RPD Duplicates Acceptance Criteria is 30% In calculating the RPD values, the following protocols are adopted:-Where both concentrations are above laboratory reporting limits the RPD formula is used;

Where both concentrations are below the laboratory reporting limits, no RPD is calculated; and

\*\*\*Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

### APPENDIX

### LABORATORY ANALYTICAL REPORTS

### Certificate of Analysis

Cardno (NSW/ACT) Pty Ltd Level 9, 203 Pacific Highway St Leonards NSW 2065

NATA Accredited Accreditation Number 1261 Site Number 18217

Accredited for compliance with ISO/IEC 17025 – Testing The results of the tests, calibrations and/or measurements included in this document are traceable to Australian/national standards.

### Attention:

Ben Withnall

# Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported. A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

mgt

#### Internal Quality Control Review and Glossary

#### General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.

- 2. All soil results are reported on a dry basis, unless otherwise stated.
- 3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
- 4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
- 5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
- 6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
- 7. Samples were analysed on an 'as received' basis.
- 8. This report replaces any interim results previously issued.

#### **Holding Times**

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days. \*\*NOTE: pH duplicates are reported as a range NOT as RPD

#### Units

| mg/kg: milligrams per kilogram           | mg/L: milligrams per litre         | ug/L: micrograms per litre                                       |
|--|------------------------------------|--|
| ppm: Parts per million                   | ppb: Parts per billion             | %: Percentage  |
| org/100mL: Organisms per 100 millilitres | NTU: Nephelometric Turbidity Units | MPN/100mL: Most Probable Number of organisms per 100 millilitres |

#### Terms

| Dry              | Where a moisture has been determined on a solid sample the result is expressed on a dry basis.   |
|------------------|--|
| LOR              | Limit of Reporting.  |
| SPIKE            | Addition of the analyte to the sample and reported as percentage recovery.   |
| RPD              | Relative Percent Difference between two Duplicate pieces of analysis.  |
| LCS              | Laboratory Control Sample - reported as percent recovery.  |
| CRM              | Certified Reference Material - reported as percent recovery.   |
| Method Blank     | In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.     |
| Surr - Surrogate | The addition of a like compound to the analyte target and reported as percentage recovery.   |
| Duplicate        | A second piece of analysis from the same sample and reported in the same units as the result to show comparison.   |
| USEPA            | United States Environmental Protection Agency  |
| APHA             | American Public Health Association   |
| TCLP             | Toxicity Characteristic Leaching Procedure   |
| сос              | Chain of Custody   |
| SRA              | Sample Receipt Advice  |
| QSM              | Quality Systems Manual ver 5.1 US Department of Defense  |
| СР               | Client Parent - QC was performed on samples pertaining to this report  |
| NCP              | Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within. |
| TEQ              | Toxic Equivalency Quotient   |

#### **QC** - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

#### **QC Data General Comments**

- 1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
- 2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
- 3. Organochlorine Pesticide analysis where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
- 4. Organochlorine Pesticide analysis where reporting Spike data, Toxaphene is not added to the Spike.
- 5. Total Recoverable Hydrocarbons where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
- 6. pH and Free Chlorine analysed in the laboratory Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
- 7. Recovery Data (Spikes & Surrogates) where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
- 8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
- 9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
- 10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

### **Quality Control Results**

| Test   | Units | Result 1 |     | Acceptance<br>Limits | Pass<br>Limits | Qualifying<br>Code |
|--|-------|----------|-----|----------------------|----------------|--------------------|

| Attempt to Chill was evident  | Yes |
| Sample correctly preserved  | Yes |
| Appropriate sample containers have been used                            | Yes |
| Sample containers for volatile analysis received with minimal headspace | Yes |
| Samples received within HoldingTime                                     | Yes |
| Some samples have been subcontracted                                    | No  |

#### **Qualifier Codes/Comments**

Code Description

 F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).

 Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.

F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.

N07 Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs

Q15 The RPD reported passes Eurofins | mgt's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.

Field Screen uses the following fizz rating to classify the rate the samples reacted to the peroxide: 1.0; No reaction to slight. 2.0; Moderate reaction. 3.0; Strong reaction with persistent froth. 4.0; Extreme reaction.

| Received Date                                    | Nov 12, 2018  |
| Date Reported                                    | Nov 21, 2018  |
| Methodology:                                     |   |
| Asbestos Fibre<br>Identification                 | Conducted in accordance with the Australian Standard AS 4964 – 2004: Method for the Qualitative Identification of Asbestos in Bulk Samples and in-house Method LTM-ASB-8020 by polarised light microscopy (PLM) and dispersion staining (DS) techniques.<br>NOTE: Positive Trace Analysis results indicate the sample contains detectable respirable fibres.  |
| Unknown Mineral<br>Fibres                        | Mineral fibres of unknown type, as determined by PLM with DS, may require another analytical technique, such as<br>Electron Microscopy, to confirm unequivocal identity.<br>NOTE: While Actinolite, Anthophyllite and Tremolite asbestos may be detected by PLM with DS, due to variability in the<br>optical properties of these materials, AS4964 requires that these are reported as UMF unless confirmed by an<br>independent technique.  |
| Subsampling Soil<br>Samples                      | The whole sample submitted is first dried and then passed through a 10mm sieve followed by a 2mm sieve. All fibrous matter greater than 10mm, greater than 2mm as well as the material passing through the 2mm sieve are retained and analysed for the presence of asbestos. If the sub 2mm fraction is greater than approximately 30 to 60g then a sub-sampling routine based on ISO 3082:2009(E) is employed.<br><i>NOTE: Depending on the nature and size of the soil sample, the sub-2 mm residue material may need to be sub-sampled for trace analysis, in accordance with AS 4964-2004.</i>  |
| Bonded asbestos-<br>containing material<br>(ACM) | The material is first examined and any fibres isolated for identification by PLM and DS. Where required, interfering matrices may be removed by disintegration using a range of heat, chemical or physical treatments, possibly in combination. The resultant material is then further examined in accordance with AS 4964 - 2004. NOTE: Even after disintegration it may be difficult to detect the presence of asbestos in some asbestos-containing bulk materials using PLM and DS. This is due to the low grade or small length or diameter of the asbestos fibres present in the material, or to the fact that very fine fibres have been distributed intimately throughout the materials. Vinyl/asbestos floor tiles, some asbestos-containing sealants and mastics, asbestos-containing epoxy resins and some ore samples are examples of these types of material, which are difficult to analyse.   |
| Limit of Reporting                               | The performance limitation of the AS 4964 (2004) method for non-homogeneous samples is around 0.1 g/kg (equivalent to 0.01% (w/w)). Where no asbestos is found by PLM and DS, including Trace Analysis, this is considered to be at the nominal reporting limit of 0.01% (w/w). The NEPM screening level of 0.001% (w/w) is intended as an on-site determination, not a laboratory Limit of Reporting (LOR), per se. Examination of a large sample size (e.g. 500 mL) may improve the likelihood of detecting asbestos, particularly AF, to aid assessment against the NEPM criteria. Gravimetric determinations to this level of accuracy are outside of AS 4964 and hence NATA Accreditation does not cover the performance of this service (non-NATA results shown with an asterisk). NOTE: NATA News March 2014, p.7, states in relation to AS 4964: "This is a qualitative method with a nominal reporting limit of 0.01 % " and that currently in Australia "there is no validated method available for the quantification of asbestos". This report is consistent with the analytical procedures and reporting recommendations in the NEPM and the WA DoH. |

## **Sample History**

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported. A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

#### Internal Quality Control Review and Glossary General

#### 1. QC data may be available on request.

- 2. All soil results are reported on a dry basis, unless otherwise stated.
- 3. Samples were analysed on an 'as received' basis.
- 4. This report replaces any interim results previously issued.

#### **Holding Times**

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

#### Units

| % w/w: weight for weight b | pasis   | grams per kilogram  |
|----------------------------|---|---|
| Filter loading:            |   | fibres/100 graticule areas  |
| Reported Concentration:    |   | fibres/mL   |
| Flowrate:                  |   | L/min   |
| Terms                      |   |   |
| Dry                        | Sample is dried by heating prior to analysis  |   |
| LOR                        | Limit of Reporting  |   |
| COC                        | Chain of Custody  |   |
| SRA                        | Sample Receipt Advice   |   |
| ISO                        | International Standards Organisation  |   |
| AS                         | Australian Standards  |   |
| WA DOH                     | Reference document for the NEPM. Government of Western Austr<br>Sites in Western Australia (2009), including supporting document F      | alia, Guidelines for the Assessment, Remediation and Management of Asbestos-Contaminated<br>Recommended Procedures for Laboratory Analysis of Asbestos in Soil (2011) |
| NEPM                       | National Environment Protection (Assessment of Site Contamination   | on) Measure, 2013 (as amended)  |
| ACM                        | Asbestos Containing Materials. Asbestos contained within a non-a:<br>NEPM, ACM is generally restricted to those materials that do not p | sbestos matrix, typically presented in bonded and/or sound condition. For the purposes of the<br>ass a 7mm x 7mm sieve.   |
| AF                         | Asbestos Fines. Asbestos containing materials, including friable, w equivalent to "non-bonded / friable".                               | eathered and bonded materials, able to pass a 7mm x 7mm sieve. Considered under the NEPM as   |
| FA                         | Fibrous Asbestos. Asbestos containing materials in a friable and/or<br>materials that do not pass a 7mm x 7mm sieve.                    | severely weathered condition. For the purposes of the NEPM, FA is generally restricted to those   |
| Friable                    | Asbestos-containing materials of any size that may be broken or cr<br>outside of the laboratory's remit to assess degree of friability. | umbled by hand pressure. For the purposes of the NEPM, this includes both AF and FA. It is  |
| Trace Analysis             | Analytical procedure used to detect the presence of respirable fibre  | es in the matrix.   |

#### Comments

Samples No14961 & No14962 received were less than the nominal 500mL as recommended in Section 4.10 of the NEPM Schedule B1 - Guideline on Investigation Levels for Soil and Groundwater.

Eurofins | mgt accreditation number 1261, corporate site 1254 is currently in progress of a controlled transition to a new custom built location at 6 Monterey Road, Dandenong South, Victoria 3175. All results on this report denoted as being performed by Eurofins | mgt 2-5 Kingston Town Close, Oakleigh Victoria 3166 corporate site 1254, will have been performed on either Oakleigh or new Dandenong South site.

#### Sample Integrity

| Custody Seals Intact (if used)  | N/A |
|---|-----|
| Attempt to Chill was evident  | Yes |
| Sample correctly preserved  | Yes |
| Appropriate sample containers have been used                            | Yes |
| Sample containers for volatile analysis received with minimal headspace | Yes |
| Samples received within HoldingTime                                     | Yes |
| Some samples have been subcontracted                                    | No  |

Sample Receipt Advice

Cardno (NSW/ACT) Pty Ltd Company name: Contact name: **Ben Withnall KYEEMAGH INFANTS SCHOOL** Project name: Project ID: 80818157 COC number: Not provided Turn around time: 5 Day Nov 12, 2018 4:31 PM Date/Time received: Eurofins | mgt reference: 627289

## Sample information

- A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- All samples have been received as described on the above COC.
- ☑ COC has been completed correctly.
- Attempt to chill was evident.
- Appropriately preserved sample containers have been used.
- All samples were received in good condition.
- Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- Appropriate sample containers have been used.
- Split sample sent to requested external lab.
- Some samples have been subcontracted.
- N/A Custody Seals intact (if used).

## Notes

Sample QA200 forwarded to ALS. Extra Jar received (BH04\_0.5-0.95) placed on hold.

## **Contact notes**

If you have any questions with respect to these samples please contact:

Nibha Vaidya on Phone : +61 (2) 9900 8415 or by e.mail: NibhaVaidya@eurofins.com

Results will be delivered electronically via e.mail to Ben Withnall - ben.withnall@cardno.com.au.

Note: A copy of these results will also be delivered to the general Cardno (NSW/ACT) Pty Ltd email address.

| Report   | 629407-AID  |
| Project Name                                     | ADDITIONAL - KYEEMAGH INFANTS SCHOOL  |
| Project ID                                       | 80818157  |
| Received Date                                    | Nov 22, 2018  |
| Date Reported                                    | Nov 29, 2018  |
| Methodology:                                     |   |
| Asbestos Fibre<br>Identification                 | Conducted in accordance with the Australian Standard AS 4964 – 2004: Method for the Qualitative Identification of Asbestos in Bulk Samples and in-house Method LTM-ASB-8020 by polarised light microscopy (PLM) and dispersion staining (DS) techniques.<br>NOTE: Positive Trace Analysis results indicate the sample contains detectable respirable fibres.  |
| Unknown Mineral<br>Fibres                        | Mineral fibres of unknown type, as determined by PLM with DS, may require another analytical technique, such as<br>Electron Microscopy, to confirm unequivocal identity.<br>NOTE: While Actinolite, Anthophyllite and Tremolite asbestos may be detected by PLM with DS, due to variability in the<br>optical properties of these materials, AS4964 requires that these are reported as UMF unless confirmed by an<br>independent technique.  |
| Subsampling Soil<br>Samples                      | The whole sample submitted is first dried and then passed through a 10mm sieve followed by a 2mm sieve. All fibrous matter greater than 10mm, greater than 2mm as well as the material passing through the 2mm sieve are retained and analysed for the presence of asbestos. If the sub 2mm fraction is greater than approximately 30 to 60g then a sub-<br>sampling routine based on ISO 3082:2009(E) is employed.<br>NOTE: Depending on the nature and size of the soil sample, the sub-2 mm residue material may need to be sub-<br>sampled for trace analysis, in accordance with AS 4964-2004.   |
| Bonded asbestos-<br>containing material<br>(ACM) | The material is first examined and any fibres isolated for identification by PLM and DS. Where required, interfering matrices may be removed by disintegration using a range of heat, chemical or physical treatments, possibly in combination. The resultant material is then further examined in accordance with AS 4964 - 2004. NOTE: Even after disintegration it may be difficult to detect the presence of asbestos in some asbestos-containing bulk materials using PLM and DS. This is due to the low grade or small length or diameter of the asbestos fibres present in the material, or to the fact that very fine fibres have been distributed intimately throughout the materials. Vinyl/asbestos floor tiles, some asbestos-containing sealants and mastics, asbestos-containing epoxy resins and some ore samples are examples of these types of material, which are difficult to analyse.   |
| Limit of Reporting                               | The performance limitation of the AS 4964 (2004) method for non-homogeneous samples is around 0.1 g/kg (equivalent to 0.01% (w/w)). Where no asbestos is found by PLM and DS, including Trace Analysis, this is considered to be at the nominal reporting limit of 0.01% (w/w). The NEPM screening level of 0.001% (w/w) is intended as an on-site determination, not a laboratory Limit of Reporting (LOR), per se. Examination of a large sample size (e.g. 500 mL) may improve the likelihood of detecting asbestos, particularly AF, to aid assessment against the NEPM criteria. Gravimetric determinations to this level of accuracy are outside of AS 4964 and hence NATA Accreditation does not cover the performance of this service (non-NATA results shown with an asterisk). NOTE: NATA News March 2014, p.7, states in relation to AS 4964: "This is a qualitative method with a nominal reporting limit of 0.01 % " and that currently in Australia "there is no validated method available for the quantification of asbestos". This report is consistent with the analytical procedures and reporting recommendations in the NEPM and the WA DOH. |

Accredited for compliance with ISO/IEC 17025–Testing The results of the tests, calibrations and/or measurements included in this document are traceable to Australian/national standards.

## **Sample History**

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported. A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

#### Internal Quality Control Review and Glossary General

#### 1. QC data may be available on request.

- 2. All soil results are reported on a dry basis, unless otherwise stated.
- 3. Samples were analysed on an 'as received' basis.
- 4. This report replaces any interim results previously issued.

#### **Holding Times**

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

| WA DOH     Reference document for the NEPM. Government of Western Australia, Guidelines for the Assessment, Remediation and Management of Asbestos-Contaminated       Sites in Western Australia (2009), including supporting document Recommended Procedures for Laboratory Analysis of Asbestos in Soil (2011) |
| NEPM National Environment Protection (Assessment of Site Contamination) Measure, 2013 (as amended)   |
| ACM Asbestos Containing Materials. Asbestos contained within a non-asbestos matrix, typically presented in bonded and/or sound condition. For the purposes of the NEPM, ACM is generally restricted to those materials that do not pass a 7mm x 7mm sieve.   |
| AF Asbestos Fines. Asbestos containing materials, including friable, weathered and bonded materials, able to pass a 7mm x 7mm sieve. Considered under the NEPM as equivalent to "non-bonded / friable".  |
| FA Fibrous Asbestos. Asbestos containing materials in a friable and/or severely weathered condition. For the purposes of the NEPM, FA is generally restricted to those materials that do not pass a 7mm x 7mm sieve.   |
| Friable Asbestos-containing materials of any size that may be broken or crumbled by hand pressure. For the purposes of the NEPM, this includes both AF and FA. It is outside of the laboratory's remit to assess degree of friability.   |
| Trace Analysis     Analytical procedure used to detect the presence of respirable fibres in the matrix.  |

From: Joel Griffiths [mailto:joel.griffiths@cardno.com.au] Sent: Thursday, 22 November 2018 12:04 PM To: Nibha Vaidya Cc: Ben Withnall Subject: Report 627289 : Site KYEEMAGH INFANTS SCHOOL (80818157) - TP04\_0.4 ASB analysis

## EXTERNAL EMAIL\*

Hello Nibha,

Sorry to bug you again! Going through my notes from the other weekends field work it looks as though there was piece of FC in the ASB bag taken for TP04\_0.4. Could we please have this sample analysed? I have attached the relevant COC. Thanks a million!

Kind regards,

Joel Griffiths ENVIRONMENTAL SCIENTIST CARDNO

## Sample information

- A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- All samples have been received as described on the above COC.
- ☑ COC has been completed correctly.
- Attempt to chill was evident.
- Appropriately preserved sample containers have been used.
- All samples were received in good condition.
- Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- Appropriate sample containers have been used.
- Split sample sent to requested external lab.
- Some samples have been subcontracted.
- N/A Custody Seals intact (if used).

# **Contact notes**

If you have any questions with respect to these samples please contact:

Nibha Vaidya on Phone : +61 (2) 9900 8415 or by e.mail: NibhaVaidya@eurofins.com

Results will be delivered electronically via e.mail to Ben Withnall - ben.withnall@cardno.com.au.

Note: A copy of these results will also be delivered to the general Cardno (NSW/ACT) Pty Ltd email address.

- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with **Quality Review and Sample Receipt Notification.** 

## Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

| Signatories      | Position              | Accreditation Category             |
|------------------|-----------------------|------------------------------------|
| Alex Rossi       | Organic Chemist       | Sydney Organics, Smithfield, NSW   |
| Celine Conceicao | Senior Spectroscopist | Sydney Inorganics, Smithfield, NSW |
| Edwandy Fadjar   | Organic Coordinator   | Sydney Inorganics, Smithfield, NSW |
| Edwandy Fadjar   | Organic Coordinator   | Sydney Organics, Smithfield, NSW   |

### **General Comments**

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key: CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society. LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

ø = ALS is not NATA accredited for these tests.

~ = Indicates an estimated value.

Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full. This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

### Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

#### **General Comments**

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key: Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot

CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

RPD = Relative Percentage Difference

# = Indicates failed QC

### Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

## Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

## Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

# **Summary of Outliers**

### **Outliers : Quality Control Samples**

This report highlights outliers flagged in the Quality Control (QC) Report.

- <u>NO</u> Method Blank value outliers occur.
- <u>NO</u> Duplicate outliers occur.
- <u>NO</u> Laboratory Control outliers occur.
- <u>NO</u> Matrix Spike outliers occur.
- For all regular sample matrices, <u>NO</u> surrogate recovery outliers occur.

### **Outliers : Analysis Holding Time Compliance**

• NO Analysis Holding Time Outliers exist.

### **Outliers : Frequency of Quality Control Samples**

• <u>NO</u> Quality Control Sample Frequency Outliers exist.

## Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for <u>VOC in soils</u> vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

| Matrix: SOIL                                |                                   |                |                    | Evaluation | n: × = Holding time | breach ; 🗸 = Withi | n holding time. |

# **Quality Control Parameter Frequency Compliance**

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

| Matrix: SOIL                     |            |    |         | Evaluatio | n: × = Quality Co | ntrol frequency | not within specification ; $\checkmark$ = Quality Control frequency within specification. |

# **Brief Method Summaries**

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

| Analytical Methods   | Method     | Matrix | Method Descriptions   |
|--|------------|--------|---|
| Moisture Content   | EA055      | SOIL   | In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).  |
| Total Metals by ICP-AES                                    | EG005T     | SOIL   | In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3)  |
| Total Mercury by FIMS                                      | EG035T     | SOIL   | In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3) |
| Polychlorinated Biphenyls (PCB)                            | EP066      | SOIL   | In house: Referenced to USEPA SW 846 - 8270D Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 504)  |
| Pesticides by GCMS   | EP068      | SOIL   | In house: Referenced to USEPA SW 846 - 8270D Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM (2013) Schedule B(3) (Method 504,505)   |
| TRH - Semivolatile Fraction                                | EP071      | SOIL   | In house: Referenced to USEPA SW 846 - 8015A Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM amended 2013.   |
| Volatile Organic Compounds                                 | EP074      | SOIL   | In house: Referenced to USEPA SW 846 - 8260B Extracts are analysed by Purge and Trap, Capillary GC/MS.<br>Quantification is by comparison against an established 5 point calibration curve. This method is compliant with<br>NEPM (2013) Schedule B(3) (Method 501)   |
| PAH/Phenols (SIM)  | EP075(SIM) | SOIL   | In house: Referenced to USEPA SW 846 - 8270D. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 502 and 507)   |
| TRH Volatiles/BTEX   | EP080      | SOIL   | In house: Referenced to USEPA SW 846 - 8260B. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM amended 2013.   |
| Preparation Methods  | Method     | Matrix | Method Descriptions   |
| Hot Block Digest for metals in soils sediments and sludges | EN69       | SOIL   | In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM (2013) Schedule B(3) (Method 202)   |
| Methanolic Extraction of Soils for Purge and Trap          | ORG16      | SOIL   | In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.   |

### Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported. A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

| Description  | Testing Site | Extracted    | Holding Time |

### Internal Quality Control Review and Glossary

### General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.

- 2. All soil results are reported on a dry basis, unless otherwise stated.
- 3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
- 4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
- 5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
- 6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
- 7. Samples were analysed on an 'as received' basis.
- 8. This report replaces any interim results previously issued.

### **Holding Times**

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days. \*\*NOTE: pH duplicates are reported as a range NOT as RPD

### Units

| mg/kg: milligrams per kilogram           | mg/L: milligrams per litre         | ug/L: micrograms per litre                                       |
|--|------------------------------------|--|
| ppm: Parts per million                   | ppb: Parts per billion             | %: Percentage  |
| org/100mL: Organisms per 100 millilitres | NTU: Nephelometric Turbidity Units | MPN/100mL: Most Probable Number of organisms per 100 millilitres |

### Terms

| Dry              | Where a moisture has been determined on a solid sample the result is expressed on a dry basis.   |
|------------------|--|
| LOR              | Limit of Reporting.  |
| SPIKE            | Addition of the analyte to the sample and reported as percentage recovery.   |
| RPD              | Relative Percent Difference between two Duplicate pieces of analysis.  |
| LCS              | Laboratory Control Sample - reported as percent recovery.  |
| CRM              | Certified Reference Material - reported as percent recovery.   |
| Method Blank     | In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.     |
| Surr - Surrogate | The addition of a like compound to the analyte target and reported as percentage recovery.   |
| Duplicate        | A second piece of analysis from the same sample and reported in the same units as the result to show comparison.   |
| USEPA            | United States Environmental Protection Agency  |
| APHA             | American Public Health Association   |
| TCLP             | Toxicity Characteristic Leaching Procedure   |
| сос              | Chain of Custody   |
| SRA              | Sample Receipt Advice  |
| QSM              | Quality Systems Manual ver 5.1 US Department of Defense  |
| СР               | Client Parent - QC was performed on samples pertaining to this report  |
| NCP              | Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within. |
| TEQ              | Toxic Equivalency Quotient   |

### **QC** - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

### **QC Data General Comments**

- 1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
- 2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
- 3. Organochlorine Pesticide analysis where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
- 4. Organochlorine Pesticide analysis where reporting Spike data, Toxaphene is not added to the Spike.
- 5. Total Recoverable Hydrocarbons where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
- 6. pH and Free Chlorine analysed in the laboratory Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
- 7. Recovery Data (Spikes & Surrogates) where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
- 8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
- 9. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
- 10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

### **Quality Control Results**

| Test   | Units | Result 1 |     | Acceptance<br>Limits | Pass<br>Limits | Qualifying<br>Code |
|--|-------|----------|-----|----------------------|----------------|--------------------|
| Method Blank   |       |          |     | -                    |                |                    |

### Comments

Eurofins | mgt accreditation number 1261, corporate site 1254 is currently in progress of a controlled transition to a new custom built location at 6 Monterey Road, Dandenong South, Victoria 3175. All results on this report denoted as being performed by Eurofins | mgt 2-5 Kingston Town Close, Oakleigh Victoria 3166 corporate site 1254, will have been performed on either Oakleigh or new Dandenong South site.

| Sample Integrity  |     |
|---|-----|
| Custody Seals Intact (if used)  | N/A |
| Attempt to Chill was evident  | Yes |
| Sample correctly preserved  | Yes |
| Appropriate sample containers have been used                            | Yes |
| Sample containers for volatile analysis received with minimal headspace | Yes |
| Samples received within HoldingTime                                     | Yes |
| Some samples have been subcontracted                                    | No  |

### **Qualifier Codes/Comments**

Code Description

F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).

Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.

F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.

Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to N07 the total of the two co-eluting PAHs

R20 This sample is a Trip Spike and therefore all results are reported as a percentage

Field Screen uses the following fizz rating to classify the rate the samples reacted to the peroxide: 1.0; No reaction to slight. 2.0; Moderate reaction. 3.0; Strong reaction with persistent froth. 4.0; Extreme reaction.

| Received Date                                    | Nov 19, 2018  |
| Date Reported                                    | Nov 27, 2018  |
| Methodology:                                     |   |
| Asbestos Fibre<br>Identification                 | Conducted in accordance with the Australian Standard AS 4964 – 2004: Method for the Qualitative Identification of Asbestos in Bulk Samples and in-house Method LTM-ASB-8020 by polarised light microscopy (PLM) and dispersion staining (DS) techniques.<br>NOTE: Positive Trace Analysis results indicate the sample contains detectable respirable fibres.  |
| Unknown Mineral<br>Fibres                        | Mineral fibres of unknown type, as determined by PLM with DS, may require another analytical technique, such as<br>Electron Microscopy, to confirm unequivocal identity.<br>NOTE: While Actinolite, Anthophyllite and Tremolite asbestos may be detected by PLM with DS, due to variability in the<br>optical properties of these materials, AS4964 requires that these are reported as UMF unless confirmed by an<br>independent technique.  |
| Subsampling Soil<br>Samples                      | The whole sample submitted is first dried and then passed through a 10mm sieve followed by a 2mm sieve. All fibrous matter greater than 10mm, greater than 2mm as well as the material passing through the 2mm sieve are retained and analysed for the presence of asbestos. If the sub 2mm fraction is greater than approximately 30 to 60g then a sub-sampling routine based on ISO 3082:2009(E) is employed.<br><i>NOTE: Depending on the nature and size of the soil sample, the sub-2 mm residue material may need to be sub-sampled for trace analysis, in accordance with AS 4964-2004.</i>  |
| Bonded asbestos-<br>containing material<br>(ACM) | The material is first examined and any fibres isolated for identification by PLM and DS. Where required, interfering matrices may be removed by disintegration using a range of heat, chemical or physical treatments, possibly in combination. The resultant material is then further examined in accordance with AS 4964 - 2004. NOTE: Even after disintegration it may be difficult to detect the presence of asbestos in some asbestos-containing bulk materials using PLM and DS. This is due to the low grade or small length or diameter of the asbestos fibres present in the material, or to the fact that very fine fibres have been distributed intimately throughout the materials. Vinyl/asbestos floor tiles, some asbestos-containing sealants and mastics, asbestos-containing epoxy resins and some ore samples are examples of these types of material, which are difficult to analyse.   |
| Limit of Reporting                               | The performance limitation of the AS 4964 (2004) method for non-homogeneous samples is around 0.1 g/kg (equivalent to 0.01% (w/w)). Where no asbestos is found by PLM and DS, including Trace Analysis, this is considered to be at the nominal reporting limit of 0.01% (w/w). The NEPM screening level of 0.001% (w/w) is intended as an on-site determination, not a laboratory Limit of Reporting (LOR), per se. Examination of a large sample size (e.g. 500 mL) may improve the likelihood of detecting asbestos, particularly AF, to aid assessment against the NEPM criteria. Gravimetric determinations to this level of accuracy are outside of AS 4964 and hence NATA Accreditation does not cover the performance of this service (non-NATA results shown with an asterisk). NOTE: NATA News March 2014, p.7, states in relation to AS 4964: "This is a qualitative method with a nominal reporting limit of 0.01 % " and that currently in Australia "there is no validated method available for the quantification of asbestos". This report is consistent with the analytical procedures and reporting recommendations in the NEPM and the WA DoH. |

Accredited for compliance with ISO/IEC 17025–Testing The results of the tests, calibrations and/or measurements included in this document are traceable to Australian/national standards.

### **Sample History**

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported. A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

#### Internal Quality Control Review and Glossary General

#### 1. QC data may be available on request.

- 2. All soil results are reported on a dry basis, unless otherwise stated.
- 3. Samples were analysed on an 'as received' basis.
- 4. This report replaces any interim results previously issued.

#### **Holding Times**

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

#### Comments

No24247: Sample received was less than the nominal 500mL as recommended in Section 4.10 of the NEPM Schedule B1 - Guideline on Investigation Levels for Soil and Groundwater.

Eurofins | mgt accreditation number 1261, corporate site 1254 is currently in progress of a controlled transition to a new custom built location at 6 Monterey Road, Dandenong South, Victoria 3175. All results on this report denoted as being performed by Eurofins | mgt 2-5 Kingston Town Close, Oakleigh Victoria 3166 corporate site 1254, will have been performed on either Oakleigh or new Dandenong South site.

#### Sample Integrity

| Custody Seals Intact (if used)  | N/A |
|---|-----|
| Attempt to Chill was evident  | Yes |
| Sample correctly preserved  | Yes |
| Appropriate sample containers have been used                            | Yes |
| Sample containers for volatile analysis received with minimal headspace | Yes |
| Samples received within HoldingTime                                     | Yes |
| Some samples have been subcontracted                                    | No  |
|   |     |

#### **Qualifier Codes/Comments**

| Code | Description    |
|------|----------------|
| N/A  | Not applicable |

### Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported. A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

#### Internal Quality Control Review and Glossary

#### General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.

- 2. All soil results are reported on a dry basis, unless otherwise stated.
- 3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
- 4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
- 5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
- 6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
- 7. Samples were analysed on an 'as received' basis.
- 8. This report replaces any interim results previously issued.

#### **Holding Times**

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days. \*\*NOTE: pH duplicates are reported as a range NOT as RPD

#### Units

| mg/kg: milligrams per kilogram           | mg/L: milligrams per litre         | ug/L: micrograms per litre                                       |
|--|------------------------------------|--|
| ppm: Parts per million                   | ppb: Parts per billion             | %: Percentage  |
| org/100mL: Organisms per 100 millilitres | NTU: Nephelometric Turbidity Units | MPN/100mL: Most Probable Number of organisms per 100 millilitres |

#### Terms

| Dry              | Where a moisture has been determined on a solid sample the result is expressed on a dry basis.   |
|------------------|--|
| LOR              | Limit of Reporting.  |
| SPIKE            | Addition of the analyte to the sample and reported as percentage recovery.   |
| RPD              | Relative Percent Difference between two Duplicate pieces of analysis.  |
| LCS              | Laboratory Control Sample - reported as percent recovery.  |
| CRM              | Certified Reference Material - reported as percent recovery.   |
| Method Blank     | In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.     |
| Surr - Surrogate | The addition of a like compound to the analyte target and reported as percentage recovery.   |
| Duplicate        | A second piece of analysis from the same sample and reported in the same units as the result to show comparison.   |
| USEPA            | United States Environmental Protection Agency  |
| APHA             | American Public Health Association   |
| TCLP             | Toxicity Characteristic Leaching Procedure   |
| сос              | Chain of Custody   |
| SRA              | Sample Receipt Advice  |
| QSM              | Quality Systems Manual ver 5.1 US Department of Defense  |
| СР               | Client Parent - QC was performed on samples pertaining to this report  |
| NCP              | Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within. |
| TEQ              | Toxic Equivalency Quotient   |

#### **QC** - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

#### **QC Data General Comments**

- 1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
- 2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
- 3. Organochlorine Pesticide analysis where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
- 4. Organochlorine Pesticide analysis where reporting Spike data, Toxaphene is not added to the Spike.
- 5. Total Recoverable Hydrocarbons where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
- 6. pH and Free Chlorine analysed in the laboratory Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
- 7. Recovery Data (Spikes & Surrogates) where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
- 8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
- 9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
- 10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

#### **Quality Control Results**

| Test   | Units | Result 1 |   | Acceptance<br>Limits | Pass<br>Limits | Qualifying<br>Code |
|--|-------|----------|---|----------------------|----------------|--------------------|

#### Comments

Eurofins | mgt accreditation number 1261, corporate site 1254 is currently in progress of a controlled transition to a new custom built location at 6 Monterey Road, Dandenong South, Victoria 3175. All results on this report denoted as being performed by Eurofins | mgt 2-5 Kingston Town Close, Oakleigh Victoria 3166 corporate site 1254, will have been performed on either Oakleigh or new Dandenong South site.

| Sample Integrity  |     |
|---|-----|
| Custody Seals Intact (if used)  | N/A |
| Attempt to Chill was evident  | Yes |
| Sample correctly preserved  | Yes |
| Appropriate sample containers have been used                            | Yes |
| Sample containers for volatile analysis received with minimal headspace | Yes |
| Samples received within HoldingTime                                     | Yes |
| Some samples have been subcontracted                                    | No  |

#### **Qualifier Codes/Comments**

Code Description

F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).

Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.

F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.

N07 Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs

Q15 The RPD reported passes Eurofins | mgt's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.

# Sample Receipt Advice

Company name: Cardno (NSW/ACT) Pty Ltd Contact name: **Ben Withnall KYEEMAGH INFANTS SCHOOL** Project name: Project ID: 80818157 COC number: Not provided Turn around time: 5 Day Nov 19, 2018 2:52 PM Date/Time received: Eurofins | mgt reference: 628416

# Sample information

- A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- All samples have been received as described on the above COC.
- ☑ COC has been completed correctly.
- Attempt to chill was evident.
- Appropriately preserved sample containers have been used.
- All samples were received in good condition.
- Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- Appropriate sample containers have been used.
- Sample containers for volatile analysis received with zero headspace.
- Split sample sent to requested external lab.
- Some samples have been subcontracted.

N/A Custody Seals intact (if used).

# Notes

Sample QA400 forwarded to ALS.

# **Contact notes**

If you have any questions with respect to these samples please contact:

Nibha Vaidya on Phone : +61 (2) 9900 8415 or by e.mail: NibhaVaidya@eurofins.com

Results will be delivered electronically via e.mail to Ben Withnall - ben.withnall@cardno.com.au.

Note: A copy of these results will also be delivered to the general Cardno (NSW/ACT) Pty Ltd email address.

| Ivan Taylor    | Analyst             | Sydney Inorganics, Smithfield, NSW |

#### **General Comments**

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key: CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society. LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

ø = ALS is not NATA accredited for these tests.

~ = Indicates an estimated value.

Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full. This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

#### Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

| Signatories    | Position            | Accreditation Category             |

#### **General Comments**

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key: Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot

CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

RPD = Relative Percentage Difference

# = Indicates failed QC

#### Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

### Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

### Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

# Summary of Outliers

### **Outliers : Quality Control Samples**

This report highlights outliers flagged in the Quality Control (QC) Report.

- <u>NO</u> Method Blank value outliers occur.
- <u>NO</u> Duplicate outliers occur.
- <u>NO</u> Laboratory Control outliers occur.
- <u>NO</u> Matrix Spike outliers occur.
- For all regular sample matrices, <u>NO</u> surrogate recovery outliers occur.

### **Outliers : Analysis Holding Time Compliance**

• NO Analysis Holding Time Outliers exist.

### **Outliers : Frequency of Quality Control Samples**

• <u>NO</u> Quality Control Sample Frequency Outliers exist.

### Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

| Matrix: SOIL  |                                      |                |                    | Evaluation | : × = Holding time | breach ; 🗸 = Withi | in holding time. |

# **Quality Control Parameter Frequency Compliance**

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

| Matrix: SOIL                     |            |    |         | Evaluatio | on: × = Quality Co | ntrol frequency | not within specification ; $\checkmark$ = Quality Control frequency within specification. |

# **Brief Method Summaries**

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

| Analytical Methods   | Method     | Matrix | Method Descriptions   |
|--|------------|--------|---|
| Moisture Content   | EA055      | SOIL   | In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).  |
| Total Metals by ICP-AES                                    | EG005T     | SOIL   | In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3)  |
| Total Mercury by FIMS                                      | EG035T     | SOIL   | In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2) (Cold Vapour generation) AAS)<br>FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an<br>appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then<br>purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This<br>method is compliant with NEPM (2013) Schedule B(3) |
| TRH - Semivolatile Fraction                                | EP071      | SOIL   | In house: Referenced to USEPA SW 846 - 8015A Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM amended 2013.   |
| PAH/Phenols (SIM)  | EP075(SIM) | SOIL   | In house: Referenced to USEPA SW 846 - 8270D. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 502 and 507)   |
| TRH Volatiles/BTEX   | EP080      | SOIL   | In house: Referenced to USEPA SW 846 - 8260B. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM amended 2013.   |
| Preparation Methods  | Method     | Matrix | Method Descriptions   |
| Hot Block Digest for metals in soils sediments and sludges | EN69       | SOIL   | In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM (2013) Schedule B(3) (Method 202)   |
| Methanolic Extraction of Soils for Purge and Trap          | ORG16      | SOIL   | In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.   |
| Tumbler Extraction of Solids                               | ORG17      | SOIL   | In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.  |

### Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported. A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

| Description                     | Testing Site | Extracted    | Holding Time |
|---------------------------------|--------------|--------------|--------------|

### Internal Quality Control Review and Glossary

### General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.

- 2. All soil results are reported on a dry basis, unless otherwise stated.
- 3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
- 4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
- 5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
- 6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
- 7. Samples were analysed on an 'as received' basis.
- 8. This report replaces any interim results previously issued.

### **Holding Times**

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days. \*\*NOTE: pH duplicates are reported as a range NOT as RPD

#### Units

| mg/kg: milligrams per kilogram           | mg/L: milligrams per litre         | ug/L: micrograms per litre                                       |
|--|------------------------------------|--|
| ppm: Parts per million                   | ppb: Parts per billion             | %: Percentage  |
| org/100mL: Organisms per 100 millilitres | NTU: Nephelometric Turbidity Units | MPN/100mL: Most Probable Number of organisms per 100 millilitres |

#### Terms

| Dry              | Where a moisture has been determined on a solid sample the result is expressed on a dry basis.   |
|------------------|--|
| LOR              | Limit of Reporting.  |
| SPIKE            | Addition of the analyte to the sample and reported as percentage recovery.   |
| RPD              | Relative Percent Difference between two Duplicate pieces of analysis.  |
| LCS              | Laboratory Control Sample - reported as percent recovery.  |
| CRM              | Certified Reference Material - reported as percent recovery.   |
| Method Blank     | In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.     |
| Surr - Surrogate | The addition of a like compound to the analyte target and reported as percentage recovery.   |
| Duplicate        | A second piece of analysis from the same sample and reported in the same units as the result to show comparison.   |
| USEPA            | United States Environmental Protection Agency  |
| APHA             | American Public Health Association   |
| TCLP             | Toxicity Characteristic Leaching Procedure   |
| сос              | Chain of Custody   |
| SRA              | Sample Receipt Advice  |
| QSM              | Quality Systems Manual ver 5.1 US Department of Defense  |
| СР               | Client Parent - QC was performed on samples pertaining to this report  |
| NCP              | Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within. |
| TEQ              | Toxic Equivalency Quotient   |

### **QC** - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

#### **QC Data General Comments**

- 1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
- 2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
- 3. Organochlorine Pesticide analysis where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
- 4. Organochlorine Pesticide analysis where reporting Spike data, Toxaphene is not added to the Spike.
- 5. Total Recoverable Hydrocarbons where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
- 6. pH and Free Chlorine analysed in the laboratory Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
- 7. Recovery Data (Spikes & Surrogates) where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
- 8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
- 9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
- 10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

### Comments

Eurofins | mgt accreditation number 1261, corporate site 1254 is currently in progress of a controlled transition to a new custom built location at 6 Monterey Road, Dandenong South, Victoria 3175. All results on this report denoted as being performed by Eurofins | mgt 2-5 Kingston Town Close, Oakleigh Victoria 3166 corporate site 1254, will have been performed on either Oakleigh or new Dandenong South site.

| Sample Integrity  |     |
|---|-----|
| Custody Seals Intact (if used)  | N/A |
| Attempt to Chill was evident  | Yes |
| Sample correctly preserved  | Yes |
| Appropriate sample containers have been used                            | Yes |
| Sample containers for volatile analysis received with minimal headspace | Yes |
| Samples received within HoldingTime                                     | Yes |
| Some samples have been subcontracted                                    | No  |

### **Qualifier Codes/Comments**

### Code Description

| S01 | Liming rate is calculated and reported on a dry weight basis assuming use of fine agricultural lime (CaCO3) and using a safety factor of 1.5 to allow for non-homogeneous mixing and poor reactivity of lime. For conversion of Liming Rate from 'kg/t dry weight' to 'kg/m3 in-situ soil' multiply 'reported results' x 'wet bulk density of soil in t/m3' |
|-----|---|
| S02 | Retained Acidity is Reported when the pHKCI is less than pH 4.5   |
| S03 | Acid Neutralising Capacity is only required if the pHKCl if greater than or equal to pH 6.5   |
| S04 | Acid Sulfate Soil Samples have a 24 hour holding time unless frozen or dried within that period   |

### Sample information

- A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- All samples have been received as described on the above COC.
- COC has been completed correctly.
- $\mathbf{V}$ Attempt to chill was evident.
- Appropriately preserved sample containers have been used.
- All samples were received in good condition.
- $\mathbf{V}$ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- Appropriate sample containers have been used.
- $\boxtimes$ Split sample sent to requested external lab.
- $\times$ Some samples have been subcontracted.
- Custody Seals intact (if used). N/A

# Contact notes

If you have any questions with respect to these samples please contact:

Nibha Vaidya on Phone : +61 (2) 9900 8415 or by e.mail: NibhaVaidya@eurofins.com

Results will be delivered electronically via e.mail to Ben Withnall - ben.withnall@cardno.com.au.

Note: A copy of these results will also be delivered to the general Cardno (NSW/ACT) Pty Ltd email address.

### Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported. A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

| Description                     | Testing Site | Extracted    | Holding Time |

### Internal Quality Control Review and Glossary

### General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.

- 2. All soil results are reported on a dry basis, unless otherwise stated.
- 3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
- 4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
- 5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
- 6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
- 7. Samples were analysed on an 'as received' basis.
- 8. This report replaces any interim results previously issued.

### **Holding Times**

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days. \*\*NOTE: pH duplicates are reported as a range NOT as RPD

#### Units

| mg/kg: milligrams per kilogram           | mg/L: milligrams per litre         | ug/L: micrograms per litre                                       |
|--|------------------------------------|--|
| ppm: Parts per million                   | ppb: Parts per billion             | %: Percentage  |
| org/100mL: Organisms per 100 millilitres | NTU: Nephelometric Turbidity Units | MPN/100mL: Most Probable Number of organisms per 100 millilitres |

### Terms

| Dry              | Where a moisture has been determined on a solid sample the result is expressed on a dry basis.   |
|------------------|--|
| LOR              | Limit of Reporting.  |
| SPIKE            | Addition of the analyte to the sample and reported as percentage recovery.   |
| RPD              | Relative Percent Difference between two Duplicate pieces of analysis.  |
| LCS              | Laboratory Control Sample - reported as percent recovery.  |
| CRM              | Certified Reference Material - reported as percent recovery.   |
| Method Blank     | In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.     |
| Surr - Surrogate | The addition of a like compound to the analyte target and reported as percentage recovery.   |
| Duplicate        | A second piece of analysis from the same sample and reported in the same units as the result to show comparison.   |
| USEPA            | United States Environmental Protection Agency  |
| APHA             | American Public Health Association   |
| TCLP             | Toxicity Characteristic Leaching Procedure   |
| coc              | Chain of Custody   |
| SRA              | Sample Receipt Advice  |
| QSM              | Quality Systems Manual ver 5.1 US Department of Defense  |
| СР               | Client Parent - QC was performed on samples pertaining to this report  |
| NCP              | Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within. |
| TEQ              | Toxic Equivalency Quotient   |

### **QC** - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

### **QC Data General Comments**

- 1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
- 2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
- 3. Organochlorine Pesticide analysis where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
- 4. Organochlorine Pesticide analysis where reporting Spike data, Toxaphene is not added to the Spike.
- 5. Total Recoverable Hydrocarbons where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
- 6. pH and Free Chlorine analysed in the laboratory Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
- 7. Recovery Data (Spikes & Surrogates) where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
- 8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
- 9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
- 10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

### Comments

Eurofins | mgt accreditation number 1261, corporate site 1254 is currently in progress of a controlled transition to a new custom built location at 6 Monterey Road, Dandenong South, Victoria 3175. All results on this report denoted as being performed by Eurofins | mgt 2-5 Kingston Town Close, Oakleigh Victoria 3166 corporate site 1254, will have been performed on either Oakleigh or new Dandenong South site.

| Sample Integrity  |     |
|---|-----|
| Custody Seals Intact (if used)  | N/A |
| Attempt to Chill was evident  | Yes |
| Sample correctly preserved  | Yes |
| Appropriate sample containers have been used                            | Yes |
| Sample containers for volatile analysis received with minimal headspace | Yes |
| Samples received within HoldingTime                                     | Yes |
| Some samples have been subcontracted                                    | No  |

### **Qualifier Codes/Comments**

### Code Description

| S01 | Liming rate is calculated and reported on a dry weight basis assuming use of fine agricultural lime (CaCO3) and using a safety factor of 1.5 to allow for non-homogeneous mixing and poor reactivity of lime. For conversion of Liming Rate from 'kg/t dry weight' to 'kg/m3 in-situ soil' multiply 'reported results' x 'wet bulk density of soil in t/m3' |
|-----|---|
| S02 | Retained Acidity is Reported when the pHKCI is less than pH 4.5   |
| S03 | Acid Neutralising Capacity is only required if the pHKCl if greater than or equal to pH 6.5   |
| S04 | Acid Sulfate Soil Samples have a 24 hour holding time unless frozen or dried within that period   |

### EXTERNAL EMAIL\*

Hi Nibha,

Happy Friday! For lab report 627289 for our job 80818157 Kyeemagh I've attached an additional analysis request for SPOCAS and CRS on some samples we had pHFOX done on.

Thanks very much.

### Sample information

- A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- All samples have been received as described on the above COC.
- COC has been completed correctly.
- $\mathbf{V}$ Attempt to chill was evident.
- Appropriately preserved sample containers have been used.
- All samples were received in good condition.
- $\mathbf{V}$ Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- Appropriate sample containers have been used.
- $\boxtimes$ Split sample sent to requested external lab.
- $\boxtimes$ Some samples have been subcontracted.
- N/A Custody Seals intact (if used).

# Contact notes

If you have any questions with respect to these samples please contact:

Nibha Vaidya on Phone : +61 (2) 9900 8415 or by e.mail: NibhaVaidya@eurofins.com

Results will be delivered electronically via e.mail to Ben Withnall - ben.withnall@cardno.com.au.

Note: A copy of these results will also be delivered to the general Cardno (NSW/ACT) Pty Ltd email address.

### Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported. A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

| Description  | Testing Site | Extracted    | Holding Time |
|--|--------------|--------------|--------------|
| Eurofins   mgt Suite B8 (filtered metals)                              |              |              |              |
| Total Recoverable Hydrocarbons - 1999 NEPM Fractions                   | Sydney       | Nov 26, 2018 | 7 Day        |

#### Internal Quality Control Review and Glossary

#### General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.

- 2. All soil results are reported on a dry basis, unless otherwise stated.
- 3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
- 4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
- 5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
- 6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
- 7. Samples were analysed on an 'as received' basis.
- 8. This report replaces any interim results previously issued.

#### **Holding Times**

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days. \*\*NOTE: pH duplicates are reported as a range NOT as RPD

#### Units

| mg/kg: milligrams per kilogram           | mg/L: milligrams per litre         | ug/L: micrograms per litre                                       |
|--|------------------------------------|--|
| ppm: Parts per million                   | ppb: Parts per billion             | %: Percentage  |
| org/100mL: Organisms per 100 millilitres | NTU: Nephelometric Turbidity Units | MPN/100mL: Most Probable Number of organisms per 100 millilitres |

#### Terms

| Dry              | Where a moisture has been determined on a solid sample the result is expressed on a dry basis.   |
|------------------|--|
| LOR              | Limit of Reporting.  |
| SPIKE            | Addition of the analyte to the sample and reported as percentage recovery.   |
| RPD              | Relative Percent Difference between two Duplicate pieces of analysis.  |
| LCS              | Laboratory Control Sample - reported as percent recovery.  |
| CRM              | Certified Reference Material - reported as percent recovery.   |
| Method Blank     | In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.     |
| Surr - Surrogate | The addition of a like compound to the analyte target and reported as percentage recovery.   |
| Duplicate        | A second piece of analysis from the same sample and reported in the same units as the result to show comparison.   |
| USEPA            | United States Environmental Protection Agency  |
| APHA             | American Public Health Association   |
| TCLP             | Toxicity Characteristic Leaching Procedure   |
| сос              | Chain of Custody   |
| SRA              | Sample Receipt Advice  |
| QSM              | Quality Systems Manual ver 5.1 US Department of Defense  |
| СР               | Client Parent - QC was performed on samples pertaining to this report  |
| NCP              | Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within. |
| TEQ              | Toxic Equivalency Quotient   |

#### **QC** - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

#### **QC Data General Comments**

- 1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
- 2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
- 3. Organochlorine Pesticide analysis where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
- 4. Organochlorine Pesticide analysis where reporting Spike data, Toxaphene is not added to the Spike.
- 5. Total Recoverable Hydrocarbons where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
- 6. pH and Free Chlorine analysed in the laboratory Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
- 7. Recovery Data (Spikes & Surrogates) where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
- 8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
- 9. For Matrix Spikes and LCS results a dash " -" in the report means that the specific analyte was not added to the QC sample.
- 10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

### **Quality Control Results**

| Test   | Units | Result 1 |   | Acceptance<br>Limits | Pass<br>Limits | Qualifying<br>Code |
|--|-------|----------|---|----------------------|----------------|--------------------|
| Method Blank   |       | 1        | 1 | -                    | -              |                    |

#### Comments

Eurofins | mgt accreditation number 1261, corporate site 1254 is currently in progress of a controlled transition to a new custom built location at 6 Monterey Road, Dandenong South, Victoria 3175. All results on this report denoted as being performed by Eurofins | mgt 2-5 Kingston Town Close, Oakleigh Victoria 3166 corporate site 1254, will have been performed on either Oakleigh or new Dandenong South site.

| Sample Integrity  |     |
|---|-----|
| Custody Seals Intact (if used)  | N/A |
| Attempt to Chill was evident  | Yes |
| Sample correctly preserved  | Yes |
| Appropriate sample containers have been used                            | Yes |
| Sample containers for volatile analysis received with minimal headspace | Yes |
| Samples received within HoldingTime                                     | Yes |
| Some samples have been subcontracted                                    | No  |

### **Qualifier Codes/Comments**

Code Description

F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).

Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.

F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.

N07 Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs

 N09
 Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard.

 Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogue analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.

Where the native PFAS compound does not have labelled analogue then the quantification is made using the Extracted Internal Standard Analyte with the closest retention time to the analyte and no recovery correction has been made (Internal Standard Quantitation).

# Sample Receipt Advice

Company name: Cardno (NSW/ACT) Pty Ltd Contact name: **Ben Withnall KYEEMAGH INFANTS SCHOOL** Project name: Project ID: 80818157 COC number: Not provided Turn around time: 5 Day Nov 23, 2018 5:43 PM Date/Time received: Eurofins | mgt reference: 629653

# Sample information

- A detailed list of analytes logged into our LIMS, is included in the attached summary table.
- All samples have been received as described on the above COC.
- ☑ COC has been completed correctly.
- Attempt to chill was evident.
- Appropriately preserved sample containers have been used.
- All samples were received in good condition.
- Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
- Appropriate sample containers have been used.
- Sample containers for volatile analysis received with zero headspace.
- Split sample sent to requested external lab.
- Some samples have been subcontracted.

N/A Custody Seals intact (if used).

# Notes

# QA200 forwarded to ALS

# **Contact notes**

If you have any questions with respect to these samples please contact:

Nibha Vaidya on Phone : +61 (2) 9900 8415 or by e.mail: NibhaVaidya@eurofins.com

Results will be delivered electronically via e.mail to Ben Withnall - ben.withnall@cardno.com.au.

Note: A copy of these results will also be delivered to the general Cardno (NSW/ACT) Pty Ltd email address.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

# Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

| Signatories      | Position              | Accreditation Category             |
|------------------|-----------------------|------------------------------------|
| Celine Conceicao | Senior Spectroscopist | Sydney Inorganics, Smithfield, NSW |
| Edwandy Fadjar   | Organic Coordinator   | Sydney Organics, Smithfield, NSW   |
| Franco Lentini   |                       | Sydney Organics, Smithfield, NSW   |

### **General Comments**

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key: CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society. LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

ø = ALS is not NATA accredited for these tests.

~ = Indicates an estimated value.

Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full. This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

### Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

| Signatories      | Position              | Accreditation Category             |
|------------------|-----------------------|------------------------------------|
| Celine Conceicao | Senior Spectroscopist | Sydney Inorganics, Smithfield, NSW |
| Edwandy Fadjar   | Organic Coordinator   | Sydney Organics, Smithfield, NSW   |
| Franco Lentini   |                       | Sydney Organics, Smithfield, NSW   |

### **General Comments**

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high

Key: Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot

- CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
- LOR = Limit of reporting
- RPD = Relative Percentage Difference
- # = Indicates failed QC

### Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

## Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

# Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

### Summary of Outliers

#### **Outliers : Quality Control Samples**

This report highlights outliers flagged in the Quality Control (QC) Report.

- <u>NO</u> Method Blank value outliers occur.
- <u>NO</u> Duplicate outliers occur.
- <u>NO</u> Laboratory Control outliers occur.
- <u>NO</u> Matrix Spike outliers occur.
- For all regular sample matrices, <u>NO</u> surrogate recovery outliers occur.

#### **Outliers : Analysis Holding Time Compliance**

• NO Analysis Holding Time Outliers exist.

#### **Outliers : Frequency of Quality Control Samples**

• <u>NO</u> Quality Control Sample Frequency Outliers exist.

### Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for <u>VOC in soils</u> vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive <u>or</u> Vinyl Chloride and Styrene are not key analytes of interest/concern.

# **Quality Control Parameter Frequency Compliance**

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

| Matrix: WATER  |            |                |         | Evaluatio | n: × = Quality Co | ontrol frequency              | not within specification ; $\checkmark$ = Quality Control frequency within specification. |

## **Brief Method Summaries**

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

| Analytical Methods                                      | Method     | Matrix | Method Descriptions  |
|---|------------|--------|--|
| Dissolved Metals by ICP-MS - Suite A                    | EG020A-F   | WATER  | In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.  |
| Dissolved Mercury by FIMS                               | EG035F     | WATER  | In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS)<br>Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique.<br>A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic<br>mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell.<br>Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM<br>(2013) Schedule B(3)  |
| TRH - Semivolatile Fraction                             | EP071      | WATER  | In house: Referenced to USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)   |
| Volatile Organic Compounds                              | EP074      | WATER  | In house: Referenced to USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)  |
| PAH/Phenols (GC/MS - SIM)                               | EP075(SIM) | WATER  | In house: Referenced to USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)   |
| TRH Volatiles/BTEX                                      | EP080      | WATER  | In house: Referenced to USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve.<br>Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)  |
| Per- and Polyfluoroalkyl Substances<br>(PFAS) by LCMSMS | EP231X     | WATER  | In house: Direct injection analysis of fresh waters after dilution (1:1) with methanol. Analysis by LC-Electrospray-MS-MS, Negative Mode using MRM. Where commercially available, isotopically labelled analogues of the target analytes are used as internal standards for quantification. Where a labelled analogue is not commercially available, the internal standard with similar chemistry and the closest retention time to the target is used for quantification. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. This method complies with the quality control definitions as stated in QSM 5.1. Data is reviewed in line with the DQOs as stated in QSM5.1 |
| Preparation Methods                                     | Method     | Matrix | Method Descriptions  |
| Preparation for PFAS in water.                          | EP231-PR   | WATER  | Method presumes direct injection without workup. Preparation includes addition of internal standard and surrogate, and filtration prior to anaylsis.   |

| Preparation Methods                     | Method  | Matrix | Method Descriptions   |
|---|---------|--------|---|
| Separatory Funnel Extraction of Liquids | ORG14   | WATER  | In house: Referenced to USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel |
|   |         |        | and serially extracted three times using 60mL DCM for each extract. The resultant extracts are combined,  |
|   |         |        | dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3). ALS    |
|   |         |        | default excludes sediment which may be resident in the container.   |
| Volatiles Water Preparation             | ORG16-W | WATER  | A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for sparging.                     |

# QA/QC REPORT

# **Quality Control / Quality Assurance Report**

Quality Assurance/Quality Control (QA/QC) procedures were implemented to ensure the precision accuracy, representativeness, completeness and comparability of all data gathered. The QA/QC procedures included:

- > Equipment calibration to ensure field measurements obtained are accurate;
- > Equipment decontamination to prevent cross contamination;
- > The completion of a log for each soil bore;
- > Use of appropriate measures (i.e. gloves) to prevent cross contamination;
- > Appropriate sample identification;
- > Collection and analysis of duplicate samples for QA/QC purposes;
- > Correct sample preservation;
- > Sample transport with Chain of Custody (COC) documentation; and
- > Laboratory analysis in accordance with NATA accredited methods.

**Table G-1** details the QA/QC procedures and sample collection details undertaken through the elements of the investigation. **Table G-2** summarises the number of QA/QC samples collected during this investigation. Copies of all the COCs, along with the Sample Receipt Notifications (SRNs), Interpretive QA/QC Reports are provided in **Appendix F**.

| Requirement               | Yes/No | Comments   |
|---------------------------|--------|--|
| Equipment calibration     | Yes    | Calibration certificates are presented at the end of this Appendix.  |
| Equipment decontamination | Yes    | Decontamination of sampling equipment (hand auger and solid flight) was<br>undertaken by washing with phosphate free detergent (Liquinox) followed by a<br>rinse with potable water.   |
| Soil logging              | Yes    | All intrusive locations and soil samples collected were logged in accordance with the Unified Soil Classification System. Borehole logs provided in <b>Appendix E</b> .  |
| Sample collection         | Yes    | Samples were collected using disposable nitrile gloves and placed directly into appropriate sample jars and resealable bags provided by the laboratory. A clean pair of gloves was used for each new sample being collected to limit the possibility of cross-contamination.   |
| Sample identification     | Yes    | All samples were marked with a unique identifier including project number, sample location, depth and date.  |
| QA/QC sample collection   | Yes    | Two soil duplicate samples were collected for intra-lab QA/QC purposes with a further two triplicate soil samples collected to monitor the quality of the field practices for sample collection. Cardno based the investigation around a rate of one duplicate sample per 20 primary samples as the requirement for duplicate sample collection.   |
| Sample preservation       | Yes    | Samples were placed in a chilled ice box with ice for storage and transport to the laboratory. Samples for ASS analysis were frozen following field works.   |
| COC documentation         | Yes    | A COC form was completed by Cardno detailing sample identification, collection date, sampler and laboratory analysis required. The COC form was signed off and returned to Cardno by the laboratory staff upon receipt of all the samples. COC forms and Sample Receipt Notification (SRN) are provided in <b>Appendix F</b> . The SRN indicates that the samples were received at the laboratory intact and chilled and within the required holding times. Outliers present on the SRNs were addressed with the laboratory. |
| NATA accredited methods   | Yes    | Eurofins mgt, a NATA accredited laboratory analysed the samples in accordance with NATA accredited methods. Inter-lab QAQC samples were analysed at ALS Environmental Services. Analytical methods used are indicated in the stamped laboratory results provided in <b>Appendix F</b> .  |

#### Table G-2 Field QA/QC Collection Summary

# **Relative Percentage Difference Determination**

Laboratory results for duplicate and triplicate samples are assessed using a determination of the Relative Percentage Difference (RPD). Where a primary sample and a duplicate sample are compared, the RPD provides an indication of the reproducibility of the results, which incorporates the sampling method. Where a primary sample and a split sample are compared, the RPD provides an indication of the accuracy of the primary laboratory results as compared to the secondary laboratory result.

The calculation used to determine the RPD is:

$$RPD = \frac{(Co - Cs)}{\left(\frac{Co + Cs}{2}\right)} x100$$

Where:

Co = Concentration of the original sample

Cs = Concentration of the duplicate sample

In calculating the RPD values the following protocols were adopted:

- > Where both concentrations are above laboratory reporting limits the RPD formula is used;
- > Where both concentrations are below the laboratory reporting limits, no RPD is calculated; and
- > Where one or both sample concentrations are reported to be less than ten times (<10x) the laboratory reporting limit, the RPD is calculated but is not assessed against the adopted criterion.

In accordance with the Australian Standard 4482.1-2005 (Standards Australia, 2005), Cardno adopts an RPD acceptance criterion up to 50% of the mean concentration of the analyte. It should be noted that variations might be higher for organic analysis, due to the volatile nature of the components, and for low concentrations of analytes.

The adopted criterion will not apply to RPDs where one or both concentrations are less than 10 times the reporting limit, as this criterion would otherwise overestimate the significance of minor variations in concentrations at or near the laboratory reporting limit. Large RPDs returned for low concentrations of analytes near the reporting limit is not as indicative of a significant difference in the results as a small RPD is for larger concentrations.

This approach is employed by NATA accredited laboratories when assessing internal duplicate sample RPDs. This approach acknowledges that concentrations at or around the reporting limit are too low for an accurate evaluation of the significance of the RPD.

This approach has been adopted when assessing the relevance (compliance) of RPDs during this investigation. RPDs will be calculated for sample sets where one or both concentrations are less than 10 times the reporting limit for discussion purposes, but will not be assessed as a pass or fail in relation to the criterion.

A list of primary samples for the duplicate and triplicate soil and groundwater samples is provided in **Table G**-**3** with a summary of the RPD results is presented in **Appendix D**.

### Laboratory QC and QCI Report Summary

The laboratory selected for undertaking the analysis (Eurofins mgt) is NATA accredited for the analysis required, and undertook certain QA/QC requirements to demonstrate the suitability of the data that is obtained. The laboratory is required to undertake and report internal laboratory Quality Control (QC) procedures for all chemical analysis undertaken. The QC testing is required to include:

- > Laboratory duplicate sample analysis at the rate of one duplicate analysis per ten samples;
- > Method blank at the rate of one method blank analysis per 20 samples;
- > Laboratory control sample at the rate of one laboratory control sample analysis per 20 samples; and
- > Spike recovery analysis at the rate of one spike recovery analysis per 20 samples.

Compliance with the laboratory QA/QC requirements and non-conformance details are discussed in the internal Laboratory QA/QC reports included with the certificates of analysis in **Appendix F.** 

The QA/QC Reports received from Eurofins mgt and ALS Laboratory (in **Appendix F**) highlights outliers flagged in the Quality Control Report and Holding Time breaches and breaches in the Frequency of Quality Control Samples. Review of the QA/QC documentation provided by Eurofins mgt and ALS indicates outliers existed which are summarised in **Table G-4** and **G-5**.

# 1 EXECUTIVE SUMMARY

Birzulis Associates have been commissioned by Taylor Constructions to prepare a Flood Emergency Response Plan (FERP) on behalf of SINSW for the proposed stage 1 and stage 2 construction at Kyeemagh Public School. This report addresses the condition B18 in the SSD CoC, relevant Council DCP requirements and that of SES.

The aim of this FERP is for planning an evacuation (if required) due to flooding, promote situational awareness of expected flood behaviour and risks, identify measures to become flood prepared, recommend suitable coarse of action during and after flood events and any training required and by who.

This report will contain methodology used to support its conclusions and recommendations, a summary of the likely flood behaviours and safe exit routes from the site if required.

Stage 1 of the proposed works involves the demolition of the existing buildings to the North-East of the site and construction of the buildings on that half of the site.

Stage 2 of the proposed works will occur approximately after practical completion (PC) of the stage 1 works and the demolition of the existing buildings to the South-West half of the site.

The primary objective of this report is to define flood behaviours to Jacobson Avenue and Beehag Street. And any elements of these that contribute to the site itself.

# 2 INTRODUCTION

# 2.1 LOCATION

The site is located at 30A Jacobson Avenue, Kyeemagh NSW 2216 is broken up into two lots D.Ps (D.P.120095 & D.P. 335734). The current site is the operating site of Kyeemagh Public School. The site is generally sparsely planted and with minimal hard pavements.

To the North-West the site abuts a previous townhouse villa style development. To the South-East the site abuts Beehag Street. To the South-East the site abuts Jacobson Avenue. To the North-East the site abuts the school childcare centre which operates on the site and is not proposed to be altered. The site falls from the West to the South East at approximately 4%.

The total site area is 10 329m<sup>2</sup>.

The site is shown below represented as Figure 2.1

Figure 2.1.1 – Total D.P. Envelope

Figure 2.1.2 - Overall Site Plan Showing Staging of Works

Figure 2.1.3 - Aerial View of Kyeemagh Public School (Source: Google Map 2020)

# 2.2 GOVERNING AUTHORITIES FOR THIS SITE

Bayside Council

Department of Education

Emergency Services – SES – Police – Fire – Ambulance

Department of Environment Climate Change and Water

### 2.3 GLOSSARY OF TERMINOLOGY

Annual Exceedance Probability (AEP):

The chance of a flood of a given size (or larger) occurring in any one year, usually expressed as a percentage. For example, if a peak flood discharge of 500 m3/s has an AEP of 5%, it means that there is a 5% chance (i.e. a 1 in 20 chance) of a peak discharge of 500 m3/s (or larger) occurring in any one year. (see also average recurrence interval)

#### Australian Height Datum (AHD):

National survey datum corresponding approximately to mean sea level.

#### Astronomical Tide:

Astronomical Tide is the cyclic rising and falling of the Earth's oceans water levels resulting from gravitational forces of the Moon and the Sun acting on the Earth.

#### Attenuation

Weakening in force or intensity.

#### Average recurrence interval (ARI):

The long-term average number of years between the occurrence of a flood as big as (or larger than) the selected event. For example, floods with a discharge as great as (or greater than) the 20-year ARI design flood will occur on average once every 20 years. ARI is another way of expressing the likelihood of occurrence of a flood event. (see also annual exceedance probability)

#### Calibration:

The adjustment of model configuration and key parameters to best fit an observed data set.

#### Catchment:

The catchment at a particular point is the area of land that drains to that point.

#### Design flood event:

A hypothetical flood representing a specific likelihood of occurrence (for example the 100-year ARI or 1% AEP floods).

#### Development:

Existing or proposed works that may or may not impact upon flooding. Typical works are filling of land, and the construction of roads, floodway's and buildings.

#### Discharge:

The rate of flow of water measured in terms of volume per unit time, for example, cubic meters per second (m3/s). Discharge is different from the speed or velocity of flow, which is a measure of how fast the water is moving for example, meters per second (m/s).

#### Flood:

Relatively high river or creek flows, which overtop the natural or artificial banks, and inundate floodplains and/or coastal inundation resulting from super elevated sea levels and/or waves overtopping coastline defences.

#### Flood behaviour:

The pattern / characteristics / nature of a flood.

#### Flood fringe:

Land that may be affected by flooding but is not designated as floodway or flood storage

#### Flood hazard:

The potential risk to life and limb and potential damage to property resulting from flooding. The degree of flood hazard varies with circumstances across the full range of floods.

#### Flood level:

The height or elevation of floodwaters relative to a datum (typically the Australian Height Datum). Also referred to as "stage".

#### Flood liable land:

See flood prone land

#### Floodplain:

Land adjacent to a river or creek that is periodically inundated due to floods. The floodplain includes all land that is susceptible to inundation by the probable maximum flood (PMF) event.

#### Floodplain management:

The co-ordinated management of activities that occur on the floodplain.

#### Floodplain risk management plan

A document outlining a range of actions aimed at improving floodplain management. The plan is the principal means of managing the risks associated with the use of the floodplain. A floodplain risk management plan needs to be developed in accordance with the principles and guidelines contained in the NSW Floodplain Management Manual. The plan usually contains both written and diagrammatic information describing how particular areas of the floodplain are to be used and managed to achieve defined objectives. Flood planning levels (FPL):

Flood planning levels selected for planning purposes are derived from a combination of the adopted flood level plus freeboard, as determined in floodplain management studies and incorporated in floodplain risk management plans. Selection should be based on an understanding of the full range of flood behaviour and the associated flood risk. It should also consider the social, economic and ecological consequences associated with floods of different severities. Different FPLs may be appropriate for different categories of land use and for different flood plans. The concept of FPLs supersedes the "standard flood event". As FPLs do not necessarily extend to the limits of flood prone land, floodplain risk management plans may apply to flood prone land beyond that defined by the FPLs.

#### Flood prone land:

Land susceptible to inundation by the probable maximum flood (PMF) event. Under the merit policy, the flood prone definition should not be seen as necessarily precluding development. Floodplain Risk Management Plans should encompass all flood prone land (i.e. the entire floodplain).

#### Flood source:

The source of the floodwaters.

#### Flood storage:

Floodplain area that is important for the temporary storage of floodwaters during a flood.

#### Floodway:

A flow path (sometimes artificial) that carries significant volumes of floodwaters during a flood.

#### Freeboard:

Factors of safety usually expressed as a height above the adopted flood level thus determine the flood planning level. Freeboard tends to compensate for factors such as wave action, localised hydraulic effects and uncertainties in the design flood levels.

#### Geomorphology:

The study of the origin, characteristics and development of landforms.

#### Gauging (tidal and flood)

Measurement of flows and water levels during tides or flood events.

#### Historical flood:

A flood that has actually occurred.

#### Hydraulic:

Relating to water flow in rivers, estuaries and coastal systems; in particular,

the evaluation of flow parameters such as water level and velocity.

#### Hydrodynamic:

Pertaining to the movement of water.

#### Hydrograph:

A graph showing how a river or creek's discharge changes with time.

#### Hydrographic survey:

Survey of the bed levels of a waterway

#### Hydrologic:

Pertaining to rainfall-runoff processes in catchments

#### Hydrology:

The term given to the study of the rainfall-runoff process in catchments

#### Hyetograph:

A graph showing the distribution of rainfall over time.

#### Intensity Frequency Duration (IFD) Curve:

A statistical representation of rainfall showing the relationship between rainfall intensity, storm duration and frequency (probability) of occurrence.

#### Isohyets:

Equal rainfall contour.

#### Morphological:

Pertaining to geomorphology

#### Peak flood level, flow or velocity:

The maximum flood level, flow or velocity that occurs during a flood event.

#### **Pluviometer:**

A rainfall gauge capable of continuously measuring rainfall intensity

#### Probable maximum flood (PMF):

PMF is an extreme flood event or the largest flood that could conceivably occur at a particular location, usually estimated from probable maximum precipitation, and where applicable, (such as snow / hail melt, blockages), coupled with the maximum flood that is likely to occur. Producing the worst flood for that catchment.

#### Probability:

A statistical measure of the likely frequency or occurrence of flooding.

#### Riparian:

The interface between land and waterway. Literally means "along the river margins"

#### Runoff:

The amount of rainfall from a catchment that ends up as flowing water in the river or creek

#### Stage:

See flood level.

#### Stage hydrograph:

A graph of water level over time.

#### Sub-critical:

Refers to flow in a channel that is relatively slow and deep.

#### Topography:

The shape of the surface features of land

#### Velocity:

The speed at which the floodwaters are moving. A flood velocity predicted by a computer flood model is quoted as the depth averaged velocity, i.e. the average velocity throughout the depth of the water column or velocity across the whole river or creek section, or roadway.

#### Validation:

A test of the appropriateness of the adopted model configuration and parameters (through the calibration process) for other observed events.

#### Water level:

The level of the top of the water being described.

### 2.4 SCOPE OF METHODOLOGY

This report was based on flood information provided by Bayside Council and from Flooding Advice completed by Cardno 31 October 2018

In addition to this, a DRAINS model with overland flow capabilities was prepared to determine the capacity of the Council trunk drainage system to cope with upstream flows for any serious incident of pit surcharging in vicinity of the school.

# 3 FLOOD BEHAIVIOUR

# 3.1 POSSIBLE FLOOD SOURCE/S AND MECHANISMS

The site may be impacted by two flood mechanisms/types of flooding:

1. Fluvial flooding – flooding from Cooks River (rising river waters); and

2. Pluvial flooding (overland flow) – flooding from rainfall within the local catchment. It is important to understand both types of flooding as they pose different risks, have different consequences and evacuation & refuge response.

There is not a significant upstream catchment for this site given the site is located somewhat on a peninsula where the lands falls towards the water on all sides.

Also, the site is not significantly far from the mouth of the Cooks River and Botany Bay.

The main source is the stormwater and runoff running down Jacobson Avenue and towards Jacobson avenue from the upstream blocks.

It is important to note that the area is a marine sand area with moderate infiltration capacity and as such runoff generated will mainly be from imperious areas and are not significantly contributed to by the pervious areas.

### 3.2 <u>NSW OEH FLOODPLAIN RISK MANAGEMENT</u> <u>GUIDELINES</u>

The NSW Office of Environment and Heritage (OEH) has released a range of standard documents to support the implementation of the NSW Government's Flood Prone Land Policy through the development and implementation of FRM plans by local government through the FRM process as outlined in the Floodplain Development Manual (2005).

### **3.2.1** Flood Emergency Response Planning (ERP) – Classification of Communities

Of relevance to the CRC FRP is the guideline Flood Emergency Response Planning (ERP) – Classification of Communities. The guideline recommends that the ERP classification of the floodplain be undertaken for the probable maximum flood (PMF) and 20 and 100 year average recurrence interval (ARI) events. Classifications are to be provided for each event with reference back to the event.

The Site is classified according to NSW OEH definitions as shown in Table 3.2.1 below.

| ARI  | NSW OEH<br>classification                 | NSW OEH definition  |
|--|---|---|
| 20 year ARI – River<br>Flood   | Area with rising road<br>accessible (RRA) | Areas with Rising Road Access (RRA) are those areas<br>where access roads rising steadily uphill and away<br>from the rising floodwaters. The community cannot<br>be completely isolated before inundation reaches its<br>maximum extent, even in the PMF. Evacuation can<br>take place by vehicle or on foot along the road as<br>floodwater advances. People should not be trapped<br>unless they delay their evacuation from their homes.<br>For example people living in two storey homes may<br>initially decide to stay but reconsider after water<br>surrounds them.   |
| 20 year ARI –<br>Pluvial flood<br>(overland flow)<br>100 year ARI<br>PMF | High Flood Island<br>(HFI)                | High Flood Island (HFI). The flood island includes<br>enough land higher than the limit of flooding (i.e.<br>above the PMF) to cope with the number of people<br>in the area. During a flood event the area is<br>surrounded by floodwater and property may be<br>inundated. However, there is an opportunity for<br>people to retreat to higher ground above the PMF<br>within the island and therefore the direct risk to life<br>is limited. The area will require resupply by boat or<br>air if not evacuated before the road is cut. If it will<br>not be possible to provide adequate support during<br>the period of isolation, evacuation will have to take<br>place before isolation occurs. |

Table 3.2.1

# **3.2.2** State Emergency Services Requirements from the Floodplain Risk Management Process

Also of relevance to the site's FERP is the State Emergency Services Requirements from the Floodplain Risk Management Process which describes how the FRM process assists State Emergency Service (SES) in effective emergency response planning (ERP).

For HFI's, the key considerations are:

- External access cut, area becomes isolated;
- Transport infrastructure shutdown (railways/airports);
- Risk Of Flooding Of Key Public Utilities (Water/Sewage/Gas/Power) Starts; and
- Whole area flooded or max flood extents occur.

## 3.3 EXISTING STORMWATER DRAINAGE

The property is currently developed as a public school with an existing pit and pipe drainage system located on site. All current overland flows travel towards the east eventually discharges onto Tancred avenue and then to the crook s river located approximately 200m to the North. The indicative external stormwater network is shown in Figure 2.3.1 and is the Council trunk drainage system and is believed to be in a satisfactory condition.

Figure 2.3.1 – Indicative External Stormwater system (Source: Bayside Council)

# 3.4 PROPOSED SITE DRAINAGE SYSTEMS

The proposed site drainage system is to install infiltration systems to capture and infiltrate the site runoff onsite with only minimal discharge offsite. This will significantly reduce any flooding impact of hydraulic stress on the existing stormwater drainage system in Jacobson Avenue. The table below shows the post construction site runoff to be significantly less than the pre-development condition reducing peak discharge in the 100 year event from 225 litres per second to 81 litres per second.

|      | Design   | Peak Flow (m3/s) |                  |                 |  |
|------|----------|------------------|------------------|-----------------|--|
| ARI  | Storm    | Pre-developed    | Post-developed   |                 |  |
| Dura | Duration | Site             | Site (no atten.) | Site (+ atten.) |  |
| 5    | 5        | 0.112            | 0.143            | 0.009           |  |
| 20   | 5        | 0.191            | 0.221            | 0.063           |  |
| 100  | 5        | 0.225            | 0.257            | 0.081           |  |

Table 3.2.2 - Site and Detention Hydrology

# 3.5 FLOOD DOCUMENTATION

Flood design guidance has been provided by Bayside Council and Cardno using a review of relevant flood studies. The following is relevant:

- The design flood level for the site is RL 2.65m AHD provided by Bayside Council
- The Probable Maximum flood (PMF) level is RL 2.98m AHD provided by Bayside Council.
- Flood planning level is RL 3.15m AHD provided by Bayside Council.
- The site has been assessed as Low Hazard by Bayside Council.
- The water table is probable at RL 1.5m 2m AHD.
  - The proposed building floor level of RL4.65m AHD is sufficiently located above the design flood level.

A small floor storage area presents in the 1:100 year ARI event with a depth approximately 0.1m to 0.3m located in vicinity of RL 3.5m on the site.

#### Cardno's Flooding Advice letter dated 20 May 2020 for the site states

"Further to our letter dated 31 October 2018 in regard to Kyeemagh Public School and the effect on flooding on the proposed development we confirm that we have reviewed the report prepared by BMT WBM dated February 2017- Spring Street Drain, Muddy Creek and Scarborough Ponds Catchments Flood Study Review.

Kyeemagh Public School is located at the corner of Jacobson Avenue and Beehag Street, Kyeemagh and a CORE 14 school development is proposed. The proposed development is a combination of single and double storey buildings with a constant proposed ground floor level of RL4.65m AHD.

Cardno have reviewed available flood mapping of the area surrounding the school as documented in the above report.

Flood extent mapping was reviewed for both the 1% AEP and PMF storm events. The Kyeemagh Public School site is shown to be affected by both the 1% AEP and PMF flood extents. A copy of relevant flood mapping is attached. The Kyeemagh Public School proposed floor level of RL4.65m is in our opinion, well above the expected 1% AEP and PMF flood levels based on the existing ground levels as documented in the attached part survey plan. We have also received the attached Flood Advice letter from Bayside Council dated 18 May 2020 that confirms that the property is affected by the 1% Annual Exceedance Probability (AEP) flood. The provided 1% AEP Flood level is RL 2.65m AHD and the Probable Maximum flood (PMF) level is RL 2.98m AHD. The letter also provides a Flood Planning level (FPL) RL 3.15m AHD which is a minimum height to be used for the setting of habitable floor levels. All of the provided flood levels in the Flood Advice letter are below the proposed building floor level of RL 4.65m AHD.

Further inspection shows that main roads near the site, such as General Holmes Drive, are not flood affected during the 1% AEP and PMP storm events. These roads are therefore expected to be available for use as an evacuation route if required."

Figure 2 – Kyeemagh Public School -1:100 year (approximately 0.1 to 0.3m depth)

| LEGEND     |                                       |
|------------|---------------------------------------|
| Peak Flood | Depth (m)                             |
| - 0.2      | (lower depths mapped as same colour)  |
| - 0.5      |                                       |
| - 1.0      |                                       |
| - 1.5      |                                       |
| - 2.0      | (higher depths mapped as same colour) |

Figure 3.4.1 – Shows the 100 year flooding for this immediate area and the site (Source: Cardno)

Figure 1 – Kyeemagh Public School – PMF (approximately 0.3-1.0m depth)

Figure 3.4.2 – Shows the PMF flooding for this immediate area and the site (Source: Cardno)
### 3.6 FLOOD SOURCE ELIMINATION

The mapping below shown the surge water level as a result of the flood source from the Cooks River does not affect the site in the 100 year rain event or the PMF event. This can be ruled out as a flood source for the site and it can be concluded the only flood source is local stormwater runoff.

Figure 3.5.1 – Shows the 100 year flooding for Botany Bay & Cooks River (Source: Cardno)

Figure 3.5.2 – Shows the PMF flooding for Botany Bay & Cooks River (Source: Cardno)

## 3.7 FLOOD BEHAVIOUR & FLOOD HAZARD CATEGORYS

Given the elimination of the Cooks River flood source the site should have a relatively short response time less than 1 hour. Basically this site will be performing more of a flash flooding style performance in lieu of a long response time where flood waters need time to drain from significant upstream catchments. Hence, it is imperative that prompt action is taken to avoid adverse impacts to exposure to flood hazards.

Flood modelling and VxD governs the ability of evacuation. As can be seen above, even in the MPF flood the carpark exit will not be flood affected. Also it has been previously noted that General Holmes Drive is not flood affected. Evacuation and response to the site is possible through that exit and main road.

Modelling along Jacobson Avenue suggest the maximum water flow above ground (assuming 80% pit blockages) could be up to 0.620m<sup>3</sup> per second. This equates to a flow depth of 0.168mm, a velocity of 1.3 meters per second and a VD relationship of 0.21 which is less than the 0.4 safe maximum.

It can thus be concluded that exiting and entry to the site from Jacobson Avenue is possible up to the 100 year event.

It should be noted that driving through flood waters is extremely hazardous and risk of vehicles being swept away downstream is shown below in the following figures.

Figure 3.6.1 – Velocity & Depth relationships

Figure 3.6.2 – Hazard Categories

## 4 FLOOD EVEACUATION WARNINGS

### 4.1 FLOOD INTELIGENCE

Rainfall gauge stations are maintained by the Bureau of Meteorology (BOM) throughout Sydney. These provide information to the BOM including other information sources to assist in the flood warning systems. The BOM issues five times of warnings through the following methods:

- Radio
- Television
- Websites
  - o <a href="http://www.bom.gov.au/">http://www.bom.gov.au/</a>
  - o <a href="http://www.bom.gov.au/nsw/warnings/">http://www.bom.gov.au/nsw/warnings/</a>

In addition to this the SES may issue warnings in the form of:

- Bulletins
- Evacuation Warnings or Evacuation Order

The critical 100-year storm event duration has been identified as approximately the 2-hour event. This does not mean that the peak flood level will occur exactly 2 hours after a heavy rainfall event commences but does provide an indication on how rapidly the water levels will rise within Jacobson Avenue.

It is recommended that a temporary flood gauge be installed in a visible location at the low point on the site corner (north eastern corner) at approximately RL 4.0 to provide indication of the rate of rise in flood levels within Jacobson Avenue for the duration of the construction works.

15 minutes after heavy rainfall commences all plant should be relocated to an area above the 100year flood extent on the northern side of the site. All work shall cease within the flood prone area and employees and contractors shall take shelter within the site amenities as located on the site establishment plan appended to this report.

Works should not recommence within any flood prone area until 1 hour after the water level upstream of Jacobson Avenue has started to subside. At this time the site manager will issue the 'All Clear' and the exclusion zone removed.

### 4.2 FLOOD NOTIFICATION - TRIGGER/ACTION

Flood warning notifications are the first stage of the flood warning system implemented by the managing contractor. Flood warnings are triggered when flooding is likely to cut evacuation routes or inundate flood prone areas of the site. During any rain event the site manager and/or supervisor shall review the flood gauge at the commencement of the rainfall, 5 minutes and 10 minutes after

the rainfall event starts. If a significant rate of rise is observed (greater than 0.6m/hr) then the site manger or supervisor shall notify any workers within the flood extent to cease work immediately and relocate themselves, plant and any other loose items clear of the flood prone area.

A call shall be put over the site radio that a flood notification has been issued and the areas of the site within the 100 year flood extent shall be classified as an exclusion zone during the rainfall event. Given the location of the temporary site access road (off Jacobson Avenue) this includes the main Stage 1 entry/exit to the site.

### 4.3 WARNING TYPES

### 4.3.1 Severe Weather Warning

Given by the BOM, are provided for potentially hazardous or dangerous weather that is not solely related to severe thunderstorms, tropical cyclones or bushfires. They are issued whenever severe weather is occurring in an area or is expected to develop or move into an area.

### 4.3.2 Severe Thunderstorm Warning

Given by the BOM, are provided to warn communities of the threat of dangerous thunderstorms. They are issued when a severe thunderstorm is occurring or likely to occur.

### 4.3.3 Flood Alert/Watch/Advice

A flood alert/watch/advice will be issued if flood producing rain is expected. This provides an early warning that flooding may occur

### 4.3.4 Generalised Flood Warning

A generalised flood warning is to be issued when flooding is expected to occur in a given area. Three hours warning time is expected from issue of warning to peak flood level as per the "Service Level Specification for Flood Forecasting and Warning Services for New South Wales – Version 2.0" (Bureau of Meteorology, 2013).

This is the most likely warning type for the subject site should evacuation need to occur.

### 4.3.5 Minor/Moderate Flood Warning

A more detailed flood warning may be issued based on any additional information available. Three hours warning time is expected from issue of warning to peak flood level. Real time river and harbour height data is available from the Bureau of Meteorology website. As at January 2017, this link was *http://www.bom.gov.au/nsw/flood/*. All warnings will be issued through the website, radio and television. Radio frequencies include ABC Sydney (702AM, 92.9FM, 206.352MHz digital), Triple J (105.7FM), 2DayFM (104.1FM), Triple M (104.9FM), Nova (96.9FM), KIIS (106.5FM), 2GB (873AM), 2UE (954AM). All public and Commercial television stations should broadcast warnings.

### 4.3.6 SES Flood Bulletins

The SES may issue a flood bulletin providing information of the likely flood consequences and recommended actions.

### 4.3.7 Evacuation Warning

The SES/Police may issue an evacuation warning which allows time to prepare for evacuation.

### 4.3.8 Evacuation Order

The SES will issue an Evacuation Order if evacuation is required. If this occurs evacuation **must** be undertaken. Broadcast will be via radio/TV, door knock, automated telephone message or SMS.

### 4.3.9 Early Warning Network Automated Text and Email Service

The property can register for automatic alerts with the Early Warning Network (www.ewn.com.au) which will filter the above BoM warnings and send texts and emails to the Chief Flood Warden or property owners to notify them of the situation.

### 4.3.10 On-Site Emergency Tone

The PA system will have an uninterrupted power supply and be configured to sound an emergency tone meaning all visitors, staff and students shall assemble in the designated assembly point (the Auditorium) under the direct of staff and flood wardens. This tone will be tested every drill, or once a term. Should it be inoperable in the event of an emergency, an air horn and handheld loudspeaker is located within the Flood Emergency Kit.

### 4.3.11 Dipstick Flood Alert System

The Dipstick Flood Alert System by Tuftec (http://tuftec.com.au) will provide a failsafe for notification on-site in the event that no warnings are issued by either the Bureau or the SES. This device senses when water reaches a pre-determined level and sends a text with an alert and rate of rise to nominated stakeholders including Council and all Flood Wardens.

### 4.3.12 Flood Depth Gauge

This is a manual system where the depth gauge shows the flood depth and markings can be made on the depth to determine the flood severity. For example, 100 year event or 50 year event.

# 5 ASSEMBLY POINT AND SAFE EVACUATION RESPONSE ROUTES

### 5.1 EMERGENCY ASSEMBLY POINT

The site manager or supervisor shall notify any workers to cease work and relocate themselves to:

- Stage 1: the lunch room shed which is 400mm above ground and above PMF water flows. All workers shall be accounted for.
- Stage 2: the upper carpark off Beehag Street

In the event any worker/contractor cannot be accounted for the following steps shall be undertaken:

- 1. A radio call be placed across emergency site channel or appropriate site channel to identify the unaccounted-for person. This shall be made a minimum of three times. Also, their mobile phone shall be rung from the site sign in sheet.
- 2. The site manager or delegated person shall inspect where safe to do so the flood affected area and the site to locate the unaccounted-for person. It is important to note that at no time shall a person enter the flooded area whilst flood waters are rising.
- 3. If this fails to locate the person all other reasonable means shall be used such as email, office phone calls text messages and so on.

Workers shall remain in the refuge of the site office/s until the "all clear" has been given by the site manager.

Figure 5.1.1 – Assembly Point and Refuges

## 5.2 EVACUATION RESPONSE & REFUGE

Since the site is only partially flood prone and site accommodations have been located outside of the 100-year flood extent there is no foreseeable reason why the site would have to be fully evacuated due to a flood. Should an evacuation be required for any other reason then the Emergency Management Plan prepared by the managing contractor shall be implemented.

Given the above, **the strategy of rest-in-place (onsite refuge) is recommended for this site during major flood events**. The site is not cut off by flood water and has access to main roads unaffected in a major flood event however where possible, evacuation during a significant flood event should be discouraged.

### 5.3 SITE ACCESS ROUTES DURING FLOODING

Stage 1: Given the main site access is from Jacobsons Avenue there are no employees or contractors will be able to leave the site in a south easterly direction during heavy rainfall.

Stage 2: Given the main site access is from Beehag Street there is no restrictions to employees or contractors leaving the site during a flood event through the upper carpark as long as they walk away from Jacobsons Avenue.

Should workers or contractor be required to leave site they shall notify the site manager and leave the site in a westerly direction.

Only once the flood risk has abated and the site manager issued the 'All Clear' shall the main site accesses be open and egress to all directions re-established.

## 6 EMERGENCY CONTACT

For State Emergency Services (SES) which offer emergency assistance during major natural events are available by phone on 132 500

For Police, Fire or Ambulance which offer specialist first responders call 000

Once the call has been made notify the key appointments noted in Table 5.2

## 7 FLOOD RESPONSE PREPARATION AND TRAINING

Flood Awareness training shall be provided as part of site inductions and "tool-box meetings" (not less than every 3 months) as an ongoing reminder.

The following floor awareness items shall be covered:

- 1. Location of assembly areas, and predicted flood levels based on flood mapping given in this report.
- 2. Details of the types of flood warnings and notifications
- 3. The refuge protocol "rest-in-place"
- 4. Changes to the site access during heavy rainfall

# 8 FLOOD EMERGENCY RESPONSE FOR BOTH CONSTRUCTION AND OPERATIONAL PHASE

During proposed construction works all site employees and contractors will be informed about the SINSW site wide flood evacuation/emergency management plan requirements and guidelines. Taylor Construction will work with the stakeholders prior to completion of works, to incorporate any changes required to this plan as a result of this development.

## 9 CONCLUSION

As the site is only partially affected by a PMF flood and unaffected by a 1:100 year flood the site is relatively low risk.

The following strategies have been documented and require implementation to ensure that the requirements of the SSD Condition of Consent is achieved:

- Predicated flood levels and extent of flooding on-site is as per Section 3.
- Flood warning times and flood notification Monitoring, as per details in Section 4.
- Assembly points and refuge protocols as detailed in Section 5.
- Changes to site access as a result of flooding as detailed in Section 5.

• Ensuring employees and contractors are aware of the site-specific flood risk as outlined in Section 7.

We have examined the site, relevant documentation/reference material and the proposed development in accordance with acceptable engineering practice. We have undertaken overland flow checks to determine velocities in the road flows offsite. We declare that he proposed development will be safeguarded from flooding and flood damage associated with the design flood and will not adversely affect any other structure or property,. We area also satisfied the foreseeable flood related risks are adequately identified and managed by this report.

20 May 2020

DWP | Design Worldwide Partnership Suite 2, 19 Harris Street Pyrmont NSW 2009

Attention: Cameron Martin

Dear Cameron,

#### KYEEMAGH PUBLIC SCHOOL - FLOODING ADVICE

Further to our letter dated 31 October 2018 in regard to Kyeemagh Public School and the effect on flooding on the proposed development we confirm that we have reviewed the report prepared by BMT WBM dated February 2017- Spring Street Drain, Muddy Creek and Scarborough Ponds Catchments Flood Study Review.

Kyeemagh Public School is located at the corner of Jacobson Avenue and Beehag Street, Kyeemagh and a CORE 14 school development is proposed. The proposed development is a combination of single and double storey buildings with a constant proposed ground floor level of RL4.65m AHD.

Cardno have reviewed available flood mapping of the area surrounding the school as documented in the above report.

Flood extent mapping was reviewed for both the 1% AEP and PMF storm events. The Kyeemagh Public School site is shown to be affected by both the 1% AEP and PMF flood extents. A copy of relevant flood mapping is attached. The Kyeemagh Public School proposed floor level of RL4.65m is in our opinion, well above the expected 1% AEP and PMF flood levels based on the existing ground levels as documented in the attached part survey plan.

We have also received the attached Flood Advice letter from Bayside Council dated 18 May 2020 that confirms that the property is affected by the 1% Annual Exceedance Probability (AEP) flood. The provided 1% AEP Flood level is RL 2.65m AHD and the Probable Maximum flood (PMF) level is RL 2.98m AHD. The letter also provides a Flood Planning level (FPL) RL 3.15m AHD which is a minimum height to be used for the setting of habitable floor levels. All of the provided flood levels in the Flood Advice letter are below the proposed building floor level of RL 4.65m AHD.

Further inspection shows that main roads near the site, such as General Holmes Drive, are not flood affected during the 1% AEP and PMP storm events. These roads are therefore expected to be available for use as an evacuation route if required.

Should you require any additional information, please do not hesitate to contact the undersigned.

Yours sincerely,

12
