Executive Summary

Douglas Partners Pty Ltd (DP) was engaged by DHL Supply Chain (Australia) Pty Limited (DHL) to document the findings of a Detailed Site Investigation for Contamination (DSI) previously undertaken for The Northern Gateway DHL Site Project at 1953 - 2109 Elizabeth Drive, Badgerys Creek, NSW ('TNG site' – report reference 86548.08.R.001.Rev0) and of relevance to DHL Stage 1 ('the site'), which encompasses the southern portion of the DHL Masterplan site

The DSI will be submitted by DHL as part of the State Significant Development Application (SSD 70818708) for the SSDA 1 area (Stage 1), as shown in Drawing 1, Appendix A which shows the location of the TNG site, the wider DHL site and Stage 1 the subject site.

DP has previously prepared *Report on Sampling and Analysis Quality Plan, The Northern Gateway, 1953 – 2109 Elizabeth Drive, Badgerys Creek*, Project 86548.02, Rev1, dated February 2020 ('the SAQP') for the TNG site which provides a review of previous contamination assessments undertaken at the site, a data gaps assessment, data quality objectives (for the DSI) as well as the sampling and analysis and assessment methodology for the DSI. The SAQP documents the targeted sampling approach and analysis of identified Areas of Environmental Concern (AEC) at the subject site, of which there are two within the current site (AECs 18 and 36), and one AEC (19) immediately adjacent to the southeast of the subject site.

The purpose of the DSI is to assess and comment on the suitability of the site for the proposed development from a contamination perspective and provide recommendations for future investigation and/or remediation works (if required).

The scope of this DSI included a review of the SAQP, a detailed site walkover of AECs and an intrusive investigation including test pits in AECs and across the remainder (background) of the site, surface samples from near timber power poles and laboratory analysis.

Soil analytical results of relevance to the site have been assessed against SAC and reviewed alongside observations made in the detailed site walkover. The findings of the DSI have established there is no evidence of widespread or significant contamination across the site. Localised contamination in some AECs was observed as requiring further investigation, delineation and/or remediation. These AECs requiring further works are summarised below:

- AEC 36 – Exceedances of metals were recorded for surface soils (surface sample SS5) around one (PP10) assessed at the site. It is noted that exceedances of TRH, benzo(a)pyrene, total PAHs and total PCBs have been observed next to power poles from elsewhere across the wider TNG site. It is noted that the number of exceedances observed in this DSI and the DSI for the wider TNG site indicate additional targeted investigations of all power poles will be required around power poles at the site to establish and further define which are suitable to be retained on site and which will require remediation. The additional targeted investigations will include step-out samples around the power poles;
- Building footprints (whole site) – Structures are known to be present at the site that contain hazardous materials. As well as following the recommendations of the HAZMAT, the footprints should be inspected by an Environmental Consultant after demolition for residual building materials and filling below the footprint. If filling is present, a targeted building footprint investigation should be undertaken; and

- AEC 19 (located adjacent to the site) – ACM impact on the ground surface, a targeted investigation (double density, with reference to NSW EPA 1995 guidelines) should be undertaken to ascertain the extent of asbestos impact here. Where observed, ACM fragments on the surface should be removed by hand and the process documented in a RAP.

It is noted that the majority of the observed impact as outlined above are typical of sites in the southwest Sydney region and does not impinge on the suitability of the site for rezoning from a contamination perspective. The above additional works should be undertaken to facilitate the DA process for subdivision.

The site is therefore suitable for rezoning and development from a contamination perspective subject to the above additional investigations and/or remediation works being undertaken prior to subdivision.

A number of stockpiles have been observed across the site, some of which have since been removed. For any remainder soil stockpiles, the UXF protocol should be referred to if asbestos is encountered once these materials are disturbed. A waste classification assessment will be required for off-site disposal for materials that are not pre-classified.

Report on Site Review on Detailed Site Investigation for Contamination

DHL Site - Stage 1

Part of 1953 - 2109 Elizabeth Drive, Badgerys Creek

1. Introduction

Douglas Partners Pty Ltd (DP) was engaged by DHL Supply Chain (Australia) Pty Limited (DHL) to document the findings of a Detailed Site Investigation for Contamination (DSI) previously undertaken for The Northern Gateway DHL Site Project at 1953 - 2109 Elizabeth Drive, Badgerys Creek, NSW ('TNG site' – report reference 86548.08.R.001.Rev0) and of relevance to DHL Stage 1 ('the site'), which encompasses the southern portion of the DHL Masterplan site. The DSI will be submitted by DHL as part of the State Significant Development Application (SSD 70818708) for the SSDA 1 area (Stage 1), as shown in Drawing 1, Appendix A which shows the location of the TNG site, the wider DHL site, and the site. This report has been formatted as a DSI report typically would be but extracts the relevant data for the DHL site from the report for the larger site.

DP has previously prepared *Report on Sampling and Analysis Quality Plan, The Northern Gateway, 1953 – 2109 Elizabeth Drive, Badgerys Creek*, Project 86548.02, Rev1, dated February 2020 ('the SAQP') for the TNG site which provides a review of previous contamination assessments undertaken at the site, a data gaps assessment, data quality objectives (for the DSI) as well as the sampling and analysis and assessment methodology for the DSI. The SAQP documents the targeted sampling approach and analysis of identified Areas of Environmental Concern (AEC) at the site, of which there are two within the current site (AECs 18 and 36), and one AEC (19) located immediately adjacent to the southeast of the subject site.

This report has been prepared with reference to NSW EPA endorsed guidelines including NSW EPA *Guidelines for Reporting on Contaminated Land: Contaminated Land Guidelines* (EPA, 2020c), State Environmental Planning Policy Number 55 – *Remediation of Land* ('SEPP 55') and National Environment Protection Council (NEPC), *National Environment Protection (Assessment of Site Contamination) Measure*, 1999 as amended 2013 (NEPC 2013).

The purpose of the DSI is to assess and comment on the suitability of the site for the proposed development from a contamination perspective and provide recommendations for future investigation and/or remediation works (if required).

2. Proposed Development

It is understood that the wider 25 hectare (ha) DHL site is to be developed to provide general commercial/industrial land use.

It is understood, based on documents provided by DHL, that the 11.9 ha Stage 1 site is proposed to be provide two large scale warehouse facilities, dock offices, hardstand and car parking, and higher order employment land uses. The site layout including the location of Stage 1 is presented in Drawing 1, Appendix A.

3. Scope of Works

The following scope of works were undertaken for the DSI (and relevant sections have been repeated here):

- Review of the SAQP including the findings of previous investigations of relevance to the site and the rationale for the scope of the DSI;
- Undertake a detailed site walkover of AECs;
- Using a backhoe, undertake test pits across the site to a depth of 0.5 m into natural strata, 3 m or prior refusal (whichever came first). The following test pit numbers were undertaken within the current site:
 - o Twelve test pits (TP) in background areas (TP406 to TP410, TP429 to TP435); and
 - o Six targeted test pits within identified AECs (TP579, TP586 to TP591)
- Using hand tools (hand auger or a hand trowel) surface soil samples were collected from next to one power pole at the site;
- Soil samples were analysed for a range of contaminants of potential concern (CoPC) as defined in the SAQP (summarised in Section 6) and including metals¹, Total Recoverable Hydrocarbons (TRH), benzene, toluene, ethylbenzene and total xylenes (BTEX), polycyclic aromatic hydrocarbons (PAHs), total phenols, Polychlorinated Biphenyls (PCBs), organochlorine pesticides (OC) and organophosphorus pesticides (OP);
- Soil results were assessed against current NSW EPA endorsed criteria for residential land use in the first instance as defined in the SAQP and in this report; and
- Outline the findings of the DSI in this report which has been prepared with reference to NSW EPA (2020b) guidelines.

¹ Arsenic (As), cadmium (Cd), chromium (Cr), copper (Cu), lead (Pb), nickel (Ni) and zinc (Zn).

4. Site Information

Site Address	Part of 1953 - 2109 Elizabeth Drive, Badgerys Creek
Legal Description	Part Lot 1 on Deposited Plan (D.P) 1306448 (includes Stage 1)
Area	Stage 1: Approximately 11.9 ha Broader DHL site: 25 ha
Zoning	ENT Enterprise and ENZ Environment and Recreation adjacent to the south west site boundary See Figure 1 below for current zoning.
Local Council Area	Penrith City Council
Current Use	Vacant land and a former residence in the southern portion. The majority of the site is grass-covered with tree growth around the former residence.
Recent and historical land use	Recently (in 2020) a horse-riding school was situated in proximity of the site and the site was presumably used for horse riding and agistment. The site was historically used primarily for rural residential and pastoral land use
Surrounding Uses	North – DHL stage 2, followed by TNG site (vacant, pastoral and rural residential) followed by bushland and residential land use (Luddenham suburb) East – Vacant pastoral Western Sydney University site, followed by SUEZ Kemps Creek Resource Recovery Park and landfill (adjacent to Badgerys Creek) – a licenced waste facility and operates under an Environmental Protection Licence (Licence No. 4068). South – TNG site (vacant and pastoral) followed by Elizabeth Drive and the followed by commercial and rural residential properties (part of Badgerys Creek) West – TNG site (vacant and pastoral) followed by Cosgroves and Oaky Creek, followed by commercial and rural residential properties (part of Luddenham)

The site boundary is shown on Figure 1 (following page).

Figure 1: Current zoning including ENT Enterprise (blue) and ENZ Environment and Recreation (green) – site boundary in red, TNG boundary in blue.

5. Environmental Setting

Regional Topography	The regional topography is generally characterised as gently undulating.
Site Topography	Gently undulating terrain ranges from approximately 74 m from the highest part of the site in the south east, to the lowest part of the site (approx. RL 62) in the north, near a farm dam north of the site. Ground surface slopes within the site are typically less than five degrees. Ground surface slopes steepen considerably within the gullies, although the overall slope heights are generally less than 1 m.
Soil Landscape	The site comprises Blacktown soil landscapes (Bannerman <i>et al</i> , 1990).
Geology	The site is underlain by the Bringelly Shale Formation (Twib). This unit typically comprises shale, carbonaceous claystone, claystone, laminite, fine to medium-grained lithic sandstone, rare coal and tuff (NSW, DoM & E, 1991).
Acid Sulfate Soils	The site is not mapped within, or close to an area identified as a risk for acid sulphate soils (NSW DoE & CC, 1998).
Surface Water	Cosgroves Creek and Oaky Creek to the west; the distance from the current site is approximately 1250 m east and 780 m west respectively.

Groundwater	The unweathered shale rock unit has very low hydraulic conductivity and the few bores drilled into the unweathered shales in the Sydney area are generally dry or yielding small flows of saline groundwater, typically with total dissolved salts (TDS) contents of 10 000 mg/L to 30 000 mg/L (Old, 1942; McNally, 2004). Groundwater flow is likely to be dominated by fracture flow with resultant low yields (typically <1 L/s) in bores. A search of the NSW Department of Planning, Industry and Environment groundwater bore database undertaken by DP in July 2021 indicated that there are no registered groundwater bores on the site. Twelve ground water bores are located within 1.8 km of the site and toward the east on the SUEZ Recycling and Resource Recovery Waste Facility site. The total drill depth ranged from 17 m to 37 m depth though no groundwater information was available for the bores.
-------------	--

Refer to the SAQP (DP, 2020) for a detailed review of the environmental setting for the site.

6. Previous Investigations

6.1 Review of Previous Reports

The following previous investigations have been undertaken at the site:

- DP *Report on Soil Assessment, 1984 - 2107 Elizabeth Drive, Badgerys Creek*, Project 36288, dated 16 January 2004 (DP 2004);
- EI Australia Pty Ltd (EI) *Report on Preliminary Site Investigation, 1953-2109 Elizabeth Drive, Badgerys Creek, NSW*, Report E23773.E.01_Rev0, dated 30 May 2018 (EI 2018).
- DP, *Report on Geotechnical Land Capability Assessment, The Northern Gateway, 1953 – 2109 Elizabeth Drive, Badgerys Creek*, Project 86548.00.R.001.Rev1, November 2019 (DP 2019a);
- DP, *Report on Preliminary Site Investigation, The Northern Gateway, 1953 – 2109 Elizabeth Drive, Badgerys Creek*, Project 86548.00.R.002.Rev1, November 2019 (DP 2019b);
- DP, *Report on Sampling and Analysis Quality Plan, The Northern Gateway, 1953 – 2109 Elizabeth Drive, Badgerys Creek, NSW*, Project 86548.03, Rev. 1 (DP, 2020); and
- Environmental Risk Assessors Pty Ltd (ERA), *Focused Site Remediation and Validation, 1753 – 2019 Elizabeth Drive, Badgerys Creek, NSW*, prepared for Roy & Patricia Medich Trust Fund, dated 10 July 2020.

The above previous investigations were reviewed to inform the SAQP to (in particular) inform the data gaps assessment undertaken as part of the SAQP. Key findings of the review of relevance to this report are summarised below:

- The EI (2018) assessment comprised a qualitative assessment of the site from a contamination perspective. The scope of the assessment included a site inspection and site history search. The EI (2018) assessment generally concluded that the wider site could be made suitable for development subject to further investigations of possible localised contamination sources, including:
 - o A scientific animal research farm known as the McMaster Field Station operated by the CSIRO, where animal health, reproduction, parasitological and other pastoral issues were studied. From 1996 until present date the site has been used to graze cattle, and (more recently) for commercial purposes including firewood storage and mulching;
 - o Homesteads with associated sheds;
 - o Isolated dumping; and
 - o Two petroleum storage tanks were present on the wider TNG site but not within DHL Stage 1 area;
 - DP (2019b) undertook a Preliminary Site Investigation (PSI) of the TNG site to evaluate the contamination status of the site regarding its compatibility, from a contamination perspective, for the proposed mixed-use development. The scope of the PSI included a desktop review, a site walkover and limited intrusive soil sampling and analysis. Based on the desktop review, site walkover and geotechnical field observations, several areas were identified as Potential Areas of Environmental Concern (PAEC). Based on the findings of the limited intrusive investigation and the desktop assessment, three PAECs were declared Areas of Environmental Concern of which there are two within the current site (AECs 18 and 36), and one AEC (19) located immediately adjacent to the southeast of the subject site, which required further investigation (i.e. this DSI). The AECs generally fall within the following categories:
 - o Structures – i.e.: degradation and demolition of structures and leaks and spills;
 - o Ground disturbances/Fill;
 - o Wooden power poles.
- Refer to Section 6.3 for a summary of AECs and overview of their location at the site.
- DP (2020) prepared a Sampling and Analysis Quality Plan (SAQP) for the DSI, the scope of which included a review of previous investigations, a site walkover and a data gaps assessment to establish what data is needed to assess whether or not the site is suitable for the proposed development, from a contamination assessment. The SAQP defined the number, type and locations for soil and groundwater sampling to assess the site in particular data gaps. The SAQP also presented a methodology for sample collection, preservation and storage and establish data quality objectives (DQOs) as well as quality assurance and quality control (QA/QC) procedures. A summary of the SAQP is presented in Section 8.

6.2 Update on Record of EPA Notices

A search of EPA Public Registers² was undertaken in January 2021, after completion of the PSI (DP, 2019b) and the SAQP (DP, 2020) because the Lotsearch undertaken for the PSI included a search of EPA's records however DP understands this was informed by an incomplete dataset provided by the EPA.

² <https://www.epa.nsw.gov.au/licensing-and-regulation/public-registers>. Last accessed January 2021.

The search results identify eight notices related to the sub-leased portion of the TNG site which is outside the DHL Stage 1 site. The Clean Up and Penalty Notices were issued to both the site owner and the sub lease holder for the “unlawful transportation, storage and processing of waste, including asbestos without a licence to do so”, the use of the sub lease area as an unlawful waste facility and associated environmental pollution (land and water – Cosgroves Creek). Follow up works were carried out to resolve the notices including preparation of a validation report after removal of the stockpiles identified as containing asbestos and these are documented in reports prepared by others.

6.3 Summary of AECs

The AECs identified at the site, or immediately nearby to the site, are presented on Figure 2 below and documented in Table 1 further below. They are also shown in Drawing 1, Appendix A.

Figure 2: Location of AECs within the site (red boundary – yellow is the wider DHL site, and blue is the wider TNG boundary). Note red dots are AEC 36 (timber power poles)

Table 1: Summary of AECs

AEC Reference	Potential Sources of Contamination	Description
18	Structures, Leaks and Spills, Ground Disturbance/Filling	Building footprint, filling with anthropogenic materials and storage of >50 vehicles
19 (located adjacent to the site)	Former Structures and possible ACM impact of soil	Building footprint, footings and suspected ACM fragment observed
36	Timber power poles	All Power Poles present on site – two power poles were observed at the site and a further two within 100 m from the site boundary.

7. Preliminary Conceptual Site Model

The conceptual site model (CSM) for the site is documented in the SAQP (DP, 2020) and presented below.

Potential Sources

Based on previous site uses and site observations, the potential sources of contamination and associated contaminants are summarised in Table 2 in broad source types and their associated contaminants of potential concern.

Table 2: Potential Sources of Contamination

AECs	Potential Source	Description of Potential Source	Contaminants of Potential Concern
18 and 19	Building Construction, Degradation and Demolition (S1) (Structures)	Sheds and residential dwellings are located within the site boundary. Demolition and alterations to these buildings, including degradation of paints and renovations, may lead to hazardous materials being present within the near surface soils surrounding the building footprint if not appropriately removed.	Asbestos, lead and PCBs
18 and 19	Import of Fill / Fly Tipped Material (S2) (Ground disturbance/Filling)	There are several ground disturbances and areas of observed fill at the site. Some material contains building and demolition materials which may or may not be impacted with hazardous building materials. The contamination status of fill at the site is currently unknown.	Metals, TRH, BTEX, PAH, OCP, OPP, PCB, phenols, and asbestos
Background Areas	Agricultural Activities (S3) – Entire Site	The site has been used for agricultural activities including cattle grazing and application of pesticides and fertilizers across the site.	Heavy metals, OCP, OPP, BTEX
18	Leaks and Spills (S4)	Potential spills and leaks of chemicals within areas of the site where chemicals and fuels / oils are / were stored (i.e. UST, AST and sheds) or were used for storage of machinery and vehicles (for parking and for scrap storage).	TRH, BTEX, OCP, OPP, PAH and phenols
36	Power Poles (S5)	Leaching of timber treatment chemicals from power poles has potential to impact the adjacent soils.	Heavy metals, TRH, BTEX, PCB, PAH and OCP
Background Areas	CSIRO Activities (S7)	Use of the land as an agricultural laboratory.	Heavy metals, OCP, OPP, BTEX,

Note: More than one of the potential sources of contamination may be relevant for a single AEC. The DSI for the wider site (DP, 2021) included additional sources including Asbestos pipes and possible pipe network (S6) and Offsite Landfill Gas (LFG) and Leachate (S9) which have not been identified within the Stage 1 site.

Potential Receptors

Potential receptors of contamination have been identified to include:

- R1 – Future site users (including visitors and workers);
- R2 – Adjacent land users;
- R3 – Surface waters (both at the site and beyond the site boundary);
- R4 – Groundwater;
- R5 – Terrestrial ecology; and
- R6 – Possible inground structures.

Potential Pathways

Potential pathways for contamination to impact receptors include the following:

- P1 – Ingestion and dermal contact with soil or water;
- P2 – Inhalation of dust;
- P3 – Inhalation of vapours;
- P4 – Surface water runoff;
- P5 – Leaching of contaminants and vertical migration into groundwater;
- P6 – Lateral migration of groundwater;
- P7 – Direct contact of contaminated ground; and
- P8 – Direct contact of contaminated ground within ground structures.

It is noted that in the case of ACM, the exposure pathway is long term, i.e. once the fragment has been subject to weathering and degradation facilitating asbestos fibres to potentially become airborne and inhaled, if disturbed.

Summary of Potentially Complete Exposure Pathways

A 'source-pathway-receptor' approach has been used to assess the potential risks of harm being caused to human or environmental receptors from contamination sources on or in the vicinity of the site, via exposure pathways (complete pathways). The possible pathways between the above listed sources and receptors are provided in Table 3.

Table 3: Preliminary Conceptual Site Model

Source	Exposure Pathway	Receptor	Requirement for Additional Data and/or Management
S1: Building Construction, Degradation and Demolition	P1, P2, P4 – P7	Human health (R1 – R3) Environmental (R4 – R6)	An inspection and intrusive investigation is required to quantify and assess possible contamination including chemical testing of soil (and groundwater if deemed necessary)
S2: Import of Fill / Fly Tipped Material	P1 – P7		
S3: Agricultural Activities	P1 – P7		
S4: Leaks and Spills	P1 – P7		
S5: Power Poles	P1, P2, P4 – P7		
S7: CSIRO Activities	P1 – P7	Human health (R1 – R3) Environmental (R4 – R6)	

Groundwater in shales beneath the site is unlikely to be suitable for irrigation purposes owing to its generally low yield and reasonably high levels of salinity. The permeability of the shales is generally very low (typically <1 L / s), therefore significantly inhibiting the potential for contamination to migrate from the site. Based on the findings of DP (2019b), a groundwater investigation is not required for the areas outside of the AECs. The scope for groundwater investigation of the AECs will be determined on a case-by-case basis during the DSI.

8. Summary of the SAQP

A summary of the SAQP is presented in Table 4. For more detail on the SAQP refer to DP 2020.

Table 4: Soil Testing Summary SAQP

AEC	Source Type	Number of TP/Sample Locations	Test Pit/Sample Location Reference	Analysis (Select Samples)
19	S1, S2	1 TP per AEC	591	Heavy metals, TRH, BTEX, OCP, OPP, PCB, PAH, phenols and asbestos AEC19 – Detailed grid walkover for ACM
18	S1, S2, S4	6 TP	579, 586 - 590	Heavy metals, TRH, BTEX, OCP, OPP, PCB, PAH, phenols and asbestos
36	S5	1 surface sample	SS5	Heavy metals, TRH, BTEX, PCB, PAH, phenols

AEC	Source Type	Number of TP/Sample Locations	Test Pit/Sample Location Reference	Analysis (Select Samples)
Remaining balance of the site less samples completed as part of the PSI	S3	12	TP406 to TP410, and TP429 to TP435	Metals, TRH, BTEX, OCP, OPP, PCBs, PAHs, phenols and asbestos
Total	-	19 TP 1 surface sample	-	-

8.1 Soil Sampling Rationale

For test pits within AECs, a targeted / judgemental sampling strategy was used and was informed by site history information, the CSM and observations made during the detailed site walkover.

Soil samples were collected from test pit at depths of approximately 0.2 m, 0.5 m, 1.0 m and every 0.5 m thereafter, and changes in lithology or signs of contamination to the top of natural strata.

For test pits across the remainder of the site, i.e. background areas, test pits were generally undertaken on a grid basis, generally at a frequency of one test pit per hectare. The targeted test pits include testing within defined AEC areas to capture general soil conditions across the whole of the site.

The general sampling methods are described in the field work methodology, included in Appendix B.

8.2 Variations to the SAQP

The following variations to the SAQP were required:

- Some proposed test pit locations were slightly relocated to avoid services and their exclusion zones where relevant;
- The numbering of test pits was also amended from those presented in the SAQP to follow the order in which the test pits were carried out; and
- It is noted that field work for the site was undertaken in several mobilisations in January 2020.

Sample locations are shown on Drawing 3, Appendix A.

9. Site Assessment Criteria

As per the SAQP, the site assessment criteria (SAC) applied in the DSI has been informed by the preliminary CSM for the whole TNG site, which identified human and environmental receptors to potential contamination on the site. Analytical results were to be assessed (as a Tier 1 assessment) against the SAC comprising primarily the investigation and screening levels of Schedule B1 NEPC (2013).

Given the proposed land use for the site, which includes commercial/industrial uses, the adopted human health and ecological criteria are HIL D / HSL D and EIL/ESL D

The derivation of the SAC is included in Appendix C and the SAC for soil are listed on the summary analytical results tables in Appendix D.

10. AEC Observations

Two DP environmental scientists recorded observations made in AECs during the DSIs which were used to provide a more detailed itinerary of power poles that was possible during the SAQP.

Key observations are outlined in Table 5 below and in Drawing 2 in Appendix A.

Table 5: Summary of Key Observation in Site Walkover

AEC #	AEC Description	Key Observations	Targeted Sampling/Advice Provided
18 (See Drawing 2)	Possible filling, structures	Two residences were observed here within chain-link wire fencing. The residences appeared to be primarily constructed with timber and suspected ACM.	A HAZMAT has been prepared under separate cover. Advice provided in this report (Section 14) includes post-demolition of structures. Pit 590 targets the access road to the rear of the residences.
		Raised garden beds were observed between the two residences and general filling containing gravel to the rear (north west) of the residences.	Pit 588 targets this feature.
		Fill mounds / windrows were visible to the south of the residence which extends to a gravel covered drive-way to the rear (west) of the residences; grass cover precluded closer inspection of the mounds / windrows.	Pit 589 targets this feature.
		A small chemical storage area was visible next to the northern fence line and scattered hard rubbish just outside of the western fence line.	Pit 586 targets this feature.
19 (See Drawing 2)	Structures and possible ACM impact of soil	A building footprint outlined by soil covered brick and concrete fragments was identified. ACM fragments were also observed on the ground surface near the footprint.	Pit 591 targets the former building footprint. The presence of ACM has been considered accordingly in the advice provided in Section 14.
36	Timber power poles	A total of two power poles were observed at the site and a further two within 100 m from the site boundary. All power poles were observed to be in generally good condition.	Surface samples ('SS') were collected targeting two power poles – refer to Drawing 3 for sample locations.

11. Results of Intrusive Investigations

11.1 Summary of Field Work Completed

The field work was completed between 28 and 30 January 2020.

11.2 Field Work Results

11.2.1 Soils

The test pit logs are provided in Appendix E and the location of test pits are shown in Drawing 3, Appendix A. The logs recorded the following general sub-surface profile:

- **Topsoil:** Topsoil comprising silty clay with rootlets was observed at the top of the soil horizon in all test pits, of which four appeared to be placed fill/topsoil. Topsoil was observed to depths of between 0.2 and 0.6 m (average 0.2m). Trace rootlets, ironstone and mixed gravels were also observed on occasion. Trace anthropogenic material (bricks fragments, porcelain tiles, terracotta pipe, glass and concrete fragments) not including visible ACM was observed in fill/topsoil on ground surface of four test pits (TP434, TP586, TP588 and TP591). Of the test pits containing anthropogenic material, two were targeted test pits that were located in AEC areas;
- **Fill:** Fill silty clay with mixed gravels was observed in total of four test pits, the depth to base ranged from 0.01 to 0.3 m bgl;
- **Silty Clay:** Medium plasticity and generally brown, red brown, red orange, mottled in places with the same colour variation. Including rootlets and trace ironstone gravels. This stratum was observed in 17 test pits to varying depths (base often not observed) and is generally consistent with regional mapping of the Blacktown soil landscape; and
- **Shale:** Highly weathered low strength grey shale was observed at depth in test pit 410 from a depth of between 2.4 to 3.1 m bgl, consistent with regional mapping (Bringelly Shale). Pit 410 was background test pit that were not located in AEC areas.

There were no other apparent records of visual or olfactory evidence (e.g.: staining, odours, free phase product) to suggest the presence of contamination within the soils or groundwater observed in the investigation.

No free groundwater was observed during excavation of test pits. It should be noted that groundwater levels are affected by climatic conditions and soil permeability and will therefore vary with time.

11.3 Laboratory Analytical Results

The laboratory analytical results are summarised in Table D1 as presented in Appendix D. Copies of laboratory chain of custodies, sample receipts and analytical reports are provided in Appendix F. The findings of the analytical results compared to their respective SAC are summarised in Table 6 below for each AEC.

Table 6: Summary of Laboratory Analytical Results

AEC	Summary of Results	Exceedances and Further Assessment (where relevant)
Background	Metals: Below the laboratory PQL and / or the SAC with the exception of Ni in one out of 278 samples analysed (< 1% of the dataset). All remainder soil analytical results were below PQL and/or SAC.	Ni: Exceeds ecological SAC for residential criteria "A" (45 mg/kg) in surface soils from Pit 408 (94 mg/kg). Further assessment of this exceedance against the relevant human health SAC for commercial / industrial land use (6000 mg/kg) establishes that Ni in soils from Pit 408 does not pose an actual contamination risk to the proposed development.
18	All soil analytical results were below PQL and/or SAC.	None.
19	All soil analytical results were below PQL and/or SAC.	None.
36 – Power Poles	Metals: below the laboratory PQL and/or the SAC with the exception of: As in SS5 sample (PP10) exceeded the corresponding human health and ecological SAC. TRH: All results below both PQL and SAC. BTEX: All results below both PQL and SAC. PAH: All results below both PQL and SAC, PCBs: All soil analytical results were below PQL and/or SAC, However, exceedances were observed elsewhere in TNG site for this AEC.	As: Exceeds the human health and ecological SAC (both 100 mg/kg) in SS5 (120 mg/kg). The suggested UCL test (95% Student's t-test) completed from data collected from the wider investigation area provides a result of 102.4 mg/kg, which is above the adopted SAC. Site-specific SAC for the proposed development (commercial/industrial) provides amended human health (3,000 mg/kg) and ecological criteria (160 mg/kg) which soils from SS5 fall below.

12. Discussion

A total of 16 soil samples were collected from within AECs and from background areas across the site. Of the 16 samples analysed the following exceedances against SAC were observed in:

- Background areas: Nickel in surface soils from Pit 408 exceeds the ecological SAC; and
- AEC 36: One surface soil sample (SS5) taken from the base of one of two power poles sampled from the site exceeds the human health and ecological SACs.

12.1 Data Quality Assurance and Quality Control

The data quality assurance and quality control (QA/QC) results are included in Appendix G and have been assessed using the data collected from the DSI undertaken on the wider TNG site. Based on the results of the field QA and field and laboratory QC, and evaluation against the data quality indicators (DQI) it is concluded that the field and laboratory test data obtained are reliable and useable for this assessment.

12.2 Summary

The findings of the site walkover, field work and laboratory results have been presented in the preceding Sections of this report. The following Table 7 provides a summary of the findings specific to AECs as bore as to the remainder of the site.

Table 7: Summary of the findings of the site walkover and the intrusive investigation.

AEC	AEC Description	Summary of Site Walkover Findings	Summary of Field Observations and Laboratory Results
18	Possible filling, structures	Structures likely contain ACM. Raised garden beds, fill mounds observed along with stockpiles, rubbish, and a chemical storage area. Targeted test pits undertaken where possible.	No exceedances observed.
19	Structures and possible ACM impact of soil	ACM fragments observed on the ground surface near building footprint.	No exceedances observed.
36	Timber power poles	All generally in good condition.	Exceedances of Arsenic were recorded for surface soils around one of the power poles assessed at the site. It is noted that exceedances of metals, TRH, benzo(a)pyrene, total PAHs and total PCBs have been observed next to power poles from elsewhere across the wider TNG site.

13. Revised Conceptual Site Model

The data collected for this DSI has generally confirmed that certain potential contaminant sources outlined in the CSM provided in Section 7 pose a potentially complete pathway to the identified receptor(s) whilst others do not. No other sources of contamination have been identified as a result of the testing results.

The CSM has therefore been updated from the findings of this DSI – refer to Table 8 below.

Table 8: Updated Summary of Potentially Complete Exposure Pathways (Proposed Land Use)

Source	Transport Pathway	Receptor	Remediation Action Required
AEC 19			
Filling / ACM impact on the ground surface – asbestos	Inhalation of dust	Future site users Adjacent land users	A targeted investigation (double density, with reference to NSW EPA 1995 guidelines) should be undertaken to ascertain the extent of asbestos impact here. Where observed, ACM fragments on the surface should be removed by hand.
AEC 36			
Timber treatment and PCBs in transmission box(es): Metal, TRH, benzo(a)pyrene, total PAHs, total PCBs.	Direct contact of contaminated ground, ingestion and dermal contact with soil or water, inhalation of dust, leaching of contaminants and vertical migration into groundwater, lateral migration of groundwater.		Exceedances of Arsenic were recorded for surfaces soils around one of the two power poles assessed at the site. It is noted that exceedances of metals, TRH, benzo(a)pyrene, total PAHs and total PCBs have been observed next to power poles from elsewhere across the wider TNG site. A targeted assessment of power poles at the site should be undertaken and include delineation of soil conditions surrounding the power poles for all power poles because of the relatively high number of samples observed to exceed SAC, meaning there is the potential that contamination is present elsewhere surrounding the poles even if the sample collected from next to the power pole in this assessment passes the SAC. Alternatively, the assumption could be made that soils surrounding all power poles at the site will require remediation. A RAP will be required to document how remediation and validation works should be undertaken.
General (whole site)			
Pit 408	Direct contact of contaminated ground, ingestion and dermal contact with soil or water, inhalation of dust, leaching of contaminants and vertical migration into groundwater, lateral migration of groundwater.	Future site users Adjacent land users	Concentrations of nickel in shallow soil at levels exceeding the ecological SAC investigation levels (45 mg/kg) at Pit 408 (94 mg/kg). Further investigation is required to assess whether the nickel exceedance is either an anomalous isolated occurrence or indicative of more extensive nickel impact to site soil that may require remediation.

Source	Transport Pathway	Receptor	Remediation Action Required
Building footprints - heavy metals, TRH, BTEX, OCP, OPP, PCB, PAH, phenols and asbestos	Inhalation of dust		Structures are known to be present at the site that contain hazardous materials. As well as following the recommendations of the HAZMAT ¹ , the footprints should be inspected by an Environmental Consultant after demolition for residual building materials and filling below the footprint. If filling is present, a targeted building footprint investigation should be undertaken.

¹: Hazardous materials building assessment reported under separate cover (reference 86548.07).

14. Conclusions and Recommendations

The scope of this DSI included a review of the SAQP, a detailed site walkover of AECs and an intrusive investigation including test pits in AECs and across the remainder (background) of the site, surface samples from near timber power poles and laboratory analysis.

The site was previously and recently used for primarily pastoral and rural residential land uses. Portions of the wider site have been used for stockpiling of materials and sub-leased (in part) to other parties for storage of such materials.

Soil analytical results have been assessed against SAC and reviewed alongside observations made in the detailed site walkover. The findings of the DSI have established there is no evidence of widespread or significant contamination across the site. Localised contamination in some AECs was observed on or immediately nearby to the site as requiring further investigation, delineation and/or remediation. These AECs requiring further works are summarised below:

- AEC 36 – An exceedance of heavy metals (As) was recorded for surface soils around one of the two power poles assessed at the site. It is noted that exceedances of metals, TRH, benzo(a)pyrene, total PAHs and total PCBs have been observed next to power poles from elsewhere across the wider TNG site. It is noted that the number of exceedances observed in this DSI and the DSI for the wider TNG site indicate additional targeted investigations of all power poles will be required around power poles at the site to establish and further define which are suitable to be retained on site and which will require remediation. The additional targeted investigations will include step-out samples around the power poles;
- Building footprints (whole site) – Structures are known to be present at the site that contain hazardous materials. As well as following the recommendations of the HAZMAT, the footprints should be inspected by an Environmental Consultant after demolition for residual building materials and filling below the footprint. If filling is present, a targeted building footprint investigation should be undertaken;
- Background Areas - An exceedance of heavy metals (Ni) was recorded for surface soils at levels exceeding the ecological SAC investigation levels (45 mg/kg) at Pit 408 (94 mg/kg). Further investigation will be required to assess whether the nickel exceedance is either an anomalous isolated occurrence or indicative of more extensive nickel impact to site soil that may require remediation;

- AEC 19 (Located immediately adjacent to the site) – ACM impact on the ground surface, a targeted investigation (double density, with reference to NSW EPA 1995 guidelines) should be undertaken to ascertain the extent of asbestos impact here. Where observed, ACM fragments on the surface should be removed by hand and the process documented in a RAP.

Fill containing man-made or anthropogenic material has been observed at the site. There is the potential for such fill to contain contamination including asbestos in between test pit locations undertaken as part of this investigation and, as such the potential to encounter asbestos and other contamination in filling elsewhere at the site.

It is noted that the majority of the observed impact as outlined above are typical of sites in the southwest Sydney region and does not impinge on the suitability of the site for rezoning from a contamination perspective. The above additional works should be undertaken to facilitate the DA process for subdivision.

The site is therefore suitable for rezoning and development from a contamination perspective subject to the above additional investigations and/or remediation works being undertaken prior to subdivision.

16. Limitations

Douglas Partners Pty Ltd (DP) has prepared this report (or services) for this project that forms part of 1953 – 2109 Elizabeth Drive, Badgerys Creek in accordance with DP's proposal 86548.08.P.001 dated 30 August 2021. The work was carried out under contract with DHL Supply Chain (Australia) Pty Limited. This report is provided for the exclusive use of DHL Supply Chain (Australia) Pty Limited for this project only and for the purposes as described in the report. It should not be used by or relied upon for other projects or purposes on the same or other site or by a third party. Any party so relying upon this report beyond its exclusive use and purpose as stated above, and without the express written consent of DP, does so entirely at its own risk and without recourse to DP for any loss or damage. In preparing this report DP has necessarily relied upon information provided by the client and/or their agents.

The results provided in the report are indicative of the sub-surface conditions on the site only at the specific sampling and/or testing locations, and then only to the depths investigated and at the time the work was carried out. Sub-surface conditions can change abruptly due to variable geological processes and also as a result of human influences. Such changes may occur after DP's field testing has been completed.

DP's advice is based upon the conditions encountered during this investigation. The accuracy of the advice provided by DP in this report may be affected by undetected variations in ground conditions across the site between and beyond the sampling and/or testing locations. The advice may also be limited by budget constraints imposed by others or by site accessibility.

The assessment of atypical safety hazards arising from this advice is restricted to the (geotechnical / environmental / groundwater) components set out in this report and based on known project conditions and stated design advice and assumptions. While some recommendations for safe controls may be provided, detailed 'safety in design' assessment is outside the current scope of this report and requires additional project data and assessment.

This report must be read in conjunction with all of the attached and should be kept in its entirety without separation of individual pages or sections. DP cannot be held responsible for interpretations or conclusions made by others unless they are supported by an expressed statement, interpretation, outcome or conclusion stated in this report.

This report, or sections from this report, should not be used as part of a specification for a project, without review and agreement by DP. This is because this report has been written as advice and opinion rather than instructions for construction.

About this Report

Douglas Partners

Introduction

These notes have been provided to amplify DP's report in regard to classification methods, field procedures and the comments section. Not all are necessarily relevant to all reports.

DP's reports are based on information gained from limited subsurface excavations and sampling, supplemented by knowledge of local geology and experience. For this reason, they must be regarded as interpretive rather than factual documents, limited to some extent by the scope of information on which they rely.

Copyright

This report is the property of Douglas Partners Pty Ltd. The report may only be used for the purpose for which it was commissioned and in accordance with the Conditions of Engagement for the commission supplied at the time of proposal. Unauthorised use of this report in any form whatsoever is prohibited.

Borehole and Test Pit Logs

The borehole and test pit logs presented in this report are an engineering and/or geological interpretation of the subsurface conditions, and their reliability will depend to some extent on frequency of sampling and the method of drilling or excavation. Ideally, continuous undisturbed sampling or core drilling will provide the most reliable assessment, but this is not always practicable or possible to justify on economic grounds. In any case the boreholes and test pits represent only a very small sample of the total subsurface profile.

Interpretation of the information and its application to design and construction should therefore take into account the spacing of boreholes or pits, the frequency of sampling, and the possibility of other than 'straight line' variations between the test locations.

Groundwater

Where groundwater levels are measured in boreholes there are several potential problems, namely:

- In low permeability soils groundwater may enter the hole very slowly or perhaps not at all during the time the hole is left open;

- A localised, perched water table may lead to an erroneous indication of the true water table;
- Water table levels will vary from time to time with seasons or recent weather changes. They may not be the same at the time of construction as are indicated in the report; and
- The use of water or mud as a drilling fluid will mask any groundwater inflow. Water has to be blown out of the hole and drilling mud must first be washed out of the hole if water measurements are to be made.

More reliable measurements can be made by installing standpipes which are read at intervals over several days, or perhaps weeks for low permeability soils. Piezometers, sealed in a particular stratum, may be advisable in low permeability soils or where there may be interference from a perched water table.

Reports

The report has been prepared by qualified personnel, is based on the information obtained from field and laboratory testing, and has been undertaken to current engineering standards of interpretation and analysis. Where the report has been prepared for a specific design proposal, the information and interpretation may not be relevant if the design proposal is changed. If this happens, DP will be pleased to review the report and the sufficiency of the investigation work.

Every care is taken with the report as it relates to interpretation of subsurface conditions, discussion of geotechnical and environmental aspects, and recommendations or suggestions for design and construction. However, DP cannot always anticipate or assume responsibility for:

- Unexpected variations in ground conditions. The potential for this will depend partly on borehole or pit spacing and sampling frequency;
- Changes in policy or interpretations of policy by statutory authorities; or
- The actions of contractors responding to commercial pressures.

If these occur, DP will be pleased to assist with investigations or advice to resolve the matter.

About this Report

Site Anomalies

In the event that conditions encountered on site during construction appear to vary from those which were expected from the information contained in the report, DP requests that it be immediately notified. Most problems are much more readily resolved when conditions are exposed rather than at some later stage, well after the event.

Information for Contractual Purposes

Where information obtained from this report is provided for tendering purposes, it is recommended that all information, including the written report and discussion, be made available. In circumstances where the discussion or comments section is not relevant to the contractual situation, it may be appropriate to prepare a specially edited document. DP would be pleased to assist in this regard and/or to make additional report copies available for contract purposes at a nominal charge.

Site Inspection

The company will always be pleased to provide engineering inspection services for geotechnical and environmental aspects of work to which this report is related. This could range from a site visit to confirm that conditions exposed are as expected, to full time engineering presence on site.

Sampling

Sampling is carried out during drilling or test pitting to allow engineering examination (and laboratory testing where required) of the soil or rock.

Disturbed samples taken during drilling provide information on colour, type, inclusions and, depending upon the degree of disturbance, some information on strength and structure.

Undisturbed samples are taken by pushing a thin-walled sample tube into the soil and withdrawing it to obtain a sample of the soil in a relatively undisturbed state. Such samples yield information on structure and strength, and are necessary for laboratory determination of shear strength and compressibility. Undisturbed sampling is generally effective only in cohesive soils.

Test Pits

Test pits are usually excavated with a backhoe or an excavator, allowing close examination of the in-situ soil if it is safe to enter into the pit. The depth of excavation is limited to about 3 m for a backhoe and up to 6 m for a large excavator. A potential disadvantage of this investigation method is the larger area of disturbance to the site.

Large Diameter Augers

Boreholes can be drilled using a rotating plate or short spiral auger, generally 300 mm or larger in diameter commonly mounted on a standard piling rig. The cuttings are returned to the surface at intervals (generally not more than 0.5 m) and are disturbed but usually unchanged in moisture content. Identification of soil strata is generally much more reliable than with continuous spiral flight augers, and is usually supplemented by occasional undisturbed tube samples.

Continuous Spiral Flight Augers

The borehole is advanced using 90-115 mm diameter continuous spiral flight augers which are withdrawn at intervals to allow sampling or in-situ testing. This is a relatively economical means of drilling in clays and sands above the water table. Samples are returned to the surface, or may be collected after withdrawal of the auger flights, but they are disturbed and may be mixed with soils from the sides of the hole. Information from the drilling (as distinct from specific sampling by SPTs or undisturbed samples) is of relatively low

reliability, due to the remoulding, possible mixing or softening of samples by groundwater.

Non-core Rotary Drilling

The borehole is advanced using a rotary bit, with water or drilling mud being pumped down the drill rods and returned up the annulus, carrying the drill cuttings. Only major changes in stratification can be determined from the cuttings, together with some information from the rate of penetration. Where drilling mud is used this can mask the cuttings and reliable identification is only possible from separate sampling such as SPTs.

Continuous Core Drilling

A continuous core sample can be obtained using a diamond tipped core barrel, usually with a 50 mm internal diameter. Provided full core recovery is achieved (which is not always possible in weak rocks and granular soils), this technique provides a very reliable method of investigation.

Standard Penetration Tests

Standard penetration tests (SPT) are used as a means of estimating the density or strength of soils and also of obtaining a relatively undisturbed sample. The test procedure is described in Australian Standard 1289, Methods of Testing Soils for Engineering Purposes - Test 6.3.1.

The test is carried out in a borehole by driving a 50 mm diameter split sample tube under the impact of a 63 kg hammer with a free fall of 760 mm. It is normal for the tube to be driven in three successive 150 mm increments and the 'N' value is taken as the number of blows for the last 300 mm. In dense sands, very hard clays or weak rock, the full 450 mm penetration may not be practicable and the test is discontinued.

The test results are reported in the following form.

- In the case where full penetration is obtained with successive blow counts for each 150 mm of, say, 4, 6 and 7 as:
4,6,7
N=13
- In the case where the test is discontinued before the full penetration depth, say after 15 blows for the first 150 mm and 30 blows for the next 40 mm as:
15, 30/40 mm

Sampling Methods

The results of the SPT tests can be related empirically to the engineering properties of the soils.

Dynamic Cone Penetrometer Tests / Perth Sand Penetrometer Tests

Dynamic penetrometer tests (DCP or PSP) are carried out by driving a steel rod into the ground using a standard weight of hammer falling a specified distance. As the rod penetrates the soil the number of blows required to penetrate each successive 150 mm depth are recorded. Normally there is a depth limitation of 1.2 m, but this may be extended in certain conditions by the use of extension rods. Two types of penetrometer are commonly used.

- Perth sand penetrometer - a 16 mm diameter flat ended rod is driven using a 9 kg hammer dropping 600 mm (AS 1289, Test 6.3.3). This test was developed for testing the density of sands and is mainly used in granular soils and filling.
- Cone penetrometer - a 16 mm diameter rod with a 20 mm diameter cone end is driven using a 9 kg hammer dropping 510 mm (AS 1289, Test 6.3.2). This test was developed initially for pavement subgrade investigations, and correlations of the test results with California Bearing Ratio have been published by various road authorities.

Description and Classification Methods

The methods of description and classification of soils and rocks used in this report are generally based on Australian Standard AS1726:2017, Geotechnical Site Investigations. In general, the descriptions include strength or density, colour, structure, soil or rock type and inclusions.

The soil group symbol classifications are given as follows based on two major soil divisions:

- Coarse-grained soils
- Fine-grained soils

Major Divisions				Description	
				Group Symbol*	Typical Name
COARSE-GRAINED SOILS	More than 65% by dry mass, (excluding that larger than 63 mm) is greater than 0.075 mm	GRAVEL	More than 50% of coarse grains are greater than 2.36 mm	GW	Well graded gravels and gravel-sand mixtures, little or no fines.
				GP	Poorly graded gravels and gravel-sand mixtures, little or no fines.
				GM	Silty gravels, gravel-sand-silt mixtures.
				GC	Clay gravels, gravel-sand-clay mixtures.
		SAND	More than 50% of coarse grains are less than 2.36 mm	SW	Well graded sands and gravelly sands, little or no fines.
				SP	Poorly graded sands and gravelly sands, little or no fines.
				SM	Silty sand, sand-silt mixtures.
				SC	Clayey sands, sand-clay mixtures.

* For coarse grained soils where the fines content is between 5% and 12%, the soil shall be given a dual classification eg GP-GM.

FINE-GRAINED SOILS	More than 35% by dry mass, (excluding that larger than 63 mm) is less than 0.075 mm	Liquid Limit less than 35%	ML	Inorganic silts, very fine sands, rock flour, silty or clayey fine sands.
			CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays.
			OL	Organic silts and organic silty clays of low plasticity
		35% <LL< 50%	CI	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays.
		Liquid Limit greater than 50%	MH	Inorganic silts, micaceous or diatomaceous fine sands or silts, elastic silts.
			CH	Inorganic clays of high plasticity, fat clays.
			OH	Organic clays of medium to high plasticity.
				Pt

Soil Descriptions

Douglas Partners

Soil Types

Soil types are described according to the predominant particle size, qualified by the grading of other particles present:

Type	Particle size (mm)
Boulder	>200
Cobble	63 - 200
Gravel	2.36 - 63
Sand	0.075 - 2.36
Silt	0.002 - 0.075
Clay	<0.002

The sand and gravel sizes can be further subdivided as follows:

Type	Particle size (mm)
Coarse gravel	19 - 63
Medium gravel	6.7 - 19
Fine gravel	2.36 - 6.7
Coarse sand	0.6 - 2.36
Medium sand	0.21 - 0.6
Fine sand	0.075 - 0.21

Definitions of grading terms used are:

- Well graded - a good representation of all particle sizes
- Poorly graded - an excess or deficiency of particular sizes within the specified range
- Uniformly graded - an excess of a particular particle size
- Gap graded - a deficiency of a particular particle size with the range

The proportions of secondary constituents of soils are described as follows:

In fine grained soils (>35% fines)

Term	Proportion of sand or gravel	Example
And	Specify	Clay (60%) and Sand (40%)
Adjective	>30%	Sandy Clay
With	15 - 30%	Clay with sand
Trace	0 - 15%	Clay, trace sand

In coarse grained soils (>65% coarse)

- with clays or silts

Term	Proportion of fines	Example
And	Specify	Sand (70%) and Clay (30%)
Adjective	>12%	Clayey Sand
With	5 - 12%	Sand with clay
Trace	0 - 5%	Sand, trace clay

In coarse grained soils (>65% coarse)

- with coarser fraction

Term	Proportion of coarser fraction	Example
And	Specify	Sand (60%) and Gravel (40%)
Adjective	>30%	Gravelly Sand
With	15 - 30%	Sand with gravel
Trace	0 - 15%	Sand, trace gravel

The presence of cobbles and boulders shall be specifically noted by beginning the description with 'Mix of Soil and Cobbles/Boulders' with the word order indicating the dominant first and the proportion of cobbles and boulders described together.

Cohesive Soils

Cohesive soils, such as clays, are classified on the basis of undrained shear strength. The strength may be measured by laboratory testing, or estimated by field tests or engineering examination. The strength terms are defined as follows:

Description	Abbreviation	Undrained shear strength (kPa)
Very soft	VS	<12
Soft	S	12 - 25
Firm	F	25 - 50
Stiff	St	50 - 100
Very stiff	VSt	100 - 200
Hard	H	>200
Friable	Fr	-

Cohesionless Soils

Cohesionless soils, such as clean sands, are classified on the basis of relative density, generally from the results of standard penetration tests (SPT), cone penetration tests (CPT) or dynamic penetrometers (PSP). The relative density terms are given below:

Relative Density	Abbreviation	Density Index (%)
Very loose	VL	<15
Loose	L	15-35
Medium dense	MD	35-65
Dense	D	65-85
Very dense	VD	>85

Soil Origin

It is often difficult to accurately determine the origin of a soil. Soils can generally be classified as:

- Residual soil - derived from in-situ weathering of the underlying rock;
- Extremely weathered material – formed from in-situ weathering of geological formations. Has soil strength but retains the structure or fabric of the parent rock;
- Alluvial soil – deposited by streams and rivers;
- Estuarine soil – deposited in coastal estuaries;

- Marine soil – deposited in a marine environment;
- Lacustrine soil – deposited in freshwater lakes;
- Aeolian soil – carried and deposited by wind;
- Colluvial soil – soil and rock debris transported down slopes by gravity;
- Topsoil – mantle of surface soil, often with high levels of organic material.
- Fill – any material which has been moved by man.

Moisture Condition – Coarse Grained Soils

For coarse grained soils the moisture condition should be described by appearance and feel using the following terms:

- Dry (D) Non-cohesive and free-running.
- Moist (M) Soil feels cool, darkened in colour.
Soil tends to stick together.
Sand forms weak ball but breaks easily.
- Wet (W) Soil feels cool, darkened in colour.
Soil tends to stick together, free water forms when handling.

Moisture Condition – Fine Grained Soils

For fine grained soils the assessment of moisture content is relative to their plastic limit or liquid limit, as follows:

- 'Moist, dry of plastic limit' or 'w < PL' (i.e. hard and friable or powdery).
- 'Moist, near plastic limit' or 'w ≈ PL' (i.e. soil can be moulded at moisture content approximately equal to the plastic limit).
- 'Moist, wet of plastic limit' or 'w > PL' (i.e. soils usually weakened and free water forms on the hands when handling).
- 'Wet' or 'w ≈ LL' (i.e. near the liquid limit).
- 'Wet' or 'w > LL' (i.e. wet of the liquid limit).

Rock Strength

Rock strength is defined by the Unconfined Compressive Strength and it refers to the strength of the rock substance and not the strength of the overall rock mass, which may be considerably weaker due to defects.

The Point Load Strength Index $Is_{(50)}$ is commonly used to provide an estimate of the rock strength and site specific correlations should be developed to allow UCS values to be determined. The point load strength test procedure is described by Australian Standard AS4133.4.1-2007. The terms used to describe rock strength are as follows:

Strength Term	Abbreviation	Unconfined Compressive Strength MPa	Point Load Index * $Is_{(50)}$ MPa
Very low	VL	0.6 - 2	0.03 - 0.1
Low	L	2 - 6	0.1 - 0.3
Medium	M	6 - 20	0.3 - 1.0
High	H	20 - 60	1 - 3
Very high	VH	60 - 200	3 - 10
Extremely high	EH	>200	>10

* Assumes a ratio of 20:1 for UCS to $Is_{(50)}$. It should be noted that the UCS to $Is_{(50)}$ ratio varies significantly for different rock types and specific ratios should be determined for each site.

Degree of Weathering

The degree of weathering of rock is classified as follows:

Term	Abbreviation	Description
Residual Soil	RS	Material is weathered to such an extent that it has soil properties. Mass structure and material texture and fabric of original rock are no longer visible, but the soil has not been significantly transported.
Extremely weathered	XW	Material is weathered to such an extent that it has soil properties. Mass structure and material texture and fabric of original rock are still visible
Highly weathered	HW	The whole of the rock material is discoloured, usually by iron staining or bleaching to the extent that the colour of the original rock is not recognisable. Rock strength is significantly changed by weathering. Some primary minerals have weathered to clay minerals. Porosity may be increased by leaching, or may be decreased due to deposition of weathering products in pores.
Moderately weathered	MW	The whole of the rock material is discoloured, usually by iron staining or bleaching to the extent that the colour of the original rock is not recognisable, but shows little or no change of strength from fresh rock.
Slightly weathered	SW	Rock is partially discoloured with staining or bleaching along joints but shows little or no change of strength from fresh rock.
Fresh	FR	No signs of decomposition or staining.
<i>Note: If HW and MW cannot be differentiated use DW (see below)</i>		
Distinctly weathered	DW	Rock strength usually changed by weathering. The rock may be highly discoloured, usually by iron staining. Porosity may be increased by leaching or may be decreased due to deposition of weathered products in pores.

Rock Descriptions

Degree of Fracturing

The following classification applies to the spacing of natural fractures in diamond drill cores. It includes bedding plane partings, joints and other defects, but excludes drilling breaks.

Term	Description
Fragmented	Fragments of <20 mm
Highly Fractured	Core lengths of 20-40 mm with occasional fragments
Fractured	Core lengths of 30-100 mm with occasional shorter and longer sections
Slightly Fractured	Core lengths of 300 mm or longer with occasional sections of 100-300 mm
Unbroken	Core contains very few fractures

Rock Quality Designation

The quality of the cored rock can be measured using the Rock Quality Designation (RQD) index, defined as:

$$\text{RQD \%} = \frac{\text{cumulative length of 'sound' core sections} > 100 \text{ mm long}}{\text{total drilled length of section being assessed}}$$

where 'sound' rock is assessed to be rock of low strength or stronger. The RQD applies only to natural fractures. If the core is broken by drilling or handling (i.e. drilling breaks) then the broken pieces are fitted back together and are not included in the calculation of RQD.

Stratification Spacing

For sedimentary rocks the following terms may be used to describe the spacing of bedding partings:

Term	Separation of Stratification Planes
Thinly laminated	< 6 mm
Laminated	6 mm to 20 mm
Very thinly bedded	20 mm to 60 mm
Thinly bedded	60 mm to 0.2 m
Medium bedded	0.2 m to 0.6 m
Thickly bedded	0.6 m to 2 m
Very thickly bedded	> 2 m

Symbols & Abbreviations

Douglas Partners

Introduction

These notes summarise abbreviations commonly used on borehole logs and test pit reports.

Drilling or Excavation Methods

C	Core drilling
R	Rotary drilling
SFA	Spiral flight augers
NMLC	Diamond core - 52 mm dia
NQ	Diamond core - 47 mm dia
HQ	Diamond core - 63 mm dia
PQ	Diamond core - 81 mm dia

Water

▷	Water seep
▽	Water level

Sampling and Testing

A	Auger sample
B	Bulk sample
D	Disturbed sample
E	Environmental sample
U ₅₀	Undisturbed tube sample (50mm)
W	Water sample
pp	Pocket penetrometer (kPa)
PID	Photo ionisation detector
PL	Point load strength Is(50) MPa
S	Standard Penetration Test
V	Shear vane (kPa)

Description of Defects in Rock

The abbreviated descriptions of the defects should be in the following order: Depth, Type, Orientation, Coating, Shape, Roughness and Other. Drilling and handling breaks are not usually included on the logs.

Defect Type

B	Bedding plane
Cs	Clay seam
Cv	Cleavage
Cz	Crushed zone
Ds	Decomposed seam
F	Fault
J	Joint
Lam	Lamination
Pt	Parting
Sz	Sheared Zone
V	Vein

Orientation

The inclination of defects is always measured from the perpendicular to the core axis.

h	horizontal
v	vertical
sh	sub-horizontal
sv	sub-vertical

Coating or Infilling Term

cln	clean
co	coating
he	healed
inf	infilled
stn	stained
ti	tight
vn	veneer

Coating Descriptor

ca	calcite
cbs	carbonaceous
cly	clay
fe	iron oxide
mn	manganese
slt	silty

Shape

cu	curved
ir	irregular
pl	planar
st	stepped
un	undulating

Roughness

po	polished
ro	rough
sl	slickensided
sm	smooth
vr	very rough

Other

fg	fragmented
bnd	band
qtz	quartz

Appendix B

Field Work Methodology

Appendix B

Field Work Methodology

B1.0 Guidelines

The following key guidelines were consulted for the field work methodology:

- NEPC National Environment Protection (Assessment of Site Contamination) Measure 1999 (as amended 2013) [NEPM] (NEPC, 2013);

B2.0 Soil Sampling

Soil sampling is carried out in accordance with DP standard operating procedures. The general sampling and sample management procedures comprise:

- Collect soil samples directly from the excavator bucket at the nominated sample depth;
- Collect soil samples from the stockpile(s) from a depth of at least 0.3 m below the stockpile;
- Collect near surface samples using hand tools;
- Transfer samples in laboratory-prepared glass jars with Teflon lined lids by hand, capping immediately and minimising headspace within the sample jar;
- Transfer samples in laboratory-prepared container (specific for PFAS) by hand, capping immediately and minimising headspace within the sample jar;
- Collect replicate samples in zip-lock bags for PID screening;
- Collect ~40 g to 50 g samples in zip-lock bags for asbestos (presence / absence) analysis;
- Wear a new disposable nitrile glove for each sample point thereby minimising potential for cross-contamination;
- Collect 10% replicate samples for QC purposes;
- Label sample containers with individual and unique identification details, including project number, sample location and sample depth (where applicable);
- Place samples into a cooled, insulated and sealed container for transport to the laboratory; and
- Use chain of custody documentation.

B2.1 Field Testing

Field testing is carried out in accordance with DP standard operating procedures. The general sampling and sample management procedures comprise:

B2.1.1 PID Field Test

- Calibrate the PID with isobutylene gas at 100 ppm and with fresh air prior to commencement of each successive day's field work;
- Allow the headspace in the PID zip-lock bag samples to equilibrate; and
- Screen using the PID.

Appendix C

Derivation of Site Assessment Criteria

Appendix C

Derivation of Site Assessment Criteria

C1.0 Introduction

C1.1 Guidelines

The following key guidelines were consulted for deriving the site assessment criteria (SAC):

- NEPC National Environment Protection (Assessment of Site Contamination) Measure 1999 (as amended 2013) [NEPM] (NEPC, 2013).
- CRC CARE *Health screening levels for petroleum hydrocarbons in soil and groundwater* (CRC CARE, 2011).

C1.2 General

The SAC applied in the current investigation are informed by the CSM which identified human and environmental receptors to potential contamination at the site. Analytical results are assessed (as a Tier 1 assessment) in the first instance against the SAC comprising primarily the investigation and screening levels of Schedule B1 of NEPC (2013).

The following inputs are relevant to the selection and/or derivation of the SAC:

- Land use: site is proposed to be provide two large scale warehouse facilities, dock offices, hardstand and car parking, and higher order employment.
 - o Corresponding to land use category 'D', commercial /industrial such as shops, offices, factories and industrial sites
- Soil type: Dominantly clay.

C2.0 Soils

C2.1 Health Investigation and Screening Levels

The generic health investigation levels (HIL) and health screening levels (HSL) are considered to be appropriate for the assessment of human health risk via all relevant pathways of exposure associated with contamination at the site. The adopted soil HIL and HSL for the contaminants of concern are in Table 1 and Table 2.

Table 1: Health Investigation Levels (mg/kg)

Contaminant	HIL-D
Metals	
Arsenic	3000
Cadmium	900
Chromium (VI)	3600
Copper	240 000
Lead	1500
Mercury (inorganic)	730
Nickel	6000
Zinc	400 000
PAH	
B(a)P TEQ	40
Total PAH	4000
Phenols	
Phenol	240 000
OCP	
DDT+DDE+DDD	3600
Aldrin and dieldrin	45
Chlordane	530
Endosulfan	2000
Endrin	100
Heptachlor	50
HCB	80
Methoxychlor	2500
OPP	
Chlorpyrifos	2000
PCB	
PCB	7

Table 2: Health Screening Levels (mg/kg)

Contaminant	HSL-D	HSL-D	HSL-D	HSL-D
SILT	0 m to <1 m	1 m to <2 m	2 m to <4 m	4 m+
Benzene	4	4	6	10
Toluene	NL	NL	NL	NL
Ethylbenzene	NL	NL	NL	NL
Xylenes	NL	NL	NL	NL
Naphthalene	NL	NL	NL	NL
TRH F1	250	360	590	NL
TRH F2	NL	NL	NL	NL
CLAY	0 m to <1 m	1 m to <2 m	2 m to <4 m	4 m+
Benzene	4	6	9	20
Toluene	NL	NL	NL	NL
Ethylbenzene	NL	NL	NL	NL
Xylenes	NL	NL	NL	NL
Naphthalene	NL	NL	NL	NL
TRH F1	310	480	NL	NL
TRH F2	NL	NL	NL	NL

Notes: TRH F1 is TRH C₆-C₁₀ minus BTEX

TRH F2 is TRH >C₁₀-C₁₆ minus naphthalene

The soil saturation concentration (C_{sat}) is defined as the soil concentration at which the porewater phase cannot dissolve any more of an individual chemical. The soil vapour that is in equilibrium with the porewater will be at its maximum. If the derived soil HSL exceeds C_{sat}, a soil vapour source concentration for a petroleum mixture could not exceed a level that would result in the maximum allowable vapour risk for the given scenario. For these scenarios, no HSL is presented for these chemicals and the HSL is shown as 'not limiting' or 'NL'

C2.2 Asbestos in Soil

The HSL for asbestos in soil are based on likely exposure levels for different scenarios published in NEPC (2013) for the following forms of asbestos:

- Bonded asbestos containing material (ACM); and
- Fibrous asbestos and asbestos fines (FA and AF).

The HSL are in Table 3.

Table 3: Health Screening Levels for Asbestos

Form of Asbestos	HSL-D
ACM	0.05%
FA and AF	0.001%
FA and AF and ACM	No visible asbestos for surface soil *

Notes: Surface soils defined as top 10 cm.

* Based on site observations at the sampling points and the analytical results of surface samples.

C2.3 Ecological Investigation Levels

Ecological investigation levels (EIL) and added contaminant limits (ACL), where appropriate, have been derived in NEPC (2013) for arsenic, copper, chromium (III), nickel, lead, zinc, DDT and naphthalene. The adopted EIL, derived using the interactive (excel) calculation spreadsheet on the NEPM toolbox website are shown in Table 4, with inputs into their derivation shown in Table 3.

Table 3: Inputs to the Derivation of the Ecological Investigation Levels

Variable	Input	Rationale
Age of contaminants	"Aged" (>2 years)	Given the potential sources of soil contamination are from historic use, the contamination is considered as aged.
pH	6.6 pH Units	Based on the average of 54 soil analytical results (ranging from 4.6 to 7.8 pH units)
CEC	5.6 cmol _e /kg	Based on analysis of one soil sample from TP 208
Clay content	40 %	The soil at the site was dominantly silty clays
Traffic volumes	low	Majority of the site is not exposed to public road, with the site considered to be located within a low traffic area
State / Territory	NSW	-

Table 4: Ecological Investigation Levels (mg/kg)

Contaminant	EIL-D
Metals	
Arsenic	160
Copper	170

Contaminant	EIL-D
Nickel	75
Chromium III	1100
Lead	1800
Zinc	470
PAH	
Naphthalene	370
OCP	
DDT	640

C2.4 Ecological Screening Levels

Ecological screening levels (ESL) are used to assess the risk of selected petroleum hydrocarbon compounds, BTEX and benzo(a)pyrene to terrestrial ecosystems. The adopted ESL are shown in Table 5.

Table 5: Ecological Screening Levels (mg/kg)

Contaminant	Soil Type	EIL-D
Benzene	Fine	95
Toluene	Fine	135
Ethylbenzene	Fine	185
Xylenes	Fine	95
TRH F1	Coarse/ Fine	215*
TRH F2	Coarse/ Fine	170*
TRH F3	Fine	2500
TRH F4	Fine	6600
B(a)P	Fine	0.7

Notes: ESL are of low reliability except where indicated by * which indicates that the ESL is of moderate reliability
 TRH F1 is TRH C₆-C₁₀ minus BTEX
 TRH F2 is TRH >C₁₀-C₁₆ including naphthalene

In the case of benzo(a)pyrene, any exceedances of the ESL is further assessed against ecological guidance provided in CRC Care Technical Report No. 39 which is 33 mg/kg for urban residential and public open space, and 172 mg/kg for commercial and industrial land use.

C2.5 Ecological Soil Guideline Values

The interim ecological soil guideline values (EGV) derived from Table3 of HEPA (2020) are in Table 6.

Table 6: Ecological Soil Guideline Values (mg/kg) – All Land Uses

Contaminant	Direct Exposure	Indirect Exposure
PFOS	1	0.01
PFOA	10	NC
PFHxS	NC	NC

Notes: NC no criterion

C2.6 Management Limits

In addition to appropriate consideration and application of the HSL and ESL, there are additional considerations which reflect the nature and properties of petroleum hydrocarbons, including:

- Formation of observable light non-aqueous phase liquids (LNAPL);
- Fire and explosion hazards;
- Effects on buried infrastructure eg: penetration of, or damage to, in-ground services.

The adopted management limits are in Table 7.

Table 7: Management Limits (mg/kg)

Contaminant	Soil Type	ML-D
TRH F1	Fine	800
TRH F2	Fine	1000
TRH F3	Fine	5000
TRH F4	Fine	10 000

Notes: TRH F1 is TRH C₆-C₁₀ including BTEX
 TRH F2 is TRH >C₁₀-C₁₆ including naphthalene

Laboratory Analytical Reports and Chain-of-Custody Documentation

CERTIFICATE OF ANALYSIS 235827

Client Details

Client	Douglas Partners Pty Ltd Smeaton Grange
Attention	Emily McGinty
Address	18 Waler Crescent, Smeaton Grange, NSW, 2567

Sample Details

Your Reference	86548.03, Badgerys Creek DSI
Number of Samples	161 Soil
Date samples received	03/02/2020
Date completed instructions received	04/02/2020

Analysis Details

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

Please refer to the last page of this report for any comments relating to the results.

Report Details

Date results requested by	10/02/2020
Date of Issue	10/02/2020
NATA Accreditation Number 2901. This document shall not be reproduced except in full.	
Accredited for compliance with ISO/IEC 17025 - Testing. Tests not covered by NATA are denoted with *

Method ID	Methodology Summary
ASB-001	Asbestos ID - Qualitative identification of asbestos in bulk samples using Polarised Light Microscopy and Dispersion Staining Techniques including Synthetic Mineral Fibre and Organic Fibre as per Australian Standard 4964-2004.
AT-008	Determination of VOCs sampled onto coconut shell charcoal sorbent tubes, that can be desorbed using carbon disulphide, and analysed by GC-MS.
Inorg-008	Moisture content determined by heating at 105+/-5 °C for a minimum of 12 hours.
Inorg-031	Total Phenolics by segmented flow analyser (in line distillation with colourimetric finish). Solids are extracted in a caustic media prior to analysis.
Metals-020	Determination of various metals by ICP-AES.
Metals-021	Determination of Mercury by Cold Vapour AAS.
Org-003	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis.
Org-003	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis. Note, the Total +ve TRH PQL is reflective of the lowest individual PQL and is therefore "Total +ve TRH" is simply a sum of the positive individual TRH fractions (>C10-C40).
Org-006	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC-ECD.
Org-006	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC-ECD. Note, the Total +ve PCBs PQL is reflective of the lowest individual PQL and is therefore "Total +ve PCBs" is simply a sum of the positive individual PCBs.
Org-012/017	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS and/or GC-MS/MS.
Org-012/017	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC-MS and/or GC-MS/MS. Note, the Total +ve reported DDD+DDE+DDT PQL is reflective of the lowest individual PQL and is therefore simply a sum of the positive individually report DDD+DDE+DDT.

Method ID	Methodology Summary
Org-012/017	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS and/or GC-MS/MS. Benzo(a)pyrene TEQ as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater - 2013. For soil results:- 1. 'EQ PQL' values are assuming all contributing PAHs reported as <PQL are actually at the PQL. This is the most conservative approach and can give false positive TEQs given that PAHs that contribute to the TEQ calculation may not be present. 2. 'EQ zero' values are assuming all contributing PAHs reported as <PQL are zero. This is the least conservative approach and is more susceptible to false negative TEQs when PAHs that contribute to the TEQ calculation are present but below PQL. 3. 'EQ half PQL' values are assuming all contributing PAHs reported as <PQL are half the stipulated PQL. Hence a mid-point between the most and least conservative approaches above. Note, the Total +ve PAHs PQL is reflective of the lowest individual PQL and is therefore "Total +ve PAHs" is simply a sum of the positive individual PAHs.
Org-014	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS.
Org-016	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater.
Org-016	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater. Note, the Total +ve Xylene PQL is reflective of the lowest individual PQL and is therefore "Total +ve Xylenes" is simply a sum of the positive individual Xylenes.

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.
Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.	
The recommended maximums for analytes in urine are taken from "2018 TLVs and BEIs", as published by ACGIH (where available). Limit provided for Nickel is a precautionary guideline as per Position Paper prepared by AIOH Exposure Standards Committee, 2016.	
Guideline limits for Rinse Water Quality reported as per analytical requirements and specifications of AS 4187, Amdt 2 2019, Table 7.2	

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% – see ELN-P05 QA/QC tables for details; <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals (not SPOCAS); 60-140% for organics/SPOCAS (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Measurement Uncertainty estimates are available for most tests upon request.

Analysis of aqueous samples typically involves the extraction/digestion and/or analysis of the liquid phase only (i.e. NOT any settled sediment phase but inclusive of suspended particles if present), unless stipulated on the Envirolab COC and/or by correspondence. Notable exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, total recoverable metals and PFAS where solids are included by default.

Samples for Microbiological analysis (not Amoeba forms) received outside of the 2-8°C temperature range do not meet the ideal cooling conditions as stated in AS2031-2012.

Report Comments

TRH Soil C10-C40 NEPM - # Percent recovery for the surrogate is not possible to report as the high concentration of analytes in sample 235827-158,159 and 160 has caused interference.

PAHs in Soil - # Percent recovery for the surrogate is not possible to report as the high concentration of analytes in samples 235827-157,159,159d have caused interference.

Asbestos: A portion of the supplied samples were sub-sampled for asbestos analysis according to Envirolab procedures.

We cannot guarantee that these sub-samples are indicative of the entire sample.

Envirolab recommends supplying 40-50g of sample in its own container.

Note: Samples requested for asbestos testing were sub-sampled from jars provided by the client.

8 metals in soil - # Percent recovery is not possible to report due to the inhomogeneous nature of the element/s in the sample/s. However an acceptable recovery was obtained for the LCS.

CERTIFICATE OF ANALYSIS 235827-A

Client Details

Client	Douglas Partners Pty Ltd Smeaton Grange
Attention	Lachlan Clement
Address	18 Waler Crescent, Smeaton Grange, NSW, 2567

Sample Details

Your Reference	<u>86548.03, Badgerys Creek DSI</u>
Number of Samples	161 Soil
Date samples received	03/02/2020
Date completed instructions received	05/02/2020

Analysis Details

Please refer to the following pages for results, methodology summary and quality control data.
Samples were analysed as received from the client. Results relate specifically to the samples as received.
Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

Report Details

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.
Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.	
The recommended maximums for analytes in urine are taken from "2018 TLVs and BEIs", as published by ACGIH (where available). Limit provided for Nickel is a precautionary guideline as per Position Paper prepared by AIOH Exposure Standards Committee, 2016.	
Guideline limits for Rinse Water Quality reported as per analytical requirements and specifications of AS 4187, Amdt 2 2019, Table 7.2	

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% – see ELN-P05 QA/QC tables for details; <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals (not SPOCAS); 60-140% for organics/SPOCAS (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Measurement Uncertainty estimates are available for most tests upon request.

Analysis of aqueous samples typically involves the extraction/digestion and/or analysis of the liquid phase only (i.e. NOT any settled sediment phase but inclusive of suspended particles if present), unless stipulated on the Envirolab COC and/or by correspondence. Notable exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, total recoverable metals and PFAS where solids are included by default.

Samples for Microbiological analysis (not Amoeba forms) received outside of the 2-8°C temperature range do not meet the ideal cooling conditions as stated in AS2031-2012.

Hi Ming,

Apologies for the late reply, please can you do the following in addition to Emilys requests on the extra samples

135 326/1.0 – chloride, sulphate, sodicity
136 326/1.5 hold
137 326/2.0 hold
138 326/2.5– chloride, sulphate
139 326/3.0 hold
140 366/1.0 hold
141 366/1.5– chloride, sulphate
142 366/2.0 hold
143 366/2.5 hold
144 366/3.0– chloride, sulphate, sodicity
145 395/1.0 hold
146 395/1.5 hold
147 395/2.0– chloride, sulphate, sodicity
148 395/2.5 hold
149 395/3.0 hold
150 411/1.0– chloride, sulphate
151 411/1.5 hold
152 411/2.0 hold
153 411/2.5 hold
154 411/3.0 hold
155 357/1.0 hold
156 364/1.2 hold

Additional Info

Sample storage - Waters are routinely disposed of approximately 1 month and soils approximately 2 months from receipt.

Requests for longer term sample storage must be received in writing.

Please contact the laboratory immediately if observed settled sediment present in water samples is to be included in the extraction and/or analysis (exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, Total Recoverable metals and PFAS analysis where solids are included by default.

TAT for Micro is dependent on incubation. This varies from 3 to 6 days.

The '✓' indicates the testing you have requested. **THIS IS NOT A REPORT OF THE RESULTS.**

Additional Info

Sample storage - Waters are routinely disposed of approximately 1 month and soils approximately 2 months from receipt.

Requests for longer term sample storage must be received in writing.

Please contact the laboratory immediately if observed settled sediment present in water samples is to be included in the extraction and/or analysis (exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, Total Recoverable metals and PFAS analysis where solids are included by default.

TAT for Micro is dependent on incubation. This varies from 3 to 6 days.

CERTIFICATE OF ANALYSIS 236229

Client Details

Client	Douglas Partners Pty Ltd Smeaton Grange
Attention	Emily McGinty
Address	18 Waler Crescent, Smeaton Grange, NSW, 2567

Sample Details

Your Reference	86548.03, Badgerys Creek DSI
Number of Samples	279 Soil, 3 Material
Date samples received	07/02/2020
Date completed instructions received	10/02/2020

Analysis Details

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

Please refer to the last page of this report for any comments relating to the results.

Report Details

Date results requested by	17/02/2020
Date of Issue	17/02/2020
NATA Accreditation Number 2901. This document shall not be reproduced except in full.	
Accredited for compliance with ISO/IEC 17025 - Testing. Tests not covered by NATA are denoted with *

Method ID	Methodology Summary
ASB-001	Asbestos ID - Qualitative identification of asbestos in bulk samples using Polarised Light Microscopy and Dispersion Staining Techniques including Synthetic Mineral Fibre and Organic Fibre as per Australian Standard 4964-2004.
ASB-001	Asbestos ID - Identification of asbestos in soil samples using Polarised Light Microscopy and Dispersion Staining Techniques. Minimum 500mL soil sample was analysed as recommended by "National Environment Protection (Assessment of site contamination) Measure, Schedule B1 and "The Guidelines from the Assessment, Remediation and Management of Asbestos-Contaminated Sites in Western Australia - May 2009" with a reporting limit of 0.1g/kg (0.01% w/w) as per Australian Standard AS4964-2004. Results reported denoted with * are outside our scope of NATA accreditation. NOTE #1 Total Asbestos g/kg was analysed and reported as per Australian Standard AS4964 (This is the sum of ACM >7mm, <7mm and FA/AF) NOTE #2 The screening level of 0.001% w/w asbestos in soil for FA and AF only applies where the FA and AF are able to be quantified by gravimetric procedures. This screening level is not applicable to free fibres. Estimation = Estimated asbestos weight Results reported with "--" is equivalent to no visible asbestos identified using Polarised Light microscopy and Dispersion Staining Techniques.
AT-008	Determination of VOCs sampled onto coconut shell charcoal sorbent tubes, that can be desorbed using carbon disulphide, and analysed by GC-MS.
Inorg-008	Moisture content determined by heating at 105+/-5 °C for a minimum of 12 hours.
Inorg-031	Total Phenolics by segmented flow analyser (in line distillation with colourimetric finish). Solids are extracted in a caustic media prior to analysis.
Inorg-081	Anions - a range of Anions are determined by Ion Chromatography, in accordance with APHA latest edition, 4110-B. Waters samples are filtered on receipt prior to analysis. Alternatively determined by colourimetry/turbidity using Discrete Analyser.
Metals-020	Determination of various metals by ICP-AES.
Metals-021	Determination of Mercury by Cold Vapour AAS.
Org-003	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis.

Method ID	Methodology Summary
Org-003	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis. Note, the Total +ve TRH PQL is reflective of the lowest individual PQL and is therefore "Total +ve TRH" is simply a sum of the positive individual TRH fractions (>C10-C40).
Org-006	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC-ECD.
Org-006	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC-ECD. Note, the Total +ve PCBs PQL is reflective of the lowest individual PQL and is therefore "Total +ve PCBs" is simply a sum of the positive individual PCBs.
Org-012/017	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS and/or GC-MS/MS.
Org-012/017	Soil samples are extracted with dichloromethane/acetone and waters with dichloromethane and analysed by GC-MS and/or GC-MS/MS. Note, the Total +ve reported DDD+DDE+DDT PQL is reflective of the lowest individual PQL and is therefore simply a sum of the positive individually report DDD+DDE+DDT.
Org-012/017	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS and/or GC-MS/MS. Benzo(a)pyrene TEQ as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater - 2013. For soil results:- 1. 'EQ PQL' values are assuming all contributing PAHs reported as <PQL are actually at the PQL. This is the most conservative approach and can give false positive TEQs given that PAHs that contribute to the TEQ calculation may not be present. 2. 'EQ zero' values are assuming all contributing PAHs reported as <PQL are zero. This is the least conservative approach and is more susceptible to false negative TEQs when PAHs that contribute to the TEQ calculation are present but below PQL. 3. 'EQ half PQL' values are assuming all contributing PAHs reported as <PQL are half the stipulated PQL. Hence a mid-point between the most and least conservative approaches above. Note, the Total +ve PAHs PQL is reflective of the lowest individual PQL and is therefore "Total +ve PAHs" is simply a sum of the positive individual PAHs.
Org-014	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS.
Org-016	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater.
Org-016	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater. Note, the Total +ve Xylene PQL is reflective of the lowest individual PQL and is therefore "Total +ve Xylenes" is simply a sum of the positive individual Xylenes.

Result Definitions

NT	Not tested
NA	Test not required
INS	Insufficient sample for this test
PQL	Practical Quantitation Limit
<	Less than
>	Greater than
RPD	Relative Percent Difference
LCS	Laboratory Control Sample
NS	Not specified
NEPM	National Environmental Protection Measure
NR	Not Reported

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.
Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.	
The recommended maximums for analytes in urine are taken from "2018 TLVs and BEIs", as published by ACGIH (where available). Limit provided for Nickel is a precautionary guideline as per Position Paper prepared by AIOH Exposure Standards Committee, 2016.	
Guideline limits for Rinse Water Quality reported as per analytical requirements and specifications of AS 4187, Amdt 2 2019, Table 7.2	

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% – see ELN-P05 QA/QC tables for details; <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals (not SPOCAS); 60-140% for organics/SPOCAS (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Measurement Uncertainty estimates are available for most tests upon request.

Analysis of aqueous samples typically involves the extraction/digestion and/or analysis of the liquid phase only (i.e. NOT any settled sediment phase but inclusive of suspended particles if present), unless stipulated on the Envirolab COC and/or by correspondence. Notable exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, total recoverable metals and PFAS where solids are included by default.

Samples for Microbiological analysis (not Amoeba forms) received outside of the 2-8°C temperature range do not meet the ideal cooling conditions as stated in AS2031-2012.

Report Comments

Asbestos-ID in soil: NEPM

This report is consistent with the reporting recommendations in the National Environment Protection (Assessment of Site Contamination) Measure, Schedule B1, May 2013. This is reported outside our scope of NATA accreditation.

8 metals in soil:

- # Percent recovery is not possible to report due to the inhomogeneous nature of the element/s in the sample/s. However an acceptable recovery was obtained for the LCS.

- ## Low spike recovery was obtained for this sample. Sample matrix interference is suspected. However, an acceptable recovery was obtained for the LCS

TRH Soil C10-C40 NEPM - # Percent recovery for the surrogate/matrix spike is not possible to report as the high concentration of analytes in samples 236229-258 and 259 have caused interference.

Asbestos: Excessive sample volume was provided for asbestos analysis. A portion of the supplied sample was sub-sampled according to Envirolab procedures. We cannot guarantee that this sub-sample is indicative of the entire sample. Envirolab recommends supplying 40-50g (50mL) of sample in its own container as per AS4964-2004.

Note: Samples for testing were sub-sampled from bags provided by the client.

Asbestos-ID in soil: NEPM

This report is consistent with the reporting recommendations in the National Environment Protection (Assessment of Site Contamination) Measure, Schedule B1, May 2013. This is reported outside our scope of NATA accreditation.

PAHs in Soil - # Percent recovery for the matrix spike is not possible to report as the high concentration of analytes in sample 236229-258 have caused interference.

PCBs in Soil - The PQL has been raised due to interferences from analytes (other than those being tested) in sample 236229-259.

The '✓' indicates the testing you have requested. **THIS IS NOT A REPORT OF THE RESULTS.**

Additional Info

Sample storage - Waters are routinely disposed of approximately 1 month and soils approximately 2 months from receipt.

Requests for longer term sample storage must be received in writing.

Please contact the laboratory immediately if observed settled sediment present in water samples is to be included in the extraction and/or analysis (exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, Total Recoverable metals and PFAS analysis where solids are included by default.

TAT for Micro is dependent on incubation. This varies from 3 to 6 days.

Appendix G
