

#### **REGIONAL CONTEXT**

Located in Eastern Creek approximately half way between Mount Druit and Blacktown, the site sits within an undeveloped woodland adjacent to the M7 motorway and the Great Western Highway. Consisting of remnant vegetation communities including Shale Plains Woodland and Alluvial Woodland, the site represents western Sydney's bushland character.

Alluvial Woodland

#### SITE/LANDSCAPE ANALYSIS

#### **HYDROLOGY**

The site is located just west of Eastern Creek. Eastern Creek makes up the largest catchment area in the Blacktown LGA covering 3622 ha, much of which is flood prone. The site sits on land that falls within a low risk flood area.

#### **OPEN SPACE**

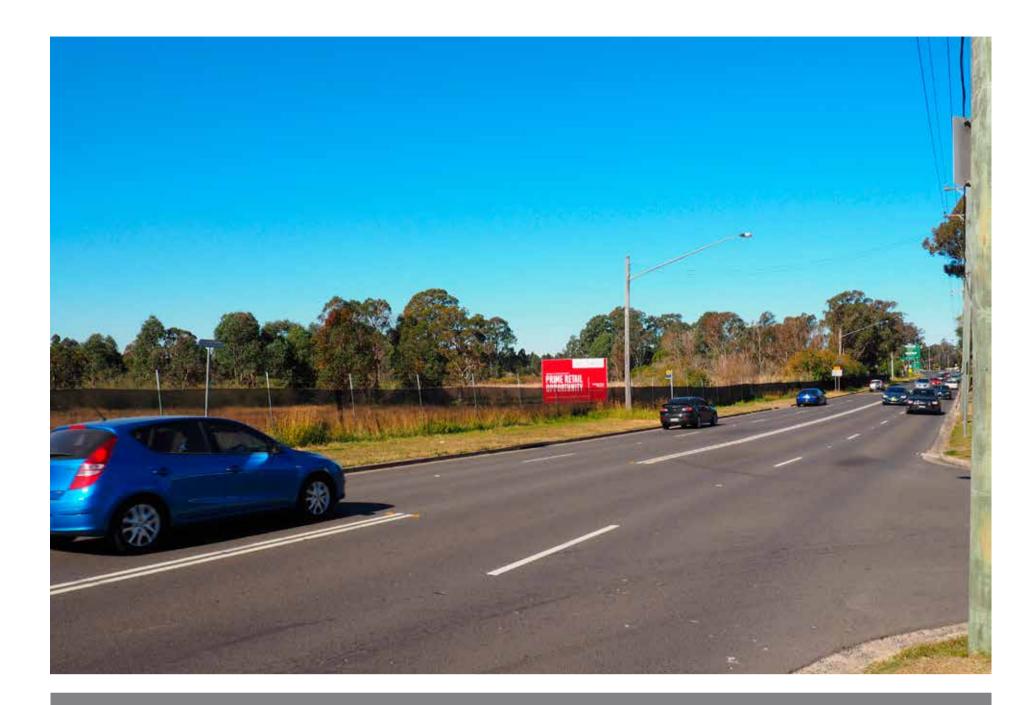

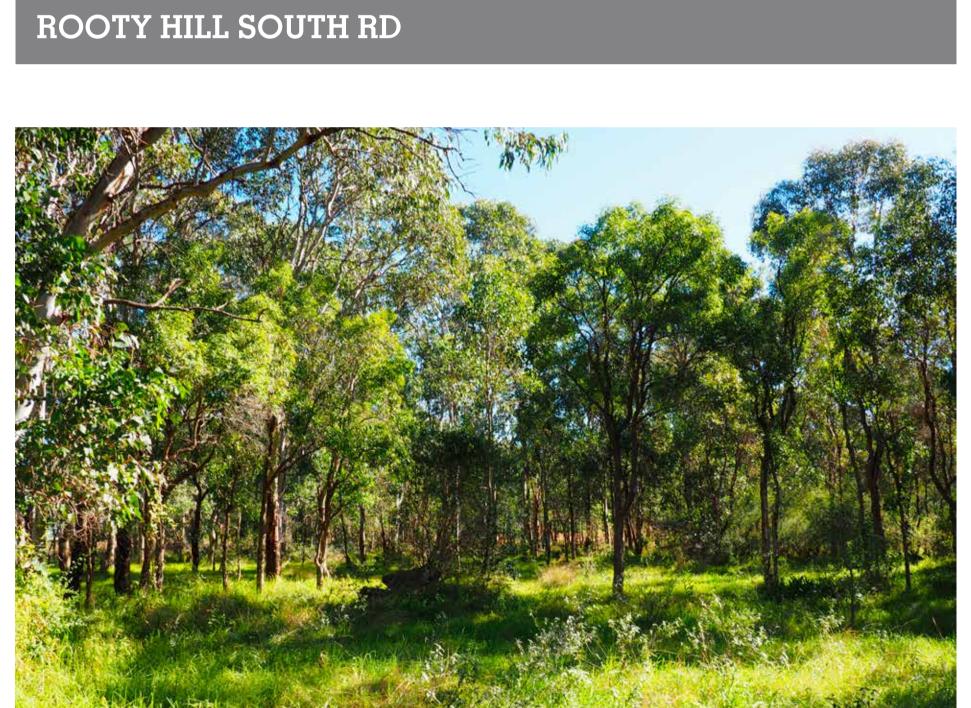

The site is located within a very large open space network, most of which is un-improved pasture. Dedicated cycleways run adjacent to the M7 and M4 Motorways as well as through the nearby reserves and pasture landscapes.

#### **PASSIVE IRRIGATION**

This proposal aims to use passive irrigation throughout the design predominately within the carpark area. By grading hardscape areas to drain toward central planted zones, the design not only saves cost through not installing an irrigation system, but also reduces the pressure on the stormwater system and the natural wetland adjacent to the site, reducing the risk of flooding.

1

# MICROCLIMATE

Providing adequate shading in this design will be essential to the success of the project. Located in Western Sydney, the site experiences harsh, dry summers. By providing large areas of shade and refuge, within the public space as well as the car park, the design will accommodate users with comfortable, cool spaces without turning its back to the surrounding landscape.

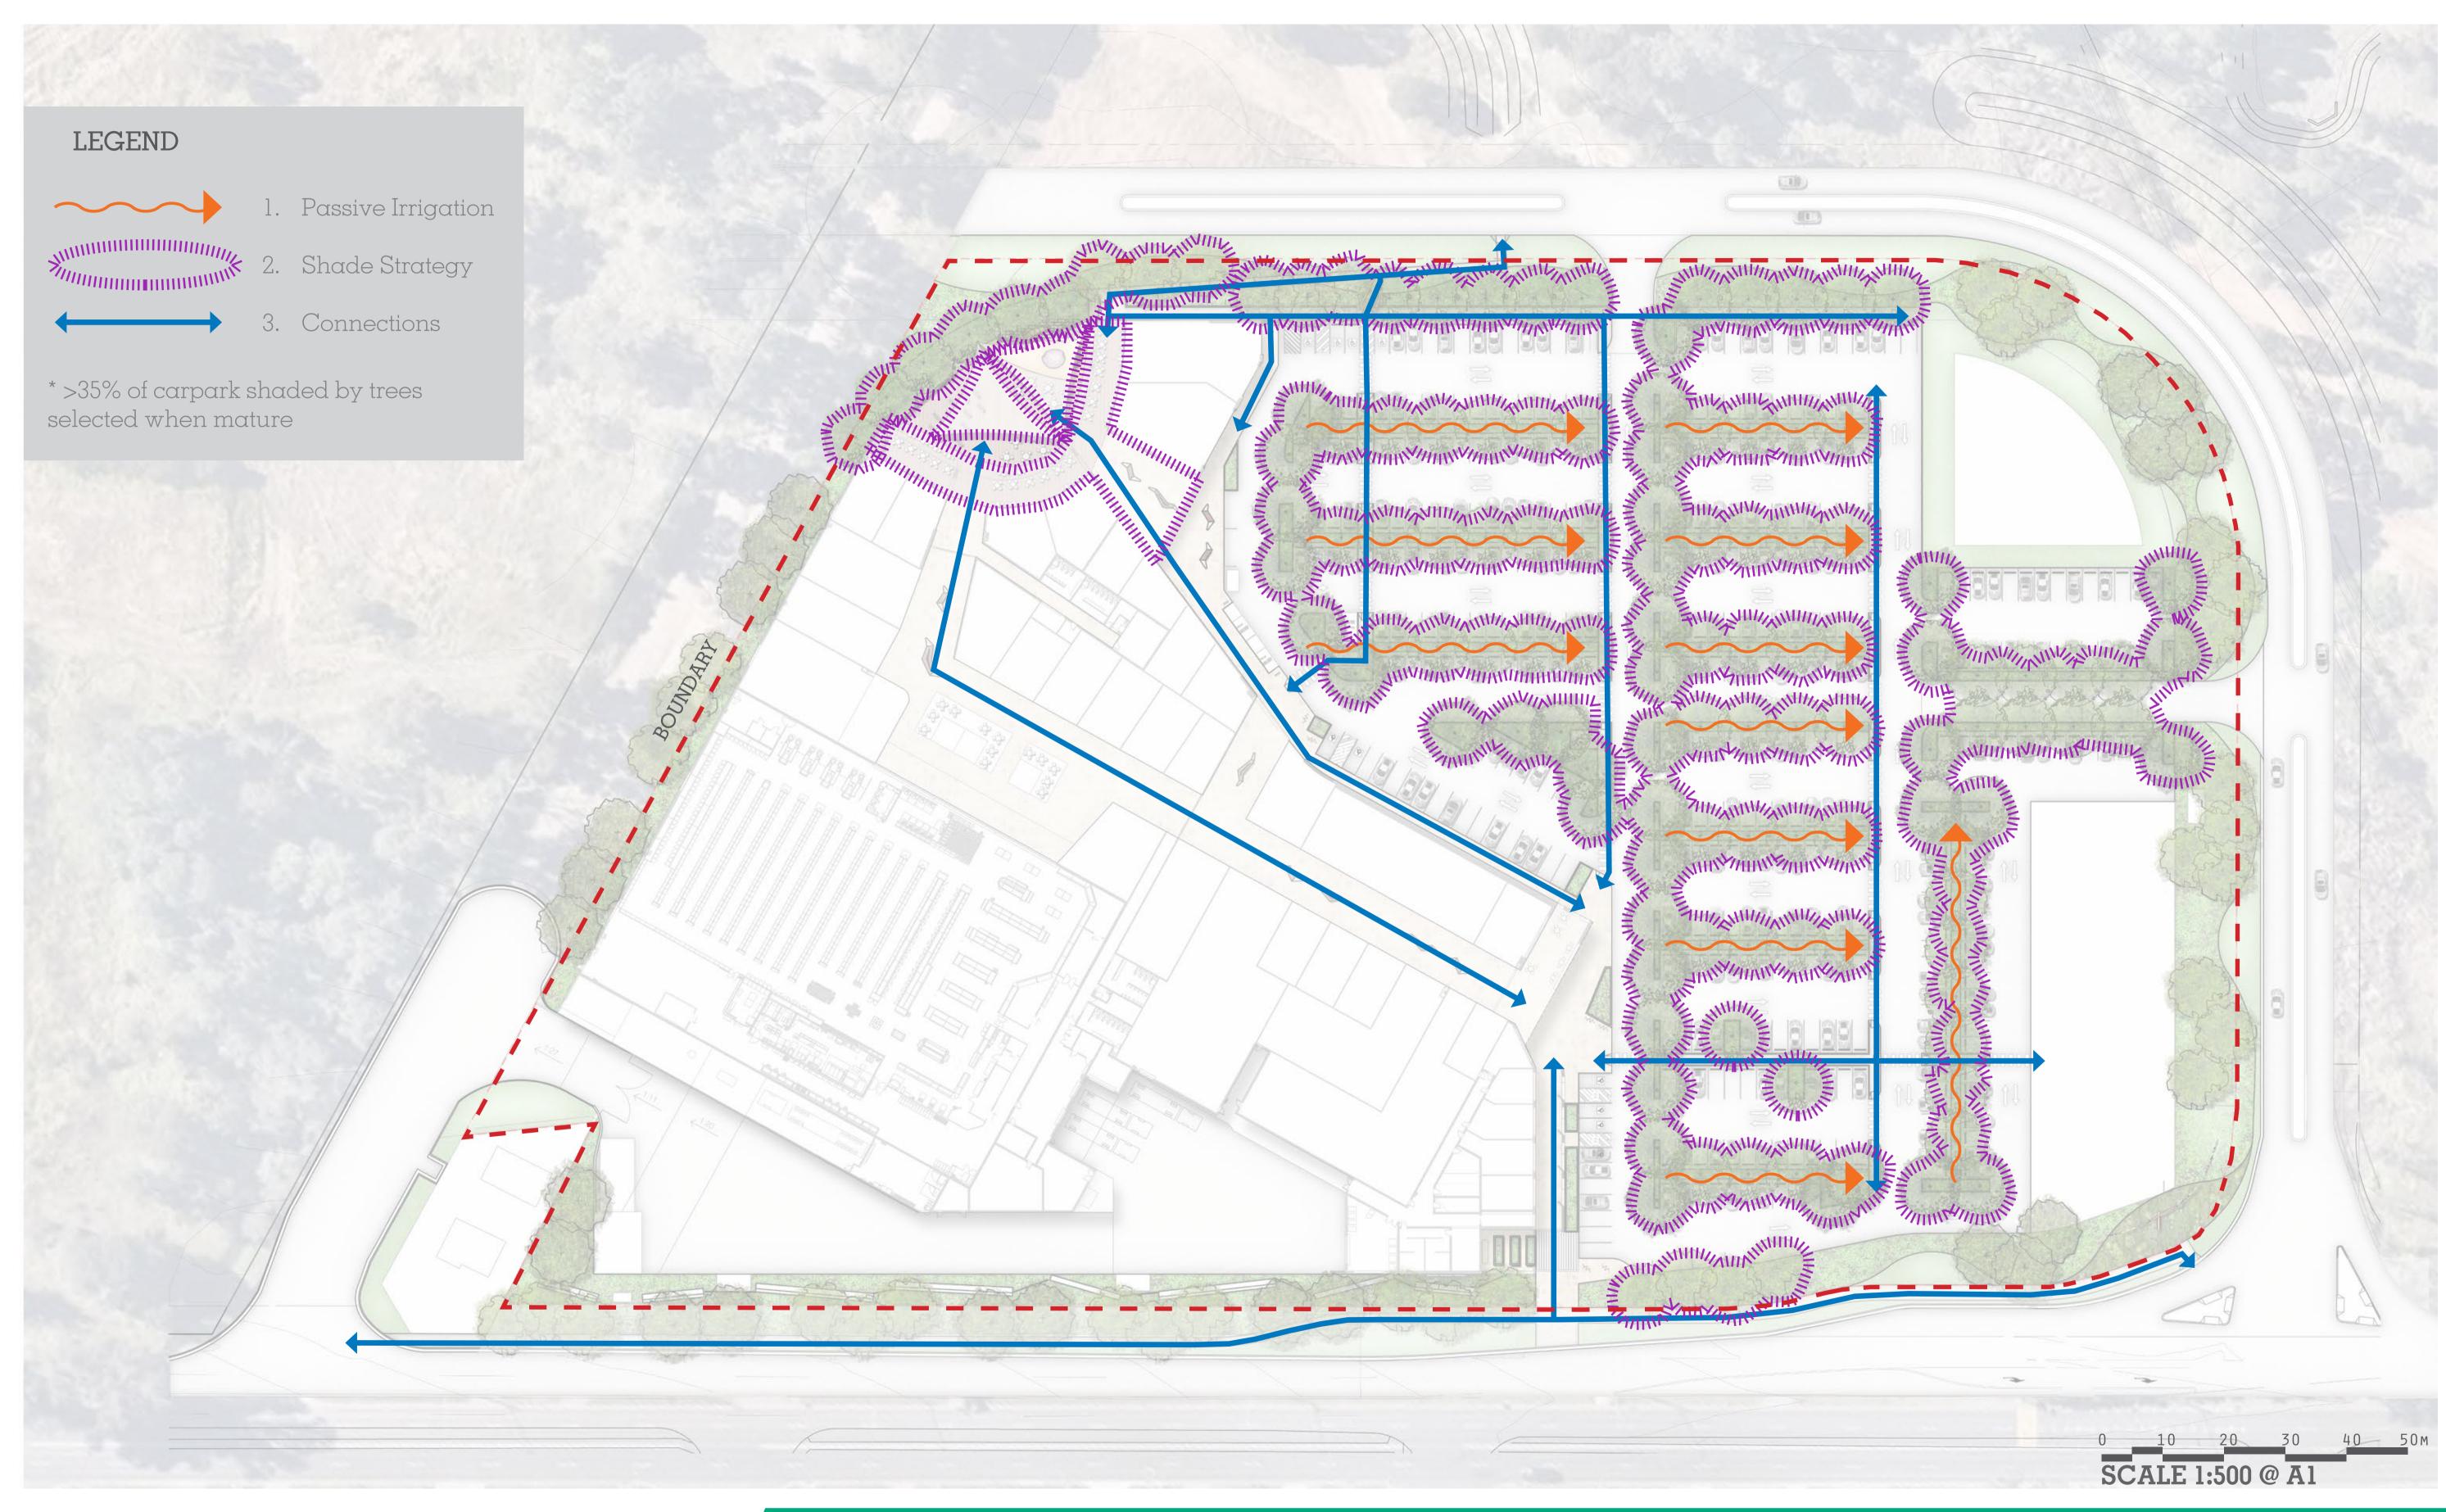

#### CONNECTIONS

The site sits adjacent to the intersection of the M7 motorway and the Great Western Highway making the site very accessible by vehicle. The M7 also includes an integrated, dedicated bicycle path that this proposal will look to provide links to and through the site, connecting to the wider existing network.

Corymbia maculata

The Shale Plains Woodland is a vegetation community within the wider Cumberland Plain Woodland community that occurs mainly in the driest parts of the Sydney basin as it is well adapted to drought and fire. Originally occuring over 122,000 hectares across Western Sydney, this vegetation community covers just 7% of its original area. This community is now listed as a critically endangered ecological community under the NSW Threatened Species Conservation Act 1995.

The species selected are core members of this ecological community, well adapted to site soil and microclimate conditions. Clear trunks provide good surveillance through the site while the large canopies cast considerable shade to reduce heat island effect.

The sculptural qualities of the Corymbia *maculata* and Eucaluptus *tereticornis* will be utilised throughout the carpark. Perimeter planting of Eucalyptus *eugenioides* and Eucalyptus *moluccana* will occur in garden beds in random groupings to promote view corridors and retain native planting arrangements.
