Rye Park Wind Farm - Modification Environmental Noise Assessment S3200C17 March 2020

sonus.

1 INTRODUCTION

The Rye Park Wind Farm is proposed to be located 12 km north east of Yass and 42 km west of Crookwell. Development Consent was granted in May 2017 (Application Number SSD 6693) for up to 92 wind turbine generators (WTGs) with a tip height of up to 157m.

An environmental noise assessment of the operation and construction stage was made and summarised in Sonus report S3200C9 dated February 2016.

Modifications to the wind farm layout and tip height are proposed and a revised environmental noise assessment of the operation has been conducted.

This report summarises the environmental noise assessment of the operation of the proposed 80 wind turbine layout. The assessment has been based on the GE 158 5.5MW WTGs, with a maximum tip height of 200m above ground level (AGL), being a representative wind turbine and having one of the highest noise emissions of those currently in the market. Should approval be granted, the final turbine selection and final layout will be assessed prior to construction of the wind farm.

2 WIND TURBINE LAYOUT

The coordinates of the 80 WTG layout are provided in Table 1.

Table 1: Coordinates of wind turbine layout.

3 RESIDENCES SURROUNDING THE WIND FARM

Residences located in the vicinity of the wind farm are listed in Table 2. The status of the land owners (associated or non-associated) of the residences are indicated, including residence R192 which has been acquired by the wind farm.

4 OPERATIONAL NOISE

4.1 CRITFRIA

The Conditions of Consent specify the following operational noise criteria:

Operational Noise Criteria - Wind Turbines

11. The Applicant must ensure that the noise generated by the operation of wind turbines does not exceed the relevant criteria in Table 4 at any non-associated residence.

Table 4: Noise criteria dB(A)

Residence R1	Criteria (dB(A)) with Reference to Hub Height Wind Speed (m/s)								
	5	6	7	8	9	10	11	12	
R1	35	35	36	37	39	41	43	46	
R6, R7, R8, R9, R10,	35	35	35	35	35	37	38	40	
R11	35	35	35	35	37	39	41	44	
R17, R19, R20, R22	36	36	36	37	38	39	40	42

R63	36	37	38	39	41	42	44	45	
All other non-associated residences	Th	ne higher		ATT.	existing b) plus 5 d		d noise le	vel	

Note: To identify the residences referred to in Table 4, see the applicable figure in Appendix 2.

Noise generated by the operation of the wind turbines is to be measured in accordance with the relevant requirements of the South Australian Environment Protection Authority's *Wind Farms – Environmental Noise Guidelines 2009* (or its latest version), as modified by the provisions in Appendix 4. If this guideline is replaced by an equivalent NSW guideline, then the noise generated is to be measured in accordance with the requirements in the NSW guideline.

However, these criteria do not apply if the Applicant has an agreement with the relevant owner/s of these residences to generate higher noise levels, and the Applicant has advised the Department in writing of the terms of this agreement.

A criterion of 45 dB(A) has been applied for associated residences (being where the *Applicant has an agreement with the relevant owner/s to generate higher noise levels, and the Applicant has advised the Department in writing of the terms of this agreement*). Residence R192 has been acquired by the wind farm and therefore has no noise limit applied.

Rye Park Wind Farm - Modification Environmental Noise Assessment S3200C17 March 2020

sonus.

4.2 ASSESSMENT

4.2.1 Layout and Details

Noise predictions have been based on GE 158 5.5MW WTGs with a tip height of 200m.

One-third octave band sound power level data for the WTG has been based on *Technical Documentation* Wind Turbine Generator System 5.3-158-50Hz (Noise_Emission-NRO_5.3-158-50Hz_IEC_NRO100-105_EN_r02.docx) and the addition of 1.5 dB(A) for uncertainty.

The sound power levels for the standard operating mode and noise reduced modes are summarised in Appendix A, with the uncertainty added. The one-third octave band data demonstrate that no penalty for the presence of tonal characteristics is warranted.

4.2.2 Noise Propagation Model – ISO 9613-2

ISO 9613-2¹ provides a methodology for predicting noise levels at sensitive land use receptors under meteorological conditions favourable to noise propagation. It is known as a downwind model, based on the conservative assumption of a receptor being downwind (resulting in the highest noise level) of all turbines simultaneously. The noise prediction model inputs are in accordance with the *May 2013 UK IOA Good Practice Guide*, including:

- 10°C temperature;
- 70% relative humidity;
- 50% acoustically hard ground and 50% acoustically soft ground;
- barrier attenuation of no greater than 2 dB(A);
- 4m receiver height; and,

• application of a 2

application of a 3 dB(A) correction where a "concave" ground profile exists as defined by the May
 2013 UK IOA Good Practice Guide.

ISO 9613-2:1996 Acoustics – Attenuation of sound during propagation outdoors

4.2.3 **Predictions**

The noise level at the residences has been predicted for wind speeds from cut in to rated power. Where the noise level is predicted to be 30 dB(A) or greater, Table 3 below provides the environmental noise criteria and predicted noise levels for each integer wind speed. Where the criteria are predicted to be exceeded, the values are in RED. A noise level contour is also provided, corresponding to wind speeds of 9-15m/s, being the wind speeds of the highest predicted noise level.

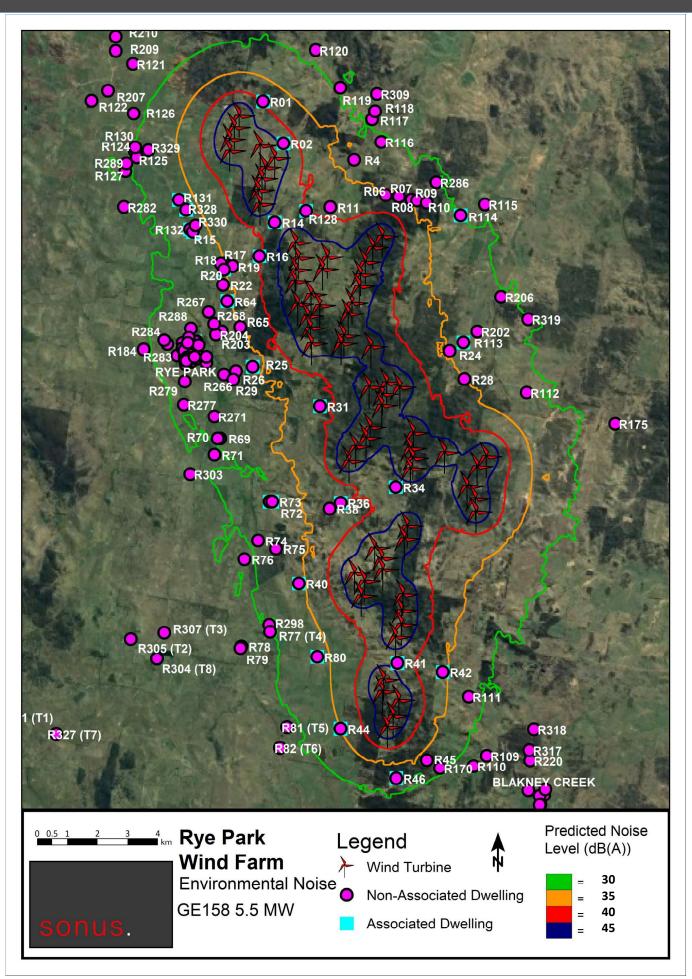

Table 3: Comparison of GE158 5.5MW Predicted Noise Levels with Operational Noise Criteria.

R330	24	35	25	35	28	35	30	35	33	35	34	35

Based on the predictions in Table 3, the noise from the 80 *GE 158 6.5MW* WTGs will achieve the operational noise criteria at all residences in the vicinity of the wind farm, with the exception of R06, R07, R11 and R38.

4.2.4 Curtailment

A curtailment regime has been determined in order to ensure the noise from the wind farm achieves the criteria at all residences and under all wind speeds. The curtailment regime involves operating selected turbines in a noise reduced mode at the wind speeds where the predictions indicate that the criteria will be exceeded.

Table 4 summarises the noise criteria and predicted noise level for wind speeds which require turbines to be curtailed.

Table 4: Predicted noise level exceeds criteria.

Dasidanas	Predicte	Criteria (dB(/ eeds	A)) at Hub				
Residence	8 n	8 m/s		9m/s 10+ m/s			
	Pred.	Crit.	Pred.	Crit.	Pred.	Crit.	
R06	35	35	36	35	36	37	
R07	35	35	36	35	36	37	
R11	37	35	38	37	38	39	
R38	36	35	37	35	37	35	

Based on the above, the curtailment strategy has been determined using the reduced noise modes of the GE 158 turbine. The sound power level for the reduced noise modes are provided in Appendix A, with the 1.5 dB(A) uncertainty added.

Table 5 below provides the noise modes and applicable turbines which are required to operate in these modes in order to ensure the criteria are achieved.

Table 5: Curtailed operating strategy.

	Noise Reduced Mode Operation @ Hub Height (m) Integer Wind Speeds					
Turbine	8 m/s	9m/s	10+ m/s			
12, 26, 137, 11	NRO 100	-	-			
18, 22	NRO 100	NRO102	-			
20	NRO 100	NRO103	-			
17, 21, 25, 136	NRO 100	NRO104	-			
71	-	NRO 105	NRO 105			
74, 61	-	NRO 103	NRO 103			
76	NRO 102	NRO 102	NRO 102			
62	NRO 103	NRO 100	NRO 100			
67, 141, 73	NRO 100	NRO 100	NRO 100			

The following table provides the predicted noise levels at the specific residences where the criteria were predicted to be exceeded, with the turbines operating under the curtailment strategy described above.

Table6: Predicted noise level for curtailed operating strategy.

	Predicted Noise Level and Operational Noise Criteria (dB(A)) at Hub Height (m) Integer Wind Speeds										
Residence	8 n	n/s	9n	9m/s		10 m/s		11 m/s		12+ m/s	
	Pred.	Crit.	Pred.	Crit.	Pred.	Crit.	Pred.	Crit.	Pred.	Crit.	
R06	32	35	35	35	36	37	36	38	36	40	
R07	32	35	35	35	36	37	36	38	36	40	
R11	35	35	37	37	38	39	38	41	38	44	
R38	35	35	35	35	35	35	35	35	35	35	

That is, with the curtailment strategy implemented for wind speeds of 8m/s and above, the noise level from the wind farm is predicted to achieve the noise criteria at all residences in the vicinity.

It is noted that the addition of 1.5 dB(A) to the sound power levels for uncertainty is a conservative approach and if the sound power levels of the installed turbines have lower sound power levels than assumed, a lesser curtailment strategy would be implemented.

The modelled turbine also has one of the highest noise emissions of those on the market. The need for curtailment and the final operating strategy will therefore be determined during the pre-construction noise assessment, once the final turbine selection, layout and guaranteed sound power levels are known.

Rye Park Wind Farm - Modification Environmental Noise Assessment S3200C17 March 2020

sonus.

5 CORONA AND AEOLIAN NOISE ASSESSMENT

As a part of the proposed wind farm modification, the location of an overhead electrical transmission line is proposed to be altered. Consideration has therefore been given to Corona and Aeolian noise from the transmission line, although these characteristics are infrequent and independent of the transmission line location.

As noted in the Sonus report S3200C9 February 2016, Corona and Aeolian noise can be generated from transmission lines.

Corona noise is electrically-induced and occurs under specific conditions when the transmission lines are operational.

Aeolian noise is wind-induced and occurs under specific conditions regardless of whether the transmission lines are operational or not.

Corona noise is infrequent and typically occurs in specific conditions of rain or high humidity when the air adjacent to a conductor of high voltage lines is ionised and becomes a conductor of electricity. The noise that is produced is typically at a low level that is rarely a problem at distances greater than 50 to 100m from the transmission lines.

Aeolian noise is also infrequent and occurs at times when there is a specific wind speed and direction to generate the mechanism of high velocity wind passing over thin structures. As Aeolian noise generally only occurs during high wind speeds, there are also generally high background noise levels. As such, the distances of influence are often similar to that for Corona noise.

Based on the above, the noise impact of transmission lines is generally dealt with by maintaining the separation distances required in the consideration of other factors related to the lines.

6 WIND FARM CONSTRUCTION

6.1 CRITERIA

The construction of a wind farm comprises activities such as road construction, civil works, excavation, foundation construction, electrical infrastructure works and turbine erection. These require processes such as heavy vehicle movements, crushing and screening, concrete batching, loaders, excavators, generators, cranes and subject to local conditions possibly blasting.

The Conditions of Development Consent for the approved wind farm include the following requirements relating to construction noise;

Construction & Decommissioning Noise

- 7. The Applicant must:
 - (a) minimise the construction or decommissioning noise of the development, including any associated traffic noise; and
 - (b) ensure that the noise generated by any construction or decommissioning activities is managed in accordance with the best practice requirements outlined in the Interim Construction Noise Guideline(DECC, 2009), or its latest version.
- 8. Unless the Secretary agrees otherwise, the Applicant must only undertake construction or decommissioning activities between:
 - (a) 7 am to 6 pm Monday to Friday;
 - (b) 8 am to 1 pm Saturdays; and
 - (c) at no time on Sundays and NSW public holidays.

The following construction or decommissioning activities may be undertaken outside these hours without the approval of the Secretary:

- activities that are inaudible at non-associated residences;
- the delivery of materials requested by the NSW Police Force or other authorities for safety reasons; or
- emergency work to avoid the loss of life, property and/or material harm to the environment.
- Blasting
- 9. The Applicant may only carry out blasting on site between 9 am and 5 pm Monday to Friday and between 8 am to 1 pm on Saturday. No blasting is allowed on Sundays or public holidays.

10. The Applicant must ensure that any blasting carried out on site does not exceed the criteria in Table 3.

Table 3: Blasting criteria

Location	Airblast overpressure (dB(Lin Peak))	Ground vibration(mm/s)	Allowable exceedance
Any non- associated	120	10	0%
residence	115	5	5% of the total number of blasts or events over a rolling period of 12 months

In accordance with the above, construction noise criteria have been determining based on the Department of Environment & Climate Change *Interim Construction Noise Guideline 2009* (the ICN Guideline).

As noted in the Sonus report S3200C9 February 2016, the ambient noise environment was monitored at 20 residences in the vicinity of the wind farm and the results were often below 30 dB(A). Therefore, in accordance with the INP, an RBL of 30 dB(A) has been considered for all residences in the assessment.

The ICN Guideline provides an emphasis on implementing "feasible" and "reasonable" noise reduction measures and does not set mandatory objective criteria. However, the ICN Guideline does establish a quantitative approach, whereby "management levels" are defined based on the existing RBL. The management levels as defined by the ICN Guideline are provided in Table 7 below.

Table 7: ICN Criteria.

Recommended standard hours:	Noise affected RBL + 10 dB	The noise affected level represents the point above which there may be some community reaction to noise.
Monday to Friday 7 am to 6 pm Saturday 8 am to 1 pm No work on Sundays or public holidays		 Where the predicted or measured L_{Aeq (15 min)} is greater than the noise affected level, the proponent should apply all feasible and reasonable work practices to meet the noise affected level. The proponent should also inform all potentially impacted residents of the nature of works to be carried out, the expected noise levels and duration, as well as contact details.
	Highly noise affected 75 dB(A)	 The highly noise affected level represents the point above which there may be strong community reaction to noise. Where noise is above this level, the relevant authority (consent, determining or regulatory) may require respite periods by restricting the hours that the very noisy activities can occur, taking into account:

		 times identified by the community when they are less sensitive to noise (such as before and after school for works near schools, or mid-morning or mid-afternoon for works near residences if the community is prepared to accept a longer period of construction in exchange for restrictions on construction times.
Outside recommended standard hours	Noise affected RBL + 5 dB	 A strong justification would typically be required for works outside the recommended standard hours. The proponent should apply all feasible and reasonable work practices to meet the noise affected level. Where all feasible and reasonable practices have been applied and noise is more than 5 dB(A) above the noise affected level, the proponent should negotiate with the community.

6.2 Construction Activity Assessment

6.2.1 WTG Installation

The separation distance of the closest non-associated dwelling to a proposed WTG is approximately 1200m. A separation distance greater than 1200m will result in lower noise levels than that presented below in the table below. The required separation distance in order to achieve the 40 dB(A) criterion, which is 10 dB(A) above the RBL, is provided in Table 8 also.

Table 8: Predicted construction noise levels and distances.

Phase	Main Plant and Equipment	Predicted Noise Level at 1200m	Separation to Achieve 40 dB(A) Criterion
Site Set-Up and Civil Works	Generator Transport truck Excavator Low loader	44 dB(A)	1650m
Road and Hard Stand Construction	Mobile crushing and screening plant Dozer Roller Low loader Tipper truck Excavator Scraper Transport truck	50 dB(A)	2400m

Phase	Main Plant and Equipment	Predicted Noise Level at 1200m	Separation to Achieve 40 dB(A) Criterion
Excavation and foundation construction	Excavator Front end loader Concrete batching plant Mobile crushing and screening plant Truck-mounted concrete pump Concrete mixer truck Mobile crane Transport truck Tipper truck	50 dB(A)	2400m
Electrical Installation	Rock trencher Concrete mixer truck Low loader Tipper truck Mobile crane	50 dB(A)	2400m
Turbine Delivery and Erection	Extendable trailer truck Low loader Mobile crane	45 dB(A)	1800m

Based on the predicted noise levels, it is expected that construction noise from the WTG installation will be greater than 40 dB(A) at a distance of 1200m. The predicted noise levels are significantly less than the 75 dB(A) upper limit provided in the ICN Guideline.

Based on the above, it is possible that a dwelling located between 1200m and up to 2400m from a WTG may be defined as "noise affected" but not "highly noise affected" by the ICN Guideline.

6.2.2 Access Roads

Access to the WTG sites will be via a specifically constructed road network. The separation distance of the closest non-associated dwelling to a designated access road is approximately 330m. The noise from typical road construction activity, such as described in Table 10 has been predicted to be 61 dB(A) at 330m.

Based on the above, it is possible that a dwelling located between 330m and up to 2400m from an access road may be defined as "noise affected" but not "highly noise affected" by the ICN Guideline.

6.2.3 Batching Plant

Three temporary batching plants have been proposed for the construction phase, at the locations in Table 9.

Table 9: Batching plant locations.

	Coordinates (UTM WGS84 H55)					
	Easting Northing					
Batching Plant 1	679110	6182542				
Batching Plant 2	679163	6165826				
Batching Plant 3	684101	6150395				

The closest non-associated dwelling to a proposed batching plant is approximately 1100m away. The noise from typical batching plant machinery, such as cement trucks, loaders, and delivery trucks has been predicted to be 34 dB(A) at 1100m.

6.2.4 Noise Mitigation

Where residences are classed as "noise affected" by the ICN Guideline, the developer is required to apply all feasible and reasonable work practices, and to inform the residents of the proposed construction work.

"Feasible and reasonable" noise control strategies to minimise noise during construction may include engineering measures such as the construction of temporary acoustic barriers, the use of proprietary enclosures around machines, the use of silencers, the substitution of alternative construction processes and the fitting of broadband reversing signals. It may also include administrative measures such as inspections, scheduling and providing training to establish a noise minimisation culture for the works.

The following mitigation measures are recommended to be implemented for the construction works and provide the framework for the development of a Construction Management Plan by the construction team once the final construction methods, timing, locations and equipment have been determined.

6.2.4.1 Scheduling

Construction works, including heavy vehicle movements into and out of the site, restricted to the hours between 7am and 6pm Monday to Friday, and between 8am and 1pm on Saturdays. Works carried out outside of the hours should only entail:

- works that do not cause noise emissions to be audible at any nearby residences not located on the site; or
- the delivery of materials as requested by Police or other authorities for safety reasons; or

• emergency work to avoid the loss of lives, property, and/or to prevent environmental harm.

If any other works are required outside of the specified hours, they will only be carried out with the prior consent of the relevant New South Wales authority.

6.2.4.2 Location of Fixed Noise Sources

Locate fixed noise sources such as crushing and screening plant, generators and compressors at the maximum practicable distance to the nearest dwellings, and where practicable, use existing landforms to block line of sight between the fixed noise source and the dwelling.

6.2.4.3 Provide Acoustic Screens around Fixed Noise Sources

Provide acoustic screens or mounding for fixed crushing and screening plant, and concrete batching plant wherever these noise sources are located within 2400m of a non-associated dwelling and do not have direct line of sight blocked to that dwelling, in accordance with the following requirements:

- Locate the screen as close as practicable to the noise source;
- Construct from mounding using excavated soil from the site or a material with a minimum surface density of 10 kg/m², such as 1.2mm thick sheet steel or 9mm thick compressed fibre cement sheeting, or use purpose built transportable sound barriers such as the Peace "Sound Barriers";
- Construct to a minimum height that blocks direct line of sight between the noise source and any receiver within 2400m;
- Construct such that there are no air gaps or openings at joints;
- Extend such that the length is at least 5 times greater than its height or so that it is bent around the noise source;

In addition, the site topography, and other shielding features (e.g. large stationary machines, mounds of topsoil and piles of materials) should be used for increased shielding when locating fixed noise sources within the 2400m distance.

6.2.4.4 Enclose Generators and Compressors

Provide proprietary acoustic enclosures for site compressors and generators located within 2400m of a non-associated dwelling.

6.2.4.5 Alternative Processes

Investigate and implement alternative processes where feasible and reasonable, such as hydraulic or chemical splitters as an alternative to impact rock breaking, or the use of broadband reversing alarms in lieu of the high pitched devices. A broadband reversing alarm emits a unique sound which addresses the annoyance from the high pitched devices. The fitting of a broadband alarm should be subject to an appropriate risk assessment, with the construction team being responsible for ensuring the alarms are installed and operated in accordance with all relevant occupational, health and safety legislative requirements.

6.2.4.6 Site Management

- Select and locate centralised site activities and material stores as far from noise-sensitive receivers as possible;
- Care should be taken not to drop materials such as rock, to cause peak noise events, including
 materials from a height into a truck. Site personnel should be directed as part of a training
 regime to place material rather than drop it;
- Plant known to emit noise strongly in one direction, such as the exhaust outlet of an attenuated generator set, shall be orientated so that the noise is directed away from noise sensitive areas if practicable;
- Machines that are used intermittently shall be shut down in the intervening periods between works or throttled down to a minimum;
- Implement worksite induction training, educating staff.

6.2.4.7 Equipment and Vehicle Management

- Ensure equipment has Original Equipment Manufacturer (OEM) mufflers (or better) installed;
- Ensure equipment is well maintained and fitted with adequately maintained silencers which
 meet the OEM design specifications. This inspection should be part of a monitoring regime;
- Ensure silencers and enclosures are intact, rotating parts are balanced, loose bolts are tightened,
 frictional noise is reduced through lubrication and cutting noise reduced by keeping equipment
 sharp. These items should be part of a monitoring regime;
- Use only necessary power to complete the task;
- Inspect, as part of a monitoring regime, plant and equipment to determine if it is noisier than other similar machines, and replace or rectify as required.

6.2.4.8 Community Consultation

Implement the following noise and vibration elements into the overall community consultation process. The aim of the consultation is to ensure adequate community awareness and notice of expected construction noise.

The minimum elements should include:

- Regular Community Information newsletters, providing details of the construction plan and duration of the construction phases;
- A site notice board in a community location providing copies of the newsletters, updated construction program details, and contact details of relevant project team members;
- A feedback mechanism for the community to submit questions to the construction team, and for the construction team to respond;
- Regular updates on the construction activities to local authorities to assist in complaint management if necessary;
- Contact details of the project manager and/or site "Environmental Representative".

In addition, prior to any construction activity occurring within 2400m of a dwelling without a commercial agreement, or significant construction traffic periods or impacts on local road conditions:

- Contact the local community potentially affected by the proposed works and inform them of the proposed work, the location of the work, the day(s) and date(s) of the work and the hours involved³;
- This contact shall be made a reasonable time before the proposed commencement of the work; and
- Contact details of the project manager and / or site "Environmental Representative" should be provided.

The above measures should be incorporated and implemented through a Construction Noise Management Plan for the site. The Plan should be developed by the construction team once the actual construction activities have been determined.

³ It is preferable to overestimate the hours of work, rather than extending the work hours for longer than anticipated.

Rye Park Wind Farm - Modification Environmental Noise Assessment S3200C17 March 2020

sonus.

6.3 Blasting Assessment

In accordance with the Conditions of Consent, all blasting (if conducted) will be undertaken in a manner which achieves the objective noise and vibration requirements.

The separation distances between any potential blasting activity and the nearest dwellings are of the order of magnitude for which ground vibration and airblast levels have been adequately controlled at other sites.

Given the range of factors associated with both the generation and control of blasting, it is recommended that in the event of blasting occurring, a monitoring regime is implemented to ensure compliance with the Blasting criteria.

APPENDIX A: WTG Sound Power Levels
