
|   | SOC No. 10.1<br>Rehabilitation                                       | Within six months of Project Approval a single Rehabilitation Plan will be prepared for the entire PAA in consultation with the Department and will include the timeframes provided within this EIS, details of the rehabilitation methods, monitoring and reporting framework. Results arising from the implementation of  | Section 8.0                         |

| Approval                               | Condition No  | Requirement   | Where addressed in<br>Annual Review |
|--|---|---|-------------------------------------|
|  |   | the program will be reported each year in the Annual Review (currently referred to as the AEMR).  |                                     |
| ML 1352<br>ML 204<br>ML 1319<br>CL 394 | Condition 3 Mining Operations Plan and Annual Rehabilitation Report | (a) The lease holder must comply with an approved Mining Operations Plan (MOP) in carrying out any significant surface disturbing activities, including mining operations, mining purposes and prospecting. The lease holder must apply to the Minister for approval of a MOP. An approved MOP must be in place prior to commencing any significant surface disturbing activities, including mining operations, mining purposes and prospecting.  | Section 6 to 10                     |
|  |   | <ul> <li>(b) The MOP must identify the post mining land use and set out a detailed rehabilitation strategy which: <ol> <li>i. identifies areas that will be disturbed;</li> <li>ii. details the staging of specific mining operations, mining purposes and prospecting;</li> <li>iii. identifies how the mine will be managed and rehabilitated to achieve the post mining land use;</li> <li>iv. identifies how mining operations, mining purposes and prospecting will be carried out in order to prevent and or minimise harm to the environment; and</li> <li>v. reflects the conditions of approval under: <ul> <li>the Environmental Planning and Assessment Act 1979;</li> <li>the Protection of the Environment Operations Act 1997; and</li> </ul> </li> <li>any other approvals relevant to the development including the conditions of this mining lease.</li> </ol></li></ul> <li>(c) The MOP must be prepared in accordance with the ESG3: Mining Operations Plan (MOP) Guidelines September 2013 published on the Department's website at www.resources.nsw.gov.au/environment</li> <li>(d) The lease holder may apply to the Minister to amend an approved MOP at any time.</li> | Section 8.0                         |
|  |   | <ul> <li>(e) It is not a breach of this condition if:</li> <li>i. the operations which, but for this condition 3(e) would be a breach of condition 3(a), were necessary to comply with a lawful order or direction given under the <i>Environmental Planning and Assessment Act 1979</i>, the <i>Protection of the Environment Operations Act 1997</i>, the <i>Mine Health and Safety Act 2004/Coal Mine Health and Safety Act 2004/Coal Mine Health and Safety Regulation 2007/Coal Mine Health and Safety Regulation 2006</i> or the <i>Work Health and Safety Act 2011</i>; and the Minister had been notified in writing of the terms of the order or direction prior to the operations constituting the breach being carried out.</li> </ul>   |                                     |
|  |   | <ul> <li>(f) The lease holder must prepare a Rehabilitation Report to the satisfaction of the Minister.</li> <li>The report must: <ol> <li>provide a detailed review of the progress of rehabilitation against the performance measures and criteria established in the approved MOP;</li> </ol> </li> </ul>  | Section 12.0                        |

| Approval          | Condition No Requirement                                       |   | Where addressed in<br>Annual Review |
|-------------------|--|---|-------------------------------------|
|                   |  | ii. be submitted annually on the grant anniversary date (or at such other times as agreed by the Minister); and be prepared in accordance with any relevant annual reporting  |                                     |
|                   |  | guidelines published on the Department's website at<br>www.resources.nsw.gov.au/environment   |                                     |
| ML 1448<br>ML 564 | Condition 3<br>Annual<br>Environmental<br>Management<br>Report | (1) Within 12 months of the commencement of mining operations and thereafter annually or, at such other times as may be allowed by the Director-General, the lease holder must lodge an Annual Environmental Management Report (AEMR) with the Director-General.  | Section 10.0                        |
|                   |  | (2) The AEMR must be prepared in accordance with the Director-General's guidelines current at the time of reporting and contain a review and forecast of performance for the preceding and ensuing twelve months in terms of:   |                                     |
|                   |  | (a) the accepted Mining Operations Plan;  |                                     |
|                   |  | (b) development consent requirements and conditions;  |                                     |
|                   |  | (c) Environment Protection Authority and Department of Land and Water Conservation licenses and approvals;  |                                     |
|                   |  | (d) any other statutory environmental requirements;     (e) details of any variations to environmental approvals applicable to the lease area; and  |                                     |
|                   |  | where relevant, progress towards final rehabilitation objectives.   |                                     |
|                   |  | (3) After considering an AEMR the Director-General may, by notice in writing, direct the lease holder to undertake operations, remedial actions or supplementary studies in the manner and within the period specified in the notice to ensure the operations on the lease area are conducted in accordance with sound mining and environmental practice. |                                     |
|                   |  | (4) The lease holder shall, as and when directed by the Minister, cooperate with the Director-General to conduct and facilitate review of the AEMR involving other government agencies.   |                                     |
| CCL 733<br>CL 361 | Condition 4<br>Environment<br>Management<br>Reporting          | The lease holder must lodge Environmental Management Reports (EMR) with the Director-General annually or at dates otherwise directed by the Director-General.   | Section 10.0                        |
|                   | Condition 5  | The EMR must:   |                                     |
|                   |  | (a) report against compliance with the MOP;   |                                     |
|                   |  | (b) report on progress in respect of rehabilitation completion criteria;  |                                     |
|                   |  | (c) report on the extent of compliance with regulatory requirements; and  |                                     |
|                   |  |   |                                     |

| Approval | Condition No | Requirement  | Where addressed in<br>Annual Review |
|----------|--------------|--|-------------------------------------|
|          |              | (d) have regard to any relevant guidelines adopted by the Director General;  |                                     |
|          | Condition 6  | Additional environmental reports may be required on specific surface disturbing operations or environmental incidents from time to lime as directed in writing by the Director-General and must be lodged as instructed. |                                     |

# **4 OPERATIONS SUMMARY**

Details of coal processing and transportation operations at the WCS site for the reporting period is presented Table 4-1. Previous results and forecasted operations are also summarised within the table.

**Table 4-1: Production Summary & Forecast** 

| Material  | Approved Limit<br>(SSD-5579) | Previous<br>Reporting Period<br>(2020)<br>(Actual Tonnes) | This Reporting<br>Period (2021)<br>(Actual Tonnes) | Next Reporting<br>Period (2022)<br>(Forecast Tonnes) <sup>1</sup> |
|---|------------------------------|---|--|---|
| Waste Rock /<br>Overburden  | N/A                          | N/A   | N/A  | N/A   |
| Total receipt of coal   | 9,500,000                    | 3,963,823   | 2,555,504  | 3,033,202   |

| Receipt of ROM coal from Angus Place  | 4,000,000                    | 0   | 0  | 0   |
| Receipt of coal from<br>sources other than<br>Springvale Mine or<br>Angus Place Colliery        | 1,500,000                    | 998,441   | 554,273  | 0   |
| Receipt of coal from Lidsdale Siding  | 1,500,000                    | 998,441   | 554,273  | 0   |
| Receipt of ROM coal<br>from sources other<br>than Springvale Mine<br>or Angus Place<br>Colliery | 1,000,000                    | 0   | 0  | 0   |
| Processing of ROM coal  | 7,000,000                    | 1,056,181   | 587,840  | 280,000   |
| Coarse reject   | N/A                          | 203,243   | 232,213  | 42,000  |
| Fine reject (Tailings)  | N/A                          | 203,243   | 232,213  | 42,000  |
| Transport Lidsdale<br>Siding (Rail)   | 6,300,000                    | 0   | 193,946  | 0   |
| Transport other parties (Mt Piper)  | N/A                          | 3,551,884   | 0  | 0   |

There were no inconsistencies between the approved limit and actual coal processing, transport for the reporting period as defined by Schedule 2 Condition 6, 7, 7, 8 and 8A. Further detail regarding coal transportation and processing is presented in Appendix 2.

\_

<sup>&</sup>lt;sup>1</sup> As per SCSO budgeted forecast at 31/02/2022- Budgets subject to variation but will be conducted in accordance with approved operations.

## 4.1 OTHER OPERATIONS

Coal transportation is monitored in accordance with Development Consent SSD-5579, Schedule 3, Condition 39. A summary of operations relevant to WCS is provided in Table 4-2 and Table 4-3 WCS compliance with residual waste limits of consent are discussed in Section 6.7.1.2.

**Table 4-2: Operations Summary** 

| Requirement   | Approved Limit (SSD-5579)   | Previous<br>Reporting Period<br>(2020) (Actual)   | This Reporting<br>Period (2021)<br>(Actual)   | Comment   |  |

There were no inconsistencies between the approved limit and actual processing or transportation limits for the reporting period. Further detail regarding coal transportation and processing is presented in Appendix 2.

### 4.2 MINING OPERATIONS

There was no mining activity throughout reporting period.

### 4.3 EXPLORATION

There was no exploration throughout reporting period.

#### 4.4 LAND DISTURBANCE

There was no land disturbance throughout reporting period.

#### 4.5 CONSTRUCTION

There was no construction or demolition throughout reporting period.

#### 4.6 NEXT REPORTING PERIOD

WCS will continue to receive coal from Springvale and Airly mines. WCS will Wash ROM coal as required for quality control to produce product coal for Energy Australia, and for Export at Lidsdale Siding. The Huon Rehabilitation Project will continue throughout 2022.

# 5 ACTIONS REQUIRED FROM PREVIOUS ANNUAL REVIEW

Table 5-1 summarises the outcomes of the 2020 Annual Review, including actions issued by Regulators and actions taken by WCS.

**Table 5-1: Actions from Previous Annual Review** 

| Action Required                           | Requested<br>By | Action Taken  | Where<br>addressed<br>in Annual<br>Review |

## **6 ENVIRONMENTAL PERFORMANCE**

WCS implements an Environmental Management Strategy, including management plans, procedures and monitoring programs that provide a framework for managing environment and community risks and impacts. To measure compliance with site approvals and licences, WCS undertakes a comprehensive monitoring program. The environmental monitoring program is shown in Figure 6-1.

This section provides a summary of environmental performance in the reporting period, including:

- Section 6.1 Meteorological Summary
- Section 6.2 Noise
- Section 6.3 Blasting
- Section 6.4 Air Quality
- Section 6.5 Biodiversity
- Section 6.6 Heritage
- Section 6.7- Other Aspects

The environmental performance for water, rehabilitation, and community aspects are reported in Sections 7.0, 8.0, 9.0 and 10.0 respectively.

**Figure 6-1: Western Coal Services Monitoring Locations** 

### 6.1 METEROLOGICAL SUMMARY

#### **6.1.1** Environmental Management

WCS operates a metrological monitoring station in accordance with SSD-5579 Schedule 3 Condition 18 and EPL 21229.

#### **6.1.2** Environmental Performance

A summary of meteorological data collected throughout 2021 is presented in Table 6-1. WCS metrological station a recorded minimum temperature of -6.8°C in July, and a maximum temperature of 31.6°C in January.

On 23 November 2021 the Bureau of Meteorology declared that a La Nina weather pattern has developed in the Pacific Ocean. In November 2021 the highest amount of rainfall was recorded at the site. March 2021 also recorded greater than long term average rainfall. The total rainfall received in 2021 was below the levels recorded in 2020 (923.4mm) however was above the long-term average (748.4mm).

**Table 6-1: Annual Meteorological Weather Data** 

| Month   | Total Rainfall<br>(mm) | Cumulative<br>Rainfall (mm) | Minimum<br>Temperature (deg<br>C) @ 2m | Maximum<br>Temperature (deg<br>C) @ 2m |
|---------|------------------------|-----------------------------|--|--|
| Jan-21  | 104.8                  | 104.8                       | 7.3                                    | 31.6                                   |
| Feb-21  | 83.4                   | 188.2                       | 8.9                                    | 26.7                                   |
| Mar-21  | 151.8                  | 340.0                       | 3.4                                    | 27.4                                   |

Monthly rainfall trends have been presented against annual term average in Figure 6-2.

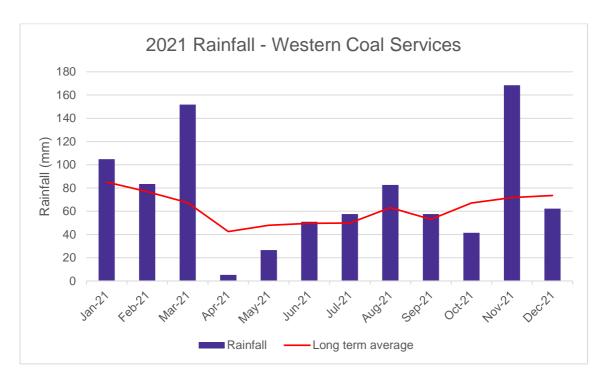

Figure 6-2 2021 Rainfall

Wind speed and direction have been plotted in a wind rose in Figure 6-3. Predominate winds are observed in north west and south west direction.

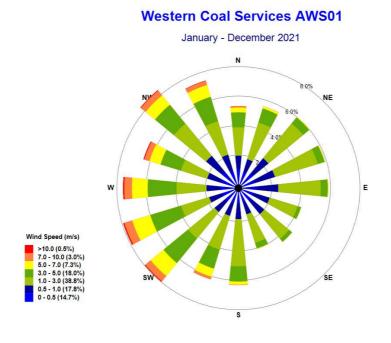

Figure 6-3 2021 Windrose

#### 6.2 NOISE

#### **6.2.1** Environmental Management

WCS manages noise in accordance with the Western Region Noise Management Plan (WRNMP) dated Feb 2021. This plan was approved by DPIE 15 Feb 2021.

The following sources of noise identified in the WRNMP are relevant for WCS operations:

- Operation of mobile equipment e.g. trucks, loaders
- Coal transporting activities e.g. overland conveyors
- · Washing of ROM coal

Noise mitigation measures for WCS are:

- Maintaining all plant and equipment to manufacturer specifications (ongoing)
- Operate mobile plant in a quiet, efficient manner and regular training of operators (ongoing)
- Installation of frequency modulated reversing alarms or "quakers" on mobile plant to replace reversing alarms (complete)
- Switching off vehicles and plant when not in use (ongoing)
- Low-noise design for transfer chutes on conveyor systems (complete)
- Low-noise idlers fitted to conveyors (complete and ongoing as required to ensure compliance)
- Limiting sound power levels for key noise sources such as conveyor drives and the stockpile dozer (complete)
- Partial enclosures on conveyors (complete)

Additional noise management and mitigation measures are outlined in the WRNMP.

#### 6.2.2 Environmental Performance

#### **Noise Criteria**

Schedule 3, Condition 7 of SSD-5579 provides noise criteria for 14 identified locations. EPL 21229 condition L.5.1 specifies noise monitoring limits for 4 locations. Table 6-3 presents the applicable criteria for both the consent and EPL in reference to the monitoring location the attended noise monitoring is undertaken at.

**Table 6-2: Western Coal Services Noise Criteria**

| -                         | -                               | S3                                   | 36                             | 36                              | 39                            | 45                         |
| Note 1: Day is defined as | -                               | All other privately owned residences | 35                             | 35                              | 35                            | 45                         |

Note 1: Day is defined as the period from 7:00 am to 6:00 pm, evening is defined as the period from 6 pm to 10 pm and night time is defined as 10:00 pm to 7:00 am.

Note 2: The noise criteria in Table 3.1 are to apply under all meteorological conditions except the following:

(a) Average wind speed at microphone height exceeds 5 m/s

(b) Wind speeds greater than 3 m/s measured at 10 m above ground level
(c) Temperature inversion conditions greater than 3°C/100 m
Note 3: The noise criteria in Table 3.1 do not apply to noise generated by the operation of the overland coal conveyor, Mount Piper haul road or the Wallerawang haul road.

#### **Attended Noise Monitoring**

In accordance with the long-term monitoring program, monthly attended noise surveys have been undertaken at 4 locations which have been selected to be representative of identified receiver locations in 2021. These locations were shown in Figure 6-1.

Results for Day, Evening and Night are presented in Table 6-3 to Table 6-5.

Table 6-3: Western Coal Services LAeq (15minute) Day

ND – Not Discernible. When site only noise is noted as ND, there was no noise from the source of interest audible at the monitoring location

#### **Sound Power Levels**

In accordance with the WRNMP sound power levels (SPL) monitoring was undertaken in 2021. SP testing was undertaken by Global Acoustics in 2021.

**Table 6-6 Annual Sound Power Level Results** 

| No.       | 20              | 21             |
|-----------|-----------------|----------------|
| Item      | L <sub>WA</sub> | L <sub>W</sub> |
| CW01      | 78              | 89             |
| CW02      | 71              | 76             |
| CW03      | 89              | 94             |
| CW04      | 86              | 89             |
| CW05      | 80              | 85             |
| CW06      | 79              | 83             |
| CW07      | 79              | 84             |
| CW09      | 79              | 85             |
| TT05      | 105             | 115            |
| TT07      | 95              | 103            |
| OL3 Drive | 97              | 102            |
| CPP       | 107             | 127            |

WCS will continue to monitor potential impact at nearby noise sensitive receivers through the monthly operator-attended noise monitoring program.

#### **Real Time Monitoring**

In accordance with Schedule 3, Condition 8 (b), a noise management system is installed at WCS uses a combination of predictive meteorological forecasting and real time noise monitoring data to guide day to day planning of the Western Coal Services operations. As outlined in the WRNMP the system is installed for proactive management purposes only. During the reporting period the system was calibrated and operational.

Further detail for noise monitoring results in the reporting period are presented in Appendix 3.

#### **6.2.3** Comparison against Predictions

Modelled predictions indicate that WCS will comply with the Industrial Noise Policy (INP) Project Specific Criteria. Modelled predictions indicate that there will be likely residual noise impacts above the INP Project Specific Criteria at some receptors in the locality of Blackmans Flat.

#### 6.2.4 Long Terms Analysis

Table 6-7 summarises the number of noise non-compliances at attended monitoring locations since 2017.

Table 6-7: 2017-2021 WCS Attended Noise Monitoring Exceedances

|          |   | 2017 | , |   | 2018 |   |   | 2019 |   |   | 2020 | ) |   | 2021 |   |
|----------|---|------|---|---|------|---|---|------|---|---|------|---|---|------|---|
| Location | D | Е    | N | D | Е    | N | D | Е    | N | D | Е    | N | D | Е    | N |
| WNM1     | 0 | 2    | 2 | 0 | 0    | 0 | 0 | 0    | 0 | 0 | 0    | 0 | 0 | 0    | 0 |
| WNM2     | 0 | 1    | 2 | 0 | 0    | 0 | 0 | 0    | 0 | 0 | 0    | 0 | 0 | 0    | 0 |
| WNM3     | 1 | 1    | 1 | 0 | 0    | 0 | 0 | 0    | 0 | 0 | 0    | 0 | 0 | 0    | 0 |
| WNM4     | 0 | 1    | 2 | 0 | 0    | 0 | 0 | 0    | 0 | 0 | 0    | 0 | 0 | 0    | 0 |
| WNM5     | 0 | 0    | 0 | 0 | 0    | 0 |   |      |   |   |      |   |   |      |   |
| WNM6     | 3 | 5    | 6 | 0 | 0    | 0 |   |      |   |   |      |   |   |      |   |
| WNM7     | 4 | 6    | 4 | 0 | 0    | 0 |   |      |   |   |      |   |   |      |   |
| WNM8     | 0 | 0    | 0 | 0 | 0    | 0 |   |      |   |   |      |   |   |      |   |
| WNM9     | 0 | 0    | 0 | 0 | 0    | 0 |   |      |   |   |      |   |   |      |   |
| WNM10    | 0 | 0    | 0 | 0 | 0    | 0 |   |      |   |   |      |   |   |      |   |
| WNM11    | 0 | 0    | 0 | 0 | 0    | 0 | 1 |      |   |   |      |   |   |      |   |

 $<sup>{</sup>m D}={m D}$ ay period (The period from 7am to 6pm on Monday to Saturday, and 8am to 6pm on Sundays and Public Holidays).

As shown in Table 6-7 there have been no non-compliant measurements since 2018. The WCS attended noise monitoring moved to the long-term monitoring program in 2019 as per the WRNMP which requires only WNM1, WNM2, WNM3, and WNM4 to be monitored.

#### **6.2.5** Implemented / Proposed Improvements

Noise management controls are considered effective based upon compliance with the noise criteria. WCS will continue to implement the WRNMP. WCS will review and revise the WRNMP in accordance with Schedule 5 Condition 5.

#### 6.2.6 Acquisition

There have been no requests received or actions undertaken during the reporting period.

#### 6.3 BLASTING

#### **6.3.1** Environmental Management

There was no blasting carried out at WCS in 2021.

#### 6.4 AIR QUALITY

#### **6.4.1** Environmental Management

WCS manages air quality in accordance with the Western Region Air Quality and Greenhouse Gas Management Plan (WRAQMP) dated April 2021. This plan was approved by DPIE 10 May 2021.

The following identified sources of dust emissions in the WRAQMP are relevant for WCS operations:

- Wind erosion from coal stockpiles;
- Wind erosion from disturbed areas and coal stockpiles;
- Wheel generated dust from vehicle movements;
- Fugitive emissions from coal handling and processing;
- Fugitive emissions during train loading operations;
- Coal transporting activities (i.e. conveyors and trains);

**E** = Evening period (The period from 6pm to 10pm).

N = Night period (The period from 10pm to 7am on Monday to Saturday, and 10pm to 8am on Sundays and Public Holidays).

· Operation of mobile equipment.

Key dust mitigation measures for WCS are:

- Signage to display speed limits on all unsealed roads in the surface facilities area;
- Water sprays on unsealed areas during use or windy conditions;
- Water sprays (sprinkler system) on the coal product stockpile during dry and windy conditions; and
- Maintaining enclosures on conveyor systems

Additional noise management and mitigation measures are outlined in the WRAQMP.

#### 6.4.2 Environmental Performance

#### **Air Quality Criteria**

The criteria for the WCS project is shown in Table 6-8, Table 6-9 and Table 6-10.

Table 6-8: Long term criteria for deposited dust

| Pollutant | Averaging period | Maximum increase in deposited dust level | Maximum total<br>deposited dust<br>level |
|-----------|------------------|--|--|
| Dust      | Annual           | <sup>2</sup> 2 g/m <sup>2</sup> /month4  | <sup>1</sup> 4 g/m <sup>2</sup> /month   |

Table 6-9: Short term criteria for particulate matter

| Pollutant                         | Averaging period | Criterion                        |
|-----------------------------------|------------------|----------------------------------|
| Particulate matter < 10 μm (PM10) | 24 hour          | <sup>1</sup> 50μg/m <sup>3</sup> |

Table 6-10: Long term criteria for particulate matter

| Pollutant                                | Averaging period | Criterion                        |
|--|------------------|----------------------------------|
| Total suspended particulate matter (TSP) | Annual           | <sup>1</sup> 90µg/m <sup>3</sup> |
| Particulate matter < 10 μm (PM10)        | Annual           | <sup>1</sup> 25µg/m <sup>3</sup> |

<sup>&</sup>lt;sup>1</sup>Total impact (ie incremental increase in concentrations due to the development plus background concentrations due to all other sources);

WCS undertakes air quality monitoring in accordance with the short-term program. The air quality monitoring locations are shown in Figure 6-1.

#### **Dust Deposition**

Table 6-11 presents monitoring results obtained during the reporting period.

<sup>&</sup>lt;sup>2</sup> Incremental impact (ie incremental increase in concentrations due to the development on its own)

Table 6-11: 2021 results for deposited dust

| Dust Gauge | Min  | Mean | Max  |
|------------|------|------|------|
| WCSDG3     | 0.46 | 1.66 | 3.29 |
| WCSDG4     | 0.27 | 0.69 | 2.39 |
| WCSDG5     | 0.21 | 1.37 | 3.70 |

The annual averages for deposited dust are within of below the predicted ranges and remain compliant with the limits in the project approval and EPL.

#### PM10 and TSP

A real time  $PM_{10}$  unit monitors air quality levels for compliance purposes. As outlined in the WRAQMP, a ratio of PM10 and TSP is used to estimate TSP contributions.

Table 6-12: 2021 results particulate matter

|                     | Criteria | Maximum (µg/m³) | Mean<br>(μg/m³) |
|---------------------|----------|-----------------|-----------------|
| PM10<br>(long term) | 25       | 25.80           | 9.44            |
| TSP <sup>3</sup>    | 90       | 60.00           | 21.94           |

<sup>&</sup>lt;sup>3</sup>calculated TSP concentration estimate (PM10 annual average divided by 0.43)

The annual averages for PM10 are within of below the predicted ranges and remain compliant with the limits in the project approval and EPL.

During the reporting period the Real time monitor operated 100 % of time.

Further detail for air quality monitoring results in the reporting period are presented in Appendix 4.

#### **6.4.3** Comparison against Predictions

As outlined in SSD 5579, dust levels from the Project are predicted to meet relevant air quality criteria for TSP, PM10, PM2.5 and dust deposition.

The dispersion modelling conducted for WCS predicted compliance for all assessed particulate matter air pollutants at all surrounding sensitive receptor locations.

Mod 3 was not predicated to significantly change air quality impacts from those currently generated by the approved operation of the facility.

#### 6.4.4 Long Terms Analysis

The annual average long-term trends are summarised in Table 6-13. Exceedances for particulate matter are summarised in Table 6-14.

Table 6-13: Long term trends for deposited dust

|        | 2017 | 2018 | 2019 | 2020 | 2021 |
|--------|------|------|------|------|------|
| WCSDG3 | 1.35 | 1.63 | 1.13 | 1.72 | 1.66 |
| WCSDG4 | 0.61 | 0.98 | 1.15 | 1.01 | 0.69 |
| WCSDG5 | 0.46 | 0.73 | 2.04 | 1.44 | 1.37 |

**Table 6-14: Exceedances for particulate matter** 

|              | 2017 | 2018 | 2019 | 2020    | 2021 |
|--------------|------|------|------|---------|------|
| 24hr PM10    | 0    | 0    | 04   | $0^{4}$ | 0    |
| (short term) |      |      |      |         |      |
| PM10         | 0    | 0    | 0    | 0       | 0    |
| (long term)  |      |      |      |         |      |
| TSP          | 0    | 0    | 0    | 0       | 0    |

<sup>&</sup>lt;sup>4</sup> Excludes extraordinary events such as bushfires, prescribed burning, dust storms, sea fog, fire incidents, or any other activity agreed by the Secretary as described in the 2019 and 2020 Annual Reviews per Schedule 3 Condition 15

#### **6.4.5** Implemented / Proposed Improvements

Dust emission controls are considered effective based upon compliance with the air quality criteria. WCS will continue to implement the WRAQMP. WCS will review and revise the WRAQMP in accordance with Schedule 5 Condition 5.

#### 6.5 BIODIVERSITY

#### **6.5.1** Environmental Management

WCS manages biodiversity in accordance with the Western Region Biodiversity Management Plan (WRBMP). After receiving feedback from DPIE in October 2021 further consultation is proposed with relevant stakeholders in 2022 with re-submission by 30 April 2022.

#### 6.5.2 Aquatic Ecology

Aquatic ecology monitoring is undertaken in accordance with the requirements of the Upper Coxs River Action and Monitoring dated March 2020. This was approved under Springvale Mine Extension Project (SSD 5594 Schedule 4 Condition 13) on 7 May 2020 by DPIE.

A summary of results as relevant to WCS is presented in Appendix 5.

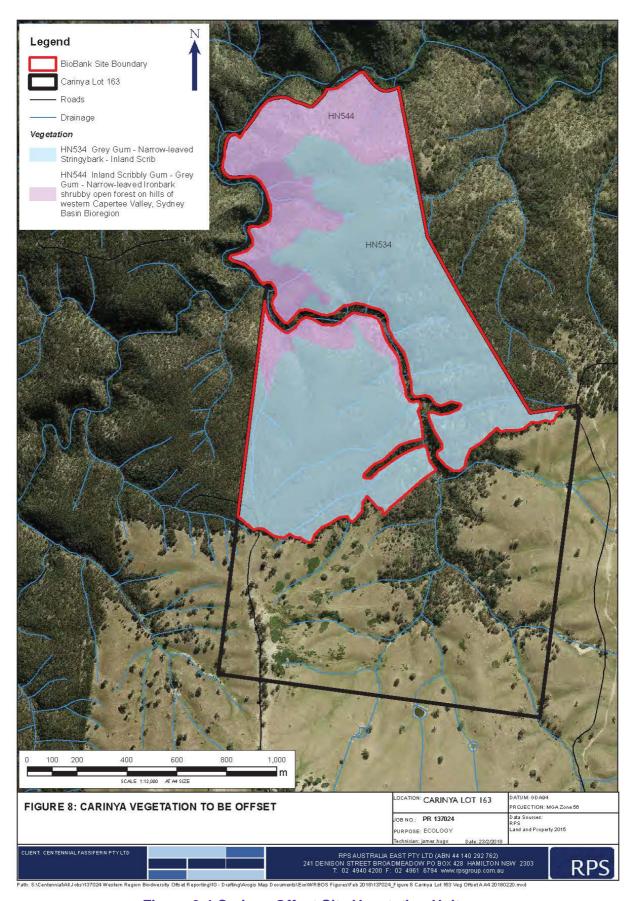

#### 6.5.3 Biodiversity Offset

The Biodiversity Offset Strategy developed by centennial fulfills the requirements of Schedule 3 Condition 25. The Strategy dated November 2020 was approved by DPIE on 27 January 2021.

To offset the loss of 10.67 ha of vegetation clearing which constitutes the requirement for 695 ecosystem credits the following has been provided as an offset:

- 292 ecosystem credits from HN534 Moderate/Good Carinya Offset site; and
- 403 ecosystem credits from HN544 Moderate/Good Carinya Offset site

The conservation agreement for Carinya Lot 163 was finalised in October 2020. Springvale submits Annual Management reports to BCT for the site. Figure 6-4 presents the offset site.

**Figure 6-4 Carinya Offset Site Vegetation Units** 

#### 6.5.4 Comparison against Predictions

The WCS EIS predicted that:

- there are no significant impacts on adjacent aquatic habitats as impacts will be satisfactorily managed and mitigated via construction and operational Environmental Management Plans (EMPs).
- There are no significant impacts on the ecology of the Springvale Coal Services Site, including vegetation communities, threatened flora and fauna or endangered ecological communities that are known or expected to occur.
- There are no significant impacts on threatened species or Endangered Ecological Community (EECs) listed under the NSW Threatened Species Conservation Act 1995 (TSC Act 1995), or Matters National Environmental Significance (MNES) under the Commonwealth Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act 1999).

During the reporting period there were no impacts to biodiversity because of operational activities at WCS.

#### 6.6 HERITAGE

#### **6.6.1** Environmental Management

WCS manages Aboriginal Heritage in accordance with the Western Region Aboriginal Cultural Heritage Management Plan dated September 2021. This plan was approved by DPIE on 14 October 2021.

WCS manages European heritage in accordance with the Historic Heritage Management Plan dated June 2018. This was approved by DPIE on 4 July 2018.

#### **6.6.2** Environmental Performance

No heritage monitoring was triggered at WCS throughout the reporting period because there was no surface disturbance at WCS during the reporting period.

Fencing surrounding aboriginal heritage sites was inspected during the reporting period to ensure that there was no direct or indirect impact on identified Aboriginal sites. There was no damage to the fencing around the sites and no evidence of disturbance in the areas inspected.

#### 6.6.3 Comparison against Predictions

A total of nine known Aboriginal sites (three existing and six new sites) are located on the Springvale Coal Services Site. Of these sites, none are at high risk of impact, one is at low-moderate risk, and eight are at low (remote) risk of impact.

There are no impacts on non-Aboriginal Heritage items predicated.

During the reporting period there was no impact observed to aboriginal or non-aboriginal items.

#### **6.6.4** Implemented / Proposed Improvements

WCS will continue to monitor and implement mitigation and management measures (as triggered) to ensure inadvertent harm to sites can be avoided.

The Western Region Heritage Committee Meetings were held on in May and November 2021.

The land disturbance due diligence process implemented by the site is considered appropriate for the management of heritage items.

#### 6.7 OTHER MATTERS

#### 6.7.1 Bushfire Management

WCS manages Bushfire management in accordance with the SCSO Bushfire Management System.

Fire control equipment was inspected monthly as part of normal operational maintenance.

No fires occurred in the WCS approval boundary area that required Rural Fire Services assistance.

#### 6.7.2 Waste

#### 6.7.1.1 Operational waste

This section provides an overview of waste minimisation and management measures as required under Schedule 3 Condition 42.

There are four main forms of waste generated by the Western Coal Services Project and in particular the Springvale Coal Services Site. These include Coal reject material produced from the washery, recyclable materials, workshop wastes, and domestic wastes.

Coal reject was utilised in the construction of the REA, and for landform completion works for Area 4 in accordance with the WCS MOP.

The following items are collected to minimise waste to landfill

- Waste Oil
- Paper, Cardboard, packaging
- Metals
- Other recyclables (glass plastics)
- Chep Pallets

All general waste is collected by licensed waste contractor for disposed at Licensed land fill site.

In 2021, 1,121 Tonnes was sent offsite for disposal. 271 Tonnes was recycled with yields a 24.2% recycling rate. This compares to a recycling rate of 23.33% in 2020. Figure 6-5 provides a summary of waste generated in 2021 at the WCS site.

Further detail on waste management is presented in Appendix 6.

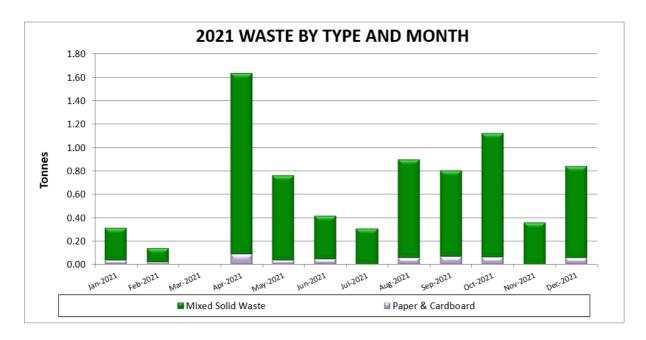

Figure 6-5 2021 Waste Generation

#### 6.7.1.2 Residual Waste

Schedule 2 Condition 8A specifies the limits associated with the transfer of residual waste from the Springvale Water Treatment project. The limits are presented in Table 6-15, alongside the 2021 volumes transferred.

**Table 6-15 Residual Transfer Limits and Performance** 

| Performance Criteria | Limit                   | 2021 Results            |  |  |  |
|----------------------|-------------------------|-------------------------|--|--|--|
| Annual Average       | 0.35 Megalitres per Day | 0.32 Megalitres per Day |  |  |  |
| Daily Maximum        | 0.43 Megalitres per Day | 0.43 Megalitres per Day |  |  |  |

Results are presented graphically in Figure 6-6.

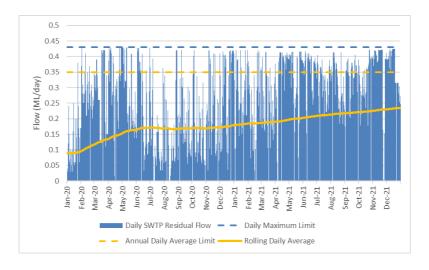

Figure 6-6 2021 Residuals Transferred to WCS 2020-2021

Results obtained during the reporting period demonstrate compliance with limits specified in the consent.

#### **6.7.3 Visual**

WCS manages Visual impacts in accordance with the Development Consent SSD-5579, Schedule 3, Condition 40.

- No fixed outdoor lights or mobile lighting rigs shined above the horizontal.
- All external lighting associated with the development complied with Australian Standard AS4282.
- Ensured that the visual appearance of all buildings, structures, facilities or works (including paint colours and specifications) was aimed at blending as far as possible with the surrounding landscape.

During the reporting period no complaints were received in relation to the visual amenity of the site.

#### 7 WATER

#### 7.1 WATER MANAGEMENT

WCS manages both surface water and groundwater in accordance with the Water Management Plan dated August 2014. Versions have also been submitted in 2017 and 2019 however these are not approved by DPIE. This will be followed up with DPIE in 2022.

Key management measures during the operational phase include:

- The use of higher grades of mechanical equipment across the facility to reduce downtime and increase the efficiency of the water management system.
- The management of water discharged from site
- Storage and use of chemicals/ fuel on site in accordance with Technical guidelines
- The use of sprinklers and water carts on coal stockpiles and compacted coal reject –
- The removal of coal spillage on ground
- The removal of invasive species
- Visual, acoustic and water management bunds around maintenance
- Drainage lines maintenance.
- Ponds and Sediment Detention Basins maintenance.

#### 7.1.1 Water Licenses

WCS do not require any licences for the extraction of surface water or groundwater.

#### 7.1.2 Water Balance

A summary of the predicted average annual inputs and outputs for existing and future conditions is provided in Table 7-1.

**Table 7-1: WCS Water Balance** 

|   | 2021 (simulated actual conditions) (ML/year) | 2022 (average<br>forecast)<br>(ML/year) |
|---|--|---|
| INPUTS  |  |   |
| Catchment runoff onto storages                              | 592  | 652                                     |
| Direct rainfall onto storages                               | 134  | 91                                      |
| Groundwater recharge  | 305  | 299                                     |
| SWTP residuals  | 116  | 128                                     |
| Flocculant makeup   | 0  | 0                                       |
| ROM coal moisture   | 42   | 20                                      |
| Mount Piper Ash Repository                                  | 454  | 454                                     |
| TOTAL INPUTS  | 1643   | 1644                                    |
| OUTPUTS   |  |   |
| Evaporation   | 160  | 145                                     |
| Dust suppression  | 55   | 55                                      |
| Coarse coal reject moisture                                 | 11   | 5                                       |
| Product coal moisture                                       | 28   | 13                                      |
| Seepage from DML Dam and Cooks Dam to Wangcol Creek         | 199  | 204                                     |
| Overflow from FPL to Wangcol Creek                          | 267  | 302                                     |
| Discharge via LDP001 to Wangcol Creek (SCSS)                | 852  | 1053                                    |
| Discharge via LDP002 to Coxs River (conveyor at Brays Lane) | 0  | 0                                       |
| TOTAL OUTPUTS   | 1572   | 1779                                    |
| CHANGE IN STORAGE   |  |   |
| Surface water storages                                      | 112  | -113                                    |

| TOTAL CHANGE IN STORAGE                                     | 72   | -135                                    |
| BALANCE   | -1   | 0                                       |

The model predications were developed for average and range of water and salt transfers at WCS, particularly the discharge from LDP001 for 2022. The modelling predicts that discharges from LDP001 in 2022 will range from approximately 2 to 4 ML/day, with an EC between approximately 4000 and 6000  $\mu$ S/cm.

The modelling predicates an upward trend in EC, however that result is highly sensitive to the assumed quantity and quality of potential groundwater seepage from Mount Piper Ash Repository.

Variability in coal washing rates is a major confounding factor in identifying the influence on rainfall and seepage on the shallow groundwater system. Observation during 2021 with minimal coal production is expected to provide additional information of behaviour of the shallow groundwater system.

#### 7.1 SURFACE WATER

#### 7.1.1 Environmental Management

Discharge water quality is monitored monthly during discharge as per the requirements of EPL 21229 and the Western Coal Services Water Management Plan at Licenced Discharge Point (LDP) LDP001, and LDP002. The Location of LDP001, and LDP002 is shown in Figure 6-1.

Further detail on monitoring results obtained during the reporting period are presented in Appendix 7.

#### 7.1.2 Environmental Performance

#### **Discharge Water**

Discharge water quality results from LDP001 through the reporting period are summarised in Table 7-2.

**Table 7-2: LDP001 Water Quality Summary** 

| Parameter    | Unit of<br>Measure | Lowest sample value | Mean of sample | Highest sample value | EPL limit |
|--------------|--------------------|---------------------|----------------|----------------------|-----------|
| рН           | pH units           | 6.6                 | 6.91           | 7.2                  | 6.5-8.5   |
| TSS          | mg/L               | 10                  | 8.5            | 7                    | 30        |
| EC           | μS/cm              | 1601                | 3084           | 3490                 | -         |
| Oil & Grease | mg/L               | <5                  | <5             | <5                   | 10        |
| Turbidity    | NTU                | 4.8                 | 12.87          | 23                   | 50        |

<sup>\*</sup> For averaging purposes, when a sample result is reported below the laboratory limit of reporting (LOR), half the LOR value is used for the result where 50% of the total samples are less than the LOR. Otherwise the result is reported as zero.

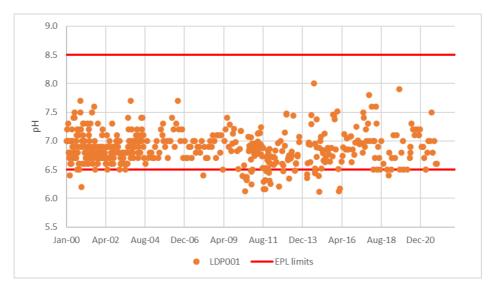

Figure 7-1 pH Trends LDP001

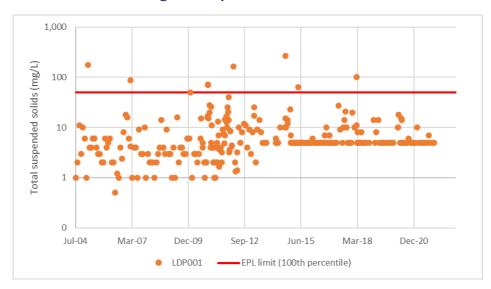

Figure 7-2 TSS Trends LDP001

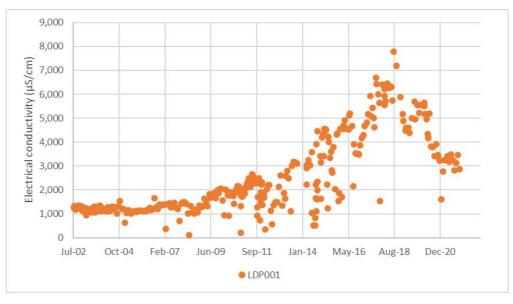

Figure 7-3 EC Trends LDP001

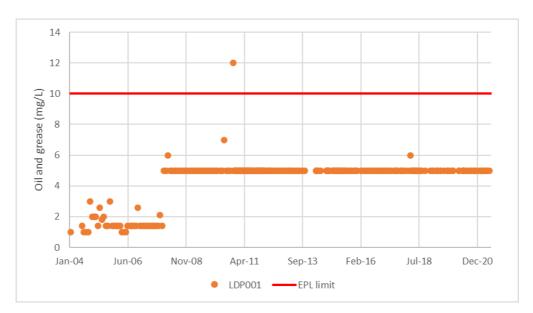

Figure 7-4 TOG trends LDP001

The LDP001 flow summary for the 2021 reporting period is presented in Table 7-3.

Table 7-3: LDP001 2021 Flows

| Unit of<br>Measure | Frequency                        | No. of measurements made | Lowest daily volume | Mean<br>daily<br>volume | Highest<br>daily<br>volume | Total<br>annual<br>volume |
|--------------------|----------------------------------|--------------------------|---------------------|-------------------------|----------------------------|---------------------------|
| Megalitres<br>(ML) | Daily during<br>any<br>discharge | 365                      | 0                   | 0.545                   | 4.41                       | 198.895                   |

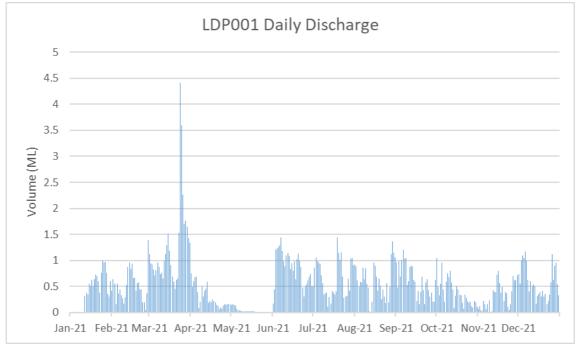

Figure 7-5 LDP001 Flow Summary

During the reporting period monitoring has been undertaken in accordance EPL 21229 and the Western Coal Services Water Management Plan. There was no discharge from LDP002 in 2021.

#### 7.1.3 Wangcol Creek

Surface water monitoring sites on Wangcol Creek are monitored to assess potential impact from site discharges through LDP001. A summary of the water quality data is provided in Table 7-4.

Table 7-4: Wangcol Creek water quality - 2021

| Parameter                  | Units       | War | igcol Creek<br>Gauge | Wan | gcol Creek<br>US | Wan | gcol Creek<br>DS | Wangcol Creek Far<br>DS |        |  |

Graphical representation of results surface water results is presented in Appendix 7.

#### 7.1.4 Comparison against Predictions

The EIS identified that after mitigation measures had been implemented, the Project's impact on water quality would be further improved. The improvements would be progressively implemented and monitored to verify that the anticipated improvements were realised. Section 9.5.3.6 of the EIS shall be referred to for detail on the surface water management and mitigation measures identified as part of the project.

#### 7.1.5 Implemented / Proposed Improvements

A key focus for WCS in 2022 is securing Modification 4. Modification 4 provides resolution of the SCSI Pollution Reduction Program seeking a volume limitation on LDP001 into Wangcol Creek. The project aims to achieve the following objectives

- 99% reduction of discharge volume (616ML/yr down to 5ML/yr)
- 99% reduction in average salt load (1932 tpa to less than 10 tpa)

WCS will follow up with DPIE on the Water Management Plan approval in 2022.

The site will continue to focus on the maintenance of water management structures and soil and erosion controls to ensure ongoing compliance with the performance criteria and EPL limits applicable to WCS.

#### 7.2 GROUNDWATER

#### **7.2.1** Environmental Management

WCS manages groundwater in accordance with the 2014 WCS Water Management Plan as discussed in Section 7.1.

Further detail on monitoring results obtained during the reporting period are presented in Appendix 8.

#### 7.2.2 Environmental Performance

WCS monitoring both groundwater level and quality across a network of boreholes. Groundwater levels trends are summarised in Table 7-5 and groundwater quality trends are presented in Table 7-6.

**Table 7-5: WCS groundwater levels trends** 

| Monitoring<br>bore | Groundwater<br>level trigger (m<br>AHD) | 2021<br>Maximum<br>Level (m<br>AHD) | Groundwater level trend  |
|--------------------|---|-------------------------------------|--|
| BH01               | 910                                     | 908.9                               | Level influenced by DML dam.  Decreasing level during the first half of 2021, increasing level during the second half of 2021.   |
| BH02               | 893                                     | 890.6                               | Level has rebounded to pre-2017 levels, likely due to increased rainfall in 2021  Bore was reported as dry for most of 2021 until September.                                   |
| вноз               | 905                                     | 904.0                               | Levels vary between 901 m AHD and 904 m AHD in 2021.  Levels are potentially influenced by water levels in surrounding surface water storages.                                 |
| BH04               | 913                                     | 908.4                               | Level influenced by DML dam.  Level has remained relatively constant through 2021.  Troughs and spikes are caused by groundwater purging and subsequent recovery respectively. |
| BH05               | 928                                     | 908.4                               | Level is highly influenced by DML dam and Lithgow City Council void.  Levels vary between 906 m AHD and 908 m AHD in 2021.   |

| Monitoring<br>bore | Groundwater<br>level trigger (m<br>AHD) | 2021<br>Maximum<br>Level (m<br>AHD) | Groundwater level trend   |
|--------------------|---|-------------------------------------|---|
| вно6               | 903                                     | 900.7                               | Level has generally risen through 2021, likely from the influence of above average rainfall during 2021.    |
| BH07               | 923                                     | 911.0                               | Level has generally risen through 2021, likely from the influence of above average rainfall during 2021.    |
| BH08               | 915                                     | 908.5                               | Level has generally remained consistent through 2021.   |
| ВН09               | 928                                     | 906.9                               | BH09 was dry until November 2021 and showed groundwater level between 905 and 907 m AHD.                    |
| BH10               | -                                       | -                                   | BH10 was dry throughout 2021.   |
| BH11               | 940                                     | 911.8                               | Level has consistently risen through 2021, likely from the influence of above average rainfall during 2021. |
| BH12               | -                                       | -                                   | BH12 was dry throughout 2021.   |
| BH13               | 914                                     | 909.4                               | Level has consistently risen through 2021, likely from the influence of above average rainfall during 2021. |
| BH15               | 947                                     | 927.8                               | BH15 was dry in 2021 with the exception of January.   |

In 2021, monitoring bores BH10 and BH12 have been consistently dry throughout 2021. A review of groundwater hydrographs indicates a groundwater flow direction from the south west to the north east. No groundwater level trigger events occurred during the reporting period.

Graphical representation of results groundwater results is presented in Appendix 8.

#### 7.2.3 Comparison against Predictions

Section 9.5.4.3 of the EIS presents details in the impacts predicated for the WCS project and shall be referred to for additional detail. Key findings from the water management assessment include:

- Predicted groundwater levels in the shallow aquifer and the Lithgow Seam indicate negligible impact from the Project.
- the Project would not impact on any groundwater users in the area.
- The water quality observed at LDP 006 is impacted by groundwater seepages to DML and Cooks Dams
- Apart from the increase in inflow to dams on the Springvale Coal Services Site over the life of the Project, there will be no other impacts to aquifer systems.
- No sensitive GDEs have been identified within the Springvale Coal Services Site. Any
  potential ecosystems associated with the Wangcol Creek would not be impacted by
  the Project both in relation to water quality and quantity.

#### **7.2.4** Implemented / Proposed Improvements

As noted by the predications, an interrelationship between surface and groundwater exists. Modification 4 outlined in Section 7.1.5 will benefit water quality discharging from the site.

#### 8 REHABILITATION

#### **8.1** Environmental Management

WCS manages rehabilitation in accordance with the WCS Mining Operation Plan Amendment A (WCS MOP) dated April 2020. The MOP was approved by Resource Regulator 28 August 2020.

The EIS identified that rehabilitation is to be undertaken following the decommissioning of the Reject Emplacement Area (REA). The REA is currently in operation.

#### **8.2** Rehabilitation and Disturbance Status

Rehabilitation works were undertaken on previously rehabilitated areas in accordance with the MOP and Rehabilitation Improvement Plan (RIP).

**Table 8-1: WCS Rehabilitation Status** 

| Year (End of)                      | Disturba   | ance and rehabilitation a                           | at WCS                                     |
|------------------------------------|--|---|--|
|                                    | Total disturbance<br>area – Per MOP year<br>(Ha) | Total rehabilitation<br>area – Per MOP year<br>(Ha) | Cumulative<br>rehabilitation areas<br>(Ha) |
| Start of MOP                       | 185.1  | 39.2  | 39.2                                       |
| 2020 (Previous reporting period)   | 180.5  | 39.2  | 39.2                                       |
| 2021 (Current reporting period)    | 180.5  | 0   | 60.2                                       |
| 2022 (Next<br>reporting<br>period) | 180.5  | 0   | 43.8                                       |
| End of MOP                         | 180.5  | -   | 43.8                                       |

Proposed landform rehabilitation was postponed due to requirements for the prioritisation of handover of areas of Energy Australia land (known as Area 4D). Table 8-1 indicates the status as of 31 December 2021. Centennial are proposing to relinquish 21 ha (Area 4D) to Energy Australia in 2022.

#### 8.3 REHABILITATION MONITORING

#### **8.3.1 Summary**

The rehabilitation assessment was undertaken for each rehabilitation area and was based on the average values/results from the monitoring sites located together with the observations made during the walkover inspection. Table 8-2 presents a summary of results against the MOP criteria.

Further detail is presented in Appendix 9

Table 8-2: Rehabilitation progress against completion criteria in the MOP (2018-2024)

|   |  | Cor          | nplianc            | e statu | s 2021                 |
|---|--|--------------|--------------------|---------|------------------------|
| Completion criteria   | Rehabilitation progress  | Cooks<br>Dam | Acce<br>ss<br>Road | REA     | Lamb<br>ert's<br>Gully |
| Landform  |  | _            |                    |         |                        |
| Landform is stable with no evidence of uncontrolled erosion   | Satisfactory landform stability has been achieved across all rehabilitation areas, with no recorded evidence of active erosion processes or severe impacts   | Yes          | Yes                | Yes     | Yes                    |
| Slopes are generally less than 18% and no more than 25%       | Except for localised exceptions (particularly along the lower contours of the 2008 Lambert's Gully rehabilitation where higher gradients had to be established to build the landform), established slopes are generally less than 25% across the rehabilitation.  Slope as measured at the monitoring sites comprised between 9-25%.   | Yes          | Yes                | Yes     | Yes                    |
| Growing media   |  |              |                    |         |                        |
| Soil analysis undertaken to determine potential constraints   | Soil sampling and analysis is undertaken on a three-yearly basis as part of the rehabilitation monitoring program. All monitoring sites were sampled in 2021 for soil characterisation. Testing results showed that all key parameters regulating plant establishment and growth were generally within acceptable values, with no key constraints identified that could prevent successful rehabilitation establishment.   | Yes          | Yes                | Yes     | Yes                    |
| Topsoil or alternative<br>spread at depth of at<br>least 50mm | Areas of older rehabilitation (Cooks Dam and access road) were dressed with adequate amount of topsoil (~100mm). However, topsoil application was minimal and uneven across the REA and Lambert's Gully rehabilitation (<50mm) and the little topsoil used was mixed and diluted in overburden/capping material. Growth medium improvement measures were defined in the RIP for these areas in the form of successive hydro mulching campaigns, but have not yet been implemented. | Yes          | Yes                | No      | No                     |
| Ecosystem establishme   | nt and sustainability  |              |                    |         |                        |
| Minimum of 70% protective ground cover                        | Protective ground cover was satisfactory at all locations in 2021, comprised between 83.5-100%.  Ground cover largely dominated by litter cover with low to moderate levels of live vegetative cover, but consistent with condition observed at analogue sites.  | Yes          | Yes                | Yes     | Yes                    |
| No bare areas >200m²  | Vegetation establishment and ground cover protection excellent across the Cooks Dam and access Road rehabilitation areas.  Vegetation and ground cover establishment were assessed as slowly improving across the REA and Lambert's Gully rehabilitation, however several continuous bare areas >200m² remain. Ground cover improvement measures were defined in the RIP for these areas in the form of successive   | Yes          | Yes                | No      | No                     |

|   |  | Compliance status 2021 |                    |      |                        |  |  |
|---|--|------------------------|--------------------|------|------------------------|--|--|
| Completion criteria   | Rehabilitation progress  | Cooks<br>Dam           | Acce<br>ss<br>Road | REA  | Lamb<br>ert's<br>Gully |  |  |
|   | hydro-mulching/seeding campaigns, but have not yet been implemented.   |                        |                    |      |                        |  |  |
| Weed cover <15%   | Weed diversity remained moderately high at the Cooks Dam and Access Road rehabilitation monitoring sites, but cumulative weed cover levels remained low and consistently <6% at all locations. Pro-active weed control is nonetheless recommended to minimise the risk of spread of occurring invasive weed species.  Negligible weed diversity and weed cover continue to occur across the REA and Lambert's Gully rehabilitation.  | Yes                    | Yes                | Yes  | Yes                    |  |  |
| Evidence of nutrient cycling (i.e. presence of litter, cryptograms, etc.)   | Active nutrient cycling was evidenced at all monitored locations, including high levels of organic litter cover, abundance of nutrient fixing shrub species (acacias) and presence of cryptograms on the soil surface particularly in older rehabilitation areas.  | Yes                    | Yes                | Yes  | Yes                    |  |  |
| Establishing species are consistent with a woodland community   | In most rehabilitation areas a range of ground covers, shrubs and canopy eucalypts occur. Although cover levels or vegetation structure are often still developing (as a function of the young ecological age of the rehabilitated communities), the establishing species are generally consistent with local native communities.  One exception is for the Cooks Dam rehabilitation where a tree layer is lacking, however improvement works under the RIP have started in this area to establish eucalypts. All planted eucalypt tubestocks consist of local species naturally occurring in the Central Tablelands.  Currently, the thick shrub layer generally occurring in the rehabilitation is uncharacteristic of local native communities as observed at the analogue sites, however it is expected that shrub abundance should naturally receded with time as the tree layer further establishes and the canopy closes out. | Trendi<br>ng           | Tren               | Tren | Tren<br>ding           |  |  |
| >70% of trees are healthy and growing   | Despite some residual drought-related impacts noted on some tree individuals; tree health was overall satisfactory with ≥88% of trees assessed as healthy at the monitoring sites. Tree growth also evidenced at many locations (increased girth and/or height), promoted by good rainfall received in the past two years  | Yes                    | Yes                | Yes  | Yes                    |  |  |
| Dominant species aligned with those in local native communities   | Although the rehabilitated communities do not perfectly align with a specific native community profile, in all vegetation layers the dominant species comprise local native species naturally occurring in the Central Tablelands region.  | Yes                    | Yes                | Yes  | Yes                    |  |  |
| Presence of a range of<br>structural habitats<br>(eucalypts, shrubs,<br>ground cover,<br>developing litter layer) | With the exception of the Cooks Dam rehabilitation where the tree layer is not yet established (tree were planted in 2020 but remain at seedling growth stage), a range of structural habitat occurred in most areas including eucalypts, shrubs, ground covers and litter.  | Trendi<br>ng           | Yes                | Yes  | Yes                    |  |  |
| Other habitat features incorporated into rehabilitation areas (large rocks, logs, etc).                           | Artificial habitat features have not been incorporated throughout the rehabilitation.  | No                     | No                 | No   | No                     |  |  |

Further retail on rehabilitation results are presented in Appendix 9.

#### **8.3.2** Implemented / Proposed Improvements

A comprehensive action plan was developed and detailed in the RIP (Koru, 2018) to improve the condition of the rehabilitation across the entire site. No additional issues other than those addressed in the RIP were identified during this 2021 monitoring event, therefore no additional recommendations are suggested. Annual rehabilitation monitoring will continue in 2022.

#### 9 COMMUNITY CONSULTATION

#### **9.1** Environmental Management

WCS consults with the community through forums such as, the Centennial Western Region Community Consultative Committee and community organised events.

Meetings of the Centennial Western Region Community Consultative Committee (CCC) were held

- 17 February 2021
- May 2021 (Presentation distributed only)
- 18 August 2021
- 17 November 2021

Some meetings were conducted using online forums (Microsoft teams to adhere to covid-19 requirements.

Representatives of the appointed community representatives, relevant government organisations and company representatives attended the meetings. A detailed presentation was provided to attendees at each CCC meeting on the operational activities at the site.

Key agenda items discussed in 2021 included:

- Reject Emplacement Management
- Community and Stakeholder Engagement
- Huon site project
- Independent Environmental Audit

#### **9.2** Community Complaints

A complaint register is made publicly available on the Centennial Coal website in accordance with Schedule 5 Condition 11. There have been no community complaints at WCS during the reporting period. Long terms trends in complaints are presented in Table 9-1.

| Community Complaints |     |       |       |       |       |       |  |  |  |  |  |  |
|----------------------|-----|-------|-------|-------|-------|-------|--|--|--|--|--|--|
| Year                 | Air | Water | Noise | Waste | Other | Total |  |  |  |  |  |  |
| 2017                 | 0   | 0     | 0     | 0     | 0     | 0     |  |  |  |  |  |  |
| 2018                 | 0   | 1     | 61    | 0     | 0     | 62    |  |  |  |  |  |  |
| 2019                 | 0   | 0     | 20    | 0     | 0     | 20    |  |  |  |  |  |  |
| 2020                 | 0   | 0     | 0     | 0     | 0     | 0     |  |  |  |  |  |  |
| 2021                 | 0   | 0     | 0     | 0     | 0     | 0     |  |  |  |  |  |  |

Table 9-1: Record of annual community complaints for 2016 to 2021

#### 9.2.1 Community Information Line

A community information line was maintained for WCS to receive calls from the local community. The community information line (6355 9500) operates 24 hours a day, 7 days a week.

#### 10 INDEPENDENT ENVIRONMENTAL AUDIT

#### **10.1 Environmental Management**

WCS undertakes an Independent Environmental Audit in accordance with Schedule 5, Condition 9 of SSD-5579 every three years from December 2015.

#### 10.2 Environmental Performance

In 2021 the IEA site visit was conducted on the 7-9 December 2021. The audit was not complete at the end of the reporting period and the next WCS Annual Review will provide and update on recommendations from this audit. In accordance with Schedule 5 Condition 9 the next audit will be conducted 2024.

Table 10-1 presents an update on the 2018 auditor's recommendations which was undertaken by MCW Environmental. Ongoing and previously completed actions are presented in Appendix 10.

**Table 10-1: Independent Audit Summary** 

| Condition<br>Number  | REC#                | Improvement Opportunity Recommendation  | Response / Addressed   | Timing  | 2021 AR Update   |
|----------------------|---------------------|---|--|---|--|
| Consultation         | REC-<br>2018-<br>93 | Follow up with Forestry Corporation NSW on the land swap on CCL-733 and required Forestry Permits to ensure these are in place where required.  | The land swap agreement is in its final stages with the possibility of Native Title on the Neubeck portion of the swap (Lot 64 DP751636) under assessment.  The land portion in question (Part Lot 502 DP825541), which is affected by the southern tip of co-disposal area, does not have any Native Title issues.  Parties agreed not to pursue an Occupation Permit for Lot 502 as FCNSW are comfortable with the fact the Land Swap was progressing.  As far as the Neubeck block is concerned, we have no reason to apply for an Occupation Permit as we do not have any infrastructure on there. | This is an ongoing process that started in 2012.  The decision rests with the Crown Solicitors Office at present.   | N/A  |
| Site<br>Observations | REC-<br>2018-<br>20 | Investigate surface water and groundwater interactions within the Additional Rehabilitation Area west of the Co-disposal ponds to understand impacts of surface crusting on proposed rehabilitation plans.  | The Rehabilitation Improvement Plan integrated as an attachment to WCS MOP Amendment A. Such issues will be identified and investigated once the RIP is implemented.   | Commenced. Shared GW study with EA ongoing. LDP001 Pollution Reduction Program considering water management infrastructure within this area for construction in 2021. | N/A  |
| 2.17                 | REC-<br>2018-<br>92 | Define and document the process for handover of areas of the WCS site to EA and how rehabilitation liabilities will be considered and managed. Consult with the Resources Regulator regarding this process. | A complex commercial and legal process between parties for land handover and exchanges is ongoing between CEY and EA.  Rehabilitation liabilities are assessed and documented via that process.  | Ongoing process. The consultation between EnergyAustralia and Centennial has over the last few years been focused on  | Centennial is continuing to prepare for handover of WCS site to EA with the Huon Rehabilitation project throughout |

| Condition<br>Number | REC#                | Improvement Opportunity Recommendation   | Response / Addressed   | Timing   | 2021 AR Update            |
|---------------------|---------------------|--|--|--|---------------------------|
|                     |                     |  |  | information sharing and reporting.  Over the period of 2020, the consultation has moved into focusing on specific projects where delivery of solutions is being collaboratively achieved and now not only is information being shared, but assessments are also being completed collaboratively. | the 2021 reporting period |
| 3.24                | REC-<br>2018-<br>43 | Once the water management works at TT03 are complete, update the Water Management Plan.  | WMP will be updated on completion of works.  CEY has dedicated approvals team who has established joint workflow process with DPIE for all CEY Management Plan Revision and submissions. WCS is included in this process.                      | Following completion of TT03 works   | N/A                       |
| 3.44                | REC-<br>2018-<br>59 | Continue progressive rehabilitation of disturbed areas to meet the condition requirements and realise environmental benefits such as minimising the total area exposed for dust. | Progressive rehabilitation is undertaken at WCS. The condition was noted as not compliant for Kerosene Vale. Kerosene Vale has been removed from the WCS MOP and is now managed under the Angus Place MOP Amendment by Angus Place Operations. | Completed –<br>Transferred to Angus<br>Place   | N/A                       |

### 11 INCIDENTS AND NON-COMPLIANCES DURING THE REPORTING PERIOD

This section refers to non-compliances and incidents reported during the reporting period. In 2021 there were no non-compliance or incidents reported.

### 12 ACTIVITES TO BE COMPLETED IN THE NEXT REPORTING PERIOD

Table 12-1 presents activities that are currently planned for the next reporting period

**Table 12-1: Forecast Operations for 2022** 

#### **Improvement Actions**

- Implement WCS IEA Actions
- Continue to undertake dam and erosion and sediment control maintenance activities
- Continue to work collaborative with relevant stakeholders to pursue modification 4

#### **Management Plan Revisions**

- Water Management Plan
- Biodiversity Management Plan

#### **Condition Triggers**

 Review and Revise Management Plans, Strategies within 3 months of the submission of the WCS 2021 IEA, and the Annual Review (Schedule 5, Condition 5)

It is noted that changes to production activities may trigger changes to planned activities.

## Appendix 5: Biodiversity

### **Upper Coxs River Catchment Aquatic Ecology 2021**

The Upper Coxs River catchment is a highly modified environment due to historical and current primary production and industrial activities.

In 2017, a coordinated, catchment-wide approach for aquatic ecology monitoring was implemented with the aim of understanding the overall health of the Upper Coxs River catchment (UCRC). The monitoring program, known as the UCRC Aquatic Ecology Monitoring Program (AEMP; GHD 2016), addresses the aquatic ecology monitoring requirements of Centennial operations and the Springvale Upper Coxs River Action and Monitoring Program (UCRAMP; GHD 2017).

The UCRC AEMP allows for identification of impacts (positive and negative) within the catchment due to mine water discharge from Centennial operated licensed discharge points (LDPs) on the ecosystem health of waterways in the UCRC (GHD 2016).

The following macroinvertebrate metrics were calculated for the purpose of this summary report:

**Taxa richness**: the number of different families/groups collected in a sample. This metric provides a measure of macroinvertebrate community diversity.

**EPT richness**: the number of taxa belonging to the Ephemeroptera, Plecoptera and Trichoptera families. These groups of macroinvertebrates have been found to be particularly sensitive to changes in their environment (Karr and Chu 1999) and, therefore, can be used to assess impacts due to chemical and physical changes (Plafkin *et al.* 1989).

**SIGNAL-2 Biotic Index**: pollution sensitivity of the macroinvertebrates collected in a sample, expressed as an average (Chessman 2003). 1 = greatest pollution tolerance, 10 = greatest pollution sensitivity.

**Table 7A-1 Surface water Trigger Investigations** 

| Parameter              | Occurrence<br>(SSGV)             | Investigation   |
|------------------------|----------------------------------|---|
| Turbidity (NTU)        | January, 50 NTU (35 NTU)         | Turbidity measured upstream at Wangcol Creek US was also high at a concentration of 60 NTU. Elevated turbidity within Wangcol Creek was likely caused by high rainfall amounts in the five days prior to sampling, equaling 67 mm.  |
| Dissolved Boron (mg/L) | February, 0.4 mg/L (0.37 mg/L)   | There was no evidence of elevated dissolved boron upstream of LDP001. LDP001 was discharging at the time of monitoring within Wangcol Creek. The elevated dissolved boron is potentially caused by discharges from WCS through LDP001. 59 mm of rain was recorded in the five days prior to sampling which may not have allowed sufficient residence time for dissolved metals to adsorb to sediment and settle out of Cooks Dam prior to discharge through LDP001. |
|                        | March, 1.09 mg/L<br>(0.37 mg/L)  | There was no evidence of elevated dissolved boron upstream of LDP001. LDP001 was discharging at the time of monitoring within Wangcol Creek. The elevated dissolved boron is potentially influenced by discharges from WCS through LDP001 and seepages from surroundings operations through historical mine workings.   |
|                        | June, 0.73 mg/L<br>(0.37 mg/L)   | Dissolved boron values did not exceed the trigger value at any upstream location. LDP001 has historically showed dissolved boron concentrations greater than the 0.37 mg/L SSGV and did so in the most recent monitoring event in May 2021 with a result of 1.03 mg/L. This suggests that the cause of the elevated result was potentially influenced by WCS and seepages from surroundings operations through historical mine workings.                            |
|                        | July, 0.38 mg/L<br>(0.37 mg/L)   | Dissolved boron values did not exceed the trigger value at any upstream location. LDP001 has concentrations of dissolved boron often greater than 0.37 mg/L SSGV. This suggests that the cause of the elevated result was potentially influenced by WCS and seepages from surroundings operations through historical mine workings.   |
|                        | August, 0.45 mg/L<br>(0.37 mg/L) | There was no recorded exceedances in upstream locations, however, LDP001 was found to contain 1.22 mg/L of dissolved boron. This suggests that the cause for the exceedance   |

| Parameter               | Occurrence<br>(SSGV)              | Investigation  |
|-------------------------|-----------------------------------|--|
|                         |                                   | may have come from WCS through LDP001 and/or from surroundings operations through historical mine workings.  |
|                         | October, 0.71 mg/L (0.37 mg/L)    | There were no recorded exceedances in upstream locations and at LDP001. LDP001 has concentrations of dissolved boron often greater than 0.37 mg/L SSGV. This suggests that the cause of the elevated result was potentially influenced by WCS and seepages from surroundings operations through historical mine workings.  |
|                         | November, 0.7 mg/L (0.37 mg/L)    | Upstream at Wangcol Creek Gauge noted an elevated dissolved boron concentration of 1.04 mg/L, as well as LDP001 with 1.07 mg/L recorded. It is inconclusive for the potential cause of this trigger event being from upstream sources or from operational discharges.  |
| Dissolved Nickel (mg/L) | March, 0.227 mg/L<br>(0.125 mg/L) | There was no evidence of elevated dissolved nickel upstream of LDP001. LDP001 was discharging at the time of monitoring within Wangcol Creek. The elevated dissolved nickel is potentially influenced by discharges from WCS through LDP001 with a discharged concentration recorded at 0.305 mg/L.  |
|                         | June, 0.128 mg/L<br>(0.125 mg/L)  | Dissolved nickel concentrations did not exceed the trigger value at any upstream location. LDP001 has historically showed dissolved nickel concentrations greater than the 0.125 mg/L SSGV and did so on the same monitoring event in June 2021 with a result of 0.318 mg/L. This suggests that the cause of the elevated result was potentially influenced by WCS and seepages from surroundings operations through historical mine workings. |
|                         | October, 0.19 mg/L (0.125 mg/L)   | Dissolved nickel concentrations did not show any exceedance of the trigger value upstream. LDP001 has historically shown dissolved nickel concentrations greater than the 0.125 mg/L SSGV did so in October 2021 with a result of 0.360 mg/L. The cause of the elevated result potentially came from WCS and seepages from surroundings operations through historical mine workings.   |
|                         | November, 0.153 mg/L (0.125 mg/L) | Dissolved nickel concentrations exceeded the trigger value at Wangcol Creek Gauge with a concentration of 0.196 mg/L. In addition, LDP001 has historically shown dissolved nickel concentrations greater than the 0.125 mg/L SSGV and has once again in November 2021  |

| Parameter | Occurrence<br>(SSGV) | Investigation  |
|-----------|----------------------|--|
|           |                      | with a concentration of 0.317 mg/L. The cause of the elevated result potentially came from WCS and seepages from surroundings operations through historical mine workings, as well as from upstream. |

### **SWTP Residuals**

Monitoring of decant water and residuals from the Springvale Water Treatment Plant (SWTP) commenced following the commissioning of the residuals pipeline in June 2019. With this, SWTP residuals stream to the REA and water decanted from the REA is monitored for water quality on a monthly basis. Residuals water quality results are shown in Figure 7-72 to Figure 7-100 and are assessed against trigger values (where available) established from Cooks Dam, being the assumed final receiving on-site water storage for the REA decant water.

**Table 8A-1 Groundwater Trigger Investigations** 

| Monitoring<br>bore | Parameter      | SSGV      | Month | Trigger<br>event | Investigation  |
|--------------------|----------------|-----------|-------|------------------|--|
|                    |                |           | Feb   | 6.2              |  |
|                    |                |           | Apr   | 6.1              |  |
|                    |                |           | May   | 6.1              |  |
|                    | pН             | 5.5 – 5.9 | Jul   | 6.1              | The pH result is trending toward the pH circumneutral range and therefore is not considered environmentally harmful.   |
| BH01               | BH01           |           | Aug   | 6.1              |  |
|                    |                |           | Oct   | 7.1              |  |
|                    |                |           | Nov   | 6.0              |  |
|                    | Dissolved zinc | 0.89 mg/L | Aug   | 0.893 mg/L       | Dissolved zinc at BH01 has only recorded one trigger event in 2021 (August). Therefore further investigation was not required as per the WCSWMP TARPs.   |
|                    |                |           | Sep   | 7.2              |  |
|                    |                | 0.4.07    | Oct   | 7.1              | The pH result is trending toward the pH circumneutral range and therefore is not   |
|                    | pН             | 6.4 - 6.7 | Nov   | 6.8              | considered environmentally harmful.  |
| BH02               |                |           | Dec   | 6.8              |  |
|                    | Dissolved iron | 0.65 mg/L | Sep   | 2.11 mg/L        | BH02 has been reported as dry since January 2020, until the next sampled date in September 2021. It is possible during this time that water existed within BH02 accumulating concentrated dissolved metals. Minimal purging was undertaken for |

| Monitoring<br>bore | Parameter | SSGV           | Month | Trigger<br>event      | Investigation  |
|--------------------|-----------|----------------|-------|-----------------------|--|
|                    |           |                | Oct   | 1.52 mg/L<br>0.7 mg/L | these sample results with samples noted as being 'cloudy'. The concentrations show a decreasing trend through 2021, with the December 2021 result of 0.4 mg/L was less than the SSGV, potentially due to sufficient purging having been performed over multiple monitoring rounds. |
|                    |           |                | NOV   | 0.7 mg/L              |  |
|                    | рН        | 3.6 – 4.8      | Jun   | 3.4                   | pH at BH03 has only recorded one potentially impactful trigger event in 2021 (June). Therefore further investigation was not required as per the WCSWMP TARPs.   |
|                    | P1.1      |                | Jul   | 6.6                   | The pH result is trending toward the pH circumneutral range and therefore is not considered environmentally harmful.   |

## **Executive Summary**

This report presents the findings of the 2021 rehabilitation monitoring program conducted at Western Coal Services (WCS) by Koru Environmental on behalf of Springvale Coal Pty Ltd to satisfy the requirements of the mining operations plan (MOP) for the operation.

#### Rehabilitation Improvement Plan progress update

A Rehabilitation Improvement Plan (RIP) was prepared in 2018 (and incorporated in the MOP) detailing management actions and strategies to improve rehabilitation condition across the site, and ensure that rehabilitated communities successfully progress towards a comparable equivalent to local native woodland communities. The plan includes an indicative annual schedule of works to be implemented progressively to improve rehabilitation condition.

Rehabilitation treatment works were implemented at the site during 2020 in accordance with the RIP. These were however limited to the older rehabilitation areas along the site access road and Cooks Dam rehabilitation, and included plantings of eucalypt tubestock to improve community composition and vegetation structure and localised hydro-seeding with a mix of native ground cover species to improve the lower stratum. A total of 582 native eucalypt tubestock were planted in 2020. No additional works were completed under RIP in these areas in 2021.

Although identified for targeted improvements under the RIP, rehabilitation across the reject emplacement area (REA) and Lambert's Gully have not yet been treated as of 2021.

#### **Monitoring Results Summary**

Monitoring methods strictly adhered to those defined in the current MOP (2018-2024), and included a combination of transect-based data collection (eight rehabilitation transects were monitored) and a walkover inspection of all rehabilitated areas. The data collected allowed for an assessment to be undertaken of current rehabilitation performance and progress against relevant objectives and completion criteria defined in the MOP.

Field surveys were completed between 22<sup>nd</sup> and 24<sup>th</sup> November 2021, following nearly two years of above average rainfall received in the locality (which in turn followed three years of severe state drought between 2016-2019). These good growing conditions were noted as having positively influenced the rehabilitation condition recorded in 2021.

All monitored rehabilitation areas were assessed as stable in 2021 with no signs of active erosion processes or issues. Soil sampling and characterisation is undertaken every three years and was implemented in 2021. Testing results showed that all key parameters regulating plant establishment and growth were generally within acceptable values, with no key constraints identified that could prevent successful rehabilitation establishment.

Ground cover protection remained excellent across all monitoring locations in 2021. Levels of live vegetative cover were measured as commensurate with analogue areas, and dominated by native grasses. Average total species richness in the ground layer increased to ~24.3 species per site in 2021, from ~22.0 species per site in 2020 and ~13.3 species per site in 2019, and average native species richness in the rehabilitation continued to be commensurate with levels recorded at the corresponding analogue sites.

Vegetation communities establishing in the rehabilitation generally remained characterised by a moderately dense to dense mid storey of primary colonising species (mainly acacias and Sifton bush), poorly resembling the condition observed in analogue areas (where the mid-storey layer is typically very sparse to absent). However, it is expected that the mid layer should naturally and progressively reduce assuming successful tree and canopy cover establishment over time.

Following tubestock plantings undertaken under the RIP, tree densities in 2021 were consistently within target range across the access road rehabilitation for a satisfactory performance. However, tree densities recorded in the Cooks Dam rehabilitation remained below target range in 2021, due to the RIP works not

yet being completed (plantings are planned to be undertaken in successive sections) and the monitoring sites occurring in areas yet to be treated.

In contrast and consistent with previous years, eucalypt densities remained very high and exceeding target range across most of the REA and Lamberts Gully rehabilitation areas. For these locations the RIP recommended selective tree thinning to reduce competition levels and improve tree growth habit and community structure, however this has not yet been implemented.

Despite some residual drought-related impacts noted in some shrubs and trees, vegetation health and tree growth were overall assessed as satisfactory in 202l. Most areas also showed signs of active natural regeneration, highlighting the potential of the established communities to be able to self-regenerate.

Exotic species diversity remained moderately high at the Cooks Dam and Access Road rehabilitation, but cumulative weed cover levels remained low and consistently <6% at all locations in 2021, and within the defined allowable levels. Pro-active weed control has nonetheless been recommended to minimise the risk of spread of occurring invasive weed species. The REA and Lambert's Gully rehabilitation areas continue to display negligible weed diversity and weed cover in 2021.

#### Recommendations

The following recommendations have been formulated based on the outcome of the 2021 field inspections and monitoring results:

- Undertake follow control of re-sprouting acacias in areas of RIP tubestock plantings.
- Continue the implementation of the rehabilitation improvement actions defined in the RIP.
- Undertake pro-active and ongoing weed control specifically targeting African Lovegrass, Blackberry, Serrated Tussock and St John's Wart in areas of older rehabilitation to minimise the risk of further spread.

## 1. Introduction

## 1.1 Background

Western Coal Services (**WCS**) is located near Blackmans Flat, approximately 15 kilometres (**km**) north of Lithgow in New South Wales (**NSW**). The facility processes coal received from Springvale Coal Mine (located approximately 8 km to the south-east) utilising a screening and sizing plant, an overland conveyor system and a coal preparation plant. WCS operates under development consent SDD 5579 granted in April 2014 under the NSW *Environmental Planning and Assessment Act 1979*, allowing operations to continue until June 2039.

Annual monitoring of rehabilitated areas at WCS commenced in 2010 and has been successively implemented by AECOM (2010-2017) and Koru Environmental (2018-2020). Monitoring is implemented to satisfy the requirements of:

- The current Mining Operations Plan 2018-2024 (MOP); and
- Schedule 3 Condition 45 of SDD 5579.

The rehabilitation monitoring program was fully revised in 2018 to improve the relevance and adequacy of collected datasets and ensure it fully aligned with the objectives and completion criteria defined in the MOP (2018-2024) for WCS rehabilitation. This revision in monitoring methods implied that some of the monitoring data collected during pre-2018 monitoring campaigns cannot be directly compared and analysed against data collected from 2018 onwards. Historic rehabilitation monitoring data remain however relevant and valuable in terms of documenting rehabilitation performance condition over time.

In 2018 and in response to a notice issued by NSW Resources Regulator under Section 240(1)(e) of the NSW Mining Act 1992, a 'Rehabilitation Improvement Plan' (RIP) document was prepared for WCS (Koru, November 2018) detailing strategies to improve rehabilitation condition across the site and ensure that rehabilitated communities successfully progress towards a comparable equivalent to local native woodland communities. The RIP defined a range of targeted improvement actions to be implemented in stages between 2019-2024 (i.e. over the remaining period of the current MOP).

## 1.2 Scope

This report presents the findings of the 2021 rehabilitation assessments undertaken at WCS in November 2021 by Koru Environmental Pty Ltd (**Koru**) on behalf of Springvale Coal Pty Limited (**Springvale Coal**) – a Centennial Coal company (**Centennial**). Assessments included:

- Assessment of RIP works progress (visual inspections and discussions with site-based staff);
- Monitoring of eight long-term rehabilitation monitoring transects; and
- A high-level walkover inspection of all rehabilitated areas to record the general condition of the rehabilitation and detect potential maintenance issues.

## 2. Post-Mined Lands Rehabilitation

## 2.1 Rehabilitation Planning and Management

As required by Schedule 3 – condition 44 of SDD 5579, Springvale Coal undertakes progressive postmining rehabilitation of the site, that is as soon as reasonably practicable following disturbance. This is undertaken with the aim to minimise the total exposed area at the site at any given time.

Rehabilitation planning and activities at WCS are undertaken in accordance a MOP approved by NSW Resources Regulator. The current MOP (Jan 2018 – Dec 2024) (Centennial Coal, 2017) also fulfils the function of Rehabilitation Management Plan (**RMP**) for the site, and was prepared to meet the requirements of Schedule 3 – Condition 45 of SDD 5579.

## 2.2 Post-Mining Land Use Goals

Post-mining land use and landscape goals are outlined in Section 4.2 of the MOP (2018-2024). A number of potential land uses have been defined for WCS (including waste emplacement and industrial uses), however relevant to this rehabilitation monitoring program are those areas proposed to be returned to either native woodland or pasture final land uses post-mining, as follows:

- Woodland will cover most of the site, which is consistent with the surrounding land use and the premining environment. Habitat augmentation activities will be undertaken to enhance the ecological values of the rehabilitated area.
- Grassland rehabilitation will only be used to rehabilitate the haul road batters, a small section of the washery area and any disturbed areas associated with the conveyor at the time of closure.

The final landform will also include permanent water bodies and drainage structures constructed to manage surface water flows and provide water resources for native fauna and stock.

## 2.3 Rehabilitation Objectives

Rehabilitation objectives for WCS are defined in Schedule 3 – Condition 43 of SDD 5579 and Table 13 (p.45) of the MOP (2018-2024). To achieve these objectives, rehabilitation planning has been undertaken in the MOP and mining 'domains' defined, each of which requiring a different rehabilitation methodology to successfully achieve the intended post-mining land use.

Relevant to this rehabilitation monitoring program are the 'secondary' woodland and grassland rehabilitation domains, i.e. areas of rehabilitation where such land uses have been or are being reestablished. Rehabilitation commitments and objectives for these domains are reproduced in **Table 1**.

Table 1 Secondary domains rehabilitation objectives for WCS

| Domain                       | Rehabilitation Objectives  |
|------------------------------|--|
| Rehabilitation –<br>Woodland | <ul> <li>All hazardous materials and contaminated materials removed.</li> <li>Stable landform that is non-polluting.</li> <li>Drainage structures will be designed and constructed where required in accordance with the Blue Book.</li> <li>Class V Land and Soil Capability.</li> <li>Ecosystem health, structure and composition satisfying completion criteria.</li> <li>Woodland rehabilitation areas will provide habitat augmentation features (such as rock piles and felled logs and woody debris) for native species.</li> <li>Woodland rehabilitation will be consistent with the Cox's Permian Red Stringybark – Brittle Gum Woodland vegetation community (as per DEC, 2006)</li> </ul> |
| Rehabilitation –<br>Pasture  | <ul> <li>Stable batters of haul roads with grassland mix used.</li> <li>Non-polluting.</li> <li>Grass seeding completed in conveyor corridor if required.</li> </ul>   |

## 2.4 Existing Rehabilitation

#### 2.4.1 Completed Rehabilitation

At the time of implementation of the 2021 monitoring campaign, a total of approximately 28.4 hectares (ha) of woodland rehabilitation had been completed across WCS, whilst no pasture rehabilitation had been established. Existing woodland rehabilitation at the site comprise:

- Cooks Dam and access road rehabilitation, established in the mid-1990s and covering ~10.4ha;
- Reject Emplacement Area (REA) rehabilitation, established in 2006 and covering ~8.5ha; and
- Lambert's Gully rehabilitation, established in 2007/2008 and covering ~9.5ha.

It is noted that an additional ~12.4ha of poorly performing woodland rehabilitation exist at the site. These areas currently remain but were re-classified in 2018 as either 'material stockpile' (for future capping works at the site) or 'water management domain'. These areas have therefore been removed from the woodland rehabilitation domain and from the monitoring program.

#### 2.4.2 Rehabilitation Improvement Plan

All areas of existing woodland rehabilitation were identified in the RIP as requiring at least some level of improvement to progress the rehabilitation towards comparable equivalent to local native woodland communities (as per the main rehabilitation objective defined in the MOP). The following treatments were defined in the RIP:

- Cooks Dam and access road rehabilitation: selective thinning of acacias followed by infill tubestock plantings of endemic eucalypt species, localised improvements of the lower stratum (hand seeding of native sub-shrubs and tubestock plantings of large herbs), and incorporation of ground logs in accessible areas.
- REA and Lambert's Gully rehabilitation: incorporation of ground logs in accessible areas, selective thinning of mid-storey in areas of high plant densities, hydro-mulching of bare areas with a native seed mix (including grasses, forbs, shrubs and trees), and localised improvements of the lower stratum in areas of successfully established canopy layer (hand seeding of native sub-shrubs and tubestock plantings of large herbs).

## 3. Monitoring Methodology

## 3.1 Long-term (Transect-based) Monitoring

#### 3.1.1 Monitoring Sites

A total of eight existing woodland rehabilitation monitoring sites were assessed during the 2021 monitoring campaign.

Each monitoring site consists of a standardised 50m long transect, with a nested 10m x 30m plot and 1m xlm quadrats, as depicted in **Figure 1**. To facilitate repeated measurements over time, all sites have been permanently located with metal star pickets at the start and end points of the 50m line, and their geographical coordinates recorded using a GPS (±3m accuracy).

The suite of monitoring sites assessed in 2021 is presented in **Table 2**, with their location mapped in **Figure 2**.

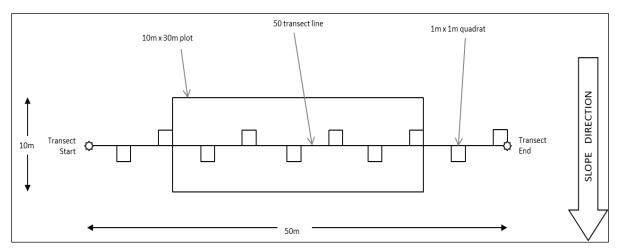

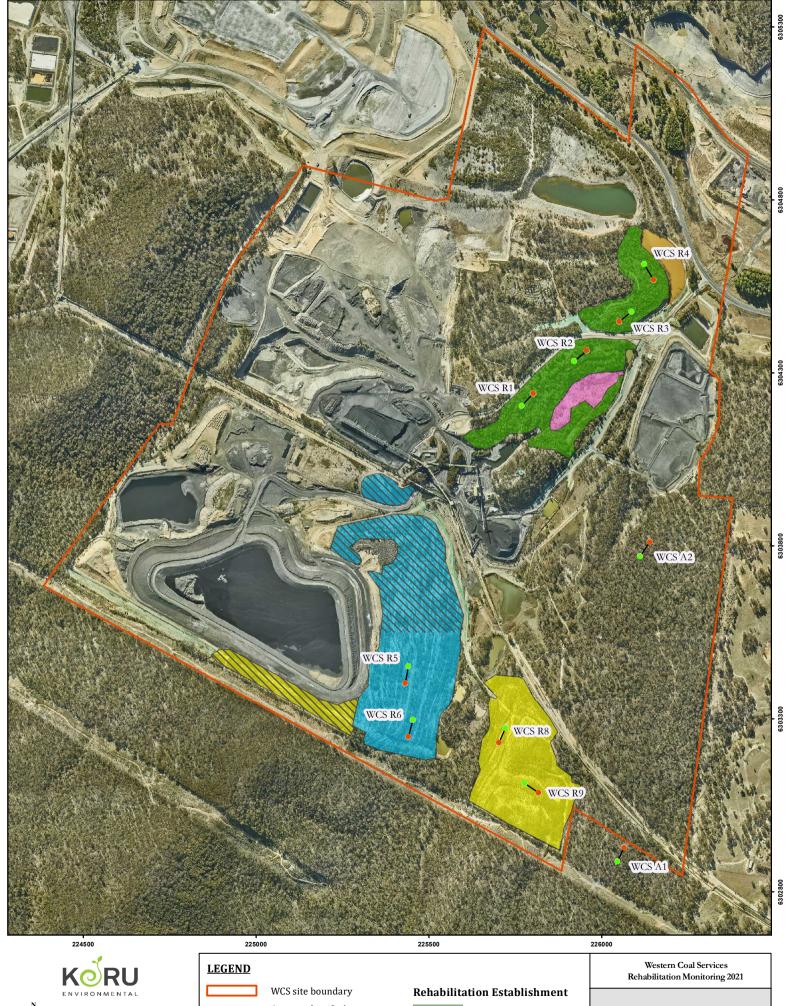

Figure 1 Monitoring site layout

The WCS monitoring program also includes a total of two woodland analogue sites, which are located in nearby areas of undisturbed native vegetation representative of local vegetation type and condition, and commensurate with *Cox's Permian Red Stringybark – Brittle Gum Woodland*. These analogue sites are subject to a 2 to 3 years monitoring frequency (depending on conditions) and were last monitored in 2020 (therefore not re-monitored in 2021).

The analogue sites form a central component of the rehabilitation monitoring program at WCS and are used to derive target benchmarks against which rehabilitation performance can be assessed, particularly with reference to species diversity, species assemblages and vegetation structure.

## 3.2 Walkover Inspections

The walkover inspection is intended as a complement to the long-term (transect-based) monitoring, and consists of a high-level assessment of all rehabilitated lands across the site with the objective to identify any potential issues / deficiencies requiring maintenance treatments. While covering the rehabilitated areas on foot (ensuring optimum geographical coverage within the available time allocation), opportunistic sightings and assessments are made identifying the following factors where relevant:

- Stability of slopes and landforms including presence and severity of active erosion areas (e.g. rill, gully and tunnel erosion);
- Function and condition of existing erosion and sediment control structures and landform features, including water management structures (e.g. drains), water ponding areas, etc. (where applicable);
- Visual assessment of ground protection and vegetation cover, vegetation health and growth rates;
- Areas of significant weed incursion;
- Evidence of presence/impact of vertebrate pests; and
- Any other disturbance factors or features, such as presence of mine waste, track disturbance, damaged fences etc.; and

GPS points (±3m accuracy) and geo-referenced photographs were taken of all observations made during the assessment. By collecting geo-located photos, areas can be re-visited in the future and photomonitoring continued to demonstrate the evolution of the site condition over time.

The walkover inspection in 202l was also targeted to capture and assess the progress of the rehabilitation improvement works defined in the RIP.

## 3.3 Works Implementation

#### 3.3.1 Monitoring Dates

Field data collection took place between  $22^{nd}$  and  $24^{th}$  November 2021, and was conducted by Matthieu Catteau (Principal Rehabilitation Scientist) from Koru.

Monitoring activities were supervised by William Olson of Centennial Coal.

#### 3.3.2 Weather Conditions

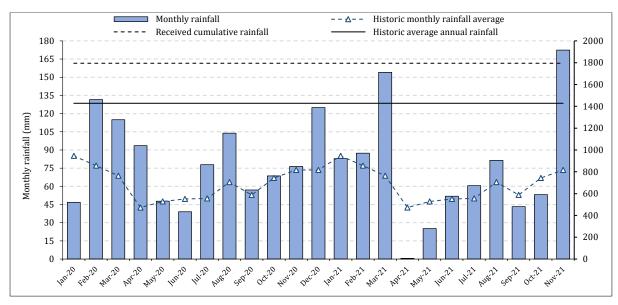

For illustration purposes, weather data for the 23 months leading to the 2021 monitoring event (i.e. since January 2020) have been presented graphically in **Graph 1** (rainfall) and **Graph 2** (temperature), together with historical data ranges included for comparison purposes (rainfall data from Lidsdale Maddox Lane BoM Station No. 063132; temperature data from Marrangaroo Defence BoM Station No. 063308).

Following the severe three-year state drought which impacted the region between 2016 and 2019 and placed a significant amount of stress on local vegetation and biophysical systems (including rehabilitated lands), conditions significantly eased off starting early 2020 and good rainfall was received (and generally sustained) throughout 2020 and 2021.

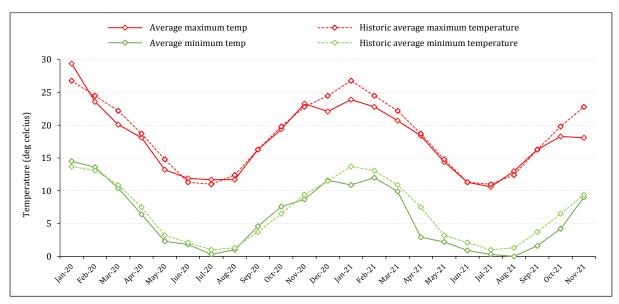

As illustrated in **Graph 1**, cumulative rainfall received in the past two years exceeded historical average by ~25% for the equivalent time period (1,795 mm received vs. 1,428 mm average). The months of April 2020, March 2021 and November 2021 were particularly wet and experienced rainfall more than double their historical monthly average

As presented in this report, the sustained good conditions of the past 2 years generally positively impacted rehabilitation condition in terms of species establishment and diversity.

Finally, temperature data records (**Graph 2**) showed that mean temperatures were generally within historical averages with the exception of a relatively cool summer and early autumn 2021. This followed two particularly hot years in 2018 and 2019 (i.e. at the peak of the drought) where average seasonal maximum temperatures were usually above historical averages (further compounding the lack of rainfall).

Graph 1 Local rainfall data (Jan 20 - Nov 21)

Graph 2 Local temperature data (Jan 20 - Nov 21)

## 3.4 Data Analysis and Interpretation

Field collected data were analysed with the view to provide an accurate assessment of current rehabilitation performance against the rehabilitation completion criteria defined in the MOP (2018-2024).

For reference, criteria defined for the 'rehabilitation – woodland' domain have been reproduced in **Table 4**, which also indicates the associated monitoring component / metrics metric used to undertake compliance assessment. (Note that for legibility purposes some criteria have been reworded or grouped where relevant).

Table 4 MOP completion criteria for woodland rehabilitation

| C   | Manitaninamatri         |
|---|-------------------------|
| Completion criteria   | Monitoring metric       |
| Landform  |                         |
| Landform is stable with no evidence of slumping or uncontrolled erosion                 | Erosion assessments     |
|   | Walkover inspection     |
| Slopes are generally less than 18% and no more than 25%                                 | Site attributes         |
|   | Walkover inspection     |
| Growing media   |                         |
| Soil analysis is undertaken to determine potential constraints to rehabilitation        | Soil monitoring         |
| Topsoil or alternative dressing media spread at depth of at least 50mm                  | Soil monitoring         |
| Ecosystem establishment / sustainability  |                         |
| Minimum of 70% protective ground cover  | Ground cover protection |
| No bare areas >200m <sup>2</sup>  | Walkover inspection     |
| Weed cover <15%   | Floristics monitoring   |
|   | Walkover inspection     |
| Evidence of nutrient cycling (i.e. presence of litter, cryptograms, etc.)               | Ground cover protection |
| Establishing species are consistent with a woodland community                           | Vegetation composition  |
| >70% of trees are healthy and growing   | Vegetation health       |
| Dominant species aligned with those in local native communities                         | Vegetation composition  |
| Presence of a range of structural habitats (eucalypts, shrubs, ground cover,            | Vegetation structure    |
| developing litter layer)  | Habitat complexity      |
| Other habitat features incorporated into rehabilitation areas (large rocks, logs, etc). | Habitat complexity      |
|   |                         |

## 4. RIP Progress

#### 4.1 Cooks Dam and Access Road Rehabilitation

Initial area preparation works including localised thinning/mulching of mature senescing acacias was undertaken during quarter 3 2019. A total of 13 locations were prepared to receive tubestock planting, ranging from approximately 20m x 20m to 20m x 30m in size. However, due to inadequate conditions at the time (i.e. particularly the drought), plantings were postponed until 2020.

Tubestock plantings of eucalypts commenced in November 2020, with a total of 582 eucalypt seedlings planted across the Cooks Dam and access road rehabilitation by the end of 2020. Details of planting locations and types (including maps) were provided in the 2020 rehabilitation monitoring report (Koru, 2021).

Species selected for plantings were limited by the availability of eucalypt tubestock in local nurseries (Neil Thompson, pers. communication), and included a total of five species comprising *Eucalyptus dalrympleana* (Mountain gum), *E. dives* (Broad-leaved peppermint), *E. pauciflora* (Snow gum), *E. rubida* (Candle gum) and *E. viminalis* (Ribbon gum). All these species are consistent with those suggested in the RIP and consist of local native species found in the surrounding *Tablelands Dry Sclerophyll Forests* native vegetation communities.

As specified in the RIP, all tubestock were mulched and protected by tree guards, and water crystals and fertiliser pellets were used during the planting process (Neil Thompson, pers. communication). An initial watering program was implemented in the weeks following planting to maximise the likelihood of seedlings survival.

All areas planted with tubestock were also hydro-seeded with a mix of native ground cover species in Spring 2020 (Neil Thompson, pers. communication).

All Cooks Dam and Access Road rehabilitation areas were re-inspected during the 2021 site works, and it appeared that no additional works under the RIP were carried on during 2021 (or any implemented works were not documented and could not be evidenced). The following observations were made on the condition of the previously treated areas:

- Satisfactory tubestock survival has generally been achieved (estimated at ~70-80% survival rate), and survived seedlings appeared healthy (see Photo 1).
- Variable growth rates were observed between the planting locations, but some areas achieved excellent seedling growth 12 months following planting (Photo 2),
- Some planted areas were noted with tree guards damaged or missing (Photo 3) possibly knocked down by macropods.
- Several infestations of Serrated Tussock (*Nassella trichotoma*) have established particularly along the access tracks created for the works (**Photo 4**), with no clear evidence of control being implemented. The spread of the species was likely promoted by inadequate vehicle hygiene protocols during works implementation.
- In several locations rapid resprouting / recolonisation of acacias has taken place in response the mulching disturbance (Photo 5). If left to re-establish, these may outcompete the young eucalypt seedlings for access to water, soil and light resources and it is recommended that localised follow-up control of re-sprouting acacias be implemented in the planted areas.

Finally and as noted in last year's report, not all areas flagged for canopy improvements (as identified in the RIP) have been treated. However, this was intentional and intended to: l) minimise the rehabilitation areas re-disturbed at any one time, and 2) allow for monitoring and determining the outcomes and efficacy of the revegetation technique before treating additional areas.

## 4.2 REA and Lambert's Gully Rehabilitation

In discordance with the RIP, none of the improvement / treatment works defined for the REA and Lambert's Gully rehabilitation areas have been implemented to date.

This is mainly justified by these areas being flagged for potential re-disturbance under the latest mine planning and REA design. This rehabilitation will continue to be monitored under the annual rehabilitation monitoring program, but investment in treatment works postponed until it is confirmed which areas (if any) will be retained.

## 5. Long-term Monitoring

<u>Notes</u>: in the following section, monitoring results showed in <u>blue font</u> indicate an acceptable rehabilitation performance for the specific metric/attribute (i.e. meeting completion criteria and/or commensurate to analogue benchmarks (within 30%)); whilst <u>red font</u> indicates otherwise.

## 5.1 Photographic Monitoring

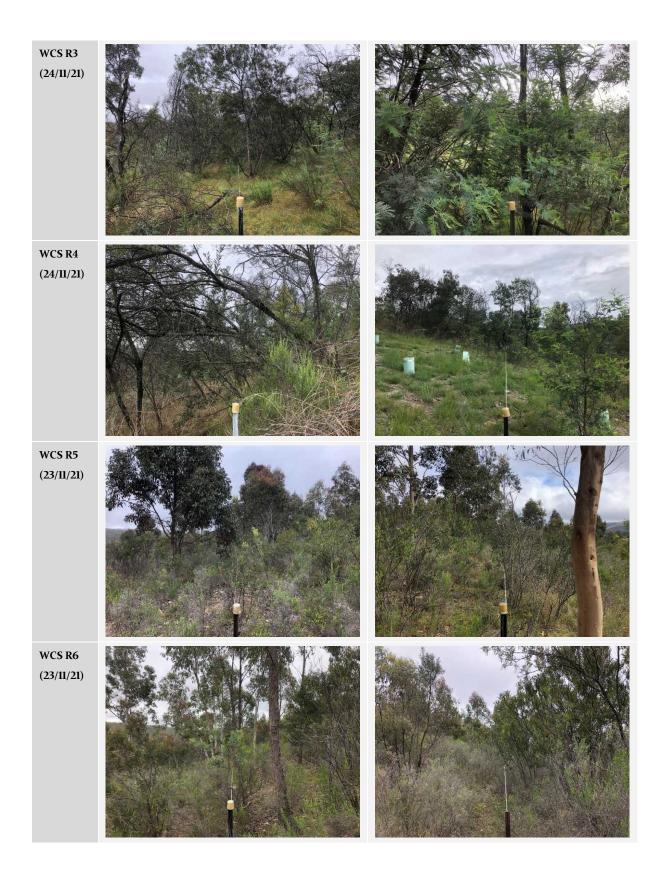

Photographs taken from the permanent photo points are provided **Table 5** which show the condition of the monitoring sites at the time of the 2021 monitoring event. These are provided to assist with the interpretation and conceptualisation of the monitoring results detailed in the following sections. For reference and comparison, analogue sites photographs (as last taken in 2021) have also been included.

Long-term photographic monitoring results are provided in Appendix B.

Table 5 Photographic monitoring results (2021)

#### 5.2 Soils and Erosion

#### 5.2.1 Erosion

The 2021 erosion monitoring results as assessed at the monitoring sites are summarised in **Table 6**. Consistently with previous years, soil and slope stability were excellent at all monitoring sites and no active erosion processes recorded. As reported in previous years, a small residual erosion channel (<30cm deep) occurred as intersecting the transect line at WCS R5, however the channel has fully stabilised and starting to fill with alluvium, therefore no erosion score was awarded.

No severe and active erosion processes or features were recorded (e.g. tunnel or gully erosion) that could compromise landform integrity and land capability objectives.

Table 6 Erosion monitoring results (2021)

#### 5.2.2 Soil Performance

This section provides a summary of results for key soil performance indicators, i.e. those most likely to limit or restrict vegetation establishment and growth or to promote erosion.

Detailed laboratory soil analyses results are included in **Appendix B** for further reference.

#### 5.2.2.1 Soil acidity

Soil pH(CaCl<sub>2</sub>) showed some seasonal fluctuations particularly at the monitoring sites located in the Access Road rehabilitation (WCS RI and WCS R2), but generally remained within comparable range from the 2018 levels (**Graph 3**).

With the exception of WCS R2 which returned a neutral soil pH, soils across the rehabilitation were acidic to strongly acidic, with pH (CaCl<sub>2</sub>) levels comprised between 4.3 and 6.4. Such acidity levels are however considered adequate as comparable to pH levels recorded in natural soil profiles at the analogue sites.

All sites returned pH readings within acceptable range for the establishment and growth of native species, for an overall acceptable performance.

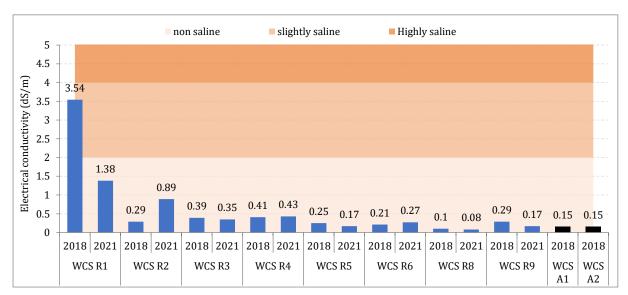

Graph 3 Soil acidity levels (pH CaCl<sub>2</sub>) (2018-2021)

#### 5.2.2.2 Soil salinity

Electrical conductivity (EC) results are presented in **Graph 4**, noting that the EC values reported in the laboratory report (**Appendix B**) were converted to account for soil types (as per Hazelton & Murphy, 2007).

The soil at WCS RI which returned as slightly saline in 2018 showed a distinct decrease in EC levels, and all EC readings in 2021 were consistently within levels classified as non-saline (i.e. <2.0 dS/m) and generally comparable to levels observed at the analogue sites. These results indicate that soil salinity is unlikely to negatively affect plant establishment and growth at the site, or become an issue in the rehabilitation.

Graph 4 Soil salinity levels (2018-2021)

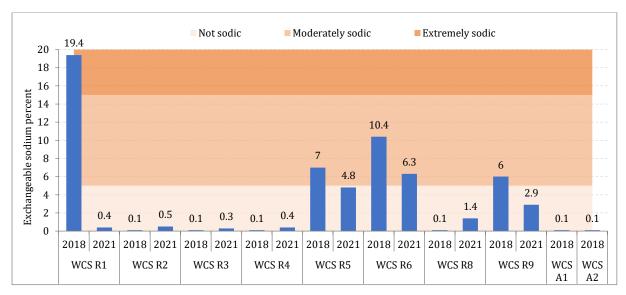

#### 5.2.2.3 Soil sodicity

Consistently with the results obtained during the last round of sampling in 2018, soil sodicity levels (i.e. as expressed by exchangeable sodium percent **ESP**) remained variable across the rehabilitation areas and between the monitoring sites (**Graph 5**).

- ESP levels only showed minor seasonal variations at WCS R2, WCS R3, WCS R4 and WCS R8, which all remained non-sodic.
- WCS RI experienced a significant drop in ESP from being extremely sodic in 2018 (19.4%) to very low sodicity in 2021 (0.4%).
- WCS R5, WCS R6 and WCS R9 all showed a moderate decrease in ESP readings. WCS R5 and WCS R9 went from being moderately sodic in 2018 to non-sodic (or only slightly sodic) levels in 2021. However, and despite a ~40% decrease in ESP, WCS remained moderately sodic in 2021 (6.3%).

These results indicate that soil sodicity levels may be a factor affecting vegetative performance across the REA rehabilitation (WCS R5 and WCS R5). High sodicity levels are generally associated with poor soil structure which can restrict root growth, and a propensity for surface crusting. This is potentially impacting on new species recruitment or establishment of ground cover vegetation at these locations.

Sodic soils can also be dispersive. However, soil and slope erosion did not appear to be an issue at the site with all rehabilitation areas being observed as generally stable and with no severe and active erosion processes. The locally sodic soils are therefore likely to slake, but unlikely to disperse.

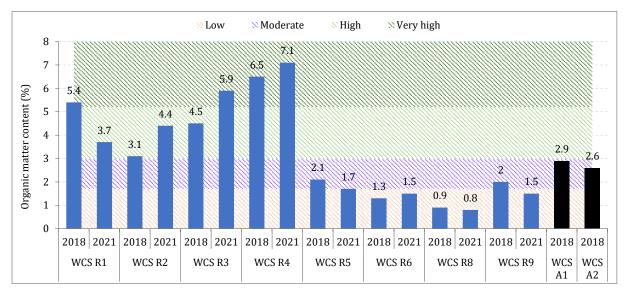

Graph 5 Soil sodicity levels (2018-2021)

#### 5.2.2.4 Soil organic matter

Testing results for organic matter content are presented in **Graph 6**. The levels of organic matter in soils are a key indicator of soil structure stability, water holding capacity and overall soil fertility (through the storage of nutrients and food source for soil microbes).

The 2021 analyses results indicated that:

- Organic matter levels in older rehabilitation areas (WCS RI, WCS R2, WCS R3 and WCS R4) showed some variation from 2018 but remained consistently high to very high, reflecting the betterestablished nature of the vegetation and soil profiles in these areas (high levels of nutrient rich litter has been returned to the soil over time). Organic matter levels in these areas greatly exceed levels recorded at the analogue sites.
- Organic matter levels remained generally low across the REA and Lambert's Gully rehabilitation
  areas and below analogue sites levels, reflecting the younger age of the rehabilitation and lack of
  topsoil in these areas compared to the Cooks Dam and Access Road rehabilitation. Organic matter
  should however gradually keep increasing over time has communities further establish and litter is
  returned and accumulates on the ground.

Graph 6 Soil organic matter content (2018-2021)

#### 5.3 Ground Cover Protection

Trends in ground cover protection since 2018 are depicted in **Graph 7**, which shows that the 2021 results were generally consistent with those recorded last year. The 70% ground cover benchmark remained met at all locations for an overall satisfactory performance.

Influenced by the ongoing good conditions, live ground cover vegetation remained comparable to last year and ranged from 12.2% to 45.6% for an average of ~22.6% (compared to ~22.6% average live cover in 2020). Ground cover distribution (i.e. the relative proportions of live vs. litter cover) at the rehabilitation sites remained very similar to the analogue sites, where the live ground cover averaged ~21.5% when last assessed in 2020.

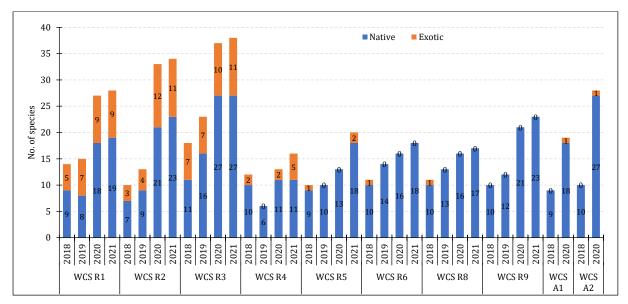

Graph 7 Ground cover protection monitoring results (2018-2021)

#### 5.4 Floristics

The following sub-sections provide an overview of the floristic composition recorded at the monitoring sites. Detailed floristics monitoring results are included in **Appendix C** for further reference.

#### 5.4.1 Ground Layer

**Graph 8** demonstrates the annual variations and dynamics in ground cover species assemblages and abundance patterns.

Graph 8 Ground cover species diversity (2018-2021)

Total species richness increased slightly at all monitor sites in 2021, reflecting the ongoing good conditions of the past two years. Recorded total richness ranged between 16-38 species with an average of ~24.3 species per site, compared to an average of ~22.0 species per site (range 13-37 species) in 2020. These levels remained well above the biodiversity levels recorded during the peak of the drought in 2019 (range 6-23 species; average ~13.3 species per site).

Consistent with previous years, the ground layer in the older Cooks Dam and Access Road rehabilitation areas remained more diverse than in the REA and Lambert's Gully rehabilitation (average ~29.0 species/site vs. ~19.5 species/site, respectively.

Positively, average native species richness in the rehabilitation also slightly increased from ~17.9 species/site in 2020 to ~19.5 species/site in 2021, highlighting additional recruitment of native species. This continued to compare well with the native diversity recorded at the analogue sites in 2020 (~22.5 species/site), for an overall good vegetative performance in the ground layer.

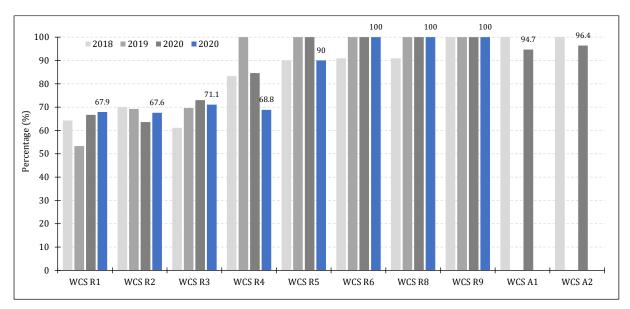

A total of 58 native ground covers were recorded across the rehabilitation in 2021 (comprising 13 grasses, 30 forbs, three twiners, one sedge, one fern and ten low shrubs), which was similar to the native ground biodiversity recorded in 2020 (also 58 species).

As presented in **Graph 9**, the proportion of native species varied very little from last year highlighting good stability in the established rehabilitated communities. Native species represented between 67.6% and 100.0% of the total species richness in the ground layer in 2021 (average of 85.0% for all sites), which compared positively to the average of ~95.5% native species proportion at the analogue sites.

Interestingly and as noted last year, the diversity of exotic species was distinctively lower REA and Lambert's Gully rehabilitation sites (97.5% average native ground cover, including three of four sites

recording no exotic species), whilst the older rehabilitation areas of Cooks Dam and the Access Road showed a lower proportion of natives (67.6-71.1%).

Consistent with previous years, local native grasses dominated the ground layer, particularly *Austrostipa rudis subpsp. nervosa* (Veined Speargrass), *Poa Sieberiana* (Snow Grass), and a range of *Rytidosperma spp.* (Wallaby Grasses). Commonly recorded forb species included *Gonocarpus tetragynus* (Common Raspwort), *Hypericum gramineum* (Small St John's Wart), *Oxalis spp.* (Wood Sorrels), *Stylidium graminifolium* (Grass Trigger-plant) or *Veronica calycina* (Hairy Speedwell); whilst the native sub-shrubs *Cassinia arcuata* (Sifton Bush) and *Dillwynia phylicoides* (Small-leaf Parrot-pea) were also common.

Graph 9 Proportion of native species in the ground layer (2018-2021)

#### 5.4.2 Mid and Canopy Layers

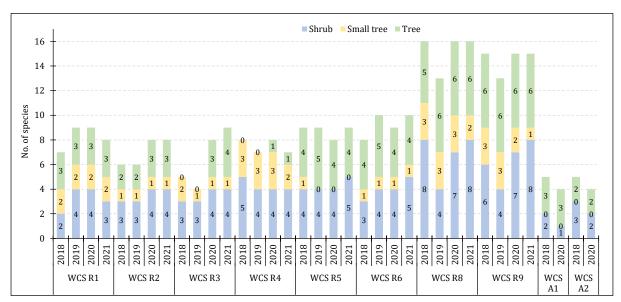

**Graph 10** presents the mid and upper storey species diversity monitoring results (i.e. excluding subshrubs and woody priority weed species).

Not surprisingly considering the well-established stage of all rehabilitation areas (i.e all areas are at least 14 years old), minimal annual variations occur in shrub and tree diversity, and the 2021 results were generally consistent with the 2020 results (with some minor differences explained by dieback of shorter-lived shrubs species and others by revised species identifications).

Shrub and tree species diversity at the rehabilitation sites in 2021 was comprised between 7-16 species, with the Cooks Dam and Access Road rehabilitation (average ~8.0 species per site) typically less diverse tan the REA and Lambert's Gully areas (average ~12.5 species per site). In both cases, this however remained much higher than the shrub and tree diversity observed at the analogue sites (4 species recorded at both sites), reflecting the abundance of primary colonising and nutrient fixing species (particularly acacias) used in the revegetation program.

In total, 27 mid and upper storey species were recorded across the rehabilitation sites in 2021 (same as last year), comprising 13 shrubs, three small trees (large acacia trees) and eleven trees (eucalypts).

Overall and as reported in previous years, the mid-storey layer occurring in the rehabilitation generally does not resemble local native communities due to the abundance of acacias, but the latter are expected to recede over time assuming successful establishment and closing of a canopy layer. However, all eucalypt tree species establishing in the rehabilitation are local native species which naturally occur across the Central Tablelands, for a satisfactory performance in terms of tree layer composition.

Graph 10 Mid and upper storey species diversity (2018-2021)

## 5.5 Vegetation Structure and Function

#### 5.5.1 Tree Stem Densities

Total eucalypt densities recorded at the analogue sites in 2020 ranged between approximately 935-2,000 stems/ha. However, these densities were highly influenced by the number of small regenerating seedlings which have germinated possibly in response to the 2020 rainfall (particularly at WCS AI). These seedlings are unlikely to develop as mature trees and are more an indication of a healthy and self-sustaining community (i.e. one with a high potential for self-regeneration following disturbance). Therefore, an acceptable and realistic benchmark range for the rehabilitation was defined by only considering established trees with diameter at breast height (DBH) >5cm (i.e. range 400-630 stems/ha), then applying the 'allowable' ±30% variance from the analogue range. The derived tree stem density benchmark range was comprised between 280-820 stems/ha.

However, and because the rehabilitation areas all remain at a relatively early stage of succession on ecological timescales (i.e. young vegetation communities compared to undisturbed native communities), tree stem counts at the rehabilitation monitoring sites included seedlings <5cm DBH (this also ensured that recently planted eucalypt tubestock were included in the stem count).

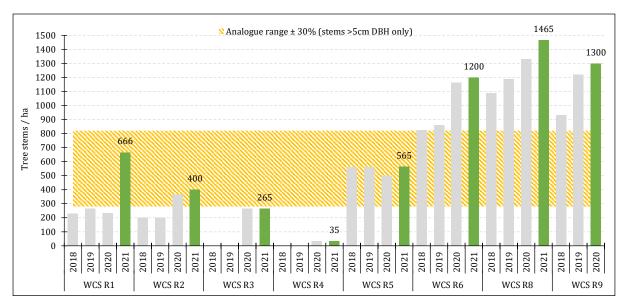

Using this approach, **Graph 11** shows that tree stem densities recorded in 2021 were within benchmark range at three of the eight rehabilitation monitoring sites (WCS RI, WCS R2 and WCS R5).

The increase in stem densities at WCS RI was explained by additional tubestock being planted under the RIP between the 2020 and 2021 monitoring event (plantings were not fully completed at the time of the 2020 monitoring). Following the successful implementation of the RIP, both sites located in the Access Road rehabilitation (WCS RI and WCS R2) now display satisfactory tree densities.

Tree densities remained below benchmark for both sites located in the Cooks Dam rehabilitation (WCS R3 and WCS R4). This is due to the RIP works not yet being completed and the monitoring sites occurring in areas yet to be treated. This should therefore increase in the coming years as RIP works are continued.

In contrast and consistent with previous years, eucalypt densities remained very high and exceeding target range at WCS R6, WCS R8 and WCS R9 (1,200-1,465 stems/ha). The slight increase recorded at these locations in 2021 was due to additional young (second generation) seedlings establishing and include in the tree count. For these locations the RIP recommended selective tree thinning to reduce

competition levels and improve tree growth habit and community structure. However, and mentioned in **Section 4.2**, this has not yet been implemented.

Graph 11 Tree (eucalypts) stem densities (2018-2021)

#### 5.5.2 Community Structure

The 2021 monitoring results for key vegetation structure metrics are presented in **Table 7**. Rehabilitation performance for these parameters is assessed against the analogue sites range  $\pm 30\%$ .

Foliage projective cover (FPC) in both the mid and canopy storey increased at most monitoring sites in 2021, highlighting continued shrub/tree foliage growth in response to the ongoing favourable conditions since early 2020.

The mid-storey across the rehabilitation remained moderately dense to dense (FPC range 14.0-44.0%, average ~26.9%) and compared poorly against the condition recorded at the analogue sites where the shrub layer is very sparse (FPC range 1.2-2.5%, average ~1.9%).

Canopy FPC increased and was within benchmark range at WCS R1 and WCS R2 in 2021, but remained below range at all other monitoring sites. At WCS R3 and WCS R4, the poor canopy scores (≤5.0% FPC) were due to the lack of trees and will likely take a long time to improve until tubestock eucalypts are planted and mature. Despite very high tree densities, canopy foliage score at WCS R8 remained very low and unchanged at ~2.0%. This is due to most trees at this location showing stunted and limited growth, and/or tree located within the sampling plot not directly intersecting the transect line. Finally, and despite remaining below target range, WCS R5, WCS R6 and WCS R9 all recorded an increase in canopy FPC score attributable to additional tree growth achieved at these locations.

Stem size class assessments indicated that additional tree growth occurred at most locations across the REA and Lambert's Gully rehabilitation since last year, highlighting continued growth in response to the good 2020/2021 rains. Community structure is slowly improving at these locations, with an increasing number of trees being recorded in the 10-14cm and 15-19cm DBH classes, which is encouraging as no RIP improvement works have yet been undertaken. If implemented, the RIP works should further speed up community structure development.

Minimum additional tree growth was recorded in the access road rehabilitation (WCS R1 and WCS R2). Established trees in these areas (except for the new tubestocks) were planted in the mid-90s and have achieved excellent growth, with mature individuals occurring in the larger DBH classes.

Overall, vegetation structure in the rehabilitation remains unlike the analogue sites where greater densities of large trees occur (**Table 7**). However, and as noted in previous reports, tree stem size is

recorded principally to allow an assessment of tree growth over time in the rehabilitation, and cannot be readily compared to analogue sites results having regards to the ecological timeframes required to achieve significant vegetation growth. It can be assumed that if satisfactory tree densities and tree health are maintained in the rehabilitation, and ongoing tree growth can be demonstrated, then community structure and complexity should naturally develop and improve over time.

Table 7 Vegetation structure monitoring results (2021)

| Metric         WCS R1         WCS R2         WCS R3         WCS R4         WCS R5         WCS R6         WCS R8         WCS R9         WCS A1         WCS A2           Vegetation layers height range (m)           Mid-storey layer         1-6         1-7         1-4         1-5         1-3         1-4         1-5         1-5         1-3         0.5-1.5           Canopy layer         10-17         12-16         5-8*         6-9*         5-10         6-10         6-10         6-11         10-18         9-15           Foliage projective cover (%)           Mid-storey layer         24.0         14.0         23.0         19.5         27.5         26.0         44.0         37.0         1.2         2.5           Trend 2020-21#         ↑  |                                    |          | -        |          |          |          |          | ·        | ·        | ·      |         |  |  |  |  |

#### 5.5.3 Habitat Complexity

The 2021 monitoring results for habitat value metrics have been summarised in **Table 8**. Rehabilitation performance for these parameters is assessed against the analogue sites range  $\pm 30\%$ .

Table 8 Habitat complexity monitoring results (2021)

| Metric                        | WCS R1 | WCS R2 | WCS R3 | WCS R4 | WCS R5 | WCS R6 | WCS R8 | WCS R9 | WCS A1 | WCS A2 |
|-------------------------------|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| Total native species richness | 27     | 29     | 36     | 16     | 26     | 27     | 31     | 37     | 22     | 31     |
| Litter cover (%)              | 82.4   | 79.3   | 61.2   | 54.4   | 53.1   | 76.8   | 75.2   | 74.0   | 78.5   | 74.2   |
| Shrub layer present           | Yes    | No     | No     |
| Tree layer present            | Yes    | Yes    | No     | No     | Yes    | Yes    | Yes    | Yes    | Yes    | Yes    |
| Cumulative length of log (m)  | 0      | 4      | 0      | 0      | 0      | 2      | 0      | 0      | 30     | 20     |
| No. hollow stems              | 0      | 0      | 0      | 0      | 0      | 0      | 0      | 0      | 4      | 8      |

<sup>#</sup> Value change ≤2.0% in FPC scores defined as a stable trend.

Consistent with last year, total native species richness was satisfactory at all sites in 2021, indicating that the rehabilitation provides levels of diversity, food and foraging resources commensurate with local native ecosystems. Additionally, the satisfactory litter layer also provides habitat and resources particularly for invertebrates.

The tree layer present at most locations and the (usually thick) shrub layer across the rehabilitation provide potential shelter and refuge resources for local native fauna to utilise or move across the landscape.

Overall, the habitat value provided by the rehabilitation remains however limited compared to analogue areas as a function of a less developed community structure, and the absence of key ecological features such as logs, hollows, rocks, boulders, etc. However, this is a direct reflection of the young ecological age of the rehabilitated communities, and these habitat values only develop naturally over long ecological timeframes (100s years) if not artificially incorporated.

Some habitat improvement measures were included in the RIP to assist in habitat construction and improve vegetation structure and current habitat value of the rehabilitation, but none have been implemented to date.

#### 5.5.4 Ecosystem Health and Resilience

**Table 9** highlights the results of the 2021 vegetation health, reproduction and regeneration assessments, which were all generally consistent with last year's observations.

| Metric  | WCS R1 | WCS R2 | WCS R3 | WCS R4 | WCS R5 | WCS R6 | WCS R8 | WCS R9 | WCS A1 | WCS A2 |
|---|--------|--------|--------|--------|--------|--------|--------|--------|--------|--------|
| Percent healthy trees                           | 90.0   | 100.0  | 100.0  | 100.0  | 88.2   | 88.9   | 88.6   | 88.1   | 83.3   | 96.6   |
| % shrubs and trees with reproductive structures | 36.4   | 50.0   | 30.0   | 37.5   | 50.0   | 66.7   | 53.3   | 66.7   | 75.0   | 75.0   |

| Regeneration status                             | Active | Active | Nil    | Nil    | Active | Active | Active | Active | Active | Active |

Table 9 Ecosystem health and resilience monitoring results (2021)

Tree health assessed in 2021 at the monitoring sites was overall satisfactory and consistently met the MOP completion criteria of >70% healthy trees. Some dieback and evidence of water stress was however noted in few individuals in the broader areas, which were likely impacts from the 2016-2019 drought.

In total, between 30.0-66.7% of all shrub and tree species at the rehabilitation sites were recorded with evidence of reproductive structures (flowers, fruits) at the time of monitoring, highlighting the potential for the established communities to be able to self-regenerate and self-sustain.

Finally, active natural regeneration (i.e. presence of second-generation eucalypt seedlings) was recorded at all sites where eucalypts were present (i.e. all sites except across the Cooks Dam rehabilitation), including in younger REA and Lamberts Gully rehabilitation areas.

#### 5.6 Weeds

A summary of weeds prevalence recorded in 2021 is presented in **Table 10**, including an indication of abundance trend from levels recorded in 2021 (a stable trend was defined for value changes  $\leq$ 2%).

Consistently with last year, minimal to no weed cover was recorded at the monitoring sites in the REA or Lambert's Gully rehabilitation, for an excellent performance. Weed cover levels in the Cooks Dam and Access Road rehabilitation remained generally stable and low, and consistently <5.3% - i.e. well below the 15% MOP completion criteria.

Consistently with previous years, a total of four invasive and potentially problematic weed species were recorded in the Cooks Dam and Access Road rehabilitation in 2021, including *Eragrostis curvula* (African Lovegrass), *Hypericum perforatum* (St John's Wort), *Nassella trichotoma* (Serrated Tussock) and *Rubus fruiticosus* (Blackberry). Ongoing control of these species will be required to prevent their spread. Details on these species and suggested control mechanisms are provided in **Table 11**.

<sup>(1)</sup> Invasive weeds have been defined to include species listed as: priority weeds within the Central Tablelands local land services region (NSW WeedWise), Weeds of National Significance (WoNS), and/or High Threat Exotics (HTE) listed under NSW biodiversity legislation.

Table 11 Recorded invasive weed species at WCS and recommended control mechanisms

| Table if Accorded invasive week species at the standard control incentioning |   |   |
|--|---|---|
| Species  | Description   | Control Mechanisms  |
| African<br>Lovegrass<br>(HTE)  | Hardy and drought-tolerant perennial grass establishing in clumps and with the potential to quickly colonise disturbed areas.   | <ul> <li>Spray plants with a suitable registered herbicide in<br/>spring to summer, targeting new seedlings as<br/>much as possible before they are allowed to<br/>mature. Successive herbicide treatment may be<br/>required on mature plants.</li> </ul>  |
| Blackberry<br>(HTE, Priority<br>weed, WoNS)                                  | Prickly scrambling shrub forming dense thickets and potentially spreading quickly. Dense thickets reduce native habitat for fauna and flora, represent a fire hazard and can harbour vermin.  The plant is classified as a weed of national significance. | <ul> <li>Physical control is usually unsuccessful because the entire root system must be removed.</li> <li>Spray the plants with suitable registered herbicide when plants are healthy and actively growing. Successive treatments will likely be required for well-established plants.</li> </ul>  |
| Serrated<br>Tussock<br>(HTE, Priority<br>weed, WoNS)                         | Small tussock grass producing very large amount of seeds and with the potential to take over new areas very rapidly, including native vegetation where it can displace other natives.  The plant is classified as a weed of national significance.        | <ul> <li>Small isolated patches should be physically removed with a mattock, ensuring that the pulled plants and soil attached to roots are bagged and dispose of correctly.</li> <li>Alternatively, spray the plants with a registered herbicide before seed production.</li> </ul>  |
| St John's Wort<br>(HTE, Priority<br>weed)                                    | Herb or small shrub with bright yellow flowers, potentially poisonous to herbivore species.   | <ul> <li>Spot spray with registered herbicide when the plants are actively growing, in early flower and before seed set (late spring/early summer).</li> <li>Successive spraying treatment will likely be required to suppress the species.</li> <li>Hand-weeding is not an effective way to control St John's wort as the entire root system must be removed to stop new plants from growing.</li> </ul> |

### 5.7 Animal Pests

Consistently with previous years, the presence of four species of animal pests was evidenced during the monitoring, including rabbits, goats, foxes and wild dogs.

- Rabbits in particular appeared abundant across the site and more particularly in younger rehabilitation areas, where they may have a detrimental impact on ground cover vegetation establishment and growth. Grazing impacts were evident in these areas (further compounded by macropods), although given the sparsity of ground vegetation these impacts were difficult to quantify.
- Impacts from goats on vegetation could not be clearly evidenced during the monitoring, however impacts can potentially become severe if population levels of the species increase.
- Foxes and wild dogs, although undesirable, are unlikely to influence rehabilitation establishment, though they may predate on local native fauna recolonising the rehabilitated areas. From this perspective the installation of supplementary habitat features throughout the rehabilitation (e.g. with logs, rocks, etc.) would provide additional refuge to ground dwelling native fauna and help mitigate predatory impacts.

Overall, given the likely low local population of feral goats and the absence of evident impacts to the rehabilitation, control of the species is considered unnecessary at present. However, rabbits are abundant and represent a more realistic threat to rehabilitation success. Rabbits are a declared noxious animal in NSW, and landholders are obliged to control rabbit populations on their land. A targeted control program should therefore be considered at the site, which should be developed and implemented in consultation with the Lithgow Local Land Services.

### 5.8 Recommendations

A comprehensive action plan was developed and detailed in the RIP (Koru, 2018) to improve the condition of the rehabilitation across the entire site. No additional issues other than those addressed in the RIP were identified during this 2021 monitoring event, therefore no additional recommendations are suggested.

# 6. Walkover Inspection

Findings and observations made during the 2021 walkover inspection are summarised in the dot point below. Note that comprehensive inspections of all rehabilitation across WCS were implemented in 2018 and 2019, and included additional findings which can be referred to in relevant reports (Koru 2018, 2019, 2020).

- **Erosion** All inspected areas were assessed as stable with no evidence of active erosion processes or impacts recorded.
- **Drainage** No drainage issues recorded in 2021. All inspected areas appeared free draining with no evidence of ponding, slumping or waterlogging.
- Vegetation establishment vegetation establishment across the REA and Lambert's Gully rehabilitation generally remained consistent with the condition reported in the RIP, and is slowly improving in terms of tree growth and ground cover establishment. Vegetation establishment across the older Cooks Dam and access road rehabilitation areas remained satisfactory, and RIP improvement works have started to further improve community structure and composition in these areas.
- **Vegetation health** Vegetation health condition was overall satisfactory throughout. However, tree dieback was observed as impacting some individuals across the REA and Lambert's Gully rehabilitation (see **Photo 5**), which may be linked to water and heat stress during the 2016-2019 drought. Tree health and continued growth will need to be closely monitored in these areas in the future.
- Weeds the prevalence of invasive species across the Access Road and Cooks Dam rehabilitation was overall assessed as increased during 2021, including African Lovegrass (Photo 6), Blackberry (Photo 7), Serrated Tussock (Photo 8) and St John's Wart (Photo 9). Increased targeted effort is recommended to control these species.
- **Predation and herbivory** Although their impact is difficult to quantify, rabbits' populations remain high across the site, and a targeted control program may need to be investigated.

# 7. Progress Against Completion Criteria

Based on the 2021 rehabilitation monitoring results as presented and discussed in previous sections, a high-level assessment of rehabilitation progress against the relevant completion criteria defined in the MOP (2018-2024) is presented in **Table 12**.

The assessment was undertaken for each rehabilitation area, and was based on the average values/results from the monitoring sites located together with the observations made during the walkover inspection.

Table 12 Rehabilitation progress against completion criteria in the MOP (2018-2024)

|   |   |           | Compliano      | e status 2021 |                    |
|---|---|-----------|----------------|---------------|--------------------|
| Completion criteria   | Rehabilitation progress   | Cooks Dam | Access<br>Road | REA           | Lambert's<br>Gully |
| Landform  |   |           |                |               |                    |
| Landform is stable with no evidence of uncontrolled erosion | Satisfactory landform stability has been achieved across all rehabilitation areas, with no recorded evidence of active erosion processes or severe impacts  | Yes       | Yes            | Yes           | Yes                |
| Slopes are generally less than 18% and no more than 25%     | Except for localised exceptions (particularly along the lower contours of the 2008 Lambert's Gully rehabilitation where higher gradients had to be established to build the landform), established slopes are generally less than 25% across the rehabilitation.  Slope as measured at the monitoring sites comprised between 9-25%.  | Yes       | Yes            | Yes           | Yes                |
| Growing media   |   |           |                |               |                    |
| Soil analysis undertaken to determine potential constraints | Soil sampling and analysis is undertaken on a three-yearly basis as part of the rehabilitation monitoring program. All monitoring sites were sampled in 2021 for soil characterisation. Testing results showed that all key parameters regulating plant establishment and growth were generally within acceptable values, with no key constraints identified that could prevent successful rehabilitation establishment.  | Yes       | Yes            | Yes           | Yes                |
| Topsoil or alternative spread at depth of at least 50mm     | Areas of older rehabilitation (Cooks Dam and access road) were dressed with adequate amount of topsoil (~100mm).  However, topsoil application was minimal and uneven across the REA and Lambert's Gully rehabilitation (<50mm) and the little topsoil used was mixed and diluted in overburden/capping material. Growth medium improvement measures were defined in the RIP for these areas in the form of successive hydro mulching campaigns, but have not yet been implemented.     | Yes       | Yes            | No            | No                 |
| Ecosystem establishment and sustainabilit                   | у   |           |                |               |                    |
| Minimum of 70% protective ground cover                      | Protective ground cover was satisfactory at all locations in 2021, comprised between 83.5-100%. Ground cover largely dominated by litter cover with low to moderate levels of live vegetative cover, but consistent with condition observed at analogue sites.  | Yes       | Yes            | Yes           | Yes                |
| No bare areas >200m <sup>2</sup>                            | Vegetation establishment and ground cover protection excellent across the Cooks Dam and access Road rehabilitation areas.  Vegetation and ground cover establishment were assessed as slowly improving across the REA and Lambert's Gully rehabilitation, however several continuous bare areas >200m² remain. Ground cover improvement measures were defined in the RIP for these areas in the form of successive hydro-mulching/seeding campaigns, but have not yet been implemented. | Yes       | Yes            | No            | No                 |

|   |   |           | Complianc      | e status 2021 |                    |
|---|---|-----------|----------------|---------------|--------------------|
| Completion criteria   | Rehabilitation progress   | Cooks Dam | Access<br>Road | REA           | Lambert's<br>Gully |
| Weed cover <15%   | Weed diversity remained moderately high at the Cooks Dam and Access Road rehabilitation monitoring sites, but cumulative weed cover levels remained low and consistently <6% at all locations. Pro-active weed control is nonetheless recommended to minimise the risk of spread of occurring invasive weed species. Negligible weed diversity and weed cover continue to occur across the REA and Lambert's Gully rehabilitation.  | Yes       | Yes            | Yes           | Yes                |
| Evidence of nutrient cycling (i.e. presence of litter, cryptograms, etc.)                             | Active nutrient cycling was evidenced at all monitored locations, including high levels of organic litter cover, abundance of nutrient fixing shrub species (acacias) and presence of cryptograms on the soil surface particularly in older rehabilitation areas.   | Yes       | Yes            | Yes           | Yes                |
| Establishing species are consistent with a woodland community   | In most rehabilitation areas a range of ground covers, shrubs and canopy eucalypts occur. Although cover levels or vegetation structure are often still developing (as a function of the young ecological age of the rehabilitated communities), the establishing species are generally consistent with local native communities. One exception is for the Cooks Dam rehabilitation where a tree layer is lacking, however improvement works under the RIP have started in this area to establish eucalypts. All planted eucalypt tubestocks consist of local species naturally occurring in the Central Tablelands.  Currently, the thick shrub layer generally occurring in the rehabilitation is uncharacteristic of local native communities as observed at the analogue sites, however it is expected that shrub abundance should naturally receded with time as the tree layer further establishes and the canopy closes out. | Trending  | Trending       | Trending      | Trending           |
| >70% of trees are healthy and growing   | Despite some residual drought-related impacts noted on some tree individuals; tree health was overall satisfactory with ≥88% of trees assessed as healthy at the monitoring sites. Tree growth also evidenced at many locations (increased girth and/or height), promoted by good rainfall received in the past two years   | Yes       | Yes            | Yes           | Yes                |
| Dominant species aligned with those in local native communities                                       | Although the rehabilitated communities do not perfectly align with a specific native community profile, in all vegetation layers the dominant species comprise local native species naturally occurring in the Central Tablelands region.   | Yes       | Yes            | Yes           | Yes                |
| Presence of a range of structural habitats (eucalypts, shrubs, ground cover, developing litter layer) | With the exception of the Cooks Dam rehabilitation where the tree layer is not yet established (tree were planted in 2020 but remain at seedling growth stage), a range of structural habitat occurred in most areas including eucalypts, shrubs, ground covers and litter.   | Trending  | Yes            | Yes           | Yes                |
| Other habitat features incorporated into rehabilitation areas (large rocks, logs, etc).               | Artificial habitat features have not been incorporated throughout the rehabilitation.   | No        | No             | No            | No                 |

### **General Comments**

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key: CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

- ^ = This result is computed from individual analyte detections at or above the level of reporting
- ø = ALS is not NATA accredited for these tests.
- ~ = Indicates an estimated value.
- ED007 and ED008: When Exchangeable Al is reported from these methods, it should be noted that Rayment & Lyons (2011) suggests Exchange Acidity by 1M KCI Method 15G1 (ED005) is a more suitable method for the determination of exchange acidity (H+ + Al3+).

# **APPENDIX C**

# **FLORISTICS MONITORING RESULTS 2021**

# Key:

- Numeric values indicate the species was recorded and measured during the ground cover assessments, the value representing the average FPC for the species.
- 'x' indicates the species was recorded in the sampling area during the mid and upper storey assessments.

**Table 9A-1 Independent Environmental Audit Recommendations 2018** 

| Condition<br>Number | REC<br>#            | Improvement Opportunity Recommendation   | Response / Addressed   | Timing  | 2021 AR Update |
|---------------------|---------------------|--|--|---|----------------|
| Management          | anagement Plans     |  |  |   |                |
| Consultation        | REC-<br>2018-<br>93 | Follow up with Forestry Corporation NSW on the land swap on CCL-733 and required Forestry Permits to ensure these are in place where required. | The land swap agreement is in its final stages with the possibility of Native Title on the Neubeck portion of the swap (Lot 64 DP751636) under assessment.  The land portion in question (Part Lot 502 DP825541), which is affected by the southern tip of co-disposal area, does not have any Native Title issues.  Parties agreed not to pursue an Occupation Permit for Lot 502 as FCNSW are comfortable with the fact the Land Swap was progressing.  As far as the Neubeck block is concerned, we have no reason to apply for an Occupation Permit as we do not have any infrastructure on there. | This is an ongoing process that started in 2012.  The decision rests with the Crown Solicitors Office at present. | N/A            |

| Condition<br>Number | REC<br>#            | Improvement Opportunity Recommendation   | Response / Addressed  | Timing                             | 2021 AR Update |
|---------------------|---------------------|--|---|------------------------------------|----------------|
| EMS                 | REC-<br>2018-<br>01 | Update the Environmental Management Strategy to include figures that show all current environmental monitoring locations (e.g. TEOM and dust gauges).  | The approved EMS figures now show all environmental monitoring locations.   | Completed                          | N/A            |
| EMS                 | REC-<br>2018-<br>02 | Update the Environmental Management Strategy to include current environmental management plans approved for the site.  | The approved EMS includes all environmental management plans associated with SCSO   | Completed                          | N/A            |
| EMS                 | REC-<br>2018-<br>03 | Update the Environmental Management Strategy with copies of the current EPLs for 3607 and 467.   | EPL 467 is now wholly managed by Centennial Angus Place Colliery, therefore a copy is not included in the approved EMS.       | Completed                          | N/A            |
| EMS                 | REC-<br>2018-<br>04 | Update the Environmental Management Strategy - Appendix 4 – to replace the 2012 version of the Centennial Environment and Community Policy with the current policy as available on the Centennial website. | The approved EMS includes the current Centennial Environment and Community Policy.  | Completed                          | N/A            |
| Management<br>Plans | REC-<br>2018-<br>05 | Ensure all management plans include document control that identifies the revision number, when the plans had been updated and a summary of what was changed or reason for the update.                      | All management plan reviews now include document control.   | Completed                          | N/A            |
| Management<br>Plans | REC-<br>2018-<br>06 | Investigate the management plan review timeframes for the Western Region plans as outlined in the different project approvals for all the relevant sites. Identify   | CEY has dedicated approvals team who has established joint workflow process with DPE for all CEY Management Plan Revision and | Completed – Ongoing Annual process | N/A            |

| Condition<br>Number | REC<br>#            | Improvement Opportunity Recommendation  | Response / Addressed   | Timing    | 2021 AR Update |
|---------------------|---------------------|---|--|-----------|----------------|
|                     |                     | efficiencies and develop a plan for meeting timeframes within all project approvals.  | submissions. WCS is included in this process.  |           |                |
| Noise MP            | REC-<br>2018-<br>07 | Consider including the same monitoring locations in the monthly monitoring program as the 6 monthly Noise Reduction Study monitoring program required by Condition 8A, Schedule 3.                                      | Monitoring points have been reviewed and reconciled in approved 2018 WRNMP.  | Completed | N/A            |
| Air quality<br>MP   | REC-<br>2018-<br>91 | Review and consider whether the current number of dust gauges monitored provides an adequate understanding of the dust risk profile at the site.  | Dust gauge monitoring network was reviewed for adequacy during 2015 by GHD in the Centennial Western Region Environmental Monitoring Rationalisation, Review and Recommendations (GHD 2015). | Completed | N/A            |
|                     |                     |   | Operations at WCS have not changed significantly during this time in relation to the creation of dust. Mitigation measures have been managed on site as per the WRAQGGMP.                    |           |                |
| Heritage MP         | REC-<br>2018-<br>08 | Update the WRACHMP to include<br>the new site BF JN 1 identified<br>during the RPS due diligence<br>survey in May 2017.   | WRACHMP updated to include site reference 45-1-2795.   | Completed | N/A            |
| PIRMP               | REC-<br>2018-<br>09 | Update the Plans / Figures appended to the PIRMP to clearly and legibly show the location of potential pollutants on the premises. Ensure the cross referencing of Figures correlates with those included in the PIRMP. | The approved PIRMP figures show the location of potential pollutants on site when cross referenced with Tables in Section 5.   | Completed | N/A            |

| Condition<br>Number  | REC<br>#            | Improvement Opportunity Recommendation  | Response / Addressed  | Timing                                      | 2021 AR Update |
|----------------------|---------------------|---|---|---|----------------|
| PIRMP                | REC-<br>2018-<br>10 | Update the PIRMP to reflect roles and responsibilities.   | Roles and responsibilities for SCSO staff have been tabulated in the approved PIRMP.  | Completed                                   | N/A            |
| PIRMP                | REC-<br>2018-<br>11 | Upload the 2018 PIRMP to the Springvale Coal Services website.  | The approved PIRMP is published.  | Completed                                   | N/A            |
| PIRMP                | REC-<br>2018-<br>12 | Ensure the PIRMP lists all EPLs relevant to the site.   | EPL 5129 and EPL 21229 have been listed in the approved PIRMP.  | Completed                                   | N/A            |
| PIRMP                | REC-<br>2018-<br>13 | Ensure a pollution risk assessment is attached to the PIRMP that addresses the requirement of Condition 98C(1)(c).  | A risk assessment is included in the appendices for both LS and WCS. The risk assessment was produced in collaboration with GHD in 2017 and revised in 2019 and reviewed for currency in 2020.  | Completed                                   | N/A            |
| Site<br>Observations | REC-<br>2018-<br>14 | Carry out maintenance of coal spillage under conveyors and review (and address if required) the adequacy of erosion and sediment controls on steep sections along the conveyor. | Inspection and Maintenance of Coal Transport System is undertaken in a systematic manner across WCS to identify and address spillage.  Inspection and Maintenance of ESC structures at WCS undertaken in a systematic manner across the operations. | Completed - Ongoing operational requirement | N/A            |
| Site<br>Observations | REC-<br>2018-<br>15 | Undertake maintenance along conveyor OL1 to remove coal fines on rollers and spillage under the conveyor.   | Inspection and Maintenance of Coal Transport System s undertaken in a systematic manner across WCS to identify and address spillage.  Inspection and Maintenance of ESC structures at WCS undertaken in a systematic manner across the operations.  | Completed - Ongoing operational requirement | N/A            |

| Condition<br>Number  | REC<br>#            | Improvement Opportunity Recommendation   | Response / Addressed  | Timing                                      | 2021 AR Update |
|----------------------|---------------------|--|---|---|----------------|
| Site<br>Observations | REC-<br>2018-<br>16 | Inspect and maintain sediment controls at Kerosene Vale Stockpile Site, including desilting drainage structures. | Inspection and Maintenance of ESC structures at WCS undertaken in a systematic manner across the operations.  | Completed - Ongoing operational requirement | N/A            |
|                      |                     |  | A targeted maintenance project was undertaken in December 2018 for Kerosene Vale Stockpile Site and LDP003 to remove sediment build up, improve controls for drainage and water management. |   |                |
|                      |                     |  | Kerosene Vale Stockpile Site is<br>managed under the Angus Place<br>MOP by the Angus Place Operation.   |   |                |
| Site<br>Observations | REC-<br>2018-<br>17 | Restrict access to the derelict buildings and mine entries at Kerosene Vale.                                     | Access to Kerosene Vale is via locked gates with signage in place restricting access.   | Completed                                   | N/A            |
|                      |                     |  | Mine entries have been locked / barricaded.   |   |                |
|                      |                     |  | Kerosene Vale Stockpile Site is<br>managed under the Angus Place<br>MOP by the Angus Place Operation  |   |                |
| Site<br>Observations | REC-<br>2018-<br>18 | Remove materials from within the drip line of trees at Kerosene Vale.  | A targeted maintenance project was undertaken in December 2018 for Kerosene Vale Stockpile Site and LDP003 to remove sediment build up, improve controls for drainage and water management. | Completed                                   | N/A            |
|                      |                     |  | Kerosene Vale Stockpile Site is<br>managed under the Angus Place<br>MOP by the Angus Place Operation  |   |                |

| Condition<br>Number      | REC<br>#            | Improvement Opportunity Recommendation   | Response / Addressed   | Timing  | 2021 AR Update |
|--------------------------|---------------------|--|--|---|----------------|
| Site<br>Observations     | REC-<br>2018-<br>19 | Implement measures outlined in the Rehabilitation Improvement Plan (November 2018).  | The Rehabilitation Improvement Plan (RIP) integrated as an attachment to WCS MOP Amendment A. Measures from the RIP will be implemented once approved by DPIE.       | Completed – ongoing for the term of the RIP   | N/A            |
| Site<br>Observations     | REC-<br>2018-<br>20 | Investigate surface water and groundwater interactions within the Additional Rehabilitation Area west of the Co-disposal ponds to understand impacts of surface crusting on proposed rehabilitation plans. | The Rehabilitation Improvement Plan integrated as an attachment to WCS MOP Amendment A. Such issues will be identified and investigated once the RIP is implemented. | Commenced. Shared GW study with EA ongoing. LDP001 Pollution Reduction Program considering water management infrastructure within this area for construction in 2021. | N/A            |
| Complaints<br>Management | REC-<br>2018-<br>21 | Develop a single complaints record form that meets the requirements of the development consent and EPL and include in the Environmental Management Strategy and PIRMP.                                     | An SCSO Complaint Record Form<br>has been included in both the<br>approved EMS and PIRMP versions<br>that meets the requirements of EPL<br>21229 and EPL 5129        | Completed   | N/A            |
| Incident<br>management   | REC-<br>2018-<br>22 | Ensure environmental incidents meeting the definition of EPL 3607 condition R2 are notified to the EPA in writing within 7 days of the incident occurring.   | All incidents are reported within required timeframes  (1 x non- occurrence recorded in audit period)  | Completed - Ongoing operational requirement   | N/A            |
| Incident<br>management   | REC-<br>2018-<br>23 | Ensure reporting of incidents is completed within the timeframes outlined in Condition 7, Schedule 5.  | All incidents are reported within required timeframe.  (1 x non- occurrence recorded in audit period)  | Completed - Ongoing operational requirement   | N/A            |
| Incident<br>management   | REC-<br>2018-<br>24 | Review and update the categorisation of incidents in ECD with respect to incidents that have been issued with Penalty Notices.   | All environmental incidents are categorised and recorded in ECD in accordance with CEY process   | Completed   | N/A            |

| Condition<br>Number     | REC<br>#            | Improvement Opportunity Recommendation   | Response / Addressed  | Timing                                      | 2021 AR Update |
|-------------------------|---------------------|--|---|---|----------------|
| N/A Incident management | REC-<br>2018-<br>25 | Ensure all 2018 incidents are recorded in ECD database including TEOM wheel theft (27 June 2018) and ruptured diesel tank (20 April 2018).   | All environmental incidents are categorised and recorded in ECD in accordance with CEY process.  Property damage incidents are not recorded in ECD and are recorded in PULSE.   | Completed                                   | N/A            |
| EPLs,<br>Section 4.3.1  | REC-<br>2018-<br>25 | Confirm if a modification to SSD-<br>5579 is required for the transfer of<br>commitments relating to Kerosene<br>Vale to Angus Place (upon<br>approval of the proposed revisions<br>to the Mining Operations Plans). | Kerosene Vale Stockpile will be included in the Angus Place MOP in accordance with Consolidated Colliery leases associated with Angus Place.  No modification is required.  Kerosene Vale Stockpile Site is managed under the Angus Place MOP by the Angus Place Operation. | Completed                                   | N/A            |
| Development             | Consen              | t SSD-5579   |   |   |                |
| 2.4                     | REC-<br>2018-<br>26 | Ensure the response to recommendations for all future IEAs submitted to DPE includes a timeframe for implementation of recommendations.  | Noted – timeframes provided (this document)   | Completed                                   | N/A            |
| 2.6                     | REC-<br>2018-<br>94 | Ensure all material received at the site, is appropriately classified as ROM coal and does not contain other materials.  | Noted   | Completed - Ongoing operational requirement | N/A            |
| 2.6                     | REC-<br>2018-<br>95 | Continue to review and then implement options for re-use (including removal) of coal stored at Kerosene Vale. Avoid or   | Internal Review Completed.  Kerosene Vale Stockpile will be included in the Angus Place MOP in accordance with Consolidated   | Completed                                   | N/A            |

| Condition<br>Number | REC<br>#            | Improvement Opportunity Recommendation  | Response / Addressed  | Timing  | 2021 AR Update   |
|---------------------|---------------------|---|---|---|--|
|                     |                     | minimise the volume of coal received at Kerosene Vale until appropriate approvals are in place for its processing or disposal.  | Colliery leases associated with Angus Place.  Kerosene Vale Stockpile Site is managed under the Angus Place MOP by the Angus Place Operation.   |   |  |
| 2.14                | REC-<br>2018-<br>27 | Review the adequacy of the frequency of conveyor and transfer station sump maintenance.   | Inspection and Maintenance of Coal Transport System is undertaken in a systematic manner across WCS to identify and address spillage.  Existing process is subject to Continuous Improvement assessments. IEA outcomes included in process. | Completed – ongoing operational requirement   | N/A  |
| 2.17                | REC-<br>2018-<br>28 | Consider including in any future project approval modifications an adjustment of the project boundary to areas under full control of WCS.   | Noted for future MODs.  | Completed   | N/A  |
| 2.17                | REC-<br>2018-<br>92 | Define and document the process for handover of areas of the WCS site to EA and how rehabilitation liabilities will be considered and managed. Consult with the Resources Regulator regarding this process. | A complex commercial and legal process between parties for land handover and exchanges is ongoing between CEY and EA.  Rehabilitation liabilities are assessed and documented via that process.   | Ongoing process. The consultation between EnergyAustralia and Centennial has over the last few years been focused on information sharing and reporting.  Over the period of 2020, the consultation has moved into focusing on specific projects where delivery of solutions is being collaboratively achieved and now not only is information being shared, but assessments are also being completed collaboratively. | Centennial is continuing to prepare for handover of WCS site to EA with the Huon Rehabilitation project throughout the 2021 reporting period |

| Condition<br>Number | REC<br>#            | Improvement Opportunity Recommendation   | Response / Addressed   | Timing                                      | 2021 AR Update |
|---------------------|---------------------|--|--|---|----------------|
| 3.3                 | REC-<br>2018-       | Remove the Construction Environmental Management Plan  | Website published documents are periodically reviewed for relativity.  | Completed                                   | N/A            |

|---------------------|---------------------|--|---|--|----------------|
| 5.4                 | REC-<br>2018-<br>69 | Upload the revised version of the 2015 Annual Review to the website.   | Noted   | Completed                                    | N/A            |
| 5.5                 | REC-<br>2018-<br>70 | Maintain a record of review of management plans against SSD 5579 Condition 5, Schedule 5, including the details of revisions made and timing of submission to DPE.                 | Register maintained by CEY Corporate.   | Completed - Ongoing operational requirement. | N/A            |
| 5.6                 | REC-<br>2018-<br>71 | Consult with recognised environmental groups regarding participation in the CCC.   | CCC meetings are advertised in media and environmental groups are invited to participate.                               | Completed - Ongoing operational requirement. | N/A            |
| 5.6                 | REC-<br>2018-<br>72 | Consider exploring community engagement activities in addition to the Community Consultative Committee in the Wallerawang District.  | Noted   | Completed - Ongoing operational requirement. | N/A            |
| 5.10                | REC-<br>2018-<br>73 | Ensure the 2018 Audit Report and response to recommendations is provided to DPE within the timeframe required by Schedule 5, Conditions 9 and 10, or as otherwise agreed with DPE. | The 2018 WCS IEA report and the initial responses to recommendations were provided to DPE within the 3-month timeframe. | Completed                                    | N/A            |
| Environmental       | Protection          |  |   |  |                |
| L2.1                | REC-<br>2018-<br>74 | Ensure all analytes required to be sampled by EPL 3607 Condition L2.4 and M2.4 are tested and reported in the Centennial Coal  | A corrections log was provided in the WCS Environmental monitoring report to address this recommendation.               | Completed - Ongoing operational requirement. | N/A            |
|                     |                     | Environmental Monitoring Data Reports.   | Subsequent monitoring data reports contain all EPL 3607 required monitoring data  |  |                |

| Condition<br>Number | REC<br>#            | Improvement Opportunity Recommendation   | Response / Addressed   | Timing                                       | 2021 AR Update |
|---------------------|---------------------|--|--|--|----------------|
| L2.2                | REC-<br>2018-<br>75 | Continue to implement the LDP006 Works Plan, providing periodic updates to the EPA.  | An LDP001 (Formerly LDP006) options assessment was submitted to EPA on 18 December 2019. Continual consultation and future works will be ongoing.  | Completed - Ongoing operational requirement. | N/A            |
| L2.6                | REC-<br>2018-<br>76 | Ensure the EPA is advised within 3 working days of the completion of sampling and testing where TSS meets the EPL criteria outlined in L2.6.                                     | The EPA will be notified of TSS exceedances within 3 days even if the elevated result is considered compliant under condition L2.5.  | Completed - Ongoing operational requirement. | N/A            |
| O1.1                | REC-<br>2018-<br>77 | Develop and implement a staff environmental training program that ensures roles and responsibilities outlined in environmental management plans are communicated and understood. | Each management plan review is now communicated with relevant staff on their roles and responsibilities for the plan. A separate document lists each person's roles and responsibilities and is signed off accordingly.                                    | Completed - Ongoing operational requirement. | N/A            |
| O6.1                | REC-<br>2018-<br>90 | Maintain records to demonstrate that basins at LDP006 (including Cooks Dam) are maintained at the design storage capacity within 5 days following rainfall.                      | The WCS WMP includes a controlled pump-out discharge process from Cooks Dam following a rainfall event. As Cooks Dam is recharged by groundwater, this process is problematic to manage as Cook Dams levels are dependent on CHPP operation for water use. | Completed - Ongoing operational requirement. | N/A            |
| M2.4                | REC-<br>2018-<br>78 | Report turbidity results in NTU (not mg/L) in the Centennial Coal Environmental Monitoring Data Reports.   | Item corrected in Springvale Coal<br>Services monthly monitoring data<br>reports.  | Completed                                    | N/A            |
| M7.1                | REC-<br>2018-<br>79 | Ensure the volume of discharge at LDP007 is recorded and reported  | LDP007 discharge requires an estimate volume to be published. This estimate will be communicated in  | Completed - Ongoing operational requirement. | N/A            |

| Condition<br>Number | REC<br>#            | Improvement Opportunity Recommendation   | Response / Addressed  | Timing                                       | 2021 AR Update |
|---------------------|---------------------|--|---|--|----------------|
|                     |                     | in the Centennial Environmental Monitoring Data Reports.   | future instances of LDP007 discharge.   |  |                |
| R2.2                | REC-<br>2018-<br>22 | Ensure environmental incidents meeting the definition of EPL 3607 condition R2 are notified to the EPA in writing within 7 days of the incident occurring.                 | Future environmental incidents will be reported in writing to the EPA within 7 days of occurrence   | Completed - Ongoing operational requirement. | N/A            |
| O5.5                | REC-<br>2018-<br>80 | Undertake maintenance to desilt sediment basins at LDP003 at Kerosene Vale by end 2018 to ensure the basins design storage capacity is maintained.                         | Works program undertaken in 2018.<br>LDP003 maintenance is undertaken<br>by Angus Place Operations as<br>managed in the Angus Place MOP<br>and Water Management Plans.  | Completed - Q4 2018                          | N/A            |
| Statement of        | Commit              | ments  |   |  |                |
| PO SoC 3.1          | REC-<br>2018-<br>64 | Consult with relevant agencies regarding the ongoing planned use of the Co-disposal ponds and ensure appropriate approvals are gained for the relevant activities planned. | Noted. HRA process concurrent.  The planned use for the Blackmans Flat Co-Disposal (BFCD) is to cap and rehabilitate the northern cells and redesign the southern cells to emplace fine coal reject for potential future resale.  NSW Dams Safety has been contacted, seeking advice to whether | Ongoing operational requirement.             | N/A            |
|                     |                     |  | the BFCD needs to be a Declared Dam under the Dams Safety Regulation.   |  |                |
|                     |                     |  | Consultation requests were sent to other relevant agencies including:   |  |                |
