Executive Summary

AECOM Australia Pty Ltd (AECOM) was engaged by Weston Aluminium Pty Ltd (WA) to undertake a Human Health Risk Assessment (HHRA) for a proposed thermal waste processing facility at their existing aluminium recycling and refining facility located at 129 Mitchell Avenue, Kurri Kurri in the Hunter Valley, NSW (the Site). The Site location is shown on **Figure F1** (**Appendix A**), while the Site setting and surrounding land uses is illustrated on **Figure F2** (**Appendix A**).

It is understood that WA is proposing to install a medical and other waste thermal processing facility at the Site in response to a continuing decline within the aluminium and steel sectors and identified growth opportunities in other emerging markets. WA is proposing to process up to 8,000 tonnes per annum of wastes.

The proposal has been declared a State Significant Development (SSD 7396) by the Secretary of the Department of Planning and Environment (DP&E) in accordance with *State Environmental Planning Policy (State and Regional Development) 2011* schedule 1, condition 23 (4) which states that "*Development for the purpose of waste incineration that handles more than 1,000 tonnes per year of waste"*.

An Environmental Impact Statement (EIS) is required to support the application for development consent and addresses the Secretary's Environmental Assessment Requirements (SEARs) which were issued on 16 December 2015 under section 78A(8A) of the *Environmental Planning and Assessment Act 1979*.

The SEARs outlined key issues that must be addressed as part of the EIS, with the SEAR applicable to the HHRA is outlined as follows:

- **Human Health Impacts**: a human health risk assessment that considers the potential adverse effects from human exposure to Project related environmental hazards including noise, air quality and contamination of drinking water conducted in accordance with the enHealth *Environmental Health Risk Assessment: Guidelines for assessing human health risk from environmental hazards (2012).*

This HHRA has been prepared as part of the EIS prepared by AECOM to address the abovementioned SEAR relating to human health impacts associated with the proposed development.

The objective of the HHRA is to assess potential future human health risks to surrounding residents, commercial workers and recreational users resultant from possible exposure to Site-derived environmental hazards associated with the proposed thermal processing facility operation. This included consideration of air quality (i.e. vapour and particulates), noise and vibration, odour and soil and water.

A total of four future operating scenarios were considered as part of the HHRA, as detailed in the table below.

Scenario ID	Scenario Name	Description	Consideration in HHRA
1	Normal Operating Conditions	• Based on standard operating conditions, with the proposed thermal processing plant operating continuously at maximum operational capacity of 800 kg/h. • All existing point sources modelled using average source emission data. • Scenario 1 is considered to be most representative of the future operating conditions with the proposed thermal processing facility.	Chronic health assessment as this scenario was considered to represent conservative operating conditions at the Site.

Scenario ID	Scenario Name	Description	Consideration in HHRA
2	Stack Emission Limits	• Proposed thermal processing plant operating continuously using proposed stack concentration Environment Protection Limits (EPL) detailed in Table 4 of the Air Quality Impact Assessment (AQIA) (AECOM, 2017c) . • All existing point sources modelled using average source emission data. • Scenario 2 is representative of theoretical worst-case impacts using the proposed emission limits and is unlikely to ever occur, and if so unlikely to be for long periods of time.	Chronic and acute health assessments as this scenario was considered to represent maximum operating conditions at the Site, although this is likely to only occur for short periods of time.
3	Battery Recycling Facility	• Modelling of emissions from the proposed adjacent battery recycling facility, using high-level design limit emission concentrations and assumes the battery recycling facility would be operating continuously. • Results of Scenario 3 were then added to the predicted maximum impacts in Scenario 1 to determine the cumulative impacts from operation of the WA plant including the thermal processing plant and the battery recycling facility.	Chronic health assessment as this scenario was considered to represent future cumulative operating conditions at the Site. This scenario was presented as part of the Sensitivity Analysis (**Section 8.0**)
4	Emergency Bypass Operations	• This scenario utilises maximum discharge emission concentrations based on design limits for the operation of the emergency bypass stack during upset plant conditions.	Acute health assessment as this scenario was considered to represent upset operating conditions at the Site.

The Chemicals of Potential Concern (CoPC) considered as part of this HHRA included:

- total suspended particulates (TSP);
- particulate matter (PM), assumed to be emitted as PM_{10} and $PM_{2.5;}$
- carbon monoxide (CO);
- sulfur dioxide (SO_2);
- sulfuric acid mist and sulfur trioxide (SO_3) (expressed as H_2SO_4);
- oxides of nitrogen (NO_x) (expressed as nitrogen dioxide (NO_2));
- chlorine and chlorine compounds (expressed as hydrogen chloride (HCl));
- fluorine and fluorine compounds (expressed as hydrogen fluoride (HF));
- volatile organic compounds (VOCs) (expressed as benzene);

- metals (antimony (Sb), arsenic (As), beryllium (Be), cadmium (Cd), chromium (Cr), cobalt (Co), copper (Cu), lead (Pb), manganese (Mn), mercury (Hg), nickel (Ni), selenium (Se), tin (Sn) and vanadium (V); and
- semi-volatile organic compounds (dioxins and furans).

All air quality data used in the HHRA were derived from dispersion modelling provided in the AQIA (AECOM, 2017c) prepared to support the application for development consent. AECOM has adopted maximum 24-hour average concentrations reported over a year in the chronic health assessments (i.e. Scenario 1 and Scenario 2) and maximum 1-hour average concentrations reported over a year in the acute health assessments (i.e. Scenario 2 and Scenario 4). Additionally, AECOM has undertaken sensitivity assessments to assess chronic risks associated with Scenario 1 and Scenario 3 using maximum 1-hour and 24-hour concentrations, respectively. For both the main and sensitivity assessments, annual dust deposition rates derived from the dispersion modelling were used.

The following human receptors were considered in this HHRA based on the surrounding land uses:

- Off-site low-density residents;
- Off-site commercial workers; and
- Off-site recreational users of open space.

Pathways that have been considered to be complete for the Project and therefore were assessed in the HHRA include:

- Inhalation Pathway Assessment
  - Inhalation of vapours and particulates in indoor and outdoor air (acute and chronic assessments).
- Multiple Pathway Assessment
  - Inhalation of vapours and particulates in indoor and outdoor air (acute and chronic assessments);
  - Inhalation of surficial soil-derived dust in indoor and outdoor air (chronic assessment);
  - Direct contact (i.e. incidental ingestion and dermal contact) with deposited dust (chronic assessment);
  - Ingestion of home-grown fruit and vegetables following dust deposition on soil and plants (chronic assessment);
  - Ingestion of eggs from home-grown chickens residing on the deposited dust (chronic assessment); and
  - Ingestion of breast milk by infants based on mother's intake and maternal transfer (chronic assessment).

The estimated acute and chronic health risks to off-site residents (including an adult, child and infant), recreational users (adult and child) and commercial workers (adult) from all exposure pathways were considered low and acceptable excluding:

- Scenario 1 (Chronic Assessment – Sensitivity Analysis): Inhalation of vapour and particulates in indoor and outdoor air by an off-site resident (adult and child) using 1-hour grid maximum ground level concentrations and inhalation of vapour and particulates in indoor and outdoor air and ingestion of breast milk by an off-site resident (child/infant) using 1-hour maximum ground level concentrations. This scenario is considered to be overly conservative i.e. a resident exposed to the modelled 1-hour maximum concentration of all CoPC, for 24 hours a day, 365 days a year for 30 years, and is unlikely to be realised. AECOM notes that chronic human health risks under Scenario 1 using 24-hour maximum ground level concentrations were low and acceptable.
- Scenario 2 (Chronic Assessment): Inhalation of vapour and particulates in indoor and outdoor air by an off-site resident and ingestion of breast milk by an infant using 24-hour maximum and grid maximum ground level concentrations. The potential risk to off-site residents was predominantly driven by the inhalation of cadmium and nickel in air and consumption of cadmium contained in

breast milk. However, AECOM notes that the potential risk is unlikely to be realised based on the following:

- Stack concentrations for heavy metals in Scenario 2 were calculated using the proposed Type 1 and Type 2 Substances EPL stack concentration limit of 1 mg/m^3 and dividing the total stack concentration by the total number of heavy metals (13). These values were then used to calculate the relevant stack emission rate based on stack emission data. This approach is considered to be conservative and resulted in an overestimated of ground level impacts, especially when compared to Scenario 1;
- The EPCs adopted in Scenario 2 are the maximum 24-hour average concentrations that were predicted over an entire year. Therefore, it is unlikely that off-site residents would be exposed to these concentrations for 24 hours a day, 365 days a year for 30 years;
- Scenario 2 operating conditions are unlikely to ever occur, and if they do, it would only be for short periods of time. Therefore, a chronic health risk under these operating conditions is unlikely to be realised;
- It was assumed that a breast feeding mother is cumulatively exposed to CoPC all exposure pathways; and
- It was assumed that 90% of what is inhaled/ingested by a mother is stored in fat. However it is understood that cadmium is relatively poorly absorbed (2 to 7%) into the body (WHO, 2011) and cadmium levels in human milk are 5-10% of levels in blood (ATSDR, 2012).

While risk estimates were based on a number of assumptions, these were conservative in nature and likely to overestimate actual risk to receptors, as such; it is generally not considered necessary to further refine the assumptions given that the risk estimates were typically below adopted acceptable levels.

These conclusions should be read in conjunction with the data gaps outlined in **Section 3.5**, uncertainties in **Section 8.0** and limitations in **Section 10.0**.

1.0 Introduction

AECOM Australia Pty Ltd (AECOM) was engaged by Weston Aluminium Pty Ltd (WA) to undertake a Human Health Risk Assessment (HHRA) for a thermal waste processing facility at their existing aluminium recycling and refining facility located at 129 Mitchell Avenue, Kurri Kurri in the Hunter Valley, NSW (the Site). The Site location is shown on **Figure F1** (**Appendix A**), while the Site setting and surrounding land uses is illustrated on **Figure F2** (**Appendix A**).

1.1 Background

It is understood that WA is proposing to install a medical and other waste thermal processing facility at the Site in response to a continuing decline within the aluminium and steel sectors and identified growth opportunities in other emerging markets (the Project). WA is proposing to process up to 8,000 tonnes per annum of wastes.

The proposal has been declared a State Significant Development (SSD 7396) by the Secretary of the Department of Planning and Environment (DP&E) in accordance with *State Environmental Planning Policy (State and Regional Development) 2011* schedule 1, condition 23 (4) which states "*Development for the purpose of waste incineration that handles more than 1,000 tonnes per year of waste"*. Additionally, the proposal is also considered a Scheduled Activity under the *Protection of the Environment Operations Act 1997* (POEO Act). Schedule 1, condition 40 of the POEO Act implies that the thermal treatment of 'any quantity' of clinical or related waste is declared to be a scheduled activity. As such an Environment Protection Licence (EPL) issued under the POEO Act will be required.

An Environmental Impact Statement (EIS) is required to support the application for development consent and addresses the Secretary's Environmental Assessment Requirements (SEARs) which were issued on 16 December 2015 under section 78A(8A) of the *Environmental Planning and Assessment Act 1979*. The SEARs outlined key issues that must be addressed as part of the EIS, and the SEAR applicable to the HHRA is outlined as follows:

- **Human Health Impacts**: a human health risk assessment that considers the potential adverse effects from human exposure to Project related environmental hazards including noise, air quality and contamination of drinking water conducted in accordance with the enHealth *Environmental Health Risk Assessment: Guidelines for assessing human health risk from environmental hazards (2012).*

This HHRA has been prepared as part of the EIS prepared by AECOM to address the abovementioned SEAR relating to human health impacts associated with the proposed development. This HHRA has been written in conjunction with the other technical reports required as part of the EIS including:

- AECOM, 2016. *Phase 1 Environmental Site Assessment,* as summarised in Section 15 of the Environmental Impact Statement (EIS), *Weston Aluminium Thermal Waste Processing Project*. AECOM Australia Pty Ltd. 26 August 2016;
- AECOM, 2017a. *Noise Impact Assessment, Weston Aluminium Thermal Waste Processing Project*. AECOM Australia Pty Ltd. 11 April 2017;
- AECOM, 2017b. *Preliminary Hazard Analysis (PHA), Weston Aluminium Thermal Waste Processing Project*. AECOM Australia Pty Ltd. 15 February 2017; and
- AECOM, 2017c. *Air Quality Impact Assessment, Weston Aluminium Thermal Waste Processing Project*. AECOM Australia Pty Ltd. June 2017.

1.2 Objective

The objective of the HHRA is to assess potential future human health risks to surrounding residents, commercial workers and recreational users resultant from possible exposure to Site-derived environmental hazards associated with the proposed thermal processing facility operation. This included consideration of air quality (i.e. vapour and particulates), noise and vibration, odour and soil and water.

The HHRA comprises a chronic assessment with consideration of cumulative risks and an acute assessment during upset or infrequent operating conditions at the Site.

1.3 Framework and Methodology

The HHRA was undertaken in accordance with relevant nationally adopted guidelines for a health risk assessment, including:

- Environmental Health Risk Assessment: Guidelines for Assessing Human Health Risks from Environmental Hazards. Department of Health and Ageing and enHealth Council, Commonwealth of Australia (enHealth, 2012a);
- Australian Exposure Factor Guidance: Guidelines for Assessing Human Health Risks from Environmental Hazards. Department of Health and Ageing and enHealth Council, Commonwealth of Australia (enHealth, 2012b); and
- National Environment Protection (Assessment of Site Contamination) Measure (ASC NEPM) 1999. National Environment Protection Council (NEPC), as amended and in force on 16 May 2013 (ASC NEPM, 2013).

And the following international guidance:

- Health Effects of Municipal Waste Incineration, Chapter 5 - *2,3,7,8 Tetrachlorodibenzo-p-Dioxin in the Agricultural Food Chain: Potential Impact of MSW Incineration on Human Health, Jeffery B. Stevens*, CRC Press 1991; and
- US EPA (2005) Human Health Risk Assessment Protocol (HHRAP) for Hazardous Waste Combustion Facilities, Final September 2005.

1.4 Scope of Work

The scope of work for the risk assessment, in accordance with enHealth (2012a) and ASC NEPM (2013) guidance included the following five stages:

1.4.1 Stage 1: Issue Identification

The purpose of Stage 1 was to identify the problems that the risk assessment needed to address and to establish the context for the risk assessment. It comprises a number of phases, including:

- Review of existing reports applicable to the HHRA (as identified in **Section 3.0**) to determine whether further assessment of potential human health risks was required;
- Consideration of the data quality and identification of any significant data gaps;
- Identification of Chemicals of Potential Concern (CoPC) and determination of whether there are any associated human health hazards;
- Identification of potential on-site source, migration pathways and human receptors linkages; and
- Stating why a risk assessment was required, and the scope and objectives of the HHRA.

This stage included the development of a Conceptual Site Model (CSM) for the Site outlining the source-pathway-receptor linkages. This is further discussed in **Section 4.10**.

The Stage 1 works are provided as **Section 3.0** and **Section 4.0** of the HHRA.

1.4.2 Stage 2: Hazard Identification

During Stage 2, the potential hazards from the CoPC identified in Stage 1, were identified by assessing the potential for adverse health effects from exposure to the CoPC, based on chronic and acute exposures.

This was achieved by undertaking a review of toxicity information published by Australian or international regulatory agencies (e.g. National Health and Medical Research Council (NHMRC), World Health Organization (WHO), Agency for Toxic Substances and Disease Registry (ATSDR), United States Environmental Protection Agency (US EPA)). Toxicity data are provided within each of toxicity profiles presented as **Appendix G**.

The Stage 2 works are provided as **Section 5.0** of the HHRA.

1.4.3 Stage 3: Dose-Response Assessment

The Stage 3 dose-response assessment examines the quantitative relationships between exposure to the CoPC and the associated health effects. The determination of whether there is a hazard is often dependent on whether a dose-response relationship is present. Relevant toxicity values for the identified CoPC were obtained from sources recognised by Australian regulatory agencies in accordance with the hierarchical approach detailed in Section 5.12 of enHealth, 2012a.

Incremental impacts and appropriate slope factors (unit risk factors) were used for compounds where no acceptable “safe” threshold is provided (i.e. carcinogenic compounds). For threshold compounds (i.e. non-carcinogenic compounds), appropriate reference concentrations (RfC) were used following an adjustment for background exposure (see below). It should be noted that some compounds are considered to be both threshold and non-threshold toxicological endpoints, and have been assessed as such.

Background exposure from food, drink, ambient air and consumer products was taken into account for threshold chemicals where levels were established. The consideration of background exposure resulted in the adjustment to the published toxicity data to account for the level which was representative of background exposure. Details of background exposure are provided within each of the toxicity profiles presented as **Appendix G**.

The Stage 3 works are provided as **Section 5.2** of the HHRA.

1.4.4 Stage 4: Exposure Assessment

During Stage 4, AECOM assessed the exposure magnitude, frequency, extent, character and duration for the identified sensitive receptors and the potential exposure pathways.

Appropriate human exposure parameters were selected in accordance with enHealth (2012b) and ASC NEPM (2013).

It was assumed that the concentration of vapours and particulates inside a building was 100% of the level predicted in the outside air.

The Stage 4 works are provided as **Section 6.0** of the HHRA.

1.4.5 Stage 5: Risk Characterisation

Risk characterisation is the qualitative and/or quantitative estimate outcome of the risk assessment. During this stage the nature and potential incidence of adverse health effects to receptors based on comparison of estimated contaminant intake or exposures to relevant toxicity (dose-response) criteria was characterised. The risk estimate for each individual chemical and exposure pathway was summed to produce the cumulative risk estimate for each exposure scenario.

For non-threshold (carcinogenic) CoPC, the incremental lifetime cancer risk estimates for each receptor was compared to an *acceptable* carcinogenic risk level of 1 in 100,000 (1×10^{-5}) (enHealth, 2012a).

For threshold (non-carcinogens) CoPC, potentially *unacceptable* chemical intake/exposure was indicated if the exposure level exceeded the Tolerable Daily Intake (TDI) or Tolerable Concentration (TC) (i.e. if the HQ is greater than 1.0) (enHealth, 2012a).

If the risk acceptability criteria for non-threshold and threshold CoPC were exceeded, a more detailed and critical evaluation of the risk was conducted, or appropriate risk management measures were recommended.

A sensitivity and uncertainty analysis was undertaken that includes a discussion of the key uncertainties associated with the HHRA process and the assumptions adopted for the exposure modelling. The risk estimates should be considered in the context of identified uncertainties.

The Stage 5 works are provided as **Section 7.0** of the HHRA, with the sensitivity and uncertainty analysis provided as **Section 8.0**.

2.0 Site Description and Setting

2.1 Site Description

The Site description details are provided in **Table 1** below.

Table 1 Site Details

Item	Description
Site Identification	Weston Aluminium waste processing facility
Site Address	129 Mitchell Avenue, Kurri Kurri, NSW
Title Identification Details	Lot 796 DP39877
Site Owner	Weston Aluminium
Site Location	**Figure F1**, **Appendix A**
Site Setting and Surrounding Land Uses	**Figure F2**, **Appendix A**
Existing Site Layout	**Figure F3**, **Appendix A**
Proposed Site Layout	**Figure F4**, **Appendix A**
Site Area	9.2 hectares (ha)

The WA Site is zoned as *IN3 Heavy Industrial* under the *Cessnock Local Environmental Plan 2011* (LEP 2011). Development for the purpose of a waste management facility is permissible with consent within this zone.

2.2 Site Location

The Project would be wholly contained within the existing WA Site, which is located within an industrial area between the townships of Kurri Kurri and Weston, approximately 130 km north of Sydney, as illustrated on **Figure F1**, **Appendix A**.

The Site is located within the Cessnock Local Government Area (LGA).

2.3 Surrounding Land Uses

The current land uses surrounding the WA Site are shown on **Figure F2**, **Appendix A**. A description of the surrounding land uses are provided in **Table 2** below.

It is noted that the surrounding land uses are consistent with the land use zonings published in the Cessnock Local Environmental Plan 2011.

Table 2 Surrounding Land Uses

Direction from Site	Land Use
North	Swamp Creek is located adjacent to the northern boundary of the Site. The former Hydro Aluminium Smelter, which ceased operation in October 2012 (currently in care and maintenance), is located approximately 2 km north of the Site and its buffer lands extend to the northern boundary of the Site. The Hunter Expressway runs between these two sites approximately 500 m to the north of the Site. A residence is located approximately 270 m to the north, within the buffer zone of the former Hydro Aluminium Smelter. It is understood that this residence is currently unoccupied; however it has been assumed that this location could be occupied in the future.

Direction from Site	Land Use
East	Swamp Creek is located approximately 500 m east of the Site. The Kurri Kurri wastewater treatment plant is located approximately 800 m east of the Site. A battery recycling facility has been proposed and is currently being assessed for development on land adjacent to the Site.
South	A number of industrial businesses are located south of the Site, including AllightSykes Kurri Kurri to the immediate south, and Alfabs Fibreglass approximately 200 m to the southwest of the Site. The Kurri Kurri residential area is located more than 600 m to the southeast of the Site. The Weston Workers Club is located approximately 900 m southwest of the Site, while Nellie Simm Park is located 600 m south of the Site.
West	The parcel of land to the immediate west of the Site is undeveloped land. A number of industrial businesses are located further to the west, including Central Waste Station approximately 150m and Hunter Valley Tyre and Auto approximately 500 m west of the Site. The Weston residential area is located more than 750 m to the west of the Site.

2.4 Current Land Use

The Site is currently used for the operation of an aluminium refining and recycling facility. Aluminium is recovered through two separate processes at the existing facility:

- Recovery from aluminium dross generated during aluminium smelting;
- Recovery from the re-melt of scrap aluminium; and
- Processing of spent pot lining (SPL) to enable its reuse in industrial and manufacturing processes.

In addition to aluminium and metal recycling activities, WA expanded its capability to process various waste streams through the trial thermal processing of illicit and pharmaceutical wastes. The Site currently operates under two separate Development Consents (a Ministerial Consent (DA-86-04-01) and a Land and Environment Court Development Consent (DA10397 1995)) and an Environmental Protection Licence (EPL 6423).

2.5 Proposed Development

Proposed thermal destruction/processing equipment is to be incorporated into the existing WA facility footprint, using existing access and emission control systems. Proposed plant and equipment would be located within the northern end of the Site with the northern fence line to be extended further north to accommodate the new development (still remaining within WA property boundaries). The location of the Project is shown in **Figure F4, Appendix A**.

The kiln is proposed to be established in an east-west orientation, with enclosed input storage facilities and a dedicated feeding system. The existing Baghouse 5 is to be utilised for emission capture and treatment of process emissions from the proposed plant and equipment before discharge to atmosphere via the existing Stack 5. This emission control system currently services Reverberatory Furnace process emissions, typically operated during one shift per day. A dry-lime scrubber system currently operates in conjunction with Baghouse 5 to treat acid gases and adsorb pollutants (e.g. polycyclic aromatic hydrocarbons (PAHs) and dioxins/furans). It is proposed that this scrubber system be upgraded to incorporate an activated carbon dosing system, with the activated carbon injected at the baghouse entry point. This control technology proposed to be used for the treatment of the process off-gas consists of a dry injection with Fabric Filter into Stack 5. As discussed in the AQIA (AECOM, 2017c), this type of technology is used to treat emissions at similar processing facilities and it is considered to represent best-practice technology that it will be able to effectively control all significant air pollutants to the levels required to ensure compliance with Project requirements.

WA is also seeking changes to some Environmental Protection Licence (EPL) limit for Point 13 (Stack 5) during operation of the proposed thermal construction equipment and would also require a variation to the existing load limit for oxides of nitrogen. WA is not seeking to vary/increase air emission concentration or load limits associated the current operation of the Reverberatory Furnace for this discharge point.

2.6 Proposed Operations

The proposed thermal processing plant (rotary kiln) (refer to **Figure 4**, **Appendix A**) would primarily be used to thermally treat a mixture of medical wastes including general refuse, laboratory and pharmaceutical chemicals and containers, pathological wastes and cytotoxic materials. The plant would also be used to thermally treat smaller quantities of quarantine and other wastes including pitch sludge residues, solvents (non-halogenated) and paints, oily rags and documents.

2.6.1 Operational Equipment

The proposed processing equipment would include:

- Solid waste loader and bin tipper to deliver solid waste materials directly into the primary chamber of the thermal processing plant;
- Primary combustion chamber, consisting of a rotary kiln equipped with a final ash burn out zone;
- Ash discharge system, whereby ash is removed by means of a water seal pit and drag conveyor;
- Secondary combustion chamber, equipped with two natural gas fired burners used to ensure virtually complete breakdown of combustible gases generated in the plants primary chamber and minimise emissions of dioxins and other products of incomplete combustion;
- Emergency bypass for hot combustion gases to be directly vented from the plant to atmosphere during incidents, power failure or other emergency situations. This application would use a separate stack equipped with a fail-safe pneumatically assisted counterweighted insulated stack cap and would be 12.5 metres (m) in height; and
- Waste bin washing machine.

Mitigation equipment for the medical waste facility has been designed specifically for the processing of these wastes and is based on best practice mitigation measures being utilised around the world (most commonly in Europe that has embraced incineration to a higher degree than elsewhere in the world). A review of the best practice has been provided in **Appendix A** of the AQIA (AECOM, 2017c).

2.6.2 Operational Procedure

The Project would generally be operated in the following manner:

- Trucks would deliver wastes to the Site and undergo visual inspection and checking prior to the site accepting waste materials. Waste material is received at the facility in bins in a variety of sizes, typically up to 660L;
- Waste bins would be either moved straight to processing, or if they needed to be temporarily stored prior to processing, moved to the secure storage facility on-site. Depending on the waste type certain wastes would be stored in cold storage e.g. biomedical wastes;
- When ready for processing an operator places a bin within the tipper arm which mechanically tips bins into the shredder. The waste shredder hopper will be surrounded by a metal shield to ensure there is no escape of wastes during deposition. There is no direct contact between the operator and the waste material, i.e. material would not be manually fed into the shredder by hand;
- The shredder would be operated under negative pressure to prevent fugitive or particle emissions during the waste transfer for shredding process. Air drawn from the shredder would be directed back into the incineration process air stream and treated accordingly as part of the plants emission control systems;
- Following shredding, shredded waste material would either be:
    - Conveyed directly to the primary combustion chamber for processing; or

- Placed back in secure storage in a sealed bin until it can be thermally processed.

- To permit the incineration of cytotoxic wastes, or any other wastes streams which are not be shredded (bulk of total inputs), the incinerator feeding system shall also be capable of handling conventional wheeled bins to permit the direct transfer of wastes from the delivery container into the incinerator combustion chamber (kiln). As above, the kiln feeding process is both automated and maintained under negative pressure to eliminate direct contact with wastes or process emissions;
- Following processing waste would result in inert ash (ash would have a general waste classification and not represent a hazard or health risk) and emissions that would be treated through the emissions controls; and
- Processes would be controlled by Programmable Logic Controllers (PLCs) and line monitoring equipment would be in place to monitor and manage the incineration process to ensure the complete combustion of waste materials.

A full and detailed description of the project and how it would operate is provided in Section 6.0 of the project EIS.

2.7 Waste Types and Volumes

As detailed in the Project EIS, the waste is anticipated to be as per **Table 3**.

Table 3 Waste Types and Volumes

Waste Type	Volume by Weight (%)
Medical Wastes	75
Quarantine Wastes	15
Other	10
'Other' waste would potentially comprise a mixture of pitch sludge's (4%), solvents and paints (2%), oily rags (2%) and documents and hard drives (2%) (indicative only).	

It should also be noted that following discussion with the EPA the project does not propose to process electronic waste (E-waste) such as hard drives or other secure electronic storage devices.

It is anticipated that a higher percentage of medical waste would be processed through the facility due to anticipated waste availability and service demand. It is therefore considered that the dispersion model, having been based on medical waste processing results from US EPA AP42 for Scenario 1 is considered representative for the Project.

Despite there being a lack of available representative data for the quarantine and "other" waste streams the following should be considered:

1. Due to the nature of their constituent inputs, it is not expected that other waste streams (e.g. quarantine wastes) would result in emissions above those generated from medical waste processing operations.
2. The dispersion modelling that was undertaken in the AQIA (AECOM, 2017c) is considered conservative in that:
    a. Scenarios 1 was based on US EPA AP42 emissions factors derived from actual emissions data extracted from the medical waste incineration industry; and
    b. Scenario 2 was modelled with emissions at 100% of the proposed stack concentration EPL for 100% of the time. This scenario is considered extremely unlikely to occur in reality and as such the results from the scenario are considered very conservative.
3. Both Scenario1 and Scenario 2 demonstrated compliance with all relevant ground-level air quality concentration criteria.

Regardless of the final ratio of proposed wastes, WA would be required to operate in accordance with its emissions limits as would be enforced through its EPL. This would be verified through the regular independent, NATA-accredited stack emission testing WA already undertakes to demonstrate EPL compliance.

During consultation with OEH and the EPA questions regarding the composition of quarantine wastes were raised. Despite its quarantine designation, this waste stream would be similar in composition (for example plastic content) to the other waste streams proposed for processing. Quarantine waste would be derived from Ports and airports and include materials that have been deemed a quarantine risk by Biosecurity Australia and would also include a range of waste such as from customs amnesty bins at international airports (principally food and beverage wastes).

Prior to the facility accepting any quarantine wastes WA would obtain a licence under the *Biosecurity Act 2015* (Cwth). Quarantine waste would be subject to inspection and subsequent handling and processing procedures in accordance with licencing requirements from Biosecurity Australia. Having engaged with Biosecurity Australia since mid-2016, WA are now at an advanced stage with regards to the necessary site upgrades and procedural development required for licence attainment.

2.8 Site Topography and Drainage

The Site and surrounding land are topographically flat with few distinguishing features. Approximately half of the Site has been developed for the existing operation, with the remainder covered in grass and trees or used for stormwater storage and drainage.

Swamp Creek is the nearest waterway, located approximately 50 m from the northern Site boundary, and generally only flows during times of rainfall. Surface water within the vicinity of the Site is not currently extracted for use by WA. Water used by the existing site operation is provided by the Hunter Water potable water network.

On-site stormwater is collected in stormwater drains and diverted to an on-site wetland area in the northeast of the Site. Underground drainage pipes run from the on-site wetland area to an irrigation area in the west and the water is used to irrigate vegetated areas on the Site. Waste water is disposed of via the Hunter Water wastewater network under a Trade Waste Agreement.

2.9 Soil Types and Properties

On the understanding that the Site comprises cut and fill materials, with the shallow subsurface is likely to comprise fill materials. Information obtained from the Soil Conservation Service of NSW – Singleton Soil Landscape Series Sheet SI 56-1 (1:250 000) (Kovac, M. and Lawrie, J.L., 1991), indicates that the area comprises grey solodic soils in poorly drained areas with yellow solodic soils on better drained slopes.

A review of the Australian Soil Resource Information System found that the Project has an extremely low probability for the occurrence of acid sulfate soils (ASRIS, 2016). This is reinforced by the Cessnock LEP mapping which indicates they site does not site with any Class of Acid Sulfate Soils.

2.10 Regional Geology

The Site is underlain by Palaeozoic, Early Permian sandstone, which makes up the Dalwood Group, Farley/Rutherford/Allandale/Lochinvar Formation (Hunter Coalfield Regional Geology sheet (1:100 000), Department of Mineral Resources). It is primarily compromised of basalt, silty sandstone, siltstone, minor sandstone and marl, and conglomerate, lithic sandstone.

2.11 Regional Hydrogeology

A search was conducted on 29 March 2016, through the NSW Department of Primary Industries Office of Water (NOW) website, for registered groundwater bores within the vicinity of the Site. There were no bores identified to be located within 500 m of the Site. The nearest neighbouring bores, approximately 2 km north north-east of the Site, displayed no groundwater standing water levels (SWLs).

Groundwater within the Site is not currently extracted for use by WA. There are no known groundwater users in the vicinity of the Site and groundwater is unlikely to be used for any anthropogenic beneficial purposes in the vicinity of the Site. The most sensitive identified beneficial user of groundwater in the vicinity of the Site would be existing terrestrial vegetation that has a moderate potential for groundwater interaction, as well as nearby riparian vegetation.

2.12 Meteorological Conditions

The meteorological conditions used in the dispersion modelling are detailed in the *Weston Aluminium Thermal Waste Processing Project Air Quality Impact Assessment* (AECOM, 2016) and are summarised below.

2.12.1 Wind

Wind speed and direction are largely affected by topography at the small scale, while factors such as synoptic scale winds affect wind speed and direction on the larger scale. Wind speed and direction are important variables in assessing potential air quality impacts, as they dictate the direction and distance air pollutant plumes travel.

A wind speed frequency distribution table as well as annual and seasonal wind roses were prepared and the following was noted:

- On an annual basis, the dominant wind direction is from the south west (occurring approximately 12 % of the time), with winds also frequenting from the east (10 % of the time) and west northwest (9 % of the time);
- The annual average wind speed was 2.35 m/s (a light to moderate wind speed), and calm winds (< 0.5 m/s) were found to occur for just over 2 % of the year; and
- Seasonally, the highest average wind speed during 2008 was observed during the winter months (2.55 m/s) and the lowest average wind speed occurred in autumn (1.91 m/s). The occurrence of easterly winds is frequent during spring, summer and autumn, while south westerlies are also common during autumn, winter and spring. During the winter months there is also a predominance of west north-westerly winds.

2.12.2 Stability Class

In dispersion modelling, atmospheric stability describes the rate at which a plume will disperse, represented by typically six classes; A to F (that is, unstable through to stable conditions). For the Site, stability class was calculated by the CALMET meteorological model for each hour in the 2014 calendar year. **Table 4** shows the frequency of occurrence of the stability categories expected in the area.

Table 4 Frequency of occurrence of stability categories at Kurri Kurri (2014)

Atmospheric Stability Class	Category	Frequency of occurrence (%)
A	Very unstable	3
B	Unstable	16
C	Moderately unstable	19
D	Neutral	13
E	Stable	5
F	Very stable	44

The most common stability class was found to be F class (44% of hours). This suggests that the dispersion conditions are such that air emissions will disperse slowly for a significant proportion of the time.

2.13 Existing Air Quality

The NSW Environment Protection Authority (EPA) operates a number of air quality monitoring stations in the Lower Hunter. The closest monitoring station site to the proposed development is located at Beresfield (17 km east of the Site). This station records hourly particulate concentrations (PM_{10} and $PM_{2.5}$) using a Tapered Element Oscillating Microbalance (TEOM), nitrogen dioxide (NO_2) and sulfur dioxide (SO_2). The ambient air quality monitoring data is presented in Section 3.3 of the Air Quality Impact Assessment (AECOM, 2017c) and a summary is presented below:

- Annual average PM_{10} concentrations in 2015 at the Beresfield monitoring station were below the EPA criterion (18.7 µg/m^3 compared to the EPA criterion of 30 µg/m^3);
- Annual average $PM_{2.5}$ concentrations in 2015 at the Beresfield monitoring station were below the NEPM Advisory Standard (7.4 µg/m^3 compared to the NEPM Advisory Standard of 8 µg/m^3);
- Annual average NO_2 concentrations in 2015 at the Beresfield monitoring station were below the EPA criterion (18.5 µg/m^3 compared to the EPA criterion of 62 µg/m^3);
- Annual average SO_2 concentrations in 2015 at the Beresfield monitoring station were below the EPA criterion (2.9 µg/m^3 compared to the EPA criterion of 60 µg/m^3);
- Ground level concentrations for CO are not recorded at the Beresfield EPA monitoring station, however 8-hour averages for CO are recorded at the EPA monitoring station in Newcastle, located approximately 31km southeast of the Site. The maximum 8-hour average for CO recorded at Newcastle in 2015 was below the EPA criterion (1,900 µg/m^3 compared to the EPA criterion of 10,000 µg/m^3);
- No measurements of local Total Suspended Solids (TSP) concentrations were available. In the absence of annual TSP concentration data, the annual PM_{10} concentration can be assumed to be 40% of the annual TSP concentration. This is a conservative approach as per data reported by the NSW Minerals Council (2000). This equates to an annual TSP concentration of 46.7µg/m^3, which is below the NSW EPA criterion of 90 µg/m^3;
- OEH do not currently undertaken ambient air quality monitoring for lead or air toxics. Previous ambient air quality monitoring for air toxics undertaken between 1996 and 2001 indicated low levels of pollutants within the Greater Metropolitan Region (GMR) as such background concentrations of lead and air toxics are not considered to be a primary issue of concern; and
- Ambient hydrogen fluoride ground level concentrations within the study area were examined as part of the earlier study *Weston Aluminium Fluoride Review* (AECOM, 2015). The study reviewed hydrogen fluoride monitoring data recorded by the former Hydro Aluminium plant between 2006 and 2014. Results of the study found that background ground level fluoride concentrations decreased between the period of operation and cessation of smelter operations at Hydro Aluminium in October 2014. Maximum ambient fluoride concentrations during October 2012 – 2014 (i.e. 0.2 µg/m^3 after 7 days, 0.16 µg/m^3 after 30 days and 0.11 µg/m^3 after 90 days), were below the general land use criteria (i.e. 1.7 µg/m^3 for 7 days, 0.84 µg/m^3 for 30 days and 0.5 µg/m^3 for 90 days).

This page has been left blank intentionally.

3.0 Assessment of Data

3.1 Introduction

Air quality and odour data used in the HHRA were derived from dispersion modelling provided in the following report:

- AECOM, 2017c. *Air Quality Impact Assessment, Weston Aluminium Thermal Waste Processing Project*. AECOM Australia Pty Ltd. June 2017.

All air quality data used in the HHRA were derived from dispersion modelling provided in the AQIA (AECOM, 2017c) prepared to support the application for development consent. AECOM has adopted maximum 24-hour concentrations and annual average dust deposition rates in the chronic health assessments (i.e. Scenario 1 and Scenario 2 as described in **Section 4.1**) and maximum 1-hour concentrations in the acute health assessments (i.e. Scenario 2 and Scenario 4 as described in **Section 4.1**).

Additionally, as part of the sensitivity analysis in **Section 8.0**, AECOM has considered maximum 24-hour concentrations maximum and annual average dust deposition rates for a chronic health assessment under Scenario 3 operating conditions and maximum 1-hour concentrations and annual average dust deposition rates for a chronic health assessment under Scenario 1 operating conditions.

Noise and vibration, soil and groundwater and preliminary hazard data considered in the HHRA were provided in the following reports:

- AECOM, 2016. *Phase 1 Environmental Site Assessment,* as summarised in Section 15 of the Environmental Impact Statement (EIS), *Weston Aluminium Thermal Waste Processing Project*. AECOM Australia Pty Ltd. 26 August 2016;
- AECOM, 2017a. *Noise Impact Assessment, Weston Aluminium Thermal Waste Processing Project*. AECOM Australia Pty Ltd. 11 April 2017; and
- AECOM, 2017b. *Preliminary Hazard Analysis (PHA), Weston Aluminium Thermal Waste Processing Project*. AECOM Australia Pty Ltd. 15 February 2017.

An assessment of the abovementioned data is provided below **Section 3.2** (air quality and odour), **Section 3.3** (noise and vibration), **Section 3.4** (soil and groundwater) and **Section 3.5** (preliminary hazard analysis), and any associated data gaps related to the HHRA are discussed in **Section 3.5**.

3.2 Air Quality Impact Assessment, Weston Aluminium Thermal Waste Processing Project

AECOM was commissioned by WA to prepare an air quality impact assessment for inclusion into an EIS of a proposed medical waste thermal processing facility. A Level 2 AQIA was conducted in accordance with the *NSW Approved Methods for Modelling and Assessment of Air Pollutants in NSW* (DEC 2005).

The report provides an assessment of the potential ground level air quality impacts from particulates, sulphur dioxide, oxides of nitrogen, hydrogen fluoride, acid gases, volatile organic compounds (VOC), heavy metals and dioxins and furans from the proposed thermal waste processing plant.

The objective of the AQIA (AECOM, 2017c) was to characterise the proposed facility and to provide an overview of its potential effects on local air quality. Dispersion modelling was undertaken to quantitatively assess the air quality impacts associated with the Site. Four modelling scenarios were considered within the AQIA relevant to the Site as follows:

- Scenario 1 (Normal Operating Conditions): a conservative modelling scenario based on standard operating conditions, with the proposed thermal processing plant operating at a maximum operational capacity of 800 kg/h. This scenario is considered to be the most representative of future operating conditions with the proposed development;

- Scenario 2 (EPL Limits): a theoretical modelling scenario whereby the point source for the proposed thermal processing plant would operate at the maximum stack concentration for each pollutant set by the EPL;
- Scenario 3 (Battery Recycling Plant): to account for the air quality impacts associated with the proposed Kurri Kurri Battery Recycling Facility (BRF), these results were added to the predicted incremental impacts associated with the Site (i.e. Scenario 1) and existing background concentration to determine the cumulative impacts. It is noted that in the HHRA, background concentrations were added to Scenario 1 so cumulative impacts could be assessed; and
- Scenario 4 (Emergency Bypass Operations): utilises maximum discharge emission concentrations based on design limits for the operation of the emergency bypass stack during upset plant conditions. It should be noted that Scenario 4 was modelled for the purposes of the HHRA and was not presented within the AQIA (AECOM, 2017c).

Results of the modelling showed no exceedances of the relevant air quality criteria for all examined pollutants under Scenario 1 and Scenario 2 with the exception to cumulative impacts associated with predicted PM_{10} and $PM_{2.5}$ for both modelled scenarios. This was attributed to elevated background concentration of fine particulates, whereby the maximum 24-hour and annual average background particulate matter concentrations exceeded the EPA criteria. Overall, the Project contribution from the Site was found to be relatively small in Scenario 1 and Scenario 2, and similarly contributions from the adjacent BRF (Scenario 3) were also considered small. Furthermore estimates were considered conservative under 'normal operating conditions' with the thermal treatment plant operating continuously and at the maximum operational capacity of 800 kg/h, instead of intermittently in conjunction with reverb furnace operations.

The total volatile organic compound (VOC) concentration in Scenario 2 was reported well below the most stringent air quality VOC criterion of benzene. As such all VOC emissions would be below the applicable ground level concentration criteria under the proposed EPL limit. It is noted that the NSW EPA criteria for individual toxic air pollutants are based on EPA Victoria design criteria (Victorian Government Gazette 2001). These criteria are set at the lower of their toxicity and odour impact levels and as such compliance with the criteria infers compliance from both a toxicity and odour perspective. On this basis odour impacts are not expected to be a cause for concern from the facility.

In conclusion the results of the assessment indicate there would be no substantial air quality impacts from the operation of the proposed thermal processing plant at WA, and the proposed emission concentrations associated with operation of the plant are unlikely to result in any additional exceedances of local air quality criteria for all pollutants examined.

Further assessment of impacts from air quality on human health has been undertaken as part of this HHRA, refer to **Section 4.0**. It should be noted that the AQIA used 99.9^{th} percentile values in accordance with DEC (2005), while the HHRA conservatively adopted 100^{th} percentile values in accordance with ASC NEPM (2013) and enHealth (2012a).

3.3 Noise Impact Assessment, Weston Aluminium Thermal Waste Processing Project

AECOM was commissioned by WA to prepare a Noise Impact Assessment (Noise Assessment) for inclusion into an EIS for the proposed medical waste thermal processing facility. In preparing this Noise Assessment, the SEARs issued for the Project (SSD_7349) have been addressed as required by Clause 75F of the EP&A Act. The key matters raised by the Secretary for consideration in this noise and vibration impact assessment are:

- A quantitative assessment of potential construction and operational and transport noise and vibration impacts in accordance with the relevant EPA guidelines; and
- Details and justification of the proposed noise mitigation and monitoring measures.

The scope of the assessment included noise measurement surveys, establishing noise and vibration criteria, noise and vibration model predictions for construction and operational scenarios, a noise and vibration impact assessment relative to appropriate criteria and recommendations for noise and vibration control measures where necessary.

This impact assessment addresses the SEARs relating to noise by considering the impact of noise and vibration on nearby noise sensitive receivers during the construction and operational phase of the proposed facility. The noise and vibration assessment was carried out in accordance with NSW regulatory requirements which results in addressing the assessment as follows:

Construction Noise and Vibration

The construction noise and vibration assessment was conducted in accordance with EPA's Interim Construction Noise Guidelines (ICNG) and the EPA's assessing vibration: a technical guideline (AVTG). The noise and vibration assessment associated with the construction phase of the Project, indicates compliance with the ICNG and the AVTG noise and vibration management levels at the nearest residential and commercial receivers.

Construction Road Traffic Noise

The road traffic noise associated with construction activities was assessed in accordance with EPA's NSW Road Noise Policy (RNP) guidelines. The road traffic noise assessment associated with the construction phase of the Facility indicates compliance with the RNP acoustic criteria.

Operational Noise and Vibration

The operational noise and vibration assessment was conducted in accordance with EPA's NSW Industrial Noise Policy (INP) guidelines and the AVTG. The operational noise and vibration impact assessment indicates compliance at all assessment locations during the daytime periods and a minor exceedance during night-time period under conservative, worst-case modelled conditions where noise enhancing meteorology occurs. Due to the conservative nature of the modelling this impact is expected to have a negligible impact on the receiver.

Sleep Disturbance

The sleep disturbance assessment was conducted in accordance with EPA's INP guidelines. The assessment indicates compliance at all assessment locations during the night-time period.

Operational Road Traffic Noise

The road traffic noise assessment was conducted in accordance with EPA's RNP guidelines. The road traffic noise assessment associated with the operational phase of the Facility indicates compliance with the RNP acoustic criteria.

Based on the conclusions of the Noise Assessment, no further assessment of noise impacts on human health has been undertaken as part of this HHRA.

3.4 Phase 1 Environmental Site Assessment, Weston Aluminium Thermal Waste Processing Project

AECOM was commissioned by WA to prepare a Phase 1 Environmental Site Assessment (ESA) for inclusion into an EIS of a proposed medical waste thermal processing facility. The report objective was to conduct a desktop-based preliminary contamination assessment for the proposed facility.

A desktop study was conducted to review the Site and its history, including a review of land titles information, current and historical aerial photography, New South Wales Environment Protection Authority (NSW EPA) and NSW WorkCover Dangerous Goods storage records, and any available documentation regarding environmental practices and/or incidents at the Property/Site, including but not limited to the chemical register and Safety Data Sheets (SDS), asbestos register, environmental management plans or licenses or previous investigation reports and records of environmental investigations and/or incidents.

A Site inspection was also undertaken by AECOM environmental scientists on 8 March 2016 to confirm the current condition of the Site and immediate surrounds approximately 500 m from Site boundary. This inspection comprised of a visual inspection of the main operational areas within the Site and interviews with staff to discuss the historical operation at the Site.

A review of the certificates of title has identified potentially contaminating historical activities at the Site since 1990 when Australian Ultra Concrete Floor Pty Ltd commenced ownership. However, based on the aerial photographs, the potential for contaminating activities is unlikely prior to 1994 as the Site was undeveloped vegetated land prior to that time. According to the aerial photographs, the first sign of development of the Site appears in 1998 and in 2006 for the Site.

Interviews with the Plant Manager and a search of the list of NSW contaminated sites notified to the NSW EPA also indicated that no records applicable to the Site and adjacent land are currently held by the NSW EPA and no anecdotal evidence of historical spills or contamination incidents at the Site. Anecdotal evidence and the Site investigation also revealed that the storage area for finished product was undercover and unlikely to come into direct contact with stormwater and soil. Stormwater from the Site is directed into an on-site wetland area and captured water is irrigated back to vegetated areas on the Property.

This investigation indicated that the areas of potential environmental concern for the Site included the storage and the potential for degradation of metal products (aluminium) on sealed exterior areas of the Site and the potential for uncontrolled fill material to be present under the sealed surfaces of the Site. Additionally, other on-site areas of environmental concern were identified to be:

- Storage and use of batteries and hydrocarbon based chemicals within the maintenance workshop, although it is noted these activities were undertaken on good integrity concrete;
- Storage of diesel from the 10,000 L AST, and use for vehicle refuelling on sealed surfaces in its immediate vicinity;
- Vehicle washing activities in the wash-bay area;
- Parking of vehicles in sealed areas and potential for minor oil/fuel spills; and
- Potentially leaking stormwater drains and sumps.

However, this risk was lowered by current Site management such as bunded areas for storage, conditions of the AST and refuelling systems, the oil-water separator and sealed surfaces. Despite the lack of data to understand the concentrations of contaminants on-site, TPH, BTEX, VOC, PAHs and heavy metals were of potential concern and could be present within soil, groundwater and surface water at the Site. These could potentially impact workers and visitors of the Site, adjacent site users and visitors and Swamp Creek. It was recommended that soil sampling be undertaken at the Site prior to construction to assess contamination status and provide an indicative waste classification. Potential contamination could also be dealt with during the construction phase with a satisfactory Construction Environmental Management Plan; however this approach was associated with a higher level of uncertainty and the potential to delay construction.

In the absence of measured data (e.g. soil, groundwater and surface water), no further assessment of soil and water impacts on human health has been undertaken as part of this HHRA.

3.5 Preliminary Hazard Analysis, Weston Aluminium Thermal Waste Processing Project

A hazard and risk assessment has been conducted for the Project in accordance with the requirements of *State Environmental Planning Policy No 33—Hazardous and Offensive Development* (SEPP 33) and DP&Es relevant Hazardous Industry Planning Advisory Papers (HIPAPs). The objective of the Preliminary Hazard Analysis (PHA) was to assess the project from a hazardous land use planning perspective and ensure that hazards associated with the Project are identified and appropriately mitigated such that the potential for off-site impacts are considered unlikely/acceptable. The PHA reviewed potential hazards associated with Class 2, 3, 6, 8 and 9 and maximum threshold quantities of the anticipated types of hazardous materials stored at any one time were estimated.

The PHA focused on the Project itself, however a cumulative assessment of risks at the Site was also undertaken. Previous hazard and fire safety studies have been conducted for the existing operations and facilities on the Site.

The Project operations will introduce additional storage and handling of dangerous goods and hazardous chemicals in the form of wastes to be thermally treated. WA plans to process the following wastes at its proposed thermal processing plant. The corresponding NSW EPA waste codes are also included in parentheses:

- Clinical and related wastes NOS (R100);
- Pathogenic substances (R110);
- Wastes from the use of pharmaceutical products NOS (R120);
- Cytotoxic substances (R130);
- Waste from the production, preparation and use of pharmaceutical products NOS (R140);
- Waste chemical substances arising from research and development or teaching activities, NOS which are new or unidentified substances with unknown human health or environmental effects (T100);
- Solvents (non-halogenated) and Paints;
- Pitch sludge residues;
- Oily rags; and
- Documents (data-based wastes).

Biomedical waste would be the key wastes managed, however other types of wastes could include:

- Quarantine wastes, usually received from international ports (shipping and air);
- Security wastes, including confidential documents;
- Illicit materials, including drugs; and
- Miscellaneous scheduled wastes, including obsolete materials.

Additional hazardous chemicals such as diesel and natural gas are used for services supply.

Following a preliminary risk screening, Class 6.1 Toxic and 6.2 Infectious substances were identified as the key potential hazard sources. One example was loss of containment of toxic emissions due to leak/hole in equipment or equipment failure resulting in an emergency release. The bag house emissions control system is robust and has proven to effectively mitigate the risk of emissions. Additionally, a number of safeguards as listed in Appendix A of the PHA report (e.g. baghouse fitted with particulate monitoring systems and high differential pressure detection to activate bag pulsing and cleaning processes, updated environmental management systems and baghouse 5 to treat exhaust gases from the furnace) are in place to prevent such an event from occurring or mitigating the possible effects.

Other potential control measures/environmental safeguards were identified in Section 6.0 and Appendix A of the PHA report to manage storage and handling of dangerous goods and hazardous chemicals during the design, construction, operation and post-closure of the Project. These safeguards would be implemented on a project phase basis and not a scenario basis i.e. all operations safeguards would be in place for the duration of operation. Overall, due to the locational, technical, operational and organisational safeguards employed, the Project is not considered to pose a significant risk.

Based on the conclusions of the PHA, no further assessment of hazards on human health has been undertaken as part of this HHRA.

3.6 Data Gaps

Some data gaps which may impact the HHRA were identified based on a review of the available reports and data. Identified data gaps and the manner with which they have been addressed are summarised in **Table 5**.

This page has been left blank intentionally.

Table 5 Data Gaps

Data Gap	Potential Significance	Addressed in HHRA
Inherent uncertainty of air dispersion modelling	**Moderate**: Conservatism of the air quality data. Models predict maximum concentrations for any specific set of input data (say on a one hour basis), i.e. they predict the maximum concentrations that would result from a large set of observations under the specific conditions being modelled. However, for any specific hour with those exact maximum hourly conditions, the predicted ground level concentrations will never exactly match the actual pattern of ground level concentrations, due to the effects of random turbulent motions and random fluctuations in other factors such as temperature.	The HHRA has adopted 24-hour maximum concentrations over a year period based on meteorological data from a representative year to be representative of overall conditions and to account for some of the uncertainty associated with dispersion modelling. Additionally, the 1-hour maximum concentrations were considered as part of the sensitivity analysis presented in **Section 8.0**.
It is not known when the Site will be operational (e.g. when feedstock is available) or non-operational (e.g. when feedstock in available or during periods of cleaning/maintenance)	**Low**: No data available It is understood that the Site will operate intermittently in conjunction with reverb furnace operations.	The HHRA (and AQIA) conservatively assumed that the Site will operate continuously for 24 hours per day, 7 days per week. It also assumes that all seven source stacks will be operational concurrently. Therefore, if the Site was to be non-operational for periods, the air quality impacts are likely to decrease.
Longer term averaging periods (e.g. 24-hour or annual) have not been included in the upset operating conditions assessment.	**Low**: Not assessed The upset operating conditions assessment only considered short-term averaging periods (less than 4-hours).	As upset operating conditions would not continue for greater than 4-hours, the assessment of short-term averaging periods does not impact the HHRA.

Data Gap	Potential Significance	Addressed in HHRA
All CoPC not assessed for each future operating condition scenario (detailed in **Section 4.1**).	**Moderate**: No data available As discussed in **Section 4.4**, not all CoPC were assessed in each of the operating scenarios for reasons such as: • Co, Se, Sn, V and VOCs in Scenario 1 as these were not listed in the *AP 42 Compilation of Air Pollutant Emission Factors* (US EPA 1995). • SO_2, HF and Cu in Scenario 2 as there are no prescribed limits for the plant available in Schedule 4 of the Protection of the Environment Operations (Clean Air) Regulation 2010 (POEO Clean Air Regulation). • CO, SO_3, HCl, HF, VOCs, metals (excluding lead) and dioxins and furans in Scenario 3 as no emission data were available for the BRF. • $PM_{2.5}$, PM_{10}, CO, H_2SO_4, VOCs in Scenario 4 as no emission data was available in design information for the emergency bypass stack.	Where data was available, the CoPC was included in the assessment of the future operating scenario. However, where data was not available, these CoPC could not be included in the assessment. It should be noted that each CoPC listed in **Section 4.4** was assessed at least once in the HHRA under different operating scenarios. If emission data or prescribed limits become available in the future, the HHRA may need to be revised.
Potential future changes of land use surrounding the Site to more sensitive uses.	**Moderate:** Identification of potential human receptors was based on a review of the Cessnock LEP, 2011. If these land uses were to change to more sensitive uses, the risk profile to off-site receptors would likely increase.	To address any sensitive land use changes in the future, the HHRA includes an assessment using the grid maximum ground level concentration i.e. the highest 24-hour annual average (chronic) and 1-hour maximum (acute) ground level concentrations reported from the dispersion modelling. Adopting grid maximum concentrations ensures that the most sensitive receptor is being assessed with a 'worst-case' exposure point concentration.

Data Gap	Potential Significance	Addressed in HHRA
Emission data not available for a chemicals that may be present within the processed waste or that may be generated and emitted during the incineration process	**Moderate**: No data available All potential CoPC not assessed which could result in an underestimated assessment of the potential risk to human health.	A review of emission data from comparable facilities in Australia (including ACE Waste in QLD and Sterihealth in NSW) was undertaken as part of the development of the AQIA emissions inventory. Although there were emissions data available for the Sterihealth facility (10 stack testing pollutants), the context of the data was not available i.e. full stack testing report was not available including throughput at the time of testing, waste type being processed during testing etc) and as such it was considered unsuitable for use in the AQIA (AECOM, 2017c). Emission factors provided by AP42 for incineration operations were adopted for the modelling assessment. The AP42 emission factors are by their nature considered to be conservative (due to the assumptions made when developing the emission factors) and considered to be a robust estimation of the expected operational emissions from the facility.

Data Gap	Potential Significance	Addressed in HHRA
Emission data not available to assess odour emissions	**Low**: Assessed qualitatively Odour emissions not quantitatively assessed in the HHRA.	Given the control mechanisms in place for the handling of the waste i.e. cold storage and bagged material received and either stored unopened or immediately sent to the kiln or shredder (which are under negative pressure), the potential for odour prior to the shredder is considered to be low. Following shredding the medical waste material is either sent directly to the combustion chamber or sent back for cold storage. On this basis, it is considered that the potential for fugitive odour emissions is low. However, a qualitative assessment of odour was undertaken as part of the AQIA whereby VOCs (i.e. the most comment cause of odour concerns) were modelled at the Clean Air Regulation (CAR) limit. This assessment demonstrated compliance with the ambient limits for VOC, which by inference addresses the concerns relating to odours (refer to the AQIA (AECOM, 2017c) and **Section 3.2** of the HHRA). Therefore, additional system requirements and ongoing energy use required to ensure the entire building is under negative pressure is not considered to be necessary for this facility.
Emission data not available to assess fugitive emissions	**Low**: Assessed qualitatively Fugitive emissions not quantitatively assessed in the HHRA.	Fugitive emissions from the WA facility are expected to be minimal. All major sources or emissions are covered with extraction systems which are vented through emission control devices, and this is true of the proposed medical waste facility which has dual emission control system incorporated into its operation i.e. carbon injection and fabric filter collection for pollutant adsorption and capture.
No transfer factor from chicken to eggs available for vanadium	**Low –** No chemical data available Vanadium not considered in the ingestion of eggs pathway	With reference to the vanadium toxicity profile prepared by ATSDR (2012), the mean concentration of vanadium measured in eggs (0.3 µg/100g) is typically less than other food items (maximum of 1.0 µg/100g in meat/fish/poultry and 2.3 µg/100g in grains). This suggests that the transfer of vanadium from chickens to eggs is likely to be minimal. Therefore, the absence of a transfer factor for vanadium is unlikely to significantly affect the outcomes of the HHRA.

Data Gap	Potential Significance	Addressed in HHRA
No assessment of consumption of chickens has been undertaken	**Low** – Not considered to be a significant pathway Excluding potentially complete exposure pathways may result in an underestimated assessment of the potential risk to human health.	The Site is located within a predominantly industrial area with residents that may keep chickens located approximately 600 m for the Site. Given the residential area is low-density and not agricultural, similar to the assumptions made in the ASC NEPM (2013), pullet chickens are considered to be kept for egg production and not for consumption purposes.
No plant uptake factors available for lead	**Low –** No chemical data available Lead not considered in the ingestion of fruit and vegetable pathway.	IARC (2006) has noted that plant uptake of lead from soil is low due to the low bioavailability of lead in soil and its poor translocation from the root to the shoot (ASC NEPM, 2013). In the HHRA, it has been assumed that the small amount of lead that may be taken up into home-grown produce is likely accounted for in the consideration of intakes from the diet (i.e. background).

Data Gap	Potential Significance	Addressed in HHRA
No assessment of vapour-to-leaf transfer of chemicals to edible plants or dust deposition onto plants.	**Low -** Not considered to be a significant contaminant transport pathway -	Root uptake was considered in the HHRA as this was considered to be the most significant transport pathways given the nature of most contaminants. Additionally, there is a potential for dust containing bioaccumulative CoPC to deposit onto and be up taken by plants including dioxins and furans (Hattemer-Frey et. al. 1991)). Therefore this contaminant transport pathway has been included in the assessment. Vapour-to-leaf transfer was not considered to be a significant accumulation pathway as bioaccumulative CoPC considered in the multiple pathway assessment are not volatile (based on the henry's law constant and vapour pressure) and therefore unlikely to be present in 'air' in the vapour phase. This is further supported by the dispersion modelling results whereby negligible concentrations of non-volatile CoPC (e.g. metals and dioxins/furans) were reported in air across the grid. Therefore, with negligible concentrations of bioaccumulative CoPC in air, this is not likely to be a significant pathway of concern.

4.0 Issue Identification

4.1 Scenarios Considered in the HHRA

4.1.1 Future Operating Conditions

A total of four scenarios were discussed as part of AQIA (AECOM, 2017c). These scenarios are for future operating conditions and are described in **Table 6**.

Table 6 AQIA Scenarios

Scenario ID	Scenario Name	Description
1	Normal Operating Conditions	• Based on standard operating conditions, with the proposed thermal processing plant operating continuously at maximum operational capacity of 800 kg/h. • All existing point sources modelled using average source emission data. • Scenario 1 is considered to be most representative of the future operating conditions with the proposed thermal processing facility.
2	Stack Emission Limits	• Proposed thermal processing plant operating continuously using proposed stack concentration EPL detailed in Table 4 of the AQIA. • All existing point sources modelled using average source emission data. • Scenario 2 is representative of theoretical worst-case impacts using the proposed emission limits and is unlikely to ever occur, and if so unlikely to be for long periods of time.
3	Battery Recycling Facility (Cumulative Impacts)	• Modelling of emissions from the proposed adjacent battery recycling facility, using high-level design limit emission concentrations and assumes the battery recycling facility would be operating continuously. • Results of Scenario 3 were then added to the predicted maximum impacts in Scenario 1 to determine the cumulative impacts from operation of the WA plant including the thermal processing plant and the battery recycling facility.
4	Emergency Bypass Operations	• This scenario utilises maximum discharge emission concentrations based on design limits for the operation of the emergency bypass stack during upset plant conditions.

For the assessment of chronic human health risks, AECOM has used representative long-term air quality data from Scenario 1 as this is considered to represent 'normal' operating conditions at the Site. Additionally, AECOM has quantitatively assessed chronic exposures to Scenario 2 as this is considered to represent 'worst case' operating conditions at the Site.

For the assessment of acute human health risks, representative short-term air quality data from Scenario 4 was used as this was considered to represent upset operating conditions at the Site.

Sensitivity assessments were also undertaken using representative short-term air quality data from Scenario 1 and long-term air quality data from Scenario 3 (refer to **Section 8.0)**.

It is noted that general background air quality conditions were not included in any of the above modelled scenarios in the AQIA (AECOM, 2017c), excluding consideration of the proposed BRF in Scenario 3.

In accordance with ASC NEPM (2013), background concentrations of chemical substances should be understood and incorporated into the HHRA to ensure cumulative risks are being assessed. Therefore, measured background concentrations reported from the closest EPA monitoring station (i.e. Beresfield monitoring station located approximately 17 km from the Site) were added to the air quality data, as presented in **Appendix B**.

Potential human health risks to on-going commercial workers and visitors to the Site should be addressed in accordance with NSW Work Health and Safety (WHS) Regulations and have therefore not been considered further as part of this HHRA.

4.1.2 Future Construction Conditions

As per Section 4.1 of the AQIA (AECOM, 2017c), construction activities associated with the Project have the potential to generate dust due to exposed soils, and generate emissions from plant, machinery and vehicles. Civil works are expected to take several months and be restricted to a relative small area within the confirmed of the WA site, therefore potential construction air quality impacts would be minor. Standard construction air quality management measures would provide a suitable level of management and should be incorporated into the Project Construction Environmental Management Plan (CEMP).

4.1.3 Emission Data

All non-Project related emissions were modelled using average source emission data. The use of an average emission rate is considered more appropriate than using a maximum emission rate from each source as it does not represent the facility operating at normal operating conditions, which varies in terms of throughput, material composition and process schedules. It is not considered plausible for the plant to operate at its maximum rate for 365 days per year, 24 hours per day due to the cyclical nature of the process (unloading and loading furnace etc.) and schedules shutdown and maintenance periods.

To confirm whether this assertion could be considered as an overestimation even at its average emission rates, the potential for the existing stacks to operate concurrently was sought from WA. The current facility operations operate as follows:

- Stack 1 OR Stack 5 - Depending upon whether Rotary Furnaces are operating (Stack 1) or Reverb Furnace (Stack 5), but WA do not currently have the workload demand (or staff) to operate all furnaces simultaneously;

  Note: for the proposed 'Medical & Other Waste Processing' plant, both Stacks 1 and 5 may ultimately be operated concurrently for part of the month;

- Stack 2 - only operational for short periods, typically when dross/SPL deliveries occur to Front Bays within the Main Plant Building;

- Stack 3 OR Stack 4 - depending on which MRM-Cooler is operational. Not operated simultaneously;

- Stack 6 - only actively servicing 'Holding Side' of the Reverb Furnace when remelt and casting occurs (and when a heel may be held); and

- Stack 7 - typically operated for 1 or 2 x 8 hr shifts per day on a shift rotation (day, afternoon and night intervals) depending upon Crushing Plant and Briquetting Plant demand.

Based on this description, it is clear that the facility operating with all stacks emitting pollutants concurrently is an overestimate and the assumption that the facility operates 24 hours per day, 365 days per year is also considered to be highly conservative. However, as the plant could physically operate (regardless of lack of feed, maintenance downtime etc.) it has been modelled as such to allow the emissions to be included as background. The use of the average emissions is considered a realistic factor considering the nature of the operations over the year.

4.2 Contamination Sources

The proposed operation of the Site has been described in detail, including emission sources, air emission controls and potential emission concentrations in the AQIA (AECOM, 2017c).

Emission sources identified at the Site include eight emission stacks (Stack 1 to Stack 8). Stack 1 to Stack 7 have been included in the chronic risk assessment (Scenario 1 and Scenario 3), while the bypass stack (Stack 8) that is only operational in emergencies, has been included in the acute risk assessment (Scenario 4). Although Scenario 2 was assessed via an acute exposure pathway, proposed EPL limit emissions were from Stack 1 to Stack 7 as this is not an emergency condition that would require use of Stack 8.

The stack parameters for each of the eight modelled stacks are described in **Table 7**.

Table 7 Potential Sources of Contamination

Stack ID	Diameter (m)	Flow Rate (Nm^3/s)	Velocity (m/s)	Temp (K)	Height AGL (m)	MGA 56 Coordinates (m)	
						X	Y
Stack 1	1.65	24.4	26.0	349.3	15	357265	6369322
Stack 2	1.265	13.7	22.9	302.4	15	357310	6369262
Stack 3	1.0	8.9	23.9	305.2	15	357310	6369272
Stack 4	1.395	22.7	31.8	312.4	15	357314	6369296
Stack 5	1.49	21.4	18.8	423.2	30	357347	6369347
Stack 6	0.58	1.9	21.9	557.6	18	357302	6369325
Stack 7	1.5	29.5	35.1	301.4	15	357325	6369226
Stack 8	1.1	4.2	19.2	1173.2	12.5	357326	6369358

For the purposes of the HHRA, the emissions associated with each source (i.e. Stack 1 to Stack 7) have been conservatively evaluated as occurring concurrently for 24 hours a day seven days per week.

4.3 Data Used in the HHRA

The AQIA provides details of the air dispersion modelling methodology and results of the AQIA (AECOM, 2017c). The AQIA included modelling of relevant contaminants during the operation of the Site (contaminants identified in **Section 4.4**) and estimating representative ground level for each CoPC and deposition rates at each human receptor for use in the HHRA. The air quality modelling approach undertaken is summarised in **Section 3.2**. As previously discussed, the air quality modelling undertaken is conservative as it is assumed that the thermal treatment plant is operating continuously and at the maximum operational capacity of 800 kg/h, instead of intermittently in conjunction with reverb furnace operations.

4.3.1 Chronic Health Assessment (Scenario 1 and Scenario 2)

In the chronic HHRA (Scenario 1 and Scenario 2), 24-hour maximum annual average ground level concentrations at each receptor (i.e. residential, recreational and commercial) and grid maximum concentrations (discussed in **Section 4.3.3**) were adopted as these were considered to represent current and future off-site human exposure conditions. The '24-hour maximum annual average concentration' is the maximum value (concentration) of the 24-hour averages that were predicted over an entire year. The 'grid maximum' is the highest concentration reported from all arbitrary gridded receptors.

For non-volatile CoPC, annual average and grid maximum dust deposition rates[1] (as mg/m^2/year) were adopted based on the established relationship between the anticipated source concentrations under typical operating conditions and the dust deposition annual average concentration. The deposition rates were used to determine what concentrations may deposit onto soil and therefore be present via a number of additional exposure pathways other than inhalation. The deposition modelling realistically assumes dry (as opposed to wet) deposition and is estimated in CALPUFF using a multi-layer resistance model (Earth Tech, 2000). Dry deposition entails gravitational settling, impaction and diffusion to surfaces and results in greater dispersion (i.e. emissions travel further) than wet deposition which "washes out" airborne emissions. Given dust emissions from the Site are expected to be low and that the area does not receive high amounts of rainfall, the consideration of only dry deposition is appropriate for the purposes of this assessment.

Sensitivity assessments (**Section 8.0**) were also undertaken to assess the chronic health risks associated with:

- Scenario 1 using 1-hour maximum annual average and grid maximum ground level concentrations and annual average and grid maximum dust deposition rates. The '1-hour maximum annual average concentration' is the maximum value (concentration) of the 1-hour averages that were predicted over an entire year; and
- Scenario 3 using 24-hour maximum annual average and grid maximum ground level concentrations and annual average and grid maximum dust deposition rates.

4.3.2 Acute Health Assessment (Scenario 4)

In the acute HHRA (Scenario 4), 1-hour maximum annual average ground level concentrations and grid maximum concentrations (discussed in **Section 4.3.3**) were adopted as these were considered to represent worst-case off-site human exposure conditions.

In the first instance, the acute health assessment comprised a Tier 1 screening assessment using modelled air concentrations.

A sensitivity assessment (**Section 8.0**) was also undertaken to assess the acute health risks associated with Scenario 2 using 1-hour maximum annual average and grid maximum ground level concentrations and annual average and grid maximum dust deposition rates.

4.3.3 Grid Maximum Locations

As expected, the locations where grid maximum concentrations were reported differed between each scenario modelled, the CoPC and the averaging period assessed i.e. 1 hour and 24 hour averaging periods. However, it is understood that all grid maximum concentrations were reported within commercial/industrial land nearby the Site.

4.3.4 Summary of Data Used in the HHRA

A summary of the data used in the HHRA is provided in **Table 8**. Contaminant concentration and dust deposition data are presented in **Appendix B**.

[1] Given that particulate matter less than 2.5 micrometres are not readily affected by gravitational settling, to generate a non-zero outcome, deposition modelling was completed based on an assumption that all particulate matter is released within the 10 micrometre (PM_{10}) size fraction. This is considered conservative for deposition purposes, and in reality the particulate is anticipated to lie within the $PM_{2.5}$ size fraction. Deposition estimates were derived through conventional atmospheric dispersion modelling, using the assumption of particulate in the 10 micrometres in aerodynamic diameter

Table 8 Summary of Air Quality Data used in the HHRA

Scenario	Health Impact	Air Data	Dust Data
Scenario 1	Chronic (Sections 4 to 7) Chronic (Sensitivity, Section 8.0)	24-hour receptor maximum and 24-hour grid maximum GLC 1-hour receptor maximum and 1-hour grid maximum GLC	Annual average dust deposition rates
Scenario 2	Chronic (Sections 4 to 7)[1] Acute (Section 4.12)	24-hour receptor maximum and 24-hour grid maximum GLC 1-hour receptor maximum and 1-hour grid maximum GLC	Annual average dust deposition rates -
Scenario 3	Chronic (Sensitivity, Section 8.0)	24-hour receptor maximum and 24-hour grid maximum GLC	Annual average dust deposition rates
Scenario 4	Acute (Section 4.12)	1-hour receptor maximum and 1-hour grid maximum GLC	-

Notes:
GLC – ground level concentrations
1. Scenario 2 is representative of theoretical worst-case impacts using the proposed emission limits and is unlikely to ever occur, and if so unlikely to be for long periods of time. Therefore an assessment of chronic health risk is considered to be overly conservative and unlikely to be realised.

4.4 Chemicals of Potential Concern

Chemicals of potential concern (CoPC) are those chemicals which are suspected to be emitted from the sources at concentrations that may present a risk to human health. The prime objective of identifying CoPC is to focus the HHRA on assessing chemicals that have the potential to significantly contribute to risks to human health.

There are a range of CoPC that may be emitted from this type of facility (all emitted through Stack 5 for the Weston operations). The CoPC have been identified through an approach that examined a range of data sources including the following:

- Publically available emission factor sources (Air Pollutant 42 (AP42) Chapter 2, Section 3);
- Publically available stack emissions data from similar facilities (Sterihealth stack emissions data from the company website);
- Relevant publically available NSW Environmental Protection Licence(s) for similar facilities (Sterihealth EPL 6156[2]); and
- Advice from manufacturers experienced in the construction and operation of Thermal Treatment facilities for Medical Waste (Advanced Combustion Engineering). It should be noted that direct data from other medical waste facilities could not be utilised or referenced in this report due to data on emissions being commercial in confidence for the other facilities. Designers of the system are highly experienced and have designed and installed most of the medical waste facilities in Australia.

Based on the analysis outlined above, the list of CoPC that may be emitted from this facility is as follows:

- Total suspended particulates (TSP) (assessed as PM_{10} and $PM_{2.5}$);

[2] It should be noted that the Daniels Health plant would likely have higher emissions (SteriHealth 2015) than the proposed development attributed to both the size of the plant and control measures employed, which is limited to a wet scrubber installed in 1994 (DoE 2015).

- Particulate matter (PM), assumed to be emitted as PM_{10} and $PM_{2.5}$;
- Carbon monoxide (CO);
- Sulfur dioxide (SO_2);
- Sulfuric acid mist and sulfur trioxide (SO_3) (expressed as H_2SO_4);
- Oxides of nitrogen (NO_x) (expressed as nitrogen dioxide (NO_2));
- Chlorine and chlorine compounds (expressed as hydrogen chloride (HCl));
- Fluorine and fluorine compounds (expressed as hydrogen fluoride (HF));
- Total volatile organic compounds (VOCs) (conservatively assumed to only comprise benzene);
- Metals (antimony (Sb), arsenic (As), beryllium (Be), cadmium (Cd), chromium (Cr), cobalt (Co), copper (Cu), lead (Pb), manganese (Mn), mercury (Hg), nickel (Ni), selenium (Se), tin (Sn) and vanadium (V); and
- Semi-volatile organic compounds (dioxins and furans).

4.5 Potential Contaminant Transport Pathways

Potential transport mechanisms by which unmitigated CoPC may migrate off-site are summarised in **Table 9**.

Table 9 Potential Contaminant Transport Pathways

Transport Mechanism	Comments	Likelihood or Significance
Release of vapours and particulates to ambient air from the Site	Vapours and particulates may be emitted to the atmosphere via eight stacks (identified in **Section 4.2**).	Potentially Medium-High as dispersion modelling has indicated that vapour and particulates released from the on-site sources (i.e. stacks) are being reported at off-site receptor locations. This is the case for each future operating scenario (i.e. Scenario 1 to Scenario 4). It has been conservatively assumed that all CoPC are released as a vapour, volatile or not, to assess the cumulative risk associated with emissions.
Deposition of particulates (dust) onto off-site soils	Dust emitted from the Site may settle from the atmosphere onto exposed off-site soils.	Potentially Medium-High as dispersion modelling has indicated that dust (or non-volatile particulates) is emitted from on-site sources (i.e. stacks). Particulates have been detected in the atmosphere at or around the Site (refer to **Section 2.13**) likely attributed to the Site and background conditions. Low-density residential, recreational and commercial land has been identified nearby the Site where exposed soil may be present (refer to **Section 4.6**).

Transport Mechanism	Comments	Likelihood or Significance
Uptake of chemicals by home-grown produce (i.e. fruit and vegetables) from off-site soils and deposited dust	Following deposition of dust onto off-site plants and soils, home-grown produce may uptake chemicals active adsorption (see further discussion below regarding vapour-to-leaf transfer).	Low-density residential land where home-grown produce could be present has been identified nearby the Site (refer to **Section 4.6**).
Uptake of chemicals by poultry (chickens) from off-site soils and transfer to eggs	Following deposition of dust onto off-site soils, chickens may uptake chemicals present in soil via ingestion.	Refer to deposition of particulates discussion above. Low-density residential land where chickens could be present has been identified nearby the Site (refer to **Section 4.6**).
Uptake of chemicals by grazing flora (i.e. grass) from off-site soils and ingestion by grazing fauna (i.e. sheep and cattle).	Following deposition of dust onto off-site soils, sheep and cattle may uptake chemicals present in grazing flora.	Refer to deposition of particulates discussion above. Low-density residential land where sheep and cattle could be present has been identified nearby the Site (refer to **Section 4.6**).

Other transport mechanisms e.g. leaching from soil to groundwater or surface water, transport of leached contamination within groundwater, volatisation and vapour migration from surface and subsurface media, are not considered in this HHRA in the absence of measured soil, groundwater and surface water data. However, these transport mechanisms are unlikely to be significant as the primary on-site sources of contamination are considered to be the stacks i.e. emission of dust and particulates to ambient air.

The contaminant mass that may leach from soil is likely to be minimal given the nature of the contaminants. The organic contaminants (i.e. dioxins/furans) have high soil organic carbon-water partitioning coefficients (Koc) (i.e. 249000 L/kg), indicating they are less mobile and likely to bind to the soil. The inorganic contaminants (i.e. metals) have elevated distribution coefficients (kd), ranging from 2.1 L/kg to 1000 L/kg, indicating they are unlikely to partition to water.

As a result of the above, subsurface media is unlikely to be impacted by the operations at the WA facility via leaching from soil..

Vapour-to-leaf transfer was not considered to be a significant accumulation pathway as bioaccumulative CoPC considered in the multiple pathway assessment are typically not volatile (based on the henry's law constant and vapour pressure[3]) and therefore unlikely to be present in 'air'. This is further supported by the dispersion modelling data whereby concentrations of volatile contaminants are negligible in air (e.g. dioxins and furans).

4.6 Potential Off-site Human Receptors

Based on a desktop review of surrounding land use zoning undertaken by AECOM (Cessnock LEP, 2011), potential off-site human receptors were identified to be:

- Off-site low-density residents;
- Off-site commercial workers; and
- Off-site recreational users of open space.

[3] Based on Schedule B2 ASC NEPM (2013) where a CoPC is considered to be sufficiently volatile if its Henry's law constant is greater than 1 x 105 atm m3/mol and the vapour pressure is greater than 1 mm Hg at room temperature

Off-site low-density residents including schools (i.e. Kurri Kurri High School) are located approximately 600 m to the southeast and 750 m to the west of the Site boundary and therefore may be exposed to vapours and particulates emitted from the proposed development. All residential receptors were assumed to be at ground level. AECOM has conservatively assumed that low-density residents have gardens/accessible soil and home-grown produce which accounts for 100% of their fruit and vegetable intake.

Additionally, AECOM conservatively assumed that residents may keep poultry and ingest 100% of their eggs from kept poultry. It is not considered that residents will consume poultry, rather for egg production in a domestic backyard as it is noted that pullets which lay eggs are not for consumption purposes. Furthermore, no chicken farms were identified within the Kurri Kurri area. Therefore no assessment of chicken consumption has been undertaken.

No paddocks hosting sheep or cattle were identified within 2 km of the Site. Therefore, no assessment of beef or lamb consumption has been undertaken.

Off-site commercial workers are located around the Site and therefore may be exposed to vapours and particulates emitted from the Site. All commercial receptors were assumed to be at ground level.

Off-site recreational users are located approximately 600 m (Nellie Simm Park) and 900 m (Weston Workers Club) from the Site boundary and therefore may be exposed to vapours and particulates emitted from the Site. All recreational receptors were assumed to be at ground level. AECOM notes that Swamp Creek runs adjacent to the northern boundary of the Site, however it is unlikely to be used for recreational purposes given its location, dense vegetation growth and understood ephemeral low flow rate.

The human receptor locations are illustrated on **Figure F5**, **Appendix A**.

To address any sensitive land use changes in the future, the HHRA includes an assessment using the grid maximum ground level concentration i.e. the highest 24-hour annual average and 1-hour maximum ground level concentrations reported from the dispersion modelling. Adopting grid maximum concentrations ensures that the most sensitive receptor is being assessed with a ‘worst-case’ exposure point concentration. For this assessment, the computation grid (modelling domain) was 23km by 23km, the sampling grid was 13km by 13km and the nested grid was 1.5km x 1.5km.

4.7 Exposure Pathways

In order for a human receptor to be exposed to a chemical contaminant derived from a site, a complete exposure pathway must exist. An exposure pathway describes the course a chemical or physical agent takes from the source to the exposed individual and generally includes the following elements (US EPA, 1989):

- A source and mechanism of chemical release;
- A retention or transport medium (or media where chemicals are transferred between media);
- A point of potential human contact with the contaminated media; and
- An exposure route (e.g. inhalation or direct contact) at the point of exposure.

Where one or more of the above elements is missing, the exposure pathway is considered to be incomplete and no further assessment is required.

Pathways that have been considered to be complete for the Project and therefore were assessed in the HHRA include:

- Inhalation Pathway Assessment:
    - Inhalation of vapours and particulates in indoor and outdoor air (acute and chronic assessments).
- Multiple Pathway Assessment:
    - Inhalation of surficial soil-derived dust in indoor and outdoor air (chronic assessment);

- Direct contact (i.e. incidental ingestion and dermal contact) with deposited dust (chronic assessment);
- Ingestion of home-grown fruit and vegetables following dust deposition on soil and plants (chronic assessment);
- Ingestion of eggs from home-grown chickens residing on the deposited dust (chronic assessment); and
- Ingestion of breast milk by infants based on mother's intake and maternal transfer (chronic assessment).

4.8 Inhalation Pathway Assessment

A number of gaseous phase compounds were identified as CoPC in **Section 4.4** i.e. CO, SO_2, H_2SO_4, NO_2, HCl and HF. Given the nature of these compounds and their potential presence in ambient air at receptor locations (based on dispersion modelling), they have been assessed via the inhalation pathway.

Suspended particulate matter ($PM_{2.5}$ and PM_{10}) was also demonstrated to be present in ambient air at receptor locations and therefore have been assessed via the inhalation pathway.

There are a number of CoPC listed in **Section 4.4** that are not considered to be volatile based on the chemical's henry's law constant (greater than 1 x 10^{-5} atm-m^3/mol) and vapour pressure (greater than 1 mm Hg at room temperature), namely heavy metals. However, for the purposes of the inhalation pathway assessment, AECOM has conservatively assumed that heavy metals are considered to be sufficiently volatile. Those CoPC that were considered to be sufficiently volatile e.g. benzene, were also assessed via the inhalation pathway.

4.9 Multiple Pathway Assessment

There are a number of complete exposure pathways identified in **Section 4.7** above. Of these exposure pathways, inhalation of vapours and particulates in indoor and outdoor air are applicable to all identified receptors, however exposures from deposition are considered to be limited to exposures with direct access to soil.

Exposures which are a result of deposition are represented by those listed under the multiple pathway assessment heading in Section **4.7** above.

A number of the CoPC identified are considered to have the potential to bioaccumulate in the environment. Available guidelines are not derived to be protective of the potential for bioaccumulation, therefore any concentration of a chemical which has been identified to have bioaccumulative potential needs to be further evaluated for the potential for adverse health risk. Therefore within this assessment, a number of chemicals as identified in **Table 10** have been carried through to quantitative assessment of multiple pathway exposure regardless of the outcome of the Tier 1 screening assessment (as presented in **Section 4.11**). It should be noted that no guidelines for individual dust deposition concentrations are available.

The assessment and determination of chemicals which are bioacummulative reviewed available toxicity information from the following sources:

- Agency for Toxic Substances & Disease Registry (ATSDR) Toxicological Profiles, available at http://www.atsdr.cdc.gov/toxprofiles/index.asp;
- ANZECC, 2000. *Australian and New Zealand Guidelines for Fresh and Marine Water Quality*. Australian and New Zealand Environment and Conservation Council (ANZECC) and Agriculture and Resource Management Council of Australia and New Zealand (ARMCANZ), October 2000;
- DEH, 2005. National Dioxins Program, Technical Report No. 12, Human Health Risk Assessment of Dioxins in Australia. Office of Chemical Safety, Australian Government Department of the Environment and Heritage, Canberra. July 2005; and

- NHMRC, 2016. National Water Quality Management Strategy, Australian Drinking Water Guidelines 6 2011, Version 3.2. National Health and Medical Research Council. Updated February 2016; and
- WHO, 2011. Guidelines for Drinking-water Quality. Fourth Edition. World Health Organisation. July 2011.

Table 10 details the specific CoPC which were considered to be bioaccummlative have therefore been assessed for multiple pathway residential, recreational and commercial exposures. It is noted that of the CoPC listed in **Section 4.4**, only metals or semi-volatile contaminants could be considered to be bioaccumulative as all others would not typically settle in the environment.

Table 10 Bioaccumulative Chemicals

CoPC	Bioaccumulative (Yes/No)	Source
antimony	No	ATSDR, 1992 and ANZECC, 2000
arsenic	Yes	ATSDR, 2007 and ANZECC, 2000
beryllium	No	ATSDR, 2002
cadmium	Yes	ATSDR, 2012 and ANZECC, 2000
chromium	Yes	ANZECC, 2000
cobalt	No	ATSDR, 2004
copper	No	ATSDR, 2004 and ANZECC, 2000
lead	Yes	ATSDR, 2007, NHMRC, 2016 and ANZECC, 2000
manganese	No	ATSDR, 2012
mercury	Yes	NHMRC, 2016 and ANZECC, 2000
nickel	Yes	ATSDR, 2005 and ANZECC, 2000
selenium	Yes	ATSDR, 2003 and ANZECC, 2000
tin	No	NHMRC, 2016
vanadium	Yes	ATSDR, 2012
dioxins and furans	Yes	DEH, 2005
VOCs (expressed as benzene)	No	ATSDR, 2007

The multiple pathway assessment has been conducted using the maximum 24-hour annual average deposition rates which have been used to estimate a chemical concentration within soil. Given the locality and environmental setting of the Site, only dry deposition rates have been used.

The multiple pathway assessment includes both the inhalation of Site-derived vapours and particulates as well as direct contact with soil following deposition of Site-derived particulates.

AECOM notes that the adoption of deposition rates for estimates within residential areas is conservative, as the deposition rates do not take into account the presence of buildings, enclosures, green houses, fencing etc., which will affect the rate of dispersion of a particulate.

Soil concentrations have been estimated from the modelled deposition rates using the approach detailed within the following documents:

- Hattemer-Frey, H.A and Travis, C. 1991. *Health Effects of Municipal Waste Incineration*, CRC Press, Florida.
- Health Effects of Municipal Waste Incineration, Chapter 5 *2,3,7,8 Tetrachlorodibenzo-p-Dioxin in the Agricultural Food Chain: Potential Impact of MSW Incineration on Human Health, Jeffery B. Stevens*, CRC Press 1991; and
- US EPA (2005) Human Health Risk Assessment Protocol (HHRAP) for Hazardous Waste Combustion Facilities, Final September 2005.

Further detail on the equations adopted is provided in **Appendix G**.

Once present on the surface or within the soil, the bio-accumulating chemicals have been considered for the following pathways:

- Inhalation and direct contact (i.e. incidental ingestion and dermal contact) by residents of surficial soils;
- Inhalation and direct contact (i.e. incidental ingestion and dermal contact) by recreational users of surficial soils;
- Inhalation and direct contact (i.e. incidental ingestion and dermal contact) by commercial workers of surficial soils and/or dust deposited on capped surface;
- Uptake by edible plants (i.e. fruit and vegetables) within roots and stems and from dust-to-leaf transfer by residents; and
- Uptake by chickens and ingestion of eggs by residents.

The assessment of the potential exposure pathways detailed above has been undertaken in accordance with the guidance detailed above and:

- US EPA, 1989. Risk Assessment Guidance for Superfund, Volume I: Human Health Evaluation Manual. Interim Final, Office of Emergency and Remedial Response, United States Environment Protection Agency (US EPA), Washington DC, OSWER Directive 9285.7-0/a.

The assessment of multiple pathway exposure was undertaken for 25 year duration based on information provided by Weston Aluminium regarding the predicted operational period.

4.10 Conceptual Site Model

A Conceptual Site Model (CSM) is a site-specific qualitative description of the source(s) of contamination, the pathway(s) by which contaminants may migrate through the environmental media, and the populations (human or ecological) that may potentially be exposed. This relationship is commonly known as a Source-Pathway-Receptor (SPR) linkage. Where one or more elements of the SPR linkage are missing, the exposure pathway is considered to be incomplete and no further assessment is required.

The CSM for the Site has been prepared in accordance with Schedule B2, ASC NEPM (2013), and is presented as **Table 11** (**Appendix A**).

This page has been left blank intentionally.

Table 11 Potential Exposure Pathways

Exposure Pathway	Off-site Residents	Off-site Recreational User	Off-site Commercial Workers
Air			
Inhalation of vapour and particulates in indoor and outdoor air	✓	✓	✓
Soil			
Incidental ingestion of surficial soils following dust deposition	✓	✓	✓
Dermal contact with surficial soils following dust deposition	✓	✓	✓
Inhalation of surface soil-derived dust in indoor air	✓	×[1]	✓
Inhalation of surface soil-derived dust in outdoor air	✓	✓	✓
Ingestion of home-grown fruit and vegetables grown in soil impacted by deposited dust	✓	×[2]	×[2]
Ingestion of home-grown eggs where chickens are exposed to soil impacted by deposited dust	✓	×[2]	×[2]
Ingestion of home-grown lamb/beef where sheep/cattle are exposed to soil impacted by deposited dust	×[3]	×[3]	×[3]
Ingestion of milk from home-grown dairy cows that are exposed to soil impacted by deposited dust	×[3]	×[3]	×[3]
Ingestion of breast milk by infant	✓	×[4]	×[4]
Groundwater			
Ingestion of groundwater used as a potable water supply	×[5]	×[5]	×[5]
Incidental ingestion of groundwater	×[5]	×[5]	×[5]
Dermal contact with groundwater	×[5]	×[5]	×[5]
Inhalation of groundwater-derived vapours in indoor air	×[5]	×[5]	×[5]
Inhalation of groundwater-derived vapours in outdoor air	×[5]	×[5]	×[5]

Exposure Pathway	Off-site Residents	Off-site Recreational User	Off-site Commercial Workers
Surface Water			
Incidental ingestion of surface water	×[6]	×[6]	×[6]
Dermal contact with surface water	×[6]	×[6]	×[6]
Inhalation of surface water-derived vapours in outdoor air	×[6]	×[6]	×[6]

Notes: × – incomplete pathway
✓ – complete pathway

1. In accordance with ASC NEPM (2013), off-site recreational users are assumed to spend the majority of their time outdoors.
2. AECOM notes that off-site recreational and commercial properties were not suitable or used for fruit and vegetable gardens or to keep chickens.
3. As discussed in **Section 4.6**, no paddocks hosting sheep or cattle were identified within 2 km of the Site. Therefore, no assessment of beef, lamb or milk consumption has been undertaken.
4. The assessment of ingestion of breast milk by a resident mother is considered to be protective of a commercial worker mother or recreational user mother as the resident is exposed by more pathways and for longer periods of time.
5. As discussed in **Section 4.5**, subsurface media including groundwater is unlikely to be significantly impacted by the operations at the Project via leaching from soil given the nature of the contaminants.
6. As discussed in **Section 4.6**, Swamp Creek runs adjacent to the northern boundary of the Site, however it is unlikely to be used for recreational purposes given its location, dense vegetation growth and understood ephemeral low flow rate (excluding during periods of heavy rainfall). No other surface water bodies were identified nearby the Site.

4.11 Tier 1 Screening Assessment

Potential contamination sources were identified in **Section 4.2** i.e. eight on-site stacks. The Tier 1 assessment aims to confirm whether emissions from these stacks have the potential to be associated with unacceptable risks by comparison of reported CoPC concentrations in media of concern (i.e. ambient air) at the human receptor against conservative generic screening criteria, termed 'Tier 1' screening criteria which have been derived based on protection of human health. When the CoPC concentration is reported to be present in ambient air at the human receptor above Tier 1 screening criteria, further assessment of the CoPC is undertaken in the Tier 2 assessment.

Additionally, consideration has been given to the bioaccumulative nature of the CoPC, as discussed in **Section 4.9**. Regardless of the outcome of the Tier 1 screen, these contaminants have been taken to higher Tiers of assessment (i.e. Tier 2 assessment) as Tier 1 guidelines are not protective of bio-accumulation potential.

CoPC in ambient air were selected based on comparison to appropriate screening criteria in accordance with the land uses surrounding the Site (i.e. residential, recreational and commercial/industrial).

4.11.1 Selected Tier 1 Screening Criteria

For the chronic health assessment, CoPC were assessed by screening the annual average ground level concentrations at each receptor and the grid maximum concentration against the following enHealth (2012a) hierarchy of ambient air criteria:

- NEPC, 2011. National Environment Protection (Air Toxics) Measure 2004, as amended 2011. National Environment Protection Council. 16 September 2011;
- NEPC, 2003. National Environment Protection (Ambient Air Quality) Measure, as amended 2003. National Environment Protection Council. 16 September 2011. 7 July 2003;
- WHO, 2010. WHO Guidelines for Indoor Air Quality, Selected Pollutants. World Health Organisation. Geneva 2010;
- WHO, 2005. Air Quality Guidelines – Global Update, Particulate Matter, Ozone, Nitrogen Dioxide and Sulfur Dioxide. Europe. World Health Organisation. 2005;
- WHO, 2000a. Guidelines for Air Quality. Geneva. World Health Organisation. 2000;
- California EPA, 2002. Ambient Air Quality Standards. California Environmental Protection Authority; and
- US EPA, 2016. Regional Screening Levels for Chemical Contaminants at Superfund Sites – Residential Air and Industrial Air. United States Environmental Protection Authority. May 2016.

The Australian based guidelines published by the NEPC are considered current and appropriate as a first tier screen as they are applicable to ambient air and protective of human health over a lifetime (chronic) exposure. As stated in NEPC (2011) *'The monitoring investigation level values are levels of air pollution below which lifetime exposure, or exposure for a given averaging time, does not constitute a significant health risk. If these limits are exceeded in the short-term it does not mean that adverse health effects automatically occur'*. Additionally, the desired environmental outcome of the standards published in NEPC (2003) is '*ambient air quality that allows for the adequate protection of human health and well-being'.*

International guidelines published by WHO were adopted as a second tier screen. The WHO (2010) guidelines were developed to provide a uniform basis for the protection of human health from adverse effects of indoor exposure to air pollution based on toxicological and epidemiological data. Although these guidelines are conservatively for indoor air quality (with outdoor and indoor air sources), they are considered to be protective of outdoor exposure based on exposure duration (i.e. people spend longer indoors) and likely concentrations (typically higher indoors). WHO (2005) and WHO (2000) present risk based guideline values that provide a basis for protecting public health from adverse effects of air pollutants and to eliminate or reduce exposure to those pollutants that are known or likely to be hazardous to human health or wellbeing. These guidelines apply to all WHO regions, including Australia.

Other national guidelines (i.e. US EPA, 2016 and California EPA, 2002) were considered as third tier screening criteria. The US EPA RSLs for residential and industrial air are health based screening levels derived using US risk equations and input parameters e.g. for carcinogens, using a unit risk value of 1×10^{-6}. AECOM notes that a number of US EPA RSLs are more conservative than those published by NEPC and WHO. However, adopting these more conservative guidelines would not have a significant impact on the outcomes of the HHRA given the following:

- If carcinogenic compounds were converted to the Australian acceptable unit risk level of 1×10^{-5}, then the US EPA RSLs would be in the same order of magnitude as NEPC and WHO criteria e.g. benzene; and
- All bioaccumulative compounds were assessed via a Tier 2 assessment regardless of exceedances of the screening criteria e.g. lead.

The Californian Ambient Air Quality Standards (AAQS) are *'established to protect even the most sensitive individuals in our communities'.* The AAQS defines *'the maximum amount of a pollutant that can be present in outdoor air without harm to the public's health'.* California law authorises the California Air Resources Board (ARB) to set ambient (outdoor) air pollution standards (California Health & Safety Code section 39606) in consideration of public health, safety and welfare.

Refer to **Table T1** (Screening Criteria Selection Process – Chronic Exposure) and **Table T2** (Chronic Air Quality Results) (**Appendix C**) for the Tier 1 screening assessment.

4.11.2 Tier 1 Screening Results

As presented in **Table T1 (Appendix C**), the modelled 24-hour maximum concentrations of CO, SO_2, NO_2, H_2SO_4, HCL, HF, heavy metals (excluding chromium) and dioxins and furans under normal operating conditions (Scenario 1) and EPL operating conditions (Scenario 2) were below the selected Tier 1 screening criteria unless discussed below. Therefore, unless the contaminant is considered to be bioaccumulative (refer to **Section 4.9**), further assessment of these CoPC was not required.

For Scenario 1, AECOM notes that exceedances of the adopted screening criteria were reported for particular matter and chromium using the 24-hour maximum and/or grid maximum concentrations. The risks associated with exposure to the 24-hour maximum concentrations of particulate matter ($PM_{2.5}$ and PM_{10}) has been qualitatively discussed in **Section 4.11.3**. The risk associated with exposure to the 24-hour maximum concentrations of chromium has been further assessed as part of the Tier 2 assessment.

For Scenario 2, AECOM notes that exceedances of the adopted screening criteria were reported for particulate matter ($PM_{2.5}$ and PM_{10}), benzene and metals (arsenic, beryllium, chromium, cobalt and nickel) using the 24-hour maximum and/or grid maximum concentrations. The risks associated with exposure to the 24-hour maximum concentrations of particulate matter ($PM_{2.5}$ and PM_{10}) has been qualitatively discussed in **Section 4.11.3**. Those contaminants with published toxicity values (i.e. benzene and metals) have been quantitatively assessed as part of the Tier 2 assessment.

4.11.3 Particulate Assessment

The exposure-response relationships for a number of health effects associated with exposures to PM_{10} and $PM_{2.5}$ is linear (i.e. there is no level or threshold below which no adverse effects have been identified). As there is no threshold for potential adverse health effects and given the exceedance of the NEPC (2003) criteria, further assessment of particulate matter has been undertaken.

As the 24-hour and grid maximum concentration of particulate matter presented in Scenario 1 and Scenario 2 were cumulative i.e. the contribution from the Site plus the contribution of background (as discussed in **Section 4.1.1**), AECOM has further assessed the proportion emitted from the Site compared to that of background. The site-derived concentrations, background concentrations and total particulate matter concentrations are presented in **Table 12** for Scenario 1 and **Table 13** for Scenario 2.

.

Table 12 Site and Background Particular Matter Contributions for Scenario 1

CoPC	Selected Tier 1 Screening Criteria - Residents and Recreational Users ($\mu g/m^3$)	Selected Tier 1 Screening Criteria - Commercial Worker ($\mu g/m^3$)	24-hr Particulate Matter Concentrations ($\mu g/m^3$) (a)		
			Site-Derived Concentration (24-hr Max / Grid Max)	Background Concentration	Total Concentration (24-hr Max / Grid Max)
Off-site Resident					
PM_{10}	50	50	0.5 / 0.8	64.9	65.4 / 65.7
$PM_{2.5}$	25	25	0.002 / 0.002	25.9	25.9 / 25.9
Off-site Recreational Users					
PM_{10}	50	50	0.3 / 0.8	64.9	65.2 / 65.7
$PM_{2.5}$	25	25	0.0009 / 0.002	25.9	25.9 / 25.9
Off-site Commercial Worker					
PM_{10}	50	50	0.4 / 0.8	64.9	65.3 / 65.7
$PM_{2.5}$	25	25	0.001 / 0.002	25.9	25.9 / 25.9

Table 13 Site and Background Particular Matter Contributions for Scenario 2

CoPC	Selected Tier 1 Screening Criteria - Residents and Recreational Users ($\mu g/m^3$)	Selected Tier 1 Screening Criteria - Commercial Worker ($\mu g/m^3$)	24-hr Particulate Matter Concentrations ($\mu g/m^3$) (a)		
			Site-Derived Concentration (24-hr Max / Grid Max)	Background Concentration	Total Concentration (24-hr Max / Grid Max)
Off-site Resident					
PM_{10}	50	50	1.0 / 1.2	64.9	65.9 / 66.1
$PM_{2.5}$	25	25	0.1 / 0.1	25.9	26.0 / 26.0
Off-site Recreational Users					
PM_{10}	50	50	0.4 / 1.2	64.9	65.3 / 66.1
$PM_{2.5}$	25	25	0.05 / 0.1	25.9	25.9 / 26.0
Off-site Commercial Worker					
PM_{10}	50	50	0.8 / 1.2	64.9	65.7 / 66.1
$PM_{2.5}$	25	25	0.07 / 0.1	25.9	25.9 / 26.0

As presented in **Table 12** and **Table 13**, the site-derived 24-hour and grid maximum concentrations of particulate matter reported for Scenario 1 and Scenario 2 were below the criteria at each off-site receptor while the 24-hour background concentrations were above the criteria at each off-site receptor. Additionally, a significant portion (greater than 95%) of the total particulate matter concentrations is attributed to background. Therefore, particulate matter emissions from the Site were considered to be low and acceptable.

4.11.4 Summary of CoPC Assessed via Multiple Pathway Exposures

The bioaccumulative CoPC may be subject to dust deposition onto soil and accumulation in home-grown produce and potentially breast milk following mother's maternal uptake. To ensure cumulative risks are considered as part of the HHRA, multiple exposure pathways have been included as part of the Tier 2 assessment.

Table 14 below presents a summary of the CoPC considered further as part of this HHRA with respect to chronic exposures.

Table 14 Summary of CoPC for Multiple Exposure Pathways

CoPC	Multiple Exposure Pathway
antimony	× (a)
arsenic	✓
beryllium	× (b)
cadmium	✓
chromium	✓
cobalt	× (b)
copper	× (a)
lead	✓
manganese	× (a)
mercury	✓
nickel	✓
selenium	✓
tin	×
vanadium	✓
dioxins and furans	✓
VOCs (expressed as benzene)	× (b)

(a) Contaminant concentration reported below Tier 1 screening criterion and is not bioaccumulative.

(b) Assessed via the inhalation pathway only.

4.12 Review of Acute Exposure

Short duration or acute exposures to higher concentrations of chemicals from the modelled stack emissions may occur during atypical operating conditions as well as during upset conditions. Two of the scenarios identified in Section 4.1.1 may result in acute exposure to contaminants emitted from the Site i.e. Scenario 2 and Scenario 4.

Scenario 2 unrealistically assumes that the proposed thermal processing plant operates continuously using proposed stack concentration EPL limits as detailed in the AQIA (AECOM, 2017c). This scenario is considered to be representative of infrequent maximum operating conditions and therefore has been considered as part of the acute exposure assessment.

Scenario 4 addresses the use of Stack 8 (the emergency bypass stack) during upset plant conditions and utilises maximum discharge emission concentrations based on design limits provide by Advanced

Combustion Engineering Pty Ltd (ACE), as presented in Appendix B of the AQIA (AECOM, 2017c). ACE reviewed the specifications of Baghouse 5 and designed the proposed emissions controls in order to allow WA to achieve compliance with regulatory limits for the types and quantities of wastes proposed to be processed. This design review was based on experience designing similar facilities throughout Australia. Scenario 4 is considered to be representative of upset operating conditions and therefore has been considered as part of the acute exposure assessment.

The assessment of potential acute exposures has been based on the 1-hour maximum annual average ground level concentrations at each receptor for Scenario 2 and Scenario 4.

4.12.1 Approach to Acute Assessment

A variety of different criteria are available for the assessment of potential human health effects associated with acute emissions to air. There is no single organisation or methodology that has developed acute criteria values for benchmarks for all CoPC. Hence, a hierarchical approach has been adopted for selected existing guidelines for acute inhalation exposure criteria.

Acute inhalation exposure criteria have been developed by a number of organisations and agencies, including:

- American Conference of Governmental Industrial Hygienists (ACGIH);
- Occupational Safety and Health Administration (OSHA);
- National Institute of Occupational Safety and Health (NIOSH);
- American Industrial Hygiene Association (AIHA);
- National Research Council on Toxicology (NRCT) US EPA;
- Agency for Toxic Substances and Disease Registry (ATSDR);
- California Environmental Protection Agency (Cal EPA);
- National Advisory Committee (NAC) and the US Department of Energy (DOE);
- Subcommittee on Consequences Assessment and Protection Actions (SCAPA), and
- National Occupational Health and Safety Commission (NOHSC).

The acute inhalation exposure criteria were established by the abovementioned organisations and agencies to:

- Be protection of a range of exposure groups including occupational works, military personnel and the general public;
- Based on a range of exposure duration, typically relevant to the exposure group, but ranging from 15 minutes to 8-hours (typical of an occupational setting) to 24-hours; and
- Protection of a range of toxicological endpoints such as mild discomfort, irritation, serious debilitating and potentially life-threatening effects and mortality.

The hierarchical approach adopted for this acute assessment is based on that recommended by the US EPA Office of Solid Waste and detailed in Appendix A of the document '*Human Health Risk Assessment Protocol for Hazardous Waste Combustion Facilities'* (US EPA, 2005). The screening approach is focused on the protection of the general public and is summarised below in order of preference:

1. NEPC, 2003. *National Environment Protection (Ambient Air Quality) Measure*, as amended 2003. National Environment Protection Council. 16 September 2011. 7 July 2003.
2. Acute Reference Exposure Levels (ARELs) developed by the Cal EPA.
3. Temporary Emergency Exposure Limits (TEELs) developed by SCAPA.
4. Protective Action Criteria (PAC), developed in May 2016 by DOE to combine the following:
    a. Acute Exposure Guideline Levels (AEGLs) developed by the NAC/AEGL Committee and available from the US EPA. In general, three levels of AEGLs: AEGL 1, AEGL 2 and AEGL

3, have been developed for five exposure periods i.e. 10 minutes, 30 minutes, 1-hour, 4-hours and 8-hours. For the purposing of this acute assessment, the 1-hour criteria were adopted where available.

b. Emergency Response Planning Guidelines (ERPGs) developed by the AIHA and SCAPA.

c. TEELs developed by SCAPA as temporary limits for chemicals until AEGLs or ERPGs are developed.

Appendix D presents further information on each of the adopted guidelines and the relevant basis for the levels proposed by each organisation or agency. Acute criteria were established for the protection of a range of health effects. These range from Level 0 to Level 1 that are protection of all individuals including sensitive receptor groups, from mild transient effects; Level 2 that is protection of individuals who may be exposed without developing irreversible or serious health effects (injury); Level 3 that is generally the maximum concentration below which individuals will not experience life-threatening effects.

Level 0 refers to a “no effect level”, and have therefore been adopted to conservatively assess very low level effects. DOE presents PAC-1, PAC-2 and PAC-3 values, consistent with the three levels provided for AEGLs, ERPGs and TEELs, however there are no Level 0 PAC values, and therefore screening against TEEL 0 has been completed independently.

4.12.2 Further Acute Assessment

Tier 1 screening of predicted 1-hour maximum annual average ground level concentrations at each receptor during upset conditions is provided in **Table T3** and **Table T4**, (Appendix C). Ground level concentrations during upset conditions are presented in **Appendix C**.

As shown in **Table T3** and **Table T4** (**Appendix C**), no exceedances of the adopted criteria were reported for Scenario 2 and Scenario 4, therefore no CoPC required further assessment with regard to acute inhalation exposures. Overall, the potential for acute risks associated with the Project were considered to be low and acceptable.

This page has been left blank intentionally.

5.0 Hazard Identification

5.1 Hazard Identification Process

The hazard identification process requires a review of existing toxicological information from a variety of appropriate sources to describe the capacity of a specific agent to produce adverse health effects.

Toxicological profiles and associated hazards for the specific CoPC quantitatively assessed in this HHRA are provided in **Appendix E**. The toxicity values adopted in this HHRA are presented in **Table 15**.

Table 15 Adopted Toxicity Values

CoPC	Inhalation Unit Risk (IUR) $(\mu g/m^3)^{-1}$	Background Adjusted Reference Concentration (RfC) $(\mu g/m^3)$	Oral Cancer Slope Factor (CSF) $(mg/kg/day)^{-1}$	Background Adjusted Oral Reference Dose (RfD) mg/kg/day
arsenic	-	1	-	0.001
beryllium	2.40E-03	-	NA	-
cadmium	-	0.004	-	3.20E-04
chromium (a)	-	0.1	-	9.00E-04
cobalt	-	0.1	-	0.0014
lead	-	0.5	-	0.0035
mercury	-	0.18	-	3.60E-04
nickel	-	0.016	-	4.80E-03
selenium	-	8.4	-	2.40E-03
vanadium	-	1	-	1.00E-02
dioxins and furans (b)	-	8.05E-06	-	9.89E-10
benzene	6.00E-06	24	NA	0.0032

- = No published toxicity value
NA = Not applicable for this assessment
(a) = Toxicity values for hexavalent chromium (CrVI)
(b) = Toxicity values for 2,3,7,8-tetrachlorodibenzodioxin

5.2 Dose-Response Assessment

The objective of the dose-response assessment is to identify the toxicity values for each CoPC to be used for the quantification of human health risk. The numerical values derived from toxicity dose-response studies are referred to collectively as toxicity values. The toxicity values adopted are based on two different approaches to the characterisation of dose-response (NHMRC, 1999 and US EPA, 2005):

- For chemicals that have the potential to result in carcinogenic effects that are associated with a genotoxic mechanism, any level of exposure is assumed to result in some incremental lifetime risk. These chemicals are therefore assessed on the basis of a non-threshold dose-response relationship; and
- For other chemicals that may be associated with non-carcinogenic effect or carcinogenic effects that are not genotoxic, a threshold is considered relevant. The threshold level is considered a level whereby exposure below the threshold will not result in any adverse effects. Exceedance of the threshold level does not imply that adverse effects will occur, as there are a number of

uncertainties and safety factors incorporated into the threshold value adopted, rather that other factors (e.g. exposure duration) needs to be further evaluated.

The toxicity values adopted for the CoPC in this risk assessment, and the source of the adopted values are presented in **Appendix E**. The values have been obtained (where available) from the following information sources (listed in order of preference, as per enHealth (2012a) guidance):

- National Health and Medical Research council (NHMRC) publications and documents from other joint Commonwealth, State and Territory health organisations (NHMRC 2004, 2011, 2015);
- World Health Organisation (WHO) publications (WHO 2000a, 2000b);
- Criteria published by the Agency for Toxic Substances and Disease Registry (ATSDR) (see toxicity profiles for references);
- Criteria published by US EPA sources, primarily those published by the US EPA Integrated Risk Information system (IRIS) (US EPA, 2015) (see toxicity profiles for references); and
- Canadian Council of Ministers of the Environment (CCME) documents (CCME, 2010).

It is noted that, where relevant, toxicity data available from a number of sources have been reviewed with respect to currency and adequacy to identify the most appropriate value to be used in the HHRA. This approach is consistent with Section 5.12.4 (selecting data sources) of enHealth (2012a).

The following sections present additional information on the approach adopted in this assessment to the application of non-threshold and threshold dose-response (toxicity) values.

5.2.1 Non-Threshold Dose Response Values

The assessment of potential health effects associated with genotoxic carcinogens requires the use of non-threshold toxicity values. The values available are essentially the slope of the cancer dose-response curve for the chemical (based on relevant studies and approaches to extrapolate effects from high doses to low doses) and are termed either an inhalation unit risk (IUR) or oral slope factor (CSF). The IUR (expressed as $(\mu g/m^3)^{-1}$) and the CSF (expressed as $mg/kg/day^{-1}$) is used to estimate the probability of an individual developing ca or ncer at some point in a lifetime as a result of a specific exposure.

Non-threshold toxicity values adopted in this HHRA are presented in **Table 15** above.

Toxicity profiles with additional toxicological information for each compound are provided in **Appendix E**.

No compounds assessed in Scenario 1 were considered to be potential genotoxic carcinogens.

5.2.2 Threshold Dose Response Values

Potential health effects that are assessed on the basis of a threshold dose response utilise a threshold value which is typically termed an acceptable or tolerable daily intake (ADI or TDI). For the purpose of this assessment, the threshold value adopted has been termed a TDI. A TDI is a chemical intake below which it is considered that no adverse effects would occur in human populations, including sensitive sub-groups (e.g. the very young or elderly). Hence, the TDI relates to intakes from all sources, the Site related impacts as well as background intakes (where relevant).

Where relevant to inhalation exposures the threshold value is typically termed a tolerable concentration in air (TC) or reference concentration (RfC), which is an estimate of a continuous inhalation exposure concentration to people (including sensitive subgroups) that is likely to be without risk of deleterious effects during a lifetime.

Threshold toxicity values adopted in this HHRA are presented in **Table 15** above.

Toxicity profiles with additional toxicological information for each compound are provided in **Appendix E**.

5.2.3 Background Intakes

When evaluating potential health effects or deriving health-based investigation levels for chemicals assessed on the basis of a threshold dose-response criteria, total exposure to a given chemical (i.e. the sum of the background exposure and the substance exposure from contaminated media) should not exceed the TDI (enHealth, 2012a; ASC NEPM, 2013).

Background levels of contamination comprise chemical concentrations present in the environment as a result of everyday activities or natural sources. These chemicals may be present in food, air, water and consumer products and represent the non-Site sources of contamination exposure. This is commonly referred to as background exposure. enHealth (2012a) and ASC NEPM (2013) require that 'background exposure' be taken into account during the assessment of potential human health risk.

Background exposure is only applied to threshold contaminants (i.e. non-carcinogens) because intakes of non-threshold contaminants (i.e. carcinogens) are considered on the basis of an increase in risk, which is irrespective of background exposure. The allocation of background exposure is undertaken on a chemical-specific basis by applying a factor (%) to the threshold toxicity reference value (TRV or Reference Dose), as illustrated in the equation below:

$$TRV\ (adjusted\ for\ background\ exposure\ ) = \left(1 - Background\ (\%)\right) x\ TRV$$

In cases where background exposure is considered to be essentially negligible (contributing to less than 5% of the threshold TRV), no background exposure has been applied. Should background exposure be considered to comprise greater than 50% of the threshold TRV, the background exposure is generally considered to be 50% of the TRV. It should be also noted that enHealth (2012a) does not recommend a specific background exposure value for an inhalation pathway.

The baseline blood lead concentration has been assumed to be 10% of the target blood lead concentration (5 µg/dL) (NHMRC, 2015).

The background exposure allocated for each of the CoPC assessed in the HHRA is summarised in each toxicity profile (**Appendix E**) and the risk estimate models (**Appendix F**)

This page has been left blank intentionally.

6.0 Exposure Assessment

Exposure Assessment involves the estimation of magnitude, frequency, extent, and duration of exposure to Site-derived contamination (enHealth, 2012b).

"*Direct measurement of the exposures of the (potentially) affected population provides the best exposure data but this is not always available or practicable and default exposure factor data is often required*." (Langley, AJ (1993). In absence of direct measurement data, environmental sampling and predictive models are commonly used to estimate intakes of CoPC by the exposed populations. The key elements of exposure assessment in the context of contaminated land risk assessment are to:

- Identify input values for contaminant concentrations and pathways;
- Identify input values for exposed populations;
- Estimate exposure concentrations; and
- Estimate chemical intake.

The AQIA (AECOM, 2017c) provides details of the air dispersion modelling methodology and results (i.e. exposure concentrations). A summary of the AQIA is also provided in **Section 3.2**.

6.1 Representative Exposure Point Concentrations

A key element of the risk assessment process is estimation of the concentration of Site-derived CoPC in environmental media. This concentration is commonly termed the exposure point concentration (EPC) and should be selected as a conservative estimate of the average chemical concentration in an environmental medium at the point of exposure. EPCs are determined for each site-impacted 'exposure unit', which is defined as the area throughout which a receptor moves and encounters an environmental medium for the duration of exposure. Typically, an individual receptor is assumed to be equally exposed to media within all portions of the exposure unit over the time frame of the risk assessment.

For the Scenario 1 (i.e. standard operating conditions) and Scenario 2 (i.e. EPL operating conditions) assessments the adopted EPCs in air are presented in **Table 16**. It should be noted that the 24-hour maximum annual average ground level concentrations (100^{th} percentile) at each receptor and grid maximum concentrations (100^{th} percentile) were adopted in the HHRA as these were considered to represent current and future off-site human exposure conditions. Dust deposition rates (as $mg/m^2/year$) for selected CoPC (based on bioaccumulation potential), as presented in **Table 17**,are based on the anticipated at source concentrations. It is noted that dust deposition rates includes dry deposition of particulates, as discussed in **Section 4.3**.

The 24-hour maximum and grid maximum ground level concentrations and dust deposition rates are presented in **Appendix B**.

This page has been left blank intentionally.

Table 16 Exposure Point Concentrations used in the Scenario 1 and Scenario 2 Assessments (24-hour Maximum Concentrations)

CoPC (a)	Scenario 1 24-hour Maximum Concentration in Air (µg/m^3)				Scenario 2 24-hour Maximum Concentration in Air (µg/m^3)

dioxins and furans (c)	1.70E-09	5.19E-10	7.13E-10	1.92E-09	2.19E-09	6.68E-10	9.17E-10	2.47E-09

(a) As discussed in **Section 4.9**, those CoPC that were considered to be bioaccumulative are assessed via multiple exposure pathways.

(b) Chromium assumed to comprised 100% hexavalent chromium.

(c) Assessed as 2,3,7,8-tetrachlorodibenzodioxin.

A significant proportion of house dust can be attributed to soil particles that have been tracked into the indoor environment from outdoors. enHealth (2012) consider that 50% of the indoor dust is derived from the site soil, in accordance with the recommendations made by US EPA (2008; 2011). However, in this assessment AECOM has conservatively assumed that the concentration of vapours and particulates inside a building was 100% of the level predicted in the outside air.

6.2 Estimation of Chemical Intakes

Chemical intakes were calculated for each of the CoPC via the following exposure pathways:

- Inhalation Pathway Assessment:
  - Inhalation of vapours and particulates in indoor and outdoor air (acute and chronic assessments).
- Multiple Pathway Assessment:
  - Inhalation of vapours and particulates in indoor and outdoor air (acute and chronic assessments);
  - Inhalation of surficial soil-derived dust in indoor and outdoor air (chronic assessment);
  - Direct contact (i.e. incidental ingestion and dermal contact) with deposited dust (chronic assessment);
  - Ingestion of home-grown fruit and vegetables grown on the deposited dust (chronic assessment);
  - Ingestion of eggs and chickens from home-grown chickens residing on the deposited dust (chronic assessment); and
  - Ingestion of breast milk by infants based on mother's intake and maternal transfer (chronic assessment).

6.2.1 Inhalation of Particulates

enHealth (2012a) recommends that the estimation of chemical intakes via the inhalation pathway follows the US EPA (2009) RAGS-F guidance which follows the *Inhalation Dosimetry Methodology*. This methodology supersedes the previous US EPA (1989) RAGS, Part A inhalation methodology because "*the internal dose to a chemical from the inhalation pathway is not a simple function of the inhalation rate and body weight….* [and therefore the US EPA (1989) inhalation equation] *does not comply with the principles of EPA's inhalation dosimetry procedures used to determine the human equivalent concentration (HEC) for calculating a Reference Concentration (RfC) or Inhalation Unit Risk (IUR)*") (US EPA, 2003).

The updated inhalation dosimetry methodology calculates a modified exposure concentration (EC, µg/m^3) which is then directly compared with a Reference Concentration (RfC, µg/m^3) or Inhalation Unit Risk (IUR, per µg/m^3) that is derived from toxicological studies. The equation used to estimate chemical intakes via inhalation of particulates is as follows:

$$Exposure\ Adjusted\ Air\ Concentration\ (\frac{\mu g}{m^3}) = \frac{Cair\ \left(\frac{\mu g}{m^3}\right) x\ ET\ \left(\frac{h}{d}\right) x\ EF\ \left(\frac{d}{yr}\right) x\ ED\ (yr)}{AT\ (h)}$$

Where:

Cair: contaminant concentration in air (µg/m^3)

ET: exposure time (hours per day)

EF: exposure frequency (days per year)

ED: exposure duration (years)

AT: averaging time for threshold and non-threshold CoPC (hours)

The EPCs presented in **Section 6.1** will be used as the '*contaminant concentration in air (µg/m^3)*' when calculating the exposure concentration for each CoPC in this HHRA. The values representing ET, EF, ED and AT are presented in **Section 6.3** below.

Equations for the additional direct contact (i.e. ingestion and dermal contact) exposure pathways are presented in **Appendix G**.

The assessment has also considered the potential for multiple pathway exposure, which is dependent on inhalation and body weight to calculate appropriate intake factors. Therefore the equations (as outlined in **Appendix G**) have also been undertaken to be incorporated in the multiple pathway assessment.

6.2.2 Blood Lead Model

As lead has been identified as a CoPC at the Site and as a result of the proposed adjacent battery recycling facility, exposure to receptors has been assessed using lead exposure models developed by the US EPA (US EPA, 2003; US EPA, 2007). The US EPA adult lead model has been used in the HHRA to assess potential risk to off-site adult residential, recreational and commercial receptors. The Integrated Exposure Uptake Biokinetic Model (IEUBK) for lead in children has been used in the HHRA to assess potential risks to off-site child residential receptors (i.e. most sensitive off-site receptor).

The blood lead model estimates the blood lead concentration in receptors based on exposure to lead impacted media. It should be noted that the soil ingestion pathway (following dust deposition) is considered to be the primary route of exposure for most receptors with inhalation of dust and incidental ingestion in food and other media considered to account for a much lower proportion of exposures.

6.2.2.1 Adult Blood Lead Model

The Adult Lead Model has been adopted for identified off-site adult receptors to assess potential risks associated with the ingestion of soil and inhalation of dust derived from the Site.

The inhalation of dust in outdoor air has been incorporated into the Adult Lead Model to provide a means of determining the risks associated with ingestion and dust inhalation (outdoors) pathways where appropriate.

Table 18 Adult Lead Model Input Parameters

Parameters	Unit	Values	Source / Comments
Biokinetic Slope Factor for soil exposures ($BKSF_{soil}$)	µg/dL per µg/day	0.4	Default value from US EPA (2003), based on analysis of Pocock *et al*. (1983) and Sherlock *et al*. (1984) data.
Intake Slope Factor (ISF_{air})	µg/dL per µg/day	1.92	Lead intake slope factor for air adopted from ATSDR (2007).
Geometric standard deviation (GSD_I)	unitless	1.8	Default value from US EPA (2003), a value of 1.8 recommended for homogeneous populations.
Baseline Blood Lead Concentration (PbB_o)	µg/dL	0.5	The baseline blood lead concentration has been assumed to be 10% of the target blood lead concentration (5 µg/dL). This is a conservative assumption based on the background lead information presented within the ASC NEPM (ASC NEPM, 2013) and is consistent with default baseline blood lead concentrations reported by the USEPA which range from 1.7 – 2.2 ug/dL based on the NHANES Survey information for Mexican American and non-Hispanic populations (US EPA, 2003).

Parameters	Unit	Values	Source / Comments
Intake Rates (IR)	g/day	Receptor Specific	Based on receptor specific parameters (refer to Risk Estimates (**Appendix F**) and **Section 6.3**). Intake rates for indoor and outdoor air dust inhalation are calculated based on calculated adult exposure factors (calculated from dust inhalation exposures outdoors) multiplied by an inhalation rate of 20 m^3/day.
Absorption Fraction (AF)	unitless	0.12	US EPA (2003) default value for the soil ingestion pathway only. Based on an absorption factor for soluble lead of 0.2 and a relative bioavailability of 0.6 (soil/soluble).
Target Blood Lead Level	µg/dL	5	Target blood level for all Australians, blood lead concentrations below this level are not expected to result in adverse effects (NHMRC, 2015).

6.2.2.2 Child Blood Lead Model

The US EPA IEUBK model (IEUBKwin32 Lead Model Version 1.1 Build 11) (2010) has been applied for assessment of risk for off-site child residential receptors exposed to lead derived from the Site. The input parameters for this model are based on a combination of exposure parameters adopted for the remaining CoPC and the values adopted for derivation of HIL A as per Appendix D in Schedule B7 of the ASC NEPM (2013).

The results of the IEUBK model are presented in **Appendix H**.

In the first instance, risks to off-site child residents were assessed as this is considered to be protective of other off-site receptors i.e. off-site child recreational users.

6.3 Human Behavioural Exposure Parameters

Human behavioural exposure parameters adopted in this risk assessment were obtained from the following recognised Australian and international sources:

- enHealth (2012a) Environmental Health Risk Assessment, Guidelines for Assessing Human Health Risks from Environmental Hazards. Department of Health and Ageing and enHealth Council, Commonwealth of Australia;
- enHealth (2012b) Australian Exposure Factor Guide, Department of Health and Ageing and enHealth Council, Commonwealth of Australia;
- ASC NEPM (2013) National Environment Protection (Assessment of Site Contamination) Measure (ASC NEPM) 1999, National Environment Protection Council (NEPC), as amended and in force on 16 May 2013, specifically, Schedule B4, Guideline on Site-Specific Health Risk Assessment Methodology; and
- US EPA (1989) Risk Assessment Guidance for Superfund Volume I – Human Health Evaluation Manual Part A. United States Environmental Protection Agency Office of Emergency and Remedial Response. Washington DC, Revised December 1989; and associated updates.

Where specific guidance was not available from the above or other literature sources, conservative estimates for exposure parameters were adopted. Human exposure parameters adopted for the assessment, their source and justification are presented in **Table 19** to **Table 21**. Additional exposure parameters that are pathway specific are provided in **Appendix F**.

In accordance with the *Inhalation Dosimetry Methodology* described in **Section 6.2** above, consideration of body weight and inhalation rates are not required for the inhalation exposure pathway. These parameters were considered when calculating the multiple pathway exposures.

Table 19 Human Behavioural Exposure Parameters - Off-site Residents

Exposure Parameter (units)	Value Adopted		Reference
	Adult	Child	
Exposure Duration (years)	29	6	ASC NEPM (2013) - low to medium density residential.
Averaging Time (non-carcinogens) (years)	29	6	ASC NEPM (2013) - low to medium density residential.
Exposure Frequency (days/day)	365	365	ASC NEPM (2013) - low to medium density residential.
Exposure Time – Indoors (hours/day)	20	20	ASC NEPM (2013) - low to medium density residential.
Exposure Time – Outdoors (hours/day)	4	4	ASC NEPM (2013) - low to medium density residential.
Body Weight (kg)	70	15	ASC NEPM (2013) - low to medium density residential.
Daily Soil Ingestion Rate (mg/day)	50	100	ASC NEPM (2013) - low to medium density residential.
Exposed Skin Surface Area for Soil Contact (cm^2)	6300	2700	ASC NEPM (2013) - low to medium density residential. Assumes 31.5% of total body surface area (20,000 cm^2) for an adult and 44.3% (6100 cm^2) for a child.
Soil to Skin Adherence Factor (mg/cm^2)	0.5	0.5	ASC NEPM (2013) - low to medium density residential.
Particulate emission factor (indoor air) (m^3/kg)	1.30E+7	1.30E+7	ASC NEPM (2013) - low to medium density residential. Assumes 50% soil concentration present in dust as noted in Schedule B7.
Particulate emission factor (outdoor air) (m^3/kg)	2.90E+10	2.90E+10	ASC NEPM (2013) - low to medium density residential.
Lung retention factor (dust inhalation)	0.375	0.375	ASC NEPM (2013) - low to medium density residential.
Home-grown fruit ingestion rate (g/day)	212.2	198	ABS (2014). Median value for consumers only. Based on a child 2-3 year old and adults >19 years old.
Home-grown vegetable ingestion rate (g/day)	296.8	345.9	ABS (2014). Median value for consumers only. Based on a child 2-3 year old and adults >19 years old.
Home-grown egg ingestion rate (g/day)	78	44.3	ABS (2014). Median value for consumers only. Based on a child 2-3 year old and adults >19 years old.

Exposure Parameter (units)	Value Adopted		Reference
	Adult	Child	
Fraction ingestion from contamination site (unitless)	1	1	Assumes 100% fruit/vegetables and eggs were sourced from soil impacted with dust deposited from the Site.
Breast milk ingestion rate by infant (L/day)	0.85 (infant)		enHealth (2012b). Suggested intake of breastmilk 850 mL/day for an infant less than 6-months of age. High end range of average intake.
Infant exposure duration (years)	1 (infant)		Exposure time as an infant (0 to 1 years).
Infant body weight (kg)	6 (infant)		Average weight of a 6-month old infant.

Table 20 Human Behavioural Exposure Parameters - Off-site Recreational Users

Exposure Parameter (units)	Value Adopted		Reference
	Adult	Child	
Exposure Duration (years)	29	6	ASC NEPM (2013) - recreational user.
Averaging Time (non-carcinogens) (years)	29	6	ASC NEPM (2013) - recreational user.
Exposure Frequency (days/day)	365	365	ASC NEPM (2013) - recreational user.
Exposure Time – Outdoors (hours/day)	2	2	ASC NEPM (2013) - recreational user.
Body Weight	70	15	ASC NEPM (2013) - recreational user.
Daily Soil Ingestion Rate (mg/day)	25	50	ASC NEPM (2013) - recreational user.
Exposed Skin Surface Area for Soil Contact (cm^2)	6300	2700	ASC NEPM (2013) - recreational user. Assumes 31.5% of total body surface area (20,000 cm^2) for an adult and 44.3% (6100 cm^2) for a child.
Soil to Skin Adherence Factor (mg/cm^2)	0.5	0.5	ASC NEPM (2013) - recreational user.
Particulate emission factor (outdoor air) (m^3/kg)	2.60E+7	2.60E+7	ASC NEPM (2013) - recreational user.
Lung retention factor (dust inhalation)	0.375	0.375	ASC NEPM (2013) - recreational user.

Table 21 Human Behavioural Exposure Parameters - Off-site Commercial Workers

Exposure Parameter (units)	Value Adopted	Reference
Exposure Duration (years)	30	ASC NEPM (2013) - commercial/industrial.
Averaging Time – Non-Carcinogens (years)	30	ASC NEPM (2013) - commercial/industrial.
Exposure Time – Indoors (hours/day)	8	ASC NEPM (2013) - commercial/industrial.
Exposure Time – Outdoors (hours/day)	1	ASC NEPM (2013) - commercial/industrial.
Body Weight	70	ASC NEPM (2013) - commercial/industrial.
Exposure Frequency (days/year)	240	ASC NEPM (2013) - commercial/industrial.
Daily Soil Ingestion Rate (mg/day)	25	ASC NEPM (2013) - commercial/industrial.
Exposed Skin Surface Area for Soil Contact (cm^2)	3800	ASC NEPM (2013) - commercial/industrial. Assumes 19% of total body surface area (20,000 cm^2) for an adult.
Soil to Skin Adherence Factor (mg/cm^2)	0.5	ASC NEPM (2013) - commercial/industrial.
Particulate emission factor (indoor air) (m^3/kg)	1.30E+7	ASC NEPM (2013) - commercial/industrial. Assumes 50% soil concentration present in dust as noted in Schedule B7.
Particulate emission factor (outdoor air) (m^3/kg)	3.70E+10	ASC NEPM (2013) - commercial/industrial.
Lung retention factor (dust inhalation)	0.375	ASC NEPM (2013) - commercial/industrial.

7.0 Risk Characterisation

7.1 Methodology

The methodology and equations used to estimate risks for the HHRA are presented below. Threshold Risk Estimates

7.1.1 Threshold Risk Estimates

Risks to human health for CoPCs assessed on the basis of a threshold approach were estimated by comparison of the exposure adjusted air concentration (µg/m^3) of each CoPC with its respective reference concentration (RfC, µg/m^3) allowable from the Site (i.e., the RfC minus background intakes). The resulting ratio, referred to as the hazard quotient, is derived in the following manner:

$$HQ = \frac{EC_{inh}}{RfC - background}$$

Where:

HQ = Hazard Quotient (unitless)

EC_{inh} = Exposure adjusted air concentration (µg/m^3)

RfC = Tolerable Concentration in air (µg/m^3) – adjusted for background intake

A potentially unacceptable chemical intake/exposure is indicated if the EC exceeds the RfC (i.e. if the hazard quotient is greater than 1.0).

To assess the overall potential for adverse health effects posed by exposure to multiple chemicals and pathways (as presented within the multiple pathway exposure assessment), the hazard quotients for each chemical and exposure pathway relevant to a receptor are summed. The resulting sum is referred to as the hazard index (HI), and is calculated using the following equation.

$$HI = \sum_{i=1,\, j=1}^{n} HQ_{i,j}$$

Where:

HI = Hazard Index (unitless)

$HQ_{i,j}$ = Hazard Quotient for pathway *i* and chemical *j* (unitless)

n= Number of chemicals and/or multiple pathways relevant to land use scenario

If the HI is less than one, then cumulative exposure to the CoPC is considered unlikely to result in an adverse effect. If the sum is greater than 1.0, a more detailed and critical evaluation of the hazards may be required, or appropriate risk management measures at the Site may need to be implemented (enHealth, 2012a).

7.1.2 Non-Threshold (Carcinogenic) Risk Estimates

Risks to human health for CoPC considered to be genotoxic carcinogens were estimated as the incremental probability of an individual developing cancer over a lifetime as a result of chemical exposure. The numerical estimate of incremental lifetime carcinogenic risk was calculated using the following relationship:

$$ILCR = EC_{inh} * IUR$$

Where:

ILCR = Incremental Lifetime Cancer Risk (unitless)

EC_{inh} = Exposure adjusted air concentration (µg/m^3)

IUR = Inhalation Unit Risk (µg/m^3)$^{-1}$

To assess the overall potential for effects posed by simultaneous exposure to more than one chemical that is associated with non-threshold carcinogenic effects, the risk for each chemical and pathway were summed. The resulting sum is referred to as the cumulative incremental lifetime carcinogenic risk and is estimated as follows:

$$ILCR_{cum} = \sum_{i=1, j=1}^{n} ILCR_{i,j}$$

Where:

$ILCR_{cum}$ = Cumulative ILCR for a given receptor (unitless)

$ILCR_{i,j}$ = ILCR for chemical i and pathway j

n = Number of chemicals and/or pathways relevant to land use scenario.

This approach assumes that exposure to multiple carcinogens over a lifetime results in a cumulative effect, and therefore, exposures are summed over all intake routes.

7.2 Risk Acceptability Criteria

For threshold (non-carcinogens) CoPC, potentially *unacceptable* chemical intake/exposure is indicated if the exposure level exceeds the TDI or TC (i.e. if the HQ is greater than 1.0) (enHealth, 2012a).

For non-threshold (carcinogenic) CoPC, the incremental lifetime cancer risk estimates for each receptor have been compared to an *acceptable* carcinogenic risk level of 1 in 100,000 (1×10^{-5}) (enHealth, 2012a).

Where the risk acceptability criteria for threshold and non-threshold CoPC are exceeded, a more detailed and critical evaluation of the risk may be conducted, or appropriate risk management measures may be recommended.

7.3 Summary of Risk Estimates – Scenario 1

7.3.1 Inhalation Pathway Assessment

The risk calculation results are presented in **Appendix F**.

A summary of the calculated reasonable maximum threshold risks (hazard index) and non-threshold risks (incremental lifetime excess cancer risk) for vapour inhalation is presented in **Table 22**.

Table 22 Risk Characterisation Summary – Inhalation Exposure Pathway for Scenario 1

Receptor and Exposure Pathway	Adult	Child
	Threshold (HI)	Threshold (HI)
Off-site Receptors – 24-Hour Maximum Ground Level Concentrations		
Inhalation of vapour and particulates in indoor and outdoor air by an **off-site resident**	0.11	0.11
Inhalation of vapour and particulates in outdoor air by an **off-site recreational user**	0.003	0.003
Inhalation of vapour and particulates in indoor and outdoor air by an **off-site commercial worker**	0.021	NA
Off-site Receptors – Grid Maximum Ground Level Concentrations		
Inhalation of vapour and particulates in indoor and	0.18	0.18

Receptor and Exposure Pathway	Adult	Child
	Threshold (HI)	Threshold (HI)
outdoor air by an **off-site resident**		
Inhalation of vapour and particulates in outdoor air by an **off-site recreational user**	0.015	0.015
Inhalation of vapour and particulates in indoor and outdoor air by an **off-site commercial worker**	0.043	NA

NA – not assessed

As presented in **Table 22**, the calculated risk estimates for the inhalation of vapour and particulates by off-site residents, recreational users and commercial workers using the 24-hour and grid maximum concentrations were below the adopted hazard index of 1.0 for threshold compounds.

While these risk estimates were based on a number of assumptions, these were conservative in nature and likely to overestimate actual risk to receptors, as such; it is generally not considered necessary to further refine the assumptions given that the risk estimates were below adopted acceptable levels.

Overall the estimated health risks to off-site residents, recreational users and commercial workers from vapour and particulates emitted from the Site were considered low and acceptable.

7.3.2 Multiple Exposure Pathway Assessment

The risk calculation results are presented in **Appendix F**. The IEUBK blood lead model outputs are presented in **Appendix H**.

A summary of the calculated reasonable maximum threshold risks (hazard index) for the multiple exposure pathway assessment is presented in **Table 23**.

Table 23 Risk Characterisation Summary – Multiple Exposure Pathways for Scenario 1

Receptor and Exposure Pathway	24-Hour Maximum GLC		Grid Maximum GLC

(a) Refer to IEUBK model (**Appendix H**) for child risks associated with lead.

As presented in **Table 23**, hazard indices for the multiple exposure pathway assessment by off-site residents, recreational users and commercial workers using the 24-hour and grid maximum concentrations were below the adopted acceptable hazard index of 1.0.

While these risk estimates were based on a number of assumptions, these were conservative in nature and likely to overestimate actual risk to receptors, as such; it is generally not considered necessary to further refine the assumptions given that the risk estimates were below adopted acceptable levels.

Overall the estimated health risks to off-site residents, recreational users and commercial workers from multiple exposure pathways were considered low and acceptable.

Based on the modelled 24-hour maximum concentration of lead in air (0.00119 µg/m^3) and soil (0.0014 mg/kg) and the adopted exposure parameters for off-site child residents, blood lead concentrations were reported to range from 0.7 µg/dL (5 to 7 year old) and 1.5 µg/dL (0.5 to 1 year old). Additionally, based on the modelled grid maximum concentration of lead in air (0.002 µg/m^3) and soil (0.002 mg/kg), blood lead concentrations were reported to range from 0.6 µg/dL (4 to 5 year old) and 1.5 µg/dL (0.5 to 1 year old). Overall, blood lead concentrations were below the adopted baseline blood lead concentration (5 µg/dL) for children up to 7 years of age. Therefore, the Site is not considered to present a risk to the off-site child residential receptors.

7.4 Summary of Risk Estimates – Scenario 2

7.4.1 Inhalation Pathway Assessment

The risk calculation results are presented in **Appendix F**.

A summary of the calculated reasonable maximum threshold risks (hazard index) and non-threshold risks (incremental lifetime excess cancer risk) for vapour inhalation is presented in **Table 24**.

Table 24 Risk Characterisation Summary – Inhalation Exposure Pathway for Scenario 2

Receptor and Exposure Pathway	Adult		Child	
	Non-threshold (ILCR)	Threshold (HI)	Non-threshold (ILCR)	Threshold (HI)
Off-site Receptors – 24-Hour Maximum Ground Level Concentrations				
Inhalation of vapour and particulates in indoor and outdoor air by an **off-site resident**	9.50E-06	**1.70E+00**	1.96E-06	**1.70E+00**

Inhalation of vapour and particulates in indoor and outdoor air by an **off-site resident**	9.77E-06	**1.79E+00**	2.02E-06	**1.79E+00**
Inhalation of vapour and particulates in outdoor air by an **off-site recreational user**	8.14E-07	1.49E-01	1.68E-07	1.49E-01
Inhalation of vapour and particulates in indoor and outdoor air by an **off-site commercial worker**	2.49E-06	4.42E-01	NA	NA

NA – Not assessed

Bold text indicates exceedance of the risk acceptability criteria,

As presented in **Table 24**, the calculated risk estimates for the inhalation of vapour and particulates by off-site recreational users and commercial workers using the 24-hour and grid maximum concentrations were below the adopted hazard index of 1.0 for threshold compounds and ILCR of $1x10^{-5}$ for non-threshold compounds. Additionally, the calculated risk estimate for the inhalation of vapour and particulates by off-site residents using the 24-hour and grid maximum concentrations were below the adopted ILCR of $1x10^{-5}$ for non-threshold compounds

The calculated risk estimates for the inhalation of vapour and particulates by off-site residents using the 24-hour and grid maximum concentrations were slightly above the adopted acceptable hazard

index of 1.0 for threshold compounds. The potential risk to off-site residents was predominantly driven by the inhalation of cadmium and nickel. However, AECOM notes that the potential risk is unlikely to be realised based on the following:

- Stack concentrations for heavy metals in Scenario 2 were calculated using the proposed Type 1 and Type 2 Substances EPL stack concentration limit of 1 mg/m^3 and dividing the total stack concentration by the total number of heavy metals (13). These values were then used to calculate the relevant stack emission rate based on stack emission data. This approach is considered to be conservative and resulted in an overestimated of ground level impacts, especially when compared to Scenario 1;
- The EPCs adopted in Scenario 2 are the maximum 24-hour average concentrations that were predicted over an entire year. Therefore, it is unlikely that off-site residents would be exposed to these concentrations for 24 hours a day, 365 days a year for 30 years; and
- As noted in **Section 4.1.1**, Scenario 2 is representative of theoretical worst-case impacts using the proposed emission limits. These operating conditions are unlikely to ever occur, and if they do, it would only be for short periods of time. Therefore, a chronic health risk under Scenario 2 operating conditions is unlikely to be realised.

While these risk estimates were based on a number of assumptions, these were conservative in nature and likely to overestimate actual risk to receptors, as such; it is generally not considered necessary to further refine the assumptions given that the risk estimates were below adopted acceptable levels.

Overall the estimated health risks to off-site residents, recreational users and commercial workers from vapour and particulates emitted from the Site were considered low and acceptable.

7.4.2 Multiple Exposure Pathway Assessment

The risk calculation results are presented in **Appendix F**. The IEUBK blood lead model outputs are presented in **Appendix H**.

A summary of the calculated reasonable maximum threshold risks (hazard index) for the multiple exposure pathway assessment is presented in **Table 25**.

Table 25 Risk Characterisation Summary – Multiple Exposure Pathways for Scenario 2

(a) Refer to IEUBK model (**Appendix H**) for child risks associated with lead.

Bold text indicates exceedance of the risk acceptability criteria,

As presented in **Table 25**, the calculated risk estimates for the multiple exposure pathway assessment by recreational users and commercial workers using the 24-hour and grid maximum concentrations were below the adopted hazard index of 1.0 for threshold compounds. The calculated risk estimates for the multiple exposure pathway assessment by off-site residents using the 24-hour and grid maximum concentrations were slightly above the adopted acceptable hazard index of 1.0 for threshold compounds. The potential risk to off-site residents was predominantly driven by the inhalation of heavy metals (e.g. cadmium and nickel) and ingestion of breast milk containing cadmium by infants.

As discussed in **Section 7.4.1**, the potential risk via the inhalation pathway to off-site residents under Scenario 2 operating conditions is unlikely to be realised. Additionally, the approach adopted to calculate the risk via ingestion of breast milk by an infant is considered to be overly conservative based on the following:

- It has been assumed that a breast feeding mother is cumulatively exposed to CoPC emitted from the WA facility via all exposure pathways; and
- It has been assumed that 90% of what is inhaled/ingested by a mother is stored in fat. However, it is understood that cadmium is relatively poorly absorbed (2 to 7%) into the body (WHO, 2011) and cadmium levels in human milk are 5-10% of levels in blood (ATSDR, 2012).

While these risk estimates were based on a number of assumptions, these were conservative in nature and likely to overestimate actual risk to receptors, as such; it is generally not considered necessary to further refine the assumptions given that the risk estimates were below adopted acceptable levels.

Overall the estimated health risks to off-site residents, recreational users and commercial workers from multiple exposure pathways were considered low and acceptable.

Based on the modelled 24-hour maximum concentration of lead in air (0.005 µg/m^3) and soil (0.006 mg/kg) and the adopted exposure parameters for off-site child residents, blood lead concentrations were reported to range from 0.6 µg/dL (4 to 5 year old) and 1.5 µg/dL (0.5 to 1 year old). Additionally, based on the modelled grid maximum concentration of lead in air (0.006 µg/m^3) and soil (0.01 mg/kg), blood lead concentrations were reported to range from 0.6 µg/dL (4 to 5 year old) and 1.5 µg/dL (0.5 to 1 year old). Overall, blood lead concentrations were below the adopted baseline blood lead concentration (5 µg/dL) for children up to 7 years of age. Therefore, the Site is not considered to present a risk to the off-site child residential receptors.

8.0 Uncertainty and Sensitivity Analysis

The risk assessment process involves a number of assumptions regarding Site conditions, human exposure and chemical toxicity. These assumptions are based on Site-specific information (where available), but it is not always possible to fully predict or describe site conditions and human activities at a Site for the exposure period considered in the risk assessment. The assumptions adopted for this risk assessment were therefore generally selected to be conservative in nature, in order to evaluate an assumed reasonable maximum exposure scenario and provide a deliberate margin of safety.

A discussion of some of the key uncertainties associated with different components of the risk assessment process, and an input parameter sensitivity analysis, is provided below.

8.1 Air Dispersion Modelling

The atmosphere is a complex, physical system and the movement of air in a given location is dependent on a number of variables, including temperature, topography and land use, as well as larger-scale synoptic processes. Dispersion modelling is a method of simulating the movement of air pollutants in the atmosphere using mathematical equations. The model equations necessarily involve the current understanding of the complex environmental interactions and chemical reaction processes involved, available input data, processing time and data storage limitations. The model configuration particularly affects model predictions during certain meteorological conditions and source emission types. For example, the prediction of pollutant dispersion under low wind speed conditions (typically defined as those less than 1 m/s) or for low-level, non-buoyant sources, is problematic for most dispersion models. To accommodate these effects, the model is configured to provide conservative estimates of pollutant concentrations at particular locations.

The results of dispersion modelling, therefore, provide a conservative indication of the worst likely level of pollutants within the modelling domain. While the models, when used appropriately and with high quality input data, can provide very good indications of the scale of pollutant concentrations and the likely locations of the maximum concentrations occurring, their outputs should not be considered to be representative of exact pollutant concentrations at any given location or point in time.

AECOM notes that the operational periods adopted in the air dispersion modelling were conservative i.e. 24 hours per day 7 days per week (as presented in the AQIA (AECOM, 2017c)). Realistically, the operational periods are dependent on when feedstock is brought to the Site and therefore operation periods are likely to be intermittent. The conservative operational period adopted is likely to be protective of current and future operations.

To account for the variability in air dispersion modelling, 24-hour maximum annual average ground level concentrations at each receptor were adopted in the HHRA (Scenario 1) as these were considered to represent a conservative exposure scenario. Maximum dust deposition rates (as $mg/m^2/year$) for selected bioaccumulative CoPC within the grid were also adopted in the HHRA. The 24-hour maximum concentrations and deposition rates identified at off-site receptors from the air dispersion modelling are likely to overestimate exposure in the areas assessed. Additionally, the 1-hour maximum concentrations for Scenario 1 were considered in the sensitivity analysis (**Section 8.8**).

8.2 Ingestion Models

The assessment of potential multiple pathway exposure is based on a number of conservative assumptions which are likely to result in an assessment which is in the upper estimate of exposure. Namely the assessment relies on deposition rates which are determined not taking into account the terrain (i.e. buildings, enclosures, green houses, fencing) which may restrict flow path for deposition. The estimated concentrations are based on the maximum deposition rates determined to be representative of exposures over a lifetime to multiple pathways which are unlikely to be representative of the usual residential exposures. They are presented however to account for the potential that there may be a receptor in which all of the estimated exposure scenarios apply.

8.3 Toxicity Assessment

In general, the available scientific information is insufficient to provide a thorough understanding of all of the potential toxic properties of chemicals to which humans may be exposed. It is necessary, therefore, to extrapolate these properties from data obtained under other conditions of exposure and involving experimental laboratory animals. This may introduce two types of uncertainties into the risk assessment, as follows:

a) Those related to extrapolating from one species to another; and

b) Those related to extrapolating from the high exposure doses, usually used in experimental animal studies, to the lower doses usually estimated for human exposure situations.

The majority of the toxicological knowledge of chemicals comes from experiments with laboratory animals, although there may be interspecies differences in chemical absorption, metabolism, excretion and toxic response. There may also be uncertainties concerning the relevance of animal studies using exposure routes that differ from human exposure routes. In addition, the frequent necessity to extrapolate results of short-term or sub-chronic animal studies to humans exposed over a lifetime has inherent uncertainty.

In order to adjust for these uncertainties, IURs and RfCs incorporate safety factors that may vary from 10 to 10,000. The US EPA assumes that humans are as sensitive to carcinogens as the most sensitive animal species. The policy decision, while designed to minimise the potential for underestimating risk, introduces the potential to overestimate carcinogenic risk. Conversely, it also does not allow for the possibility that humans may be more sensitive than the most sensitive animal species.

The model used by the US EPA to determine slope factors is a linearised multistage model, which provides a conservative estimate of cancer risk at low doses and is likely to overestimate the actual slope factor. It is assumed in this approach that a genotoxic mechanism applies, however, most carcinogens do not actually cause cancer by this mechanism. The result is that the use of slope factors has the general effect of overestimating the incremental cancer risks.

The approach for evaluating risks to mixtures of chemicals assesses dose additively and does not account for potential synergism, antagonism or differences in target organ specificity and mechanism of action. In general, the additive approach has the effect of overestimating the risks. This is because chemicals that have no additive effects are included together as well as chemicals that may have additive effects.

8.4 Background Exposures

For metals, the available background exposure percentages adopted by the ASC NEPM (2013) were applied. Adopted background exposure percentages are provided in **Appendix E** and **Appendix F**. Background exposures to other metals (Sb, Pb, Sn and V) were considered to be negligible.

Background exposure to benzene by the general population was considered to be 20%. This is in accordance with recommendations made by Friebel & Nadebaum (2011) to be protective of the majority of residential properties and for Sydney CBD where people spend some time at ground level.

An average lifetime daily exposure (ALDE) was calculated for dioxins and furans using findings of a blood serum study and body burdens (DEH, 2004). The mean ALDE was estimated as 1.32 TEQ pg/kg bw/day (minimum of 0.13 pg/kg bw/day for ages under 16 years; maximum of 2.96 pg/kg bw/day for 60 years and older). AECOM converted 1.32 TEQ pg/kg bw/day to months, which equalled 40.15 pg/kg bw/month. This is 57% of the tolerable monthly intake (TMI) of 70 pg/kg bw/month (DEH, 2005).

The assumptions adopted in the Integrated Exposure Uptake Biokinetic Model for Lead in Children (IEUBK) assess exposures related to all potential sources of lead in a child's life (i.e. drinking water, food, air etc.). Therefore background exposures have been assessed within the IEUBK model for child exposure pathways.

The adult lead model (USEPA, 2003) has been used to assess potential exposures to lead as a result of ingestion of soil and inhalation of dust. The baseline blood lead concentration has been assumed to be 10% of the target blood lead concentration (5 µg/dL) (NHMRC, 2015). This is a conservative assumption based on the background lead information presented within the ASC NEPM (ASC NEPM, 2013) and is consistent with default baseline blood lead concentrations reported by the USEPA which range from 1.7 – 2.2 ug/dL based on the NHANES Survey information for Mexican American and non-Hispanic populations (US EPA, 2003).

8.5 Human Exposure Parameters

Risk assessment requires the adoption of several assumptions in order to assess potential human exposure. This risk assessment included assumptions about general characteristics and patterns of human exposure relevant to the Site. The assumptions used for identified off-site residential, recreational and commercial receptors located nearby the Site were conservative and developed to provide an estimate of reasonable maximum exposures rather than the actual exposures. This approach is likely to overestimate the associated health risks.

8.6 Sensitivity Analysis

When undertaking quantitative risk modelling it is important to understand the potential effects that exposure parameters may have on the overall calculated risks. **Table 26** provides a summary of the main assumptions adopted in the current risk assessment.

Table 26 Sensitivity of Modelling Input Parameters

Parameter	Value Adopted in Risk Assessment (unit)	Outcome in Risk Assessment
Exposure Time	24 hours per day	It has been assumed that human receptors will be exposed to contamination for 24 hours a day, which is considered the most conservative value. A reduction in this value will reduce the overall estimated health risks.
Exposure Frequency	365 days per year	It has been assumed that human receptors will be exposed to contamination for 365 days a year, which is considered the most conservative value. A reduction in this value will reduce the overall estimated health risks.
Exposure Duration	Resident and Recreational User – 29 (adult) and 6 (child) years Commercial Worker – 30 years	It has been assumed that residents and recreational users will be exposed to contamination for 29 years for an adult and 6 years for a child. It has been assumed that a commercial worker will be exposed to contamination for 30 years. These exposure duration periods are in accordance with the ASC NEPM (2013) and are considered to be conservative. A reduction in this value will reduce the overall estimated health risks.
Daily Soil Ingestion Rate	Resident – 50 mg/day (adult) and 100 mg/day (child) Recreational User – 25 mg/day (adult) and 50 mg/day (child)	It has been assumed that an adult resident would ingest 50 mg of soil each day, while a child resident would ingest 100 mg of soil each day. It has been assumed that an adult recreational user would ingest 25 mg of soil each day, while a child recreational user would ingest 50 mg of soil each day. These soil ingestion rates are in accordance with the ASC NEPM (2013) and are considered to be

Parameter	Value Adopted in Risk Assessment (unit)	Outcome in Risk Assessment
		conservative. A reduction in this value will reduce the overall estimated health risks.
Exposed Skin Surface Area for Soil Contact	6300 cm^2 (adult) and 2700 cm^2 (child)	It has been assumed that 31.5% of an adult's body surface area would be exposed to contaminated soil, while 44.3% of a child's body surface area would be exposed to contaminated soil. These exposed skin surface areas are in accordance with the ASC NEPM (2013) and are considered to be conservative. A reduction in this value will reduce the overall estimated health risks.
Soil to Skin Adherence Factor	0.5 mg/cm^2	A soil to skin adherence factor of 0.5 mg/cm^2 is recommended in the ASC NEPM (2013) for all receptors. A reduction in this value will reduce the overall estimated health risks.

8.7 Scenario 3 Chronic Risk Assessment Using 24-Hour Maximum Concentrations

As discussed in the Air Quality Impact Assessment (AQIA) (AECOM, 2017c), the Pymore Recyclers International Pty Ltd (Pymore) lodged a Request for SEARs for the proposed development of a battery recycling facility with the DP&E in February 2016. The facility would be located at 129 Mitchell Avenue, Kurri Kurri, and would occupy approximately 3.4 ha of the lot on which the Site is located.

The proposed facility would recycle approximately 60,000 tonnes per annum (tpa) of used-lead-acid batteries (ULABs) using a CX Integrated System which uses a combination of hydrometallurgical and pyro metallurgical process for the recovery of lead and associated by-products. ULAB recycling at the facility would be comprised of four main processes: crushing screening and separation; desulphurisation; crystallisation; and lead smelting (EMM 2016). As a result, the main pollutants of concern from the facility would be particulates, SO_2, NO_x and lead.

Therefore, cumulative impacts of the proposed BRF have been assessed below (Scenario 3).

8.7.1 Data Used in Scenario 3 HHRA

In Scenario 3, 24-hour maximum annual average and grid maximum ground level concentrations at each receptor were adopted as these were considered to represent off-site human exposure conditions. The maximum concentrations are cumulative i.e. a sum of emissions from the Site, the BRF and background (where available). The air quality data for Scenario 3 is presented in **Appendix B**.

In Scenario 3, annual average and grid maximum dust deposition rates (as mg/m^2/year) were adopted based on the established relationship between the anticipated source concentrations under typical operating conditions and the dust deposition annual average concentration. The deposition rates were used to determine what concentrations may deposit onto soil and therefore be present via a number of additional exposure pathways other than inhalation. The dust deposition data for Scenario 3 is presented in **Appendix B**.

8.7.2 Tier 1 Screening Assessment

As identified in **Section 4.4**, only selected CoPC (i.e. SO_2, NO_2, PM_{10}, $PM_{2.5}$ and lead) were considered in Scenario 3 as no emission data for other CoPC were available for the BRF. Therefore, consistent with the approach adopted for criteria pollutants in Scenario 1, these CoPC were assessed by screening the 24-hour maximum annual average concentrations at each receptor (i.e. residents, recreational users and commercial workers) and grid maximum concentrations against selected Tier 1 screening criteria (refer to **Section 4.11.1**). **Table T5 (Appendix C)** presents the Tier 1 screening assessment for Scenario 3.

8.7.2.1 Tier 1 Screening Results

The 24-hour and grid maximum concentrations of criteria pollutants were below the adopted criteria at each off-site receptor excluding:

- $PM_{2.5}$ and PM_{10} at all off-site receptors.

As no toxicity data is available for particulate matter, human health risks associated with exposure to particulate matter is qualitatively discussed below.

The exposure-response relationships for a number of health effects associated with exposures to PM_{10} and $PM_{2.5}$ is linear (i.e. there is no level or threshold below which no adverse effects have been identified). As there is no threshold for potential adverse health effects and given the exceedance of the criteria, further assessment of particulate matter has been undertaken.

As the 24-hour and grid maximum concentrations of particulate matter were cumulative (as discussed in **Section 8.7.1**), AECOM has further assessed the proportion emitted from the Site compared to that of background. The site-derived concentrations, BRF concentrations, background concentrations and total particulate matter concentrations are presented in **Table 27**.

This page has been left blank intentionally.

Table 27 Site and Background Particular Matter Contributions for Scenario 3

CoPC	Selected Tier 1 Screening Criteria - Residents and Recreational Users (µg/m^3)	Selected Tier 1 Screening Criteria - Commercial Worker (µg/m^3)	24-hr Particulate Matter Concentrations (µg/m^3)			
			Site-Derived Concentration (24-hr Max / Grid Max)	BRF-Derived Concentration (24-hr Max / Grid Max)	Background Concentration	Total Concentration (24-hr Max / Grid Max)
Off-site Resident						
PM_{10}	50	50	0.5 / 0.8	1.5 / 2.0	64.9	66.9 / 67.7
$PM_{2.5}$	25	25	0.002/ 0.002	2.0 / 2.9	25.9	27.9 / 28.7
Off-site Recreational Users						
PM_{10}	50	50	0.3 / 0.8	0.3 / 2.0	64.9	65.4 / 67.7
$PM_{2.5}$	25	25	0.0009 / 0.002	0.5 / 2.9	25.9	26.4 / 28.7
Off-site Commercial Worker						
PM_{10}	50	50	0.4 / 0.8	1.5 / 2.0	64.9	66.8 / 67.7
$PM_{2.5}$	25	25	0.001 / 0.002	1.9 / 2.9	25.9	27.8 / 28.7

This page has been left blank intentionally.

As presented in **Table 27**, the site-derived and BRF-derived 24-hour and grid maximum concentrations of particulate matter for Scenario 3 were below the criteria at each off-site receptor while the 24-hour background concentrations were above the criteria at each off-site receptor. Additionally, a significant portion (greater than 95%) of the total particulate matter concentrations is attributed to background. Therefore, cumulative particulate matter emissions from the Site and BRF were considered to be low and acceptable.

The 24-hour maximum concentration of lead was below the selected criteria at each off-site receptor. However, as lead is considered to be bioaccumulative in the environment, it has been further assessed as part of the Tier 2 multiple pathway assessment (see below).

8.7.3 Representative Exposure Point Concentrations

The adopted EPCs for Scenario 3 in air and particulate deposition rates used to then calculate the concentration of contaminants in soil are presented in **Table 28**. It should be noted that the 24-hour maximum annual average ground level concentrations (100^{th} percentile) at each receptor and grid maximum concentrations were adopted in this sensitivity assessment as these were considered to represent off-site human exposure conditions. Dust deposition rates (as mg/m^2/year) for lead are based the anticipated at source concentrations.

The Scenario 3 24-hour and grid maximum ground level concentrations and dust deposition rates are presented in **Table 28** and **Appendix B**.

This page has been left blank intentionally.

Table 28 Exposure Point Concentrations used in the Scenario 3 Assessment (24-hour Maximum Concentrations)

CoPC (a)	24-hour Maximum Concentration in Air (µg/m^3)				Dust Deposition Rate (mg/m^2/year)			
	Off-site resident	Off-site recreational user	Off-site commercial worker	Grid Maximum	Off-site resident	Off-site recreational user	Off-site commercial worker	Grid Maximum
lead	0.16	0.04	0.16	0.24	4.36E-03	4.71E-04	1.15E-03	5.65E-03

(a) As discussed in **Section 4.9**, those CoPC that were considered to be bioaccumulative are assessed via multiple exposure pathways.

A significant proportion of house dust can be attributed to soil particles that have been tracked into the indoor environment from outdoors. enHealth (2012) consider that 50% of the indoor dust is derived from the site soil, in accordance with the recommendations made by US EPA (2008; 2011). However, in this assessment AECOM has conservatively assumed that the concentration of vapours and particulates inside a building was 100% of the level predicted in the outside air.

This page has been left blank intentionally.

8.7.4 Human Behavioural Exposure Parameters

Human behavioural exposure parameters adopted in this sensitivity assessment were consistent with those used in Scenario 1. Refer to **Section 6.3** for adopted human behavioural exposure parameters.

8.7.5 Inhalation Pathway Assessment

The risk calculation results are presented in **Appendix I**.

A summary of the calculated reasonable maximum threshold risks (hazard index) and non-threshold risks (incremental lifetime excess cancer risk) for vapour inhalation is presented in **Table 29**.

Table 29 Risk Characterisation Summary – Inhalation Exposure Pathway for Scenario 3

Receptor and Exposure Pathway	Adult	Child
	Threshold (HI)	Threshold (HI)
Off-site Receptors – 24-Hour Maximum Ground Level Concentrations		
Inhalation of vapour and particulates in indoor and outdoor air by an **off-site resident**	0.32	0.32
Inhalation of vapour and particulates in outdoor air by an off-site **recreational user**	0.007	0.007
Inhalation of vapour and particulates in indoor and outdoor air by an **off-site commercial worker**	0.08	-
Off-site Receptors – Grid Maximum Ground Level Concentrations		
Inhalation of vapour and particulates in indoor and outdoor air by an **off-site resident**	0.48	0.48
Inhalation of vapour and particulates in outdoor air by an off-site **recreational user**	0.04	0.04
Inhalation of vapour and particulates in indoor and outdoor air by an **off-site commercial worker**	0.12	-

n/a – not assessed

As presented in **Table 29**, the calculated risk estimates for the inhalation of vapour and particulates by off-site residents, recreational users and commercial workers using the 24-hour and grid maximum concentrations were below the adopted acceptable hazard index of 1.0 for lead.

While these risk estimates were based on a number of assumptions, these were conservative in nature and likely to overestimate actual risk to receptors, as such; it is generally not considered necessary to further refine the assumptions given that the risk estimates were below adopted acceptable levels.

Overall the estimated health risks to off-site residents, recreational users and commercial workers from lead emitted from the Site were considered low and acceptable including when assessed cumulatively with the battery recycling facility.

8.7.6 Multiple Exposure Pathway Assessment

The risk calculation results are presented in **Appendix I**. The IEUBK blood lead model outputs are presented in **Appendix H**.

It should be noted that as no fruit and vegetable concentration factors were available for lead, the ingestion of fruit and vegetable pathway by a resident has not been assessed in Scenario 3.

A summary of the calculated reasonable maximum threshold risks (hazard index) for the multiple exposure pathway assessment is presented in **Table 30**.

Table 30 Risk Characterisation Summary – Multiple Exposure Pathways for Scenario 3

Receptor and Exposure Pathway	24-Hour Maximum GLC		Grid Maximum GLC	
	Adult	Child (a)	Adult	Child (a)
	Threshold (HI)	Threshold (HI)	Threshold (HI)	Threshold (HI)
Off-site Residents				
Inhalation of vapour and particulates in indoor and outdoor air	3.2E-01	3.2E-01	4.82E-01	4.82E-01
Incidental ingestion of lead in soil/dust	9.4E-07	Refer to IEUBK Model	4.9E-06	Refer to IEUBK Model
Inhalation of lead in indoor and outdoor air	1.4E-06	Refer to IEUBK Model	1.9E-06	Refer to IEUBK Model
Ingestion of breast milk by an infant	-	1.9E-03	-	9.6E-03
Ingestion of home-grown eggs	5.5E-10	1.5E-09	7.1E-10	1.9E-09
Total Risk Estimates	*0.32*	*0.32*	*0.48*	*0.49*
Off-site Recreational User				
Inhalation of vapour and particulates in outdoor air	7.0E-03	7.0E-03	4.01E-02	4.01E-02
Incidental ingestion of lead in soil/dust	2.0E-07	Refer to IEUBK Model	2.4E-06	Refer to IEUBK Model
Inhalation of lead in dust in outdoor air	7.8E-09	Refer to IEUBK Model	9.4E-08	Refer to IEUBK Model

Off-site Commercial Workers				
Inhalation of vapour and particulates in indoor and outdoor air	7.7E-02	-	1.19E-01	-
Incidental ingestion of lead in soil/dust	5.0E-07	-	2.4E-06	-
Inhalation of lead in dust in indoor and outdoor air	1.5E-07	-	7.5E-07	-
Total Risk Estimates	*0.08*	-	*0.12*	-

(a) Refer to IEUBK model (**Appendix H**) for child risks associated with lead.

As presented in **Table 30**, hazard indices for the multiple exposure pathway assessment by off-site residents, recreational users and commercial workers using the 24-hour and grid maximum concentrations were below the adopted acceptable hazard index of 1.0.

While these risk estimates were based on a number of assumptions, these were conservative in nature and likely to overestimate actual risk to receptors, as such; it is generally not considered necessary to further refine the assumptions given that the risk estimates were below adopted acceptable levels.

Overall the estimated health risks to off-site residents, recreational users and commercial workers from multiple exposure pathways were considered low and acceptable.

Based on the 24-hour maximum modelled concentration of lead in air (0.159 µg/m^3) and soil (0.00625 mg/kg) and the adopted exposure parameters for off-site child residents, blood lead concentrations were reported to range from 0.9 µg/dL (4 to 5 year old) and 1.7 µg/dL (0.5 to 1 year old). Additionally, based on the modelled grid maximum concentration of lead in air (0.241 µg/m^3) and soil (0.008 mg/kg), blood lead concentrations were reported to range from 1.1 µg/dL (4 to 7 year old) and 1.8 µg/dL (0.5 to 8 year old). Overall, blood lead concentrations were below the adopted baseline blood lead concentration (5 µg/dL) for children up to 7 years of age. Therefore, the Site is not considered to present a risk to the off-site child residential receptors.

8.8 Scenario 1 Chronic Risk Assessment Using 1-Hour Maximum Concentrations

8.8.1 Representative Exposure Point Concentrations

The adopted EPCs in air and particulate deposition rates used to then calculate the concentration of contaminants in soil are presented in **Table 31**. It should be noted that the 1-hour maximum annual average ground level concentrations (100^{th} percentile) at each receptor and grid maximum concentrations (100^{th} percentile) were adopted in this sensitivity assessment as these were considered to represent worst-case off-site human exposure conditions. Dust deposition rates (as mg/m^2/year) for selected CoPC (based on bioaccumulation potential) are based the anticipated at source concentrations. It is noted that as the dust deposition rates are an annual average, they are the same as those used for the 24-hour Scenario 1 assessment (**Section 6.1**).

The Scenario 1 1-hour and grid maximum ground level concentrations and dust deposition rates are presented in **Table 31** and **Appendix B**.

This page has been left blank intentionally.

Table 31 Exposure Point Concentrations used in the Scenario 1 Assessment (1-hour Maximum Concentrations)

CoPC (a)	1-hour Maximum Concentration in Air (µg/m^3)				Dust Deposition Rate (mg/m^2/year)			
	Off-site resident	Off-site recreational user	Off-site commercial worker	Grid Maximum	Off-site resident	Off-site recreational user	Off-site commercial worker	Grid Maximum
arsenic	1.57E-04	1.15E-04	1.46E-04	2.27E-04	2.10E-05	2.64E-06	5.78E-06	3.05E-05
cadmium	1.86E-03	1.25E-03	1.75E-03	3.03E-03	2.47E-04	3.03E-05	6.89E-05	3.66E-04
chromium	1.93E-03	1.34E-03	1.80E-03	3.03E-03	2.58E-04	3.19E-05	7.15E-05	3.79E-04
lead	7.43E-03	4.97E-03	6.97E-03	1.21E-02	9.85E-04	1.20E-04	2.75E-04	1.46E-03
mercury	1.29E-02	1.34E-02	1.41E-02	1.45E-02	1.83E-03	2.34E-04	3.85E-04	1.89E-03
nickel	1.88E-03	1.27E-03	1.75E-03	3.03E-03	2.50E-04	3.06E-05	6.95E-05	3.69E-04
selenium	3.49E-04	2.30E-04	3.29E-04	5.76E-04	4.61E-05	5.62E-06	1.29E-05	6.85E-05
vanadium	2.38E-04	1.58E-04	2.25E-04	3.94E-04	3.16E-05	3.84E-06	8.81E-06	4.68E-05
dioxins and furans	3.09E-09	3.22E-09	3.38E-09	3.48E-09	1.70E-09	5.19E-10	7.13E-10	1.92E-09

(a) As discussed in **Section 4.9**, those CoPC that were considered to be bioaccumulative are assessed via multiple exposure pathways.

A significant proportion of house dust can be attributed to soil particles that have been tracked into the indoor environment from outdoors. enHealth (2012) consider that 50% of the indoor dust is derived from the site soil, in accordance with the recommendations made by US EPA (2008; 2011). However, in this assessment AECOM has conservatively assumed that the concentration of vapours and particulates inside a building was 100% of the level predicted in the outside air.

This page has been left blank intentionally.

8.8.2 Human Behavioural Exposure Parameters

Human behavioural exposure parameters adopted in this sensitivity assessment were consistent with the 1-hour modelling for Scenario 1. Refer to **Section 6.3** for adopted human behavioural exposure parameters.

8.8.3 Inhalation Pathway Assessment

The risk calculation results are presented in **Appendix I**.

A summary of the calculated reasonable maximum threshold risks (hazard index) and non-threshold risks (incremental lifetime excess cancer risk) for vapour inhalation is presented in **Table 32**.

Table 32 Risk Characterisation Summary – Inhalation Exposure Pathway for Scenario 1

Receptor and Exposure Pathway	Adult	Child
	Threshold (HI)	Threshold (HI)
Off-site Receptors – 1-Hour Maximum Ground Level Concentrations		
Inhalation of vapour and particulates in indoor and outdoor air by an **off-site resident**	0.69	0.69
Inhalation of vapour and particulates in outdoor air by an **off-site recreational user**	0.04	0.04
Inhalation of vapour and particulates in indoor and outdoor air by an **off-site commercial worker**	0.16	-
Off-site Receptors – Grid Maximum Ground Level Concentrations		
Inhalation of vapour and particulates in indoor and outdoor air by an **off-site resident**	**1.08**	**1.08**
Inhalation of vapour and particulates in outdoor air by an **off-site recreational user**	0.09	0.09
Inhalation of vapour and particulates in indoor and outdoor air by an **off-site commercial worker**	0.27	-

n/a – not assessed

Bold text indicates an exceedance of the adopted risk acceptability criterion.

As presented in **Table 32**, the calculated risk estimates for the inhalation of vapour and particulates by off-site residents, recreational users and commercial workers using the 1-hour maximum concentrations were below the adopted acceptable hazard index of 1.0 for threshold compounds. Additionally, the calculated risk estimates for the inhalation of vapour and particulates by off-site recreational users and commercial workers using the grid maximum concentrations were below the adopted acceptable hazard index of 1.0 for threshold compounds.

The calculated risk estimates for the inhalation of vapour and particulates by off-site residents using the grid maximum concentrations were slightly above the adopted acceptable hazard index of 1.0 for threshold compounds. However, this scenario is considered to be overly conservative i.e. a resident exposed to the modelled 1-hour maximum concentration of all CoPC, for 24 hours a day, 365 days a year for 30 years, and is unlikely to be realised. Additionally, it should be noted that the grid maximum

location was identified on commercial/industrial land and not residential land (as noted in **Section 4.3.3**).

While these risk estimates were based on a number of assumptions, these were conservative in nature and likely to overestimate actual risk to receptors, as such; it is generally not considered necessary to further refine the assumptions given that the risk estimates were below adopted acceptable levels.

Overall the estimated health risks to off-site residents, recreational users and commercial workers from vapour and particulates emitted from the Site were considered low and acceptable.

8.8.4 Multiple Exposure Pathway Assessment

As discussed in **Section 8.8.1**, the dust deposition rates are based on an annual average and therefore were the same as those used for the 24-hour Scenario 1 assessment. Therefore the multiple exposure pathway assessment risk estimates remain unchanged (see **Appendix F** and **Appendix H**), excluding the risk estimate calculated for the inhalation of vapour and particulates in indoor and outdoor air.

A summary of the calculated reasonable maximum threshold risks (hazard index) and non-threshold risks (incremental lifetime excess cancer risk) for the 1-hour maximum multiple exposure pathway assessment is presented in **Table 33**.

Table 33 Risk Characterisation Summary – Multiple Exposure Pathways for Scenario 1

Receptor and Exposure Pathway	1-Hour Maximum GLC		Grid Maximum GLC	
	Adult	Child (a)	Adult	Child (a)

(a) Refer to IEUBK model (**Appendix H**) for child risks associated with lead.

(b) Refer to **Appendix F** for models associated with dust deposition and calculated soil concentrations i.e. all pathways excluding inhalation of vapour.

Bold text indicates an exceedance of the adopted risk acceptability criterion.

As presented in **Table 33**, hazard indices for the multiple exposure pathway assessment by off-site residents, recreational users and commercial workers were typically below the adopted acceptable hazard index of 1.0. The calculated risk estimates for the inhalation of vapour and particulates by off-site residents using the grid maximum concentrations were slightly above the adopted acceptable hazard index of 1.0 for threshold compounds, as discussed in **Section 8.8.3**.

Additionally, the cumulative risk estimate calculated for an off-site resident child using the 1-hour maximum concentrations were slightly above the adopted acceptable hazard index of 1.0 for threshold compounds, The potential risk was predominantly driven by the inhalation of heavy metals (e.g. cadmium and nickel) and ingestion of breast milk containing cadmium by infants. However, AECOM notes that the potential risk is unlikely to be realised based on the following:

- The EPCs adopted in the Scenario 1 sensitivity assessment are the maximum 1-hour average concentrations that were predicted over an entire year. Therefore, it is unlikely that off-site residents would be exposed to these concentrations for 24 hours a day, 365 days a year for 30 years;
- The approach adopted to calculate the risk via ingestion of breast milk by an infant is considered to be overly conservative based on the following:
    - It has been assumed that a breast feeding mother is cumulatively exposed to CoPC via all exposure pathways; and
    - It has been assumed that 90% of what is inhaled/ingested by a mother is stored in fat. However, it is understood that cadmium is relatively poorly absorbed (2 to 7%) into the body (WHO, 2011) and cadmium levels in human milk are 5-10% of levels in blood (ATSDR, 2012).

While these risk estimates were based on a number of assumptions, these were conservative in nature and likely to overestimate actual risk to receptors, as such; it is generally not considered necessary to further refine the assumptions given that the risk estimates were below adopted acceptable levels.

Overall the estimated health risks to off-site residents, recreational users and commercial workers from multiple exposure pathways were considered low and acceptable.

Based on the modelled 1-hour maximum concentration of lead in air (0.00743 µg/m^3) and soil (0.0014 mg/kg) and the adopted exposure parameters for off-site child residents, blood lead concentrations were reported to range from 0.7 µg/dL (5 to 7 year old) and 1.5 µg/dL (0.5 to 1 year old). Additionally, based on the modelled grid maximum concentration of lead in air (0.012 µg/m^3) and soil (0.002 mg/kg), blood lead concentrations were reported to range from 0.7 µg/dL (4 to 7 year olds) and 1.5 µg/dL (0.5 to 1 year old). Overall, blood lead concentrations were below the adopted baseline blood lead concentration (5 µg/dL) for children up to 7 years of age. Therefore, the Site is not considered to present a risk to the off-site child residential receptors.

9.0 Conclusions

AECOM Australia Pty Ltd (AECOM) was engaged by Weston Aluminium Pty Ltd (WA) to undertake a Human Health Risk Assessment (HHRA) for a proposed thermal waste processing facility at their existing aluminium recycling and refining facility located at 129 Mitchell Avenue, Kurri Kurri in the Hunter Valley, NSW (the Site). The Site location is shown on **Figure F1** (**Appendix A**), while the Site setting and surrounding land uses is illustrated on **Figure F2** (**Appendix A**).

The objective of the HHRA is to assess potential future human health risks to surrounding residents, commercial workers and recreational users resultant from possible exposure to Site-derived environmental hazards associated with the proposed thermal processing facility operation. This included consideration of air quality (i.e. vapour and particulates), noise and vibration, odour and soil and water.

A total of four future operating scenarios were considered as part of the HHRA i.e. Scenario 1 (Normal Operating Conditions), Scenario 2 (Stack Emission Limits), Scenario 3 (Battery Recycling Facility) and Scenario 4 (Emergency Bypass Operations).

The CoPC considered as part of this HHRA were sourced from publically available emission factor sources (AP42), stack emission date and EPLs from similar facilities and expert advice and are listed in **Section 4.4**.

All air quality data used in the HHRA were derived from dispersion modelling provided in the AQIA (AECOM, 2017c) prepared to support the application for development consent. AECOM has adopted maximum 24-hour average concentrations reported over a year in the chronic health assessments (i.e. Scenario 1 and Scenario 2) and maximum 1-hour average concentrations reported over a year in the acute health assessments (i.e. Scenario 2 and Scenario 4). Additionally, AECOM has undertaken sensitivity assessments to assess chronic risks associated with Scenario 1 and Scenario 3 using maximum 1-hour and 24-hour concentrations, respectively. For both the main and sensitivity assessments, annual dust deposition rates derived from the dispersion modelling were used.

The following human receptors were considered in this HHRA based on the surrounding land uses:

- Off-site low-density residents;
- Off-site commercial workers; and
- Off-site recreational users of open space.

Pathways that have been considered to be complete for the Project and therefore were assessed in the HHRA include:

- Inhalation Pathway Assessment:
  - Inhalation of vapours and particulates in indoor and outdoor air (acute and chronic assessments).
- Multiple Pathway Assessment:
  - Inhalation of vapours and particulates in indoor and outdoor air (acute and chronic assessments);
  - Inhalation of surficial soil-derived dust in indoor and outdoor air (chronic assessment);
  - Direct contact (i.e. incidental ingestion and dermal contact) with deposited dust (chronic assessment);
  - Ingestion of home-grown fruit and vegetables following dust deposition on soil and plants (chronic assessment);
  - Ingestion of eggs from home-grown chickens residing on the deposited dust (chronic assessment); and
  - Ingestion of breast milk by infants based on mother's intake and maternal transfer (chronic assessment).

The estimated acute and chronic health risks to off-site residents (including an adult, child and infant), recreational users (adult and child) and commercial workers (adult) from all exposure pathways were considered low and acceptable excluding:

- Scenario 1 (Chronic Assessment – Sensitivity Analysis): Inhalation of vapour and particulates in indoor and outdoor air by an off-site resident (adult and child) using 1-hour grid maximum ground level concentrations and inhalation of vapour and particulates in indoor and outdoor air and ingestion of breast milk by an off-site resident (child/infant) using 1-hour maximum ground level concentrations. This scenario is considered to be overly conservative i.e. a resident exposed to the modelled 1-hour maximum concentration of all CoPC, for 24 hours a day, 365 days a year for 30 years, and is unlikely to be realised. AECOM notes that chronic human health risks under Scenario 1 using 24-hour maximum ground level concentrations were low and acceptable.
- Scenario 2 (Chronic Assessment): Inhalation of vapour and particulates in indoor and outdoor air by an off-site resident and ingestion of breast milk by an infant using 24-hour maximum and grid maximum ground level concentrations. The potential risk to off-site residents was predominantly driven by the inhalation of cadmium and nickel in air and consumption of cadmium contained in breast milk. However, AECOM notes that the potential risk is unlikely to be realised based on the following:
    - Stack concentrations for heavy metals in Scenario 2 were calculated using the proposed Type 1 and Type 2 Substances EPL stack concentration limit of 1 mg/m3 and dividing the total stack concentration by the total number of heavy metals (13). These values were then used to calculate the relevant stack emission rate based on stack emission data. This approach is considered to be conservative and resulted in an overestimated of ground level impacts, especially when compared to Scenario 1.
    - The EPCs adopted in Scenario 2 are the maximum 24-hour average concentrations that were predicted over an entire year. Therefore, it is unlikely that off-site residents would be exposed to these concentrations for 24 hours a day, 365 days a year for 30 years.
    - Scenario 2 operating conditions are unlikely to ever occur, and if they do, it would only be for short periods of time. Therefore, a chronic health risk under these operating conditions is unlikely to be realised.
    - It was assumed that a breast feeding mother is cumulatively exposed to CoPC via all exposure pathways.
    - It was assumed that 90% of what is inhaled/ingested by a mother is stored in fat. However it is understood that cadmium is relatively poorly absorbed (2 to 7%) into the body (WHO, 2011) and cadmium levels in human milk are 5-10% of levels in blood (ATSDR, 2012).

While risk estimates were based on a number of assumptions, these were conservative in nature and likely to overestimate actual risk to receptors, as such; it is generally not considered necessary to further refine the assumptions given that the risk estimates were below adopted acceptable levels.

These conclusions should be read in conjunction with the data gaps outlined in **Section 3.5**, uncertainties in **Section 8.0** and limitations in **Section 10.0**.

10.0 Limitations

This document was prepared for the sole use of Weston Aluminium Pty Ltd. This party is the only intended beneficiary of our work. Any advice, opinions or recommendations contained in this document should be read and relied upon only in the context of the document as a whole and are considered current to the date of this document. Any other party should satisfy themselves that the scope of work conducted and reported herein meets their specific needs. AECOM cannot be held liable for third party reliance on this document, as AECOM is not aware of the specific needs of the third party.

This document was prepared for the purpose described herein and as agreed to by Weston Aluminium Pty Ltd. From a technical perspective, the subsurface environment at any site may present substantial uncertainty. It is a heterogeneous, complex environment, in which small subsurface features or changes in geologic conditions can have substantial impacts on water and chemical movement. Uncertainties may also affect source characterisation assessment of chemical fate and transport in the environment, assessment of exposure risks and health effects, and remedial action performance.

AECOM's professional opinions are based upon its professional judgement, experience and training. It is possible that additional testing and analysis might produce different results and/or different opinions. AECOM has limited its assessment to the scope agreed upon with it client. AECOM believes that its opinions are reasonably supported by the testing and analysis that have been done and that those opinions have been developed according to the professional standard of care for the environmental consulting profession in this area at this time. That standard of care may change and new methods and practices of exploration, testing, analysis and remediation may develop in the future, which might produce different results. AECOM's professional opinions contained in this document are subject to modification if additional information is obtained through further investigation, observations, or testing and analysis during any future assessment or remedial activities.
