								The Guthega Skink is restricted to locations above 1600 m in the Australian Alps, in the vicinity of Mt Kosciuszko, NSW, and the Bogong High Plains, Victoria.		
Fish										
Bidyanus bidyanus	Silver Perch		V	CE				Silver perch are endemic to the Murray-Darling system (including all states and sub-basins) and previously occurred in a range of habitats. Silver Perch are generally found in lowland areas outside of cooler upstream waters, although the species may undertake large scale migrations into upstream reaches. Silver Perch are generally found in faster flowing streams, including rapid habitats, and in more open water habitats. However, the species has also been stocked into impoundments.	Indicative distribution mapping for the species within the project footprint includes the Murrumbidgee River (Department of Primary Industries (DPI) 2016c, 2022a), although currently there is only one known strong viable natural population in the middle Murray region (Threatened Species Scientific Committee, 2013). Silver Perch has the potential to occur within the project footprint in larger streams, particularly the Murrumbidgee River.	Unlikely impacts.
Galaxias rostratus	Flatheaded Galaxias		CE	CE				The species occurs in still and gently flowing small streams, lakes, lagoons, billabongs and backwaters with coarse sand or muddy substrate and aquatic vegetation (DPI 2014).	The Flatheaded Galaxias is restricted to the southern Murray-Darling Basin (Lintermans 2007), although the species once occurred in the middle reaches of the Lachlan, Murrumbidgee and Murray River catchments in New South Wales (Threatened Species Scientific Committee 2016, Department of Agriculture, Water and the Environment (DAWE) 2022a). The last Flatheaded Galaxias record in the Murrumbidgee River was in 1971 and the Fisheries Scientific Committee	Unlikely impacts.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
									(2008a) suggest the species may be locally extinct from Murrumbidgee and Lachlan rivers. This is contrary to the indicative habitat mapping (DPI 2022a) which includes large sections of these major waterways and associated stream networks. On the basis of these factors, the species is considered unlikely to occur within the project footprint, however a precautionary approach has been adopted and potential impacts to the species are considered further in Section 12.5.1.	
Nannoperca australis	Southern Pygmy Perch		E	V				The Southern Pygmy Perch prefers slow flowing or still waters in small streams, billabongs, vegetated lakes and irrigation channels with dense aquatic vegetation and habitat cover (Lintermans 2007). These habitats are generally absent from the desktop assessment of aquatic habitats. Where these habitats do occur in some form, they are typically limited and have been subject to degradation from deleterious processes such as grazing and riparian clearing.	The available information on the known distribution of Southern Pygmy Perch is somewhat at odds with the indicative distribution mapping published by DPI. The indicative distribution mapping includes a significant amount of stream length in the Upper Lachlan and Murray River catchments. However, the current known range of the species in NSW is restricted to sections of three waterways in New South Wales, which include a tributary of the Lachlan River (Blakney Creek near Yass) and two tributaries of the Murray River, aside from five additional conservation	Unlikely impacts.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
									stocking sites (DPI 2013, Threatened Species Scientific Committee 2021, DAWE, 2022b) the locations of which are not published. The species is considered locally extinct in the Murrumbidgee River catchment. None of the known remaining populations of Southern Pygmy Perch would be impacted by the project. It is overall unlikely that the Southern Pygmy Perch would occur within the project footprint based upon the known distribution and habitat requirements of the species. Despite this, a precautionary approach has been adopted and potential impacts to the species are considered in Section 12.5.1.	
Maccullochella macquariensis	Trout Cod		E	E				The species occurs in a variety of flowing habitats, typically in the mid to upper reaches of rivers and streams with cover in the form of woody debris or boulders (Trout Cod Recovery Team 2008). Habitats for the species require substantial amounts of large in-stream woody debris, which provides complex habitats supporting each life-cycle stage of the species (DPI 2017).	Stocking has occurred at various locations within the Murrumbidgee River with some success. Stocking attempts however within the Tumut River have been unsuccessful or at least undetermined (Lintermans, 2007, Trout Cod Recovery Team, 2008). Trout Cod has the potential to occur within the project footprint in larger streams, particularly the Murrumbidgee River.	Unlikely impacts.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
Maccullochella peelii	Murray Cod		-	V				The Murray Cod utilises a range of habitats from clear rocky streams, to slow-flowing turbid lowland rivers and billabongs, with a strong association with woody habitats and deeper flowing stream sections. Although the species may also persist in large impoundments. Murray Cod are frequently found in the main channels of rivers and larger tributaries and is considered a main-channel specialist but may occur in flood channels and anabranches during wet periods. Preferred habitats include complex structural features such as large rocks, snags, overhanging stream banks and vegetation, trees and woody structures. Riparian vegetation is important to supply structural woody habitat and providing stream bank stability.	Murray Cod has the potential to occur within the project footprint in larger streams, particularly the Murrumbidgee River. However, any population present within these stream intersecting with the project footprint would not constitute part of any important population identified in the recovery plan for the species (National Murray Cod Recovery Team, 2010). The closest important population occurs in the Murrumbidgee River between Wagga Wagga and Hay. The upstream extent of this important population (Wagga Wagga) would be over 200 km downstream of the project footprint. Furthermore, the waterways intersecting with the project footprint are not located at the limit of the species range and it is considered unlikely that any population that may occur within the project footprint would represent a key source population for breeding or necessary for maintaining the genetic diversity of the species. As such, no important populations would be impacted by the project, although it is noted that the avoidance and mitigation	Unlikely impacts.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
									measures presented within this BDAR would apply to any individuals not part of the important population that may occur within the project footprint.	
Macquaria australasica	Macquarie Perch		E	E				The Macquarie Perch may occur in stream or lake habitats, with a preference for upper river reaches or tributaries, and lake dwelling individuals of the species will migrate into these habitats to spawn (DPI 2016b). Typical habitat for the species is described as being a large and moderately deep pool immediately upstream of fast-flowing broken water with aquatic vegetation and additional cover in the form of large boulders, debris and overhanging banks, with stream shading provided by steep rock faces, riparian trees or over hanging bank vegetation (Department of the Environment and Energy (DEE) 2018).	Macquarie Perch from the Murray-Darling Basin strain of the species may occur in the upstream reaches of the Lachlan, Murrumbidgee and Murray rivers. Indicative distribution mapping by DPI for the species includes the Lachlan River and Adjungbilly Creek within the project footprint, although a number of streams may be within the historic distribution of the species (DPI 2015c, DPI 2016a). The species is unlikely to occur within the Murrumbidgee River in the project footprint, with the population of this river occurring upstream, south of Canberra (DEE, 2018). Within the project footprint, the species has the moderate likelihood of occurring within the Lachlan River and Adjungbilly Creek despite the somewhat marginal nature of habitats at these locations.	Unlikely impacts.
Flora										
Acacia bynoeana	Bynoe's Wattle	E		V		BUN: 1 CRO: 1	BUN: 1 CRO: 1	Occurs in heath or dry sclerophyll forest on sandy soils. Seems to prefer open, sometimes slightly disturbed sites such as trail margins, edges of roadside spoil mounds and in recently burnt patches. Associated overstorey species	BUN: **Moderate** – 95 targeted threatened flora searches were undertaken in suitable habitat within the Bungonia IBRA	Potential for impacts to species habitat.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
								include Red Bloodwood, Scribbly Gum, Parramatta Red Gum, Saw Banksia and Narrow-leaved Apple. Bynoe's wattle is found in central eastern NSW, from the Hunter District (Morisset) south to the Southern Highlands and west to the Blue Mountains. The species is currently known from about 30 locations, with the size of the populations at most locations being very small (1-5 plants). It has recently been found in the Colymea and Parma Creek areas west of Nowra.	subregion portion of the project footprint. However, no individuals were identified. There are also generally low numbers of records across the broader Bungonia IBRA subregion (DPE, 2022). However, given the low number of surveys undertaken, the likelihood of occurrence is considered moderate. CRO: **Moderate**- 206 targeted threatened flora searches were undertaken in suitable habitat within the Crookwell IBRA subregion portion of the project footprint. However, no individuals were identified. There are also generally low numbers of records across the broader Crookwell IBRA subregion (DPE, 2022). However, given the low number of surveys undertaken, the likelihood of occurrence is considered moderate.	
Acacia flocktoniae	Flockton Wattle	V		V			BUN: 1	Grows in dry sclerophyll forest on sandstone. The Flockton Wattle is found only in the Southern Blue Mountains (at Mt Victoria, Megalong Valley and Yerranderie).	BUN: **Low –** Five targeted threatened flora searches were undertaken in suitable habitat within the Bungonia IBRA subregion portion of the project footprint. However, no individuals were identified. Given the species known range is limited to the Southern Blue Mountains, and there are no previous records of the species across the broader Bungonia	Direct/indirect impacts to species as a result of the project are highly unlikely.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
									IBRA subregion (BioNet, 2022), the species is unlikely to occur in the project footprint.	
Acacia meiantha		E		E				Clarence population occurs in an open eucalypt forest (*Eucalyptus dives* and *E. sieberi*) and in an adjacent area of mainly shrubs, where tree overstorey has been cleared near power lines. Dense shrub layer is dominated by Leptospermum trinervium with *L. obovatum, Phyllota squarrosa, Banksia spinulosa and Isopogon anemonifolia.* Populations at Carcalgong and Mullions Range State Forest occur in the same broad Southern Tablelands Dry Sclerophyll Forests vegetation class composition differ. At Carcalgong *Eucalyptus rossi, E. sparsifola and E. lactea dominant with scattered E. goniocalyx*. At Mullions Range State Forest, the dominant overstorey species include *Eucalyptus rossi, E. mannifera, E. dives and E. macrorhyncha.* It is only known from three disjunct locations, all within the Central Tablelands and each separated by more than 60 km. These disjunct populations include Clarence, which covers an area of approximately 1 hectare; Mullions Range State Forest north of Orange; and Carcalgong, which is confined to 2.5 km of road easements.	INL: **Unlikely –** There are no associated PCTs mapped in the project footprint. There are no previous records pf the species across the broader Inland Slopes IBRA subregion (DPE, 2022). It is only known from three disjunct locations, all within the Central Tablelands and each separated by more than 60 km.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Acacia phasmoides	Phantom Wattle	V		V			INL: 91	Grows in shrubby woodland on sandy, granitic soil near creeks or in rocky crevices. The species is only known from one location in NSW: Woomagarma National Park in Greater Hume Shire. It is also found at Burrowa-Pine Mountain National Park in Victoria.	INL: **Low–** There are associated PCTs mapped in the project footprint. There are no previous records of the species across the broader Inland Slopes IBRA subregion (DPE, 2022). The species is known from Woomagarma National Park, approximately 60 km south-west of the project footprint.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Ammobium craspedioides	Yass Daisy	V		V	BON: 6 ¶INL: 723 MUR: 33	BON: 59 INL: 799	BON: 59 CRO: 17	Found in moist or dry forest communities, Box-Gum Woodland and secondary grassland derived from clearing of these communities. Grows in association with a large	CRO: **Known (133 individuals recorded) –** 10 targeted threatened flora searches were	Potential for impacts to

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
						MUR: 60	INL: 823 MUR: 71	range of eucalypts (*Eucalyptus blakelyi, E. bridgesiana, E. dives, E. goniocalyx, E. macrorhyncha, E. mannifera, E. melliodora, E. polyanthemos, E. rubida*. Apparently unaffected by light grazing, as populations persist in some grazed sites. Found in a number of TSRs, Crown reserves, cemeteries and roadside reserves within the region. Found from near Crookwell on the Southern Tablelands to near Wagga Wagga on the Southwestern Slopes. Most populations are in the Yass region.	undertaken in suitable habitat within the Crookwell IBRA subregion portion of the project footprint. 133 individuals were identified within the Crookwell IBRA subregion portion of the project footprint. INL: **High** – 124 targeted threatened flora searches were undertaken in suitable habitat within the Inland Slopes IBRA subregion portion of the project footprint. 87 individuals were identified within the Inland Slopes IBRA subregion during targeted surveys, outside of the project footprint. MUR: **Known (159 individuals recorded) –** 64 targeted threatened flora searches were undertaken in suitable habitat within the Murrumbateman IBRA subregion portion of the project footprint. 159 individuals were identified within the Murrumbateman IBRA subregion portion of the project footprint. BON: **Known (535 individuals recorded)–** Five targeted threatened flora searches (Niche) were undertaken and 1.86 km was traversed (ELA) in suitable habitat within the Bondo IBRA subregion portion of the project footprint.	species habitat.

									Individuals were recorded within PCT 299.	
Amphibromus fluitans	Floating Swamp Wallaby-grass	V		V		CRO: 2	CRO: 2 INL: 31	*Amphibromus fluitans* grows mostly in permanent swamps. The species needs wetlands which are at least moderately fertile and which have some bare ground, conditions which are produced by seasonally-fluctuating water levels. Habitats in south-western NSW include swamp margins in mud, dam and tank beds in hard clay and in semi-dry mud of lagoons with *Potamogeton* and *Chamaeraphis* species. Flowering time is from spring to autumn or November to March. *Amphibromus fluitans* appears to fruit later than the other grasses with which it grows. The flower heads remain almost hidden by the leaf sheaths until the seeds are nearly mature, and even then elongation of the stems is barely sufficient to expose the heads completely. Disturbance regimes are not known, although the species requires periodic flooding of its habitat to maintain wet conditions. Has been observed covering several hectares in area. The species is also recorded as occasional to common in populations. There are many historic collections in the City of Greater Albury. It has been recorded recently in lagoons beside the Murray River near Cooks Lagoon (Shire of Greater Hume), Mungabarina Reserve, East Albury, at Ettamogah, Thurgoona (Charles Sturt University Campus), near Narranderra, and also further west along the Murray River (near Mathoura) and in Victoria. There is a recent record of this species near Laggan in Upper Lachlan Shire. It is also found in Victoria and in Tasmania.	CRO: **Low –** There are no associated PCTs mapped in the project footprint. There are two previous records in the IBRA subregion, both of which occur within 20 km of the project footprint. Additionally, there is minimal suitable habitat for this species in the Crookwell IBRA subregion. The survey effort is considered sufficient to consider this species likelihood of occurrence as low within this subregion of the project footprint. INL: **Low –** There are no associated PCTs mapped in the project footprint. There are 31 previous records in the in the IBRA subregion, none of which occur within 20 km of the project footprint. Additionally, there is minimal suitable habitat for this species in the Inland Slopes IBRA subregion. The survey effort is considered sufficient to consider this species likelihood of occurrence as low within this subregion of the project footprint.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Argyrotegium nitidulum	Shining Cudweed	V		V			SNO: 38	Usually found in herbfield or open heathland, above or close to the treeline. Flowers appear from December to March.	SNO: **Unlikely –** There are no associated PCTs mapped in the project footprint. Additionally, geographic restrictions to	Direct/indirect impacts to species as a result of the

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
								In NSW Shining Cudweed is found only in the higher parts of Kosciuszko National Park. The species also occurs in Victoria and the South Island of New Zealand, in similarly high mountain areas.	altitudes above 1400 m. The maximum elevation of the project footprint is 1240 m asl in Snowy Mountains sub-region. Species to be excluded from assessment.	project are highly unlikely.
Austrostipa wakoolica	A spear-grass	E		E				Grows on floodplains of the Murray River tributaries, in open woodland on grey, silty clay or sandy loam soils; habitats include the edges of a lignum swamp with box and mallee; creek banks in grey, silty clay; mallee and lignum sandy-loam flat; open Cypress Pine Forest on low sandy range; and a low, rocky rise. Associated species include *Callitris glaucophylla, Eucalyptus microcarpa, E. populnea, Austrostipa eremophila, A. drummondii, Austrodanthonia eriantha and Einadia nutans*. Flowers from October to December, mainly in response to rain. Seed dispersal is mainly by wind, rain and flood events; the awn and sharp point of the floret appear to be an adaptation for burying the seed into the soil; grass seed is traditionally believed to be viable for three to five years, so a long-lived seed bank is considered unlikely for this species. Recorded as common in the Mairjimmy State Forest population. Confined to the floodplains of the Murray River tributaries of central-western and south-western NSW, with localities including Manna State Forest, Matong, Lake Tooim, Merran Creek, Tulla, Cunninyeuk and Mairjimmy State Forest (now part of South West Woodland Nature Reserve).	INL: **Unlikely -** There are no associated PCTs mapped in the project footprint. Additionally, the species is geographically restricted to west of Cowra.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Baloskion longipes	Dense Cord-rush	V		V				Commonly found in swamps or depressions in sandy alluvium, sometimes growing with sphagnum moss. Also occurs in swails within tall forest, and in Black Gum (*Eucalyptus aggregata*) Woodland. Produces new shoots from underground stems (rhizomes), but little is known about its biology. Dense Cord-rush has been recorded from the Kanangra-Boyd area to the Southern Tablelands but all populations are small. Populations have been recorded in Blue	BUN: **Low -** 10 surveys in January 2022; 24 in February 2022; 1 in May 2022; 5 September 2021; 55 in December 2021 (31.7 person hrs). No individuals were identified and no previous records in the IBRA subregion. Additionally, there is minimal	Direct/indirect impacts to species as a result of the project are highly unlikely.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
								Mountains National Park, Kanangra-Boyd National Park, Penrose State Forest (in Hanging Rock Swamp), Morton National Park (The Vines), the Clyde Mountain area and Ballalaba (south of Braidwood).	suitable habitat within the project footprint within Bungonia. The survey effort is considered sufficient to consider this species likelihood of occurrence as low within this subregion of the project footprint.	
Boronia deanei	Deane's Boronia	V		V			BUN: 1	Grows in wet heath, often at the margins of open forest adjoining swamps or along streams. Fire ecology is poorly understood, but too intense or too frequent fires are considered a threat to this species limiting populations ability to reach maturity and set seed. There are scattered populations of Deane's Boronia between the far south-east of NSW and the Blue Mountains with the species found on Newnes Plateau (Newnes State Forest), Nalbaugh Plateau (South East National Park), Kanangra-Boyd National Park, Budderoo National Park and Morton National Park. The species mainly occurs in conservation reserves and once grew profusely in Morton National Park near Bundanoon but has rarely been seen in that area since being impacted by devastating bushfires of the 1960s. The 2019/20 black summer bushfires impacted populations at Newnes Plateau, Nalbaugh Plateau and Kanangra-Boyd National Park.	BUN: **Low -** There are no associated PCTs within the Bungonia IBRA Subregion. There is only one previous record in the IBRA subregion. However, suitable habitat occurs in the project footprint.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Bossiaea fragrans		CE		CE			INL: 55	Occurs on spilite, rhyolite or slate and volcanic substrates and is often associated with Red Stringybark (*Eucalyptus macrorhyncha*) - Red Box (*Eucalyptus polyanthemos*) woodland +/- White Box (*Eucalyptus albens*). Currently only known from the Abercrombie Karst Conservation Reserve, south of Bathurst on the NSW central tablelands. It is highly restricted, with only a small number of known sub-populations.	CRO: **Low -** 26 surveys in January 2022; 88 in February 2022; 7 in March 2022; 5 in May 2022; 10 in September 2021; 59 in December 2021 (65 person hrs). No individuals were identified and no previous records in the IBRA subregion. Additionally, the species is highly restricted, and known only from the Abercrombie Karst	Direct/indirect impacts to species as a result of the project are highly unlikely.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
									Conservation Reserve which is approximately 55 km north of the project footprint. INL: **Low:** 7 surveys in Jan-22; 4 in Feb-22; 41 in Mar-22; 11 in May-22; 124 in Oct-21; 70 in Nov-21; 135 in Dec-21 (130.7 person hrs). No individuals were identified, however associated PCTs do occur.	
Bossiaea oligosperma	Few-seeded Bossiaea	V		V			BUN: 97	Occurs on stony slopes or ridges on sandstone in the Yerranderie area. Occurs in low woodland on loamy soil in the Windellama area. Nothing is known about its ecology but it probably has hard-coated seeds that respond well to fire and soil disturbance. The Few-seeded Bossiaea is known from two disjunct areas - the lower Blue Mountains in the Warragamba area (Wollondilly, Allum, Tonalli River catchments) and the Windellama area in Goulburn Mulwaree Shire, where it is locally abundant. A 1960s record for the Araluen valley south of Braidwood is credible but has not been relocated.	BUN: **Low -** 10 surveys in Jan-22; 24 in Feb-22; 1 in May-22; 5 in Sep-21; 55 in Dec-21 (31.7 person hrs). No individuals were identified, however records do occur within the IBRA subregion (though none within 20 km of the project footprint). Additionally, the species known occurrence is restricted, and known only from the Warragamba and Windellama area, both approximately 50 km from the project footprint.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Caladenia arenaria	Sand-hill Spider Orchid	E		E	INL: 1	INL: 1	INL: 6	Occurs in woodland with sandy soil, especially that dominated by White Cypress Pine (*Callitris glaucophylla*). *Caladenia arenaria* is found mostly on the southwest plains and western southwest slopes. The original description is of a plant from Nangus, west of Gundagai (1865) and there is a report of the species from Adelong near Tumut. A record near Cootamundra needs verifying. The Sand-hill Spider Orchid is currently only known to occur in the Riverina between Urana and Narranderra.	INL: **Low -** There are no associated PCTs mapped in the project footprint. Additionally, there are only six previous records in the IBRA subregion, one of which occurs within 5 km of the project footprint. .	Direct/indirect impacts to species as a result of the project are highly unlikely.
Caladenia concolor	Crimson Spider Orchid	E		V	BON: 1	BON: 7	BON: 7 INL: 504	Habitat is regrowth woodland on granite ridge country that has retained a high diversity of plant species, including other orchids. The dominant trees are Blakely's Red Gum (*Eucalyptus blakelyi*), Red Stringybark (*E.*	BON: **Low -** No targeted surveys have been undertaken for this species in the subregion. There are seven	Direct/indirect impacts to species as a result of the

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
								macrorhyncha), Red Box *(E. polyanthemos*) and White Box (*E. albens*); the diverse understorey includes Silver Wattle (*Acacia dealbata*), Hop Bitter-pea (*Daviesia latifolia*), Common Beard-heath (*Leucopogon virgatus*), Spreading Flax-lily (*Dianella revoluta*) and Poa Tussock (*Poa sieberiana*).This species is deciduous, producing a leaf during autumn or winter and after flowering in spring survives the dry summer and early autumn as a dormant tuber. Flowering does not take place every year for reasons that are not fully understood, though each plant probably lives for a considerable number of years. It is likely that fire is not a direct requirement of the species, but it may have a positive influence on seedling germination and establishment. The current NSW Scientific Committee listing incorporates two populations which have each been described as separate species by D.L. Jones. One of these populations comprises a few hundred plants on private property near Bethungra and the other of about 100 plants occurs in Burrinjuck Nature Reserve. The other occurrences of the Crimson Spider Orchid in NSW are from the Nail Can Hill Crown Reserve near Albury. The species also occurs at two localities in Victoria near Beechworth and Chiltern.	previous records in the IBRA subregion, six of which occur within 20 km of the project footprint, and one of which occurs within 5 km of the project footprint. However, no associated PCTs occur in BON within the project footprint. INL: **Low -** No targeted surveys have been undertaken for this species in the subregion. There are 504 previous records in the IBRA subregion, none of which occur within 20 km of the project footprint. MUR: **Low -** 64 surveys in Sep-21 (21.3 person hrs). Associated habitat has been observed throughout the project footprint, however no previous records occur within the IBRA subregion.	project are highly unlikely.
Caladenia rosella	Rosella Spider Orchid	Ex		E			INL: 1	In Victoria, the species is found in woodlands and low forests of Red Box (*Eucalyptus polyanthemos*), Long-leafed Box (*E. goniocalyx*) and Red Stringybark (*E. macrorhyncha*) in well-drained, skeletal soils. Reproductive maturity is reached after three to five years and is maintained for up to five years after. Today the species is found near Melbourne in Victoria but is listed as endangered because less than 200 plants are known to exist.	INL: **Low –** Whilst no targeted surveys have been undertaken for this species in the subregion, there is only one previous record in the IBRA subregion. This record does not occur within 20 km of the project footprint. The likelihood of occurrence is therefore considered low.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Caladenia tessellata	Thick Lip Spider Orchid	E		V			INL: 1 MUR: 2	Generally found in grassy sclerophyll woodland on clay loam or sandy soils, though the population near Braidwood is in low woodland with stony soil. The single leaf regrows each year. Flowers appear between	BUN: **Low -** 5 surveys in Sep-21 (1.7 person hrs). Was not identified during targeted	Direct/indirect impacts to species as a result of the

								September and November (but apparently generally late September or early October in extant southern populations). The Thick Lip Spider Orchid is known from the Sydney area (old records), Wyong, Ulladulla and Braidwood in NSW. Populations in Kiama and Queanbeyan are presumed extinct. It was also recorded in the Huskisson area in the 1930s. The species occurs on the coast in Victoria from east of Melbourne to almost the NSW border.	surveys. There are no previous records in the IBRA subregion. INL: **Low –** Only one record in the broader IBRA subregion and none within 20 km of the project footprint. MUR: **Low -** Only two records in the broader IBRA subregion and none within 20 km of the project footprint.	project are highly unlikely.
Callitris oblonga	Pygmy Cypress Pine	V		V			BUN: 24	Usually grows in sand along watercourses in shrubland and open woodland in granite country; it also occurs in drier sites, including exposed ridges. Plants are naturally killed by flood-waters, but seed germinates readily and mature plants are quickly replaced. A fast-growing species, which is killed by fire. Pygmy Cypress Pine is represented by two subspecies in NSW and one in Tasmania. The subspecies parva occurs in northern NSW on the eastern edge of the New England Tablelands and the subspecies corangensis is only known to occur naturally in the Corang River catchment.	BUN: **Unlikely -** There are no associated PCTs mapped in the project footprint. There are 24 previous records in the IBRA subregion, none of which occur within 20 km of the project footprint.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Calotis glandulosa	Mauve Burr-daisy	V		V			SNO: 151	Found in montane and subalpine grasslands in the Australian Alps. Found in subalpine grassland (dominated by *Poa spp.*), and montane or natural temperate grassland dominated by Kangaroo Grass (*Themeda australis*) and Snow Gum (*Eucalyptus pauciflora*) Woodlands on the Monaro and Shoalhaven area. Appears to be a coloniser of bare patches, which explains why it often occurs on roadsides. Apparently common on roadsides in parts of the Monaro, though it does not persist for long in such sites. Does not persist in heavily-grazed pastures of the Monaro or the Shoalhaven area. Dispersed by animals which carry the sticky burrs to new sites. The distribution of the Mauve Burr-daisy is centred on the Monaro and Kosciuszko regions. There are three	SNO: **Low -** 19 surveys in Jan-22; 9 in Mar-22; 32 in Nov-21 (20 person hrs). Was not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys for the project. There are 151 previous records in the IBRA subregion, none of which occur within 20 km of the project footprint.	Direct/indirect impacts to species as a result of the project are highly unlikely.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
								known sites in the upper Shoalhaven catchment. There are old and possibly dubious records from near Oberon, the Dubbo area and Mt Imlay.		
Commersonia prostrata	Dwarf Kerrawang	E		E			BUN: 11	Occurs on sandy, sometimes peaty soils in a wide variety of habitats: Snow Gum (*Eucalyptus pauciflora*) Woodland and Ephemeral Wetland floor at Rowes Lagoon; Blue leaved Stringybark (*E. agglomerata*) Open Forest at Tallong; and in Brittle Gum (*E. mannifera*) Low Open Woodland at Penrose; Scribbly Gum (*E. haemostoma*)/ Swamp Mahogany (*E. robusta*) Ecotonal Forest at Tomago. Associated native species may include *Imperata cylindrica, Empodisma minus* and *Leptospermum continentale*. Appears to respond positively to some forms of disturbance (e.g. some Victorian records are from gravel road surfaces and the Tomago population is on an area previously subject to sandmining), however, there are conflicting reports about the response of the species to fire. The population at the Thirlmere lakes is most abundant in the areas of prior lake bed exposed by the dropping water levels. It is uncertain how long this may remain the case, as many of the individuals are very large, growing among the decomposing bases of bulrushes. It is also found among wattle thickets in the drainage line between the lakes. Dwarf Kerrawang occurs on the Southern Highlands and Southern Tablelands (one plant at Penrose State Forest plant at Tallong, a small population near the Corang and about 2000 plants at Rowes Lagoon), a larger population in the Thirlmere Lakes area (particularly among the dying reeds at the edge of the water), and on the North Coast (less than 100 plants at the Tomago sandbeds north of Newcastle). It is also found in Victoria.	BUN: **Low -** 10 surveys in Jan-22; 24 in Feb-22; 1 in May-22; 5 in Sep-21; 55 in Dec-21 (31.7 person hrs). Was not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys for the project. There are 11 previous records in the IBRA subregion, none of which occur within 20 km of the project footprint. The survey effort is considered sufficient to consider this species likelihood of occurrence as low within this subregion of the project footprint. Further, no associated PCTs in the BUN portion of the project footprint. CRO: **Low -** 26 surveys in Jan-22; 88 in Feb-22; 7 in Mar-22; 5 in May-22; 10 in Sep-21; 59 in Dec-21 (65 person hrs). Was not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys for the project. There are no previous records in the IBRA subregion, however the species is predicted to occur in the subregion. The survey effort is considered sufficient	Direct/indirect impacts to species as a result of the project are highly unlikely.

									to consider this species likelihood of occurrence as low within this subregion of the project footprint.	
Dichanthium setosum	Bluegrass	V		V			INL: 3	Flowering time is mostly in summer. Associated with heavy basaltic black soils and red-brown loams with clay subsoil. Often found in moderately disturbed areas such as cleared woodland, grassy roadside remnants and highly disturbed pasture. (Often collected from disturbed open grassy woodlands on the northern tablelands, where the habitat has been variously grazed, nutrient-enriched and water-enriched). It is open to question whether the species tolerates or is promoted by a certain amount of disturbance, or whether this is indicative of the threatening processes behind its depleted habitat. Associated species include *Eucalyptus albens, Eucalyptus melanophloia, Eucalyptus melliodora, Eucalyptus viminalis, Myoporum debile, Aristida ramosa, Themeda triandra, Poa sieberiana, Bothriochloa ambigua, Medicago minima, Leptorhynchos squamatus, Lomandra* aff. *longifolia*, *Ajuga australis, Calotis hispidula* and *Austrodanthonia, Dichopogon*, *Brachyscome, Vittadinia, Wahlenbergia* and *Psoralea* species. Locally common or found as scattered clumps in broader populations. The extensive distribution and wide environmental tolerances make predictions about suitable habitat difficult. Bluegrass occurs on the New England Tablelands, North West Slopes and Plains and the Central Western Slopes of NSW, extending to northern Queensland. It occurs widely on private property, including in the Inverell, Guyra, Armidale and Glen Innes areas.	INL: **Unlikely -** There are no associated PCTs mapped in the project footprint. Additionally there are only three previous records in the IBRA subregion, none of which occur within 20 km of the project footprint.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Diuris aequalis	Buttercup Doubletail	E		E		CRO: 34	BUN: 2 CRO: 44	Recorded in forest, low open woodland with grassy understorey and secondary grassland on the higher parts of the Southern and Central Tablelands (especially on the Great Dividing Range).Leaves die back each year and resprout just before flowering. Populations tend to contain few, scattered individuals; despite extensive	BUN: **Low -** No targeted surveys have been undertaken for this species in the subregion. There are two previous records in the IBRA subregion, however these	Direct/indirect impacts to species as a result of the project are highly unlikely.

								Sydney Basin Bioregion. Black Gum has a moderately narrow distribution, occurring mainly in the wetter, cooler and higher parts of the tablelands, for example in the Blayney, Crookwell, Goulburn, Braidwood and Bungendore districts.	few records across the broader Bungonia IBRA subregion (BioNet 2022), however none occur within 5 km of the project footprint. Given the low number of surveys undertaken, the likelihood of occurrence is considered moderate. CRO: **High -** 26 surveys in Jan-22; 88 in Feb-22; 7 in Mar-22; 5 in May-22; 10 in Sep-21; 59 in Dec-21 (65 person hrs). There are 52 records across the broader Crookwell IBRA subregion (BioNet 2022), 34 of which occur within 20 km of the project footprint and one of which occurs within 5 km of the project footprint. Given the low number of surveys undertaken, the likelihood of occurrence is considered high. MUR: **Moderate -** 30 surveys in Feb-22; 3 in Mar-22; 3 in May-22; 138 in Sep-21; 72 in Oct-21; 89 in Nov-21; 150 in Dec-621 (463.37 person hours). No previous records of the species in MUR. Given the low number of surveys undertaken, the likelihood of occurrence is considered moderate. INL: **Low -** 7 surveys in Jan-22; 4 in Feb-22; 41 in Mar-22; 11 in	species habitat.

Scientific name (Data source)	**Common name**	**NSW BC Act**	**NSW FM Act**	**EPBC Act**	**Records within 5km**	**Records within 20km**	**Records within IBRA Subregion**	**Habitat**	**Likelihood of occurrence (per IBRA subregion)***	**Likelihood to be impacted by the project**
									May-22; 124 in Oct-21; 70 in Nov-21; 135 in Dec-21 (130.7 person hrs). There is only one previous record within the IBRA subregion which is not within 5 km of the project footprint. Given this species is conspicuous, it is likely to have been recorded either during the threatened flora surveys and/or initial vegetation mapping where canopy species were heavily relied on to confirm PCT ID. Given the moderate survey effort and the conspicuous nature of the species, the likelihood of occurrence is low.	
Eucalyptus alligatrix subsp. *alligatrix*	*Eucalyptus alligatrix* subsp. *alligatrix*	V		V			INL: 2	The population is confined to an area of a few hectares where an estimated 3,000 to 4,500 trees survive. Most of the population consists of moderately dense regenerating stands following previous clearing, but there are also larger scattered paddock trees, probably pre-dating European settlement. Grows in dry sclerophyll woodland on shallow relatively infertile soils (grey brown loam with ironstone). It may have been part of a more-extensive open woodland community prior to the commencement of clearing and grazing. Associated trees include *Eucalyptus macrorhyncha, Eucalyptus blakelyi, Eucalyptus viminalis, Eucalyptus bridgesiana, Eucalyptus melliodora, Eucalyptus rossii and Angophora floribunda.* Only known from a single location south-west of Rylstone; however, the species has reportedly been widely propagated and planted in the Rylstone area.	INL: **Low -** 7 surveys in Jan-22; 4 in Feb-22; 41 in Mar-22; 11 in May-22; 124 in Oct-21; 70 in Nov-21; 135 in Dec-21 (130.7 person hrs). There are two previous records in the IBRA subregion, none of which occur within 20 km of the project footprint. Given this species is conspicuous, it is likely to have been recorded either during the threatened flora surveys and/or initial vegetation mapping where canopy species were heavily relied on to confirm PCT ID. Given the moderate survey effort and the conspicuous nature of the species, the likelihood of occurrence is low.	Direct/indirect impacts to species as a result of the project are highly unlikely.

Eucalyptus glaucina	Slaty Red Gum	V		V			BUN: 7	Grows in grassy woodland and dry eucalypt forest. Grows on deep, moderately fertile and well-watered soils. Found only on the north coast of NSW and in separate districts: near Casino where it can be locally common, and farther south, from Taree to Broke, west of Maitland.	BUN: **Unlikely -** There are no associated PCTs mapped in the project footprint. Additionally, there are only seven previous records in the IBRA subregion, none of which occur within 20 km of the project footprint. Given this species is conspicuous, it is likely to have been recorded either during the threatened flora surveys and/or initial vegetation mapping where canopy species were heavily relied on to confirm PCT ID.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Eucalyptus macarthurii	Paddys River Box, Camden Woollybutt	E		E		BUN: 10	BUN: 18	Occurs on grassy woodland on relatively fertile soils on broad cold flats. Paddy's River Box has a moderately restricted distribution. It is currently recorded from the Moss Vale District to Kanangra-Boyd National Park. In the Southern Highlands it occurs mainly on private land, often as isolated individuals in, or on the edges of roads and paddocks. It is not well reserved but does occur within Cecil Hoskins Nature Reserve in the Southern Highlands. In Kanangra-Boyd National Park isolated stands occur in the northwest part of the range on the Boyd Plateau.	BUN: **Low -** 10 surveys in Jan-22; 24 in Feb-22; 1 in May-22; 5 Sep-21; 55 in Dec-21 (31.7 person hrs). Was not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys for the project. There are 18 previous records in the IBRA subregion, 10 of which occur within 20 km of the project footprint. Given this species is conspicuous, it is likely to have been recorded either during the threatened flora surveys and/or initial vegetation mapping where canopy species were heavily relied on to confirm PCT ID. Given the moderate survey effort and the conspicuous nature of the species, the likelihood of occurrence is low.	Direct/indirect impacts to species as a result of the project are highly unlikely.

Eucalyptus recurva	Mongarlowe Mallee	CE		CE			BUN: 22	Found in shallow soils on gentle slopes in low heathland and in some cases at the margins of the heathland and adjacent low woodland; the woodlands are dominated by Brittle Gum (*Eucalyptus mannifera*) and Snow Gum (*E. pauciflora*), but scattered Candlebark (*E. rubida*) and Broad-leafed Peppermint (*E. dives*) trees are also nearby at some sites; in the Mongarlowe area the heathland is dominated by Stunted She-oak (*Allocasuarina nana*), with emergent shrubs of Finger Hakea (*Hakea dactyloides*). Flowering occurs in January, but very few seeds are set so the chances of recruitment of new individuals in the field is low. Seed germinated from naturally set seed has mostly produced hybrids, showing that there is a low level of cross pollination occurring with a few other locally occurring eucalypt species. The very few seedlings that have germinated from naturally set seed that appear to have been pure Mongarlowe Mallee plants have lacked vigour and ultimately died. This is not uncommon in eucalypts where self -pollination has occurred. Efforts by CSIRO to cross-pollinate the two plants near Mongarlowe to produce viable seed and to propagate the species using grafting and tissue culture techniques in 1992 were unsuccessful. Subsequent hand cross-pollination (using a modified method) of four of the individuals by DPIE staff in 2001 and 2002 were successful in producing significant quantities of viable seed. The hand pollinated branches were not bagged at that time and so only about half the seed that was sown produced what appeared to be pure Mongarlowe Mallee plants whilst about half were clearly hybrids. This work demonstrated that the species is not inherently sterile and has the capacity to be propagated using this method. The size and spread of the lignotubers (woody underground structures) suggests that some of the plants are of considerable age, probably several hundred years. The Mongarlowe Mallee is confined to the NSW Southern Tablelands where it is known from only four locations. Three of these occur near Mongarlowe (with at least a two km separation between the sites) and the third is	BUN: **Unlikely -** There are no associated PCTs mapped in the project footprint. Additionally, there are 22 previous records in the IBRA subregion, none of which occur within 20 km of the project footprint. Given this species is conspicuous, it is likely to have been recorded either during the threatened flora surveys and/or initial vegetation mapping where canopy species were heavily relied on to confirm PCT ID.	Direct/indirect impacts to species as a result of the project are highly unlikely.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
								about 30 km away near Windellama. Three of these sites support only single plants, whilst the other has three individuals present - the total known population of this species is thus only six individuals. Genetic analysis by CSIRO has confirmed that each mallee clump is comprised of a single individual (genotype). It is likely that these individuals represent a relict of a more widespread ancestor, and it is unlikely that many more individuals of the species remain undiscovered.		
Eucalyptus robertsonii subsp. *hemisphaerica*	Robertson's Peppermint	V		V			CRO: 1	Locally frequent in grassy or dry sclerophyll woodland or forest, on lighter soils and often on granite. Usually found in closed grassy woodlands in locally sheltered sites. Habitats include quartzite ridges, upper slopes and a slight rise of shallow clay over volcanics. Associated vegetation includes variously mixed woodlands of *Eucalyptus piperita*, *E. goniocalyx*, *E. dalrympleana*, *E. dives*, *E. mannifera* and *E. rossii*. Flowering period is February to March. Seed is dispersed locally by wind, and there is no dormancy mechanism. Plants resprout from epicormic buds after fire. A specimen from the Mullion Creek locality was observed to be suckering freely from base to crown after fire. Populations are usually highly localised, with trees recorded as frequent in populations. Known only from the central tablelands of NSW, at small disjunct localities from north of Orange to Burraga.	CRO: **Low -** 26 surveys in Jan-22; 88 in Feb-22; 7 in Mar-22; 5 in May-22; 10 in Sep-21; 59 in Dec-21 (65 person hrs). The species was not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys for the project. There is one previous record in the IBRA subregion, this record does not occur within 20 km of the project footprint. The survey effort is considered sufficient to consider this species likelihood of occurrence as low within this subregion of the project footprint. INL: **Low -** 7 surveys in Jan-22; 4 in Feb-22; 41 in Mar-22; 11 in May-22; 124 in Oct-21; 70 in Nov-21; 135 in Dec-21 (130.7 person hrs). The species was not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys	Direct/indirect impacts to species as a result of the project are highly unlikely.

									for the project. There are no previous records in the IBRA subregion, however this species is predicted to occur within the subregion. The survey effort is considered sufficient to consider this species likelihood of occurrence as low within this subregion of the project footprint.	
Euphrasia arguta	Euphrasia arguta	CE		CE			INL: 1	Historic records of the species noted the following habitats: 'in the open forest country around Bathurst in sub humid places', 'on the grassy country near Bathurst', and 'in meadows near rivers'. Plants from the Nundle area have been reported from eucalypt forest with a mixed grass and shrub understorey; here, plants were most dense in an open disturbed area and along the roadside, indicating the species had regenerated following disturbance. The number of plants at a given site may vary over time depending on the season and disturbance history. Near Nundle, local populations had apparently declined at sites that had been disturbed twice within three years, in contrast with sites that were disturbed only once. *Euphrasia arguta* has an annual habit and has been observed to die off over the winter months, with active growth and flowering occurring between January and April. As with other species of Euphrasia, this species is semi-parasitic and attaches to the roots of other associated plants. Euphrasia arguta was rediscovered in the Nundle area of the NSW north western slopes and tablelands in 2008. Prior to this, it had not been collected for 100 years. Historically, *Euphrasia arguta* has only been recorded from relatively few places within an area extending from Sydney to Bathurst and north to Walcha. The Royal Botanic Gardens Specimen Register records an additional location reported and vouchered in 2002 from near the	INL: **Low -** 7 surveys in Jan-22; 4 in Feb-22; 41 in Mar-22; 70 in Nov-21; 135 in Dec-21 (85.6 person hrs). The species was not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys for the project. There is one previous record in the IBRA subregion, this record does not occur within 20 km of the project footprint. The survey effort is considered sufficient to consider this species likelihood of occurrence as low within this subregion of the project footprint.	Direct/indirect impacts to species as a result of the project are highly unlikely.

								Hastings River; and Euphrasia arguta was also recorded from the Barrington Tops in 2012.		
Euphrasia collina subsp. *muelleri*	Mueller's Eyebright	E		E				Little is known about the habitat this species preferred, although there is a reference to "damp places" in an early von Mueller collection. Extant populations in Victoria occur in heathy woodland. Flowering has generally been recorded in spring and early summer, although the flowering collection from Dorrigo in 1904 was made in July. The most recent collection in NSW (Tinderry Range and Tamworth area) were made with flowers and fruit in late December / early January. Once widespread in south-eastern Australia, Mueller's Eyebright is now known only from the Mornington Peninsula near Melbourne. In NSW it was recorded more than 100 years ago in the upper Murray and McIntyre Rivers and near Dorrigo and Cootamundra. The only NSW collections in the past 50 years were made in the vicinity of the Tinderry Range between Canberra and Cooma (1970) and between Uralla and Tamorth (1987).	INL: **Unlikely -** There are no associated PCTs mapped in the project footprint. Additionally, there are no previous records in the IBRA subregion, however this species is predicted to occur within the subregion.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Glycine latrobeana	Clover Glycine	CE		V			SNO: 8	The Clover Glycine occurs mainly in grassland and grassy woodland habitats, less often in dry forests, and only rarely in heathland. Populations occur from sea level to c. 1,200 m altitude 6 (900 m in Tasmania). In Victoria, plants grow in a range of soil types including alluvial soils, and those derived from sandstones, mudstones, granite and basalt. Soils are usually clay, but may also have high loam content. Tasmanian populations occur on a well-drained basalt, dolerite or sandstone substrates (Lynch 1994). The NSW population is in subalpine grassland (at about 1300 m asl).	SNO: **Low -** 19 surveys in Jan-22; 32 in Nov-21 (17 person hrs). The species was not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys for the project. There are eight previous records in the IBRA subregion, none of which occur within 20 km of the project footprint.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Grevillea iaspicula	Wee Jasper Grevillea	CE		E		BON: 24	BON: 30 MUR: 36	Grows on rocky limestone outcrops and around sink holes and cave entrances. Vegetation is open woodland dominated by White Box (*Eucalyptus albens*) and Apple Box (*E. bridgesiana*). Often occurs as a co-dominant species within the shrubby understorey of its open woodland habitat. Flowering is mostly in winter and spring. The species readily sets seeds and these ripen in	BON: **Low** – There is no associated habitat (PCTs) mapped within the Bondo IBRA Subregion. MUR: **Low -** 29 surveys in Feb-22; 3 in Mar-22; 3 in May-22;	Direct/indirect impacts to species as a result of the project are highly unlikely.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
								late December. Recruitment is episodic and dependent on favourable seasonal conditions, but in favourable conditions and where stock grazing is excluded seedling establishment can be reasonably plentiful. The Wee Jasper Grevillea is found only in the Wee Jasper area and on the shores of Lake Burrinjuck near Burrinjuck village on the border of the Southern Tablelands and South Western Slopes. Although there is no evidence that the Grevillea was widespread in the recent past, it is possible that some of its original population was submerged following the damming of Lake Burrinjuck.	64 in Sep-21; 38 in Oct-21; 87 in Nov-21; 150 in Dec-21 (124.7 person hrs). The species is unlikely to occur in the project footprint based on the species distribution being restricted to Wee Jasper- Burrinjuck. Additionally, the species was not identified during targeted surveys and has not been incidentally identified during any other flora surveys for the project. There are 36 previous records in the IBRA subregion, none of which occur within 20 km of the project footprint.	
Grevillea wilkinsonii	Tumut Grevillea	CE		E		INL: 17	INL: 17	At the Goobarragandra River sites the species generally grows in close proximity to the water, at altitudes between 310 and 340 m. Most healthy adult plants occur in open sunny areas, and those plants found under the canopy of dense vegetation tend to be spindly and are sometimes subject to sooty mould infestations. The associated native vegetation in the Goobarragandra sites are typically remnant riverine shrub communities adjacent to open-forest, with the most common tree species being Blakely's Red Gum (*Eucalyptus blakelyi*), Apple Box (*E. bridgesiana*), Yellow Box (*E. melliodora*), and Red Stringybark (*E. macrorhyncha*) and with Kurrajongs (*Brachychiton populneus*) sometimes growing in nearby paddocks. The population at Gundagai is growing on the upper slope of a steep hill on Serpentinite rock. The associated native vegetation at this site is a grassy White Box (*Eucalyptus albens*) woodland with scattered shrubs of Pink Wedding Bush (*Ricinocarpos bowmanii*) and Hop Bush (*Dodonaea viscosa*). The groundcover is dominated by Kangaroo Grass (*Themeda triandra*) and Snow Grass (Poa sieberiana). lowers from mid-September to mid-October, with individual flower	INL: **Low -** 124 surveys in Oct-21 (41.3 person hrs). The species was not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys for the project. There are 17 previous records in the IBRA subregion, all of which occur within 20 km of the project footprint, however none occur within 5 km of the project footprint. Given the conspicuous nature of the species, it's highly restricted distribution to the Goobarragandra River (that does not intersect the project footprint), the survey effort is considered sufficient to consider this species likelihood of occurrence as low within	Direct/indirect impacts to species as a result of the project are highly unlikely.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
								clusters lasting for about two weeks from when the first individual flowers in the cluster open. Flowers have a strong and rather unpleasant smell, not unlike the smell of mice urine; most species of "toothbrush grevilleas" are adapted to bird pollination, but this species is primarily insect pollinated. Seedlings usually commence flowering once they are two or three years old. Most sites contain individuals of varying ages and numerous seedlings have been observed at some sites. The species recruits most readily where there is some bare ground. Recruitment rarely occurs where there is a dense grass groundcover. Fruits mature during December and split longitudinally down one side to release the seed. Individual plants often produce several hundred seeds each year, although in some years much of the ripening seed is eaten by parrots. The seed in this species has a lengthy dormancy, with germination usually taking between one and two years after sowing. The Tumut Grevillea has a highly restricted distribution in the NSW South-west Slopes region. Its main occurrence is along a 6 km stretch of the Goobarragandra River approximately 20 km east of Tumut where about 1,000 plants are known. The other occurrence is a small population that straddles the boundary of two private properties at Gundagai where only eight mature plants survive.	this subregion of the project footprint.	
Hakea dohertyi	Kowmung Hakea	E		E			BUN: 3	Kowmung Hakea grows in dry sclerophyll forest, usually dominated by grey gum or silvertop ash, with a sparse groundcover and midstorey. It is an obligate seeder - i.e. it is killed by fire. The fruit are possibly susceptible to fire also, and seed may be killed within the follicle with even moderate heating. Seed is stored in woody fruits on mature plants and is released after fire or death of the stem. Older follicles are retained on the plant and open as a result of secondary thickening. The seeds are often still viable and germinating and immature plants may be found within the population. No particular age cohorts are evident in the populations. Two smaller populations	BUN: **Unlikely -** 10 surveys in Jan-22; 24 in Feb-22; 1 in May-22; 5 Sep-21; 55 in Dec-21 (31.7 person hrs). The species was not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys for the project. There are three previous records in the IBRA subregion, none of which occur	Direct/indirect impacts to species as a result of the project are highly unlikely.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
								are found at a distance from the main population, on the north side of Bent Hook Swamp (leading up to the ridge) and near the Tonalli Cove of Lake Burragorang. All populations appear to favour shrubby woodland communities. Kowmung Hakea is confined to a small area (18 sq. km) in the Kowmung Valley in Kanangra Boyd National Park. Population varies, but up to 7000 plants have been counted. Additional small populations occur in Bindook area and at Tonalli Cove on Lake Burragorang.	within 20 km of the project footprint. Given the conspicuous nature of the species, and its restricted distribution 30 km north of the project footprint, the survey coverage is considered sufficient.	
Haloragis exalata subsp. *exalata*	Square Raspwort	V		V				Square Raspwort appears to require protected and shaded damp situations in riparian habitats. Flowering specimens in NSW are recorded from November to January. Square Raspwort occurs in 4 widely scattered localities in eastern NSW. It is disjunctly distributed in the Central Coast, South Coast and North-western Slopes botanical subdivisions of NSW.	SNO: **Low -** 19 surveys in Jan-22; 9 in Mar-22; 32 in Nov-21 (20 person hrs). The species was not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys for the project. There are no previous records in the IBRA subregion, however this species is predicted to occur within the subregion.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Homoranthus darwinioides	Fairy Bells	V		V				Grows in in various woodland habitats with shrubby understoreys, usually in gravely sandy soils. Landforms the species has been recorded growing on include flat sunny ridge tops with scrubby woodland, sloping ridges, gentle south-facing slopes, and a slight depression on a roadside with loamy sand. Associated species include *Callitris endlicheri, Eucalyptus crebra, E. fibrosa, C. trachyphloia, E. beyeri* subsp. *illaquens, E. dwyeri, E. rossii, Leptospermum divaricatum, Melaleuca uncinata, Calytrix tetragona, Allocasuarina* sp. and *Micromyrtus* sp. Flowers in spring or from March to December. The species has been cultivated in Sydney from Rylstone cuttings and at Burrendong Arboretum near Wellington. Forms small shrubs or shrublets, often in tangled masses. It has a localised distribution and may be the dominant	INL: **Unlikely -** There are no associated PCTs mapped in the project footprint. Additionally, there are no previous records in the IBRA subregion, however this species is predicted to occur within the subregion. The survey effort is considered sufficient within this subregion of the project footprint.	Direct/indirect impacts to species as a result of the project are highly unlikely.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
								undershrub at some sites. Its abundance in populations ranges from rare (only one plant at site) to locally very abundant. Rare in the central tablelands and western slopes of NSW, occurring from Putty to the Dubbo district. It is found west of Muswellbrook between Merriwa and Bylong, and north of Muswellbrook to Goonoo SCA. The species has been collected from Lee's Pinch, but not relocated at its original locality north of Mt Coricudgy above the headwaters of Widden Brook.		
Indigofera efoliata	Leafless Indigo	E		E			INL: 3	Dies back to a substantial underground rootstock in unfavourable seasons and it is possible that aerial parts do not appear at all unless there is significant rainfall. Associated species include *Allocasuarina luehmannii, Exocarpos cupressiformis, Alectryon oleifolius, Geijera parviflora, Eucalyptus melliodora, Acacia deanei, Acacia buxifolia, Acacia hakeoides, Acacia spectabilis, Acacia lineata, Acacia oswaldii, Eremophila mitchellii, Myoporum platycarpum, Hakea leucoptera, Dodonaea viscosa, Apophyllum anomalum, Cassinia aculeata* and *Lissanthe strigosa*. Herbarium records indicate that Indigofera efoliata flowers from August to October and fruits from November to February. Recorded in Goonoo State Forest in *Eucalyptus crebra* and *Callitris glaucophylla* dry sclerophyll forest, and in *Eucalyptus microcarpa* and *Callitris glaucophylla* tall woodland. Herbarium records note the species as growing on slight rises amongst ironstone formation in stony red-brown sandy loam. Very rare and was presumed extinct having not being seen since 1963 until a discovery in 2021, known only from a few collections in the Dubbo area. Mr E.F. Biddiscombe was the only person alive to have seen *Indigofera efoliata* in the wild. In spring 2021 the species was rediscovered near Geurie. Known sites were located along the Dubbo to Minore railway line and road, on Wallaringa and Geurie properties and in Goonoo State Forest.	INL: **Unlikely -** There are no associated PCTs mapped in the project footprint. Additionally, there are only three previous records in the IBRA subregion, none of which occur within 20 km of the project footprint. the project footprint is approximately 200 km south of any known populations of the species.	Direct/indirect impacts to species as a result of the project are highly unlikely.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
Kunzea cambagei	Cambage Kunzea	V		V		BUN: 4	BUN: 4	Cambage Kunzea is restricted to damp, sandy soils in wet heath or mallee open scrub at higher altitudes on sandstone outcrops or Silurian group sediments. Flowering occurs between September and November. *Kunzea cambagei* mainly occurs in the western and southern parts of the Blue Mountains, NSW, mainly the Yerranderie/Mt Werong area, with four main populations with 20 to 150 individuals. Populations are also located west of Berrima, along the Wingecarribee River; Loombah Plateau east of Mount Werong; the Oberon-Colong Stock Route within Kanangra-Boyd National Park (NP); and Wanganderry Plateau within the Nattai NP.	BUN: **Moderate** - No targeted surveys have been undertaken for this species in the subregion. This species has not been incidentally identified during any other flora surveys for the project. There are four previous records in the IBRA subregion, all of which occur within 20 km of the project footprint.	Potential for impacts to species habitat.
Lepidium hyssopifolium	Aromatic Peppercress	E		E			CRO: 2 MUR: 1	In NSW the species was known to have occurred in both woodland with a grassy understorey and in grassland. The species may be a disturbance opportunist, as it was discovered at the most recently discovered site (near Bungendore) following soil disturbance. The cryptic and non-descript nature (appearing like several weed species) of the species makes it hard to detect. In NSW, there is a small population near Bathurst, one population at Bungendore, and one near Crookwell. The species was also recorded near Armidale in 1945 and 1958; however it is not known whether it remains in this area. A specimen collected in the Cooma area about 100 years ago may also be Aromatic Peppercress.	CRO: **Low -** 59 surveys in Dec-21 (19.7 person hrs). The species was not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys for the project. However, there are two previous records in the IBRA subregion, none of which occur within 20 km of the project footprint. MUR: **Low -** there is only one previous record in the IBRA subregion, and it does not occur within 20 km of the project footprint.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Leptospermum thompsonii	Monga Tea Tree	V		V			BUN: 17	Monga Tea-tree is found in swamps and drainage lines. It also invades road verges. Flowering occurs mainly in summer. It is killed by fire. Plants are fast-growing (reaching reproductive maturity within about 5 years). Establishment from seed was poor following a recent fire. The species is mostly found in Monga National Park near Braidwood. Two populations have also been recorded in Morton National Park to the north (near The Vines).	BUN: **Low -** 10 surveys in Jan-22; 24 in Feb-22; 1 in May-22; 5 Sep-21; 55 in Dec-21 (31.7 person hrs). The species was not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys for the project. There are 17	Direct/indirect impacts to species as a result of the project are highly unlikely.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
									previous records in the IBRA subregion, none of which occur within 20 km of the project footprint. The survey effort is considered sufficient to consider this species likelihood of occurrence as low within this subregion of the project footprint.	
Leucochrysum albicans var. *tricolor*	Hoary Sunray	-		E	CRO: 8 ¶ INL: 1 ¶MUR: 55	CRO: 43 INL: 2 MUR: 61	BUN: 68 CRO: 57 INL: 33 MUR: 120 SNO: 1	Occurs in a wide variety of grassland, woodland, and forest habitats, generally on relatively heavy soils. Can occur in modified habitats such as semi-urban areas and roadsides. Highly dependent on the presence of bare ground for germination. In some areas, disturbance is required for successful establishment.	BON: **Low -** 5 surveys in Nov-21 (1.7 person hours). No individuals were recorded, and no previous records within the broader IBRA subregion. BUN: **Low -** 10 surveys in Jan-22; 24 in Feb-22; 5 in Sep-21; 55 in Dec-21 (31.3 person hrs). No individuals were identified during surveys. There are 68 previous records within the broader IBRA subregion, however none occur within 20 km of the project footprint. CRO: **Known (recorded) -** 26 surveys in Jan-22; 88 in Feb-22; 7 in Mar-22; '10 in Sep-21; 59 in Dec-21 (63.3 person hrs). A total of 29,631 individuals were recorded across the Crookwell IBRA subregion portion of the project footprint. INL: **Low -** 7 surveys in Jan-22; 4 in Feb-22; 41 in Mar-22; 124 in Oct-21; 70 in Nov-21; 135 in Dec-21 (127 person hrs). No individuals were recorded. There are 33 previous records	Potential for impacts to species habitat.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
									within the broader IBRA subregion, however only one occurs within 5 km of the project footprint. The survey effort is considered sufficient to consider this species likelihood of occurrence as low within this subregion of the project footprint. MUR: **Known (recorded) -** 29 surveys in Feb-22; 3 in Mar-22; 64 in Sep-21; 38 in Oct-21; 87 in Nov-21; 150 in Dec-21 (123.7 person hrs). A total of 113,369 individuals were identified across the Murrumbateman IBRA subregion portion of the project footprint. SNO: **Low -** 19 surveys in January 2022, 9 in March 2022, and 32 in November 2021 (20 person hours). No individuals were recorded, and only one previous record occurs within the broader IBRA subregion. The record does not occur within 20 km of the project footprint.	
Persoonia marginata	Clandulla Geebung	V		V				Grows in dry sclerophyll forest and woodland communities on sandstone. Recorded flowering period varies and includes December and Winter. Fruit is probably dispersed by large birds such as Currawongs and large mammals such as kangaroos and possums. Reported fire response of adult plants varies with the species sometimes resprouting after fire and at other times killed by fire. Has a persistent soil stored seed bank. May initially respond favourably to disturbance,	INL: **Low -** 7 surveys in January 2022; 4 in February 2022, and 41 in March 2022 (17.3 person hrs). The species was not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys for the project. Given the species conspicuous nature	Direct/indirect impacts to species as a result of the project are highly unlikely.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
								with greater densities found along the edges of tracks and in areas disturbed by forestry activities. The Clandulla Geebung occurs between Kandos and Clarence in the western Blue Mountains. Populations are largely disjunct and include Clandulla, Ben Bullen and Sunny Corner State Forests; isolated populations have also been recorded from Turon and Gardens of Stone National Parks.	and the fact there are no previous records in the IBRA subregion, the species has a low likelihood of occurring in the project footprint.	
Phyllota humifusa	Dwarf Phyllota	V		V				The species occurs in dry sclerophyll forest, sometimes near swamps, in deep sandy soils or gravely loams over a sandstone substrate. Accompanying trees are often Brittle Gum *Eucalyptus mannifera*, Narrow-leafed Peppermint *E. radiata* or Sydney Peppermint *E. piperita*. Plants apparently resprout following fire. Dwarf Phyllota is known from the southern Blue Mountains (Bimlow Tableland), the Joadja area west of Mittagong and Penrose area near Paddys River.	BUN: **Low -** 10 surveys in Jan-22; 55 in Dec-21 (21.7 person hrs). The species was not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys for the project. Whilst this species is predicted to occur in Bungonia, there are no previous records in the subregion.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Plinthanthesis rodwayi	Budawangs Wallaby Grass	CE		V				Budawangs Wallaby-grass has been recorded in open heathland on shallow soils. The extent of the two populations has apparently contracted greatly in the past 25 years. The species appears be restricted to two peaks in Budawang NP (Mt Budawang, Mt Currockbilly).	BUN: **Low -** 10 surveys in Jan-22; 24 in Feb-22; 55 in Dec-21 (29.7 person hrs). The species not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys for the project. Whilst this species is predicted to occur in Bungonia, there are no previous records in the subregion, additionally, the known records are approximately 90 km south of the project footprint. Given this, the likelihood of occurrence for this species is low.	Direct/indirect impacts to species as a result of the project are highly unlikely.

Pomaderris brunnea	Brown Pomaderris	E		V			BUN: 4	Brown Pomaderris grows in moist woodland or forest on clay and alluvial soils of flood plains and creek lines. Flowers appear in September and October. The species is expected to live for 10 - 20 years, while the minimum time to produce seed is estimated to be 4 - 6 years. The species has been found in association with *Eucalyptus amplifolia, Angophora floribunda, Acacia parramattensis, Bursaria spinosa* and *Kunzea ambigua*. Brown Pomaderris is found in a very limited area around the Colo, Nepean and Hawkesbury Rivers, including the Bargo area and near Camden. It also occurs near Walcha on the New England tablelands and in far eastern Gippsland in Victoria.	BUN: **Unlikely -** There are no associated PCTs mapped in the project footprint. Additionally, there are only four previous records in the IBRA subregion, none of which occur within 20 km of the project footprint. The species Brown Pomaderris is associated with, have either not been recorded, or recorded in low abundance in the project footprint.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Pomaderris cotoneaster	Cotoneaster Pomaderris	E		E		BUN: 110	BON: 11 BUN: 161	Cotoneaster Pomaderris has been recorded in a range of habitats in predominantly forested country. The habitats include forest with deep, friable soil, amongst rock beside a creek, on rocky forested slopes and in steep gullies between sandstone cliffs. Little is known about the ecology of the species. It is probably killed by fire but plants have been observed to re-sprout from the stem following death of the crown from apparent drought. Populations tend to be isolated and range in size from a few individuals to many hundreds. Populations are not apparently influenced by local variations in habitat - it is not obvious why they are only growing where they are. Cotoneaster Pomaderris has a very disjunct distribution, being known from the Nungatta area, northern Kosciuszko National Park (near Tumut), the Tantawangalo area in South-East Forests National Park and adjoining freehold land, Badgery's Lookout near Tallong, Bungonia State Conservation Area, the Yerranderie area, Kanangra-Boyd National Park, the Canyonleigh area and Ettrema Gorge in Morton National Park. The species has also been recorded along the Genoa River in Victoria.	BON: **Low -** 5 surveys in Nov-21 (1.7 person hours). Was not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys for the project. There are 11 previous records in the IBRA subregion, none of which occur within 20 km of the project footprint. This species is geographically constrained to occurring south of the Northern Kosciusko National Park boundary in the subregion. BUN: **Moderate -** No targeted surveys have been undertaken for this species in the subregion. There are 161 previous records in the IBRA subregion, 110 of which occur within 20 km of the project footprint, however none occur within 5 km of the project	Potential for impacts to species habitat.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
									footprint. Given no threatened flora surveys have been undertaken for this species, and the proximity of previous records and the potential habitat present in the forested areas of the Bungonia Subregion, the likelihood of occurrence is considered moderate. INL: **Low -** 124 surveys in Oct-21; 70 in Nov-21 (64.7 person hrs). The species was not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys for the project. Whilst this species is predicted to occur within the subregion, there are no previous records in the IBRA subregion. The survey effort is considered sufficient to consider this species likelihood of occurrence as low within this subregion of the project footprint.	
Pomaderris delicata	Delicate Pomaderris	CE		CE			BUN: 121	At both known sites the Delicate Pomaderris grows in dry open forest dominated by *Eucalyptus sieberi* with a dense she-oak understorey. Soils are shallow and derived from sandstone and siltstone. Nothing is known about the response of the species to fire and other disturbance. Delicate Pomaderris is known from only two sites; between Goulburn and Bungonia and south of Windellama (Cullula).	BUN: **Low -** 10 surveys in Jan-22; 24 in Feb-22; 1 in May-22; 5 Sep-21; 55 in Dec-21 (31.7 person hrs). Was not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys for the project. There are 121 previous records in the IBRA subregion,	Direct/indirect impacts to species as a result of the project are highly unlikely.

								annual surveys suggest that the number of individuals emerging at the site may fluctuate seasonally, with counts ranging from about 20 to 80 in the flowering seasons of 2000 and 2003.	individuals were historically recorded by NSW Forestry Corporation in 2016 within the project footprint in the Snowy Mountains IBRA subregion. Review of BioNet data indicates 397 records are known within 10km of the project footprint.	
Prasophyllum innubum	Brandy Marys Leek-orchid	CE		CE	BON: 1 SNO: 2	BON: 1 SNO: 3	BON: 1 SNO: 7	The species is known only from a highly restricted streamside habitat and Sphagnum hummocks, and rarely on adjacent grassy flats, at altitudes of 1150-1180 m. In New South Wales, *Prasophyllum innubum* is known from a single population comprising about seven small colonies, totalling about 400 individuals, from a small area about 30 km north-west of Cabramurra and about 17 km south of Talbingo, in the Tumbarumba Local Government Area. The species occurs in Bago State Forest and apparently also on adjacent Crown forestry lease and private freehold. The species is not known to occur in any conservation reserves.	BON: **High –** Suitable habitat is present. Only one record in the broader IBRA subregion, however it occurs within 5 km of the project footprint. SNO: **High -** 9 surveys in Mar-22 (3 person hrs). The species was not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys for the project. There are seven previous records in the IBRA subregion, two of which occur within 5 km of the project footprint. Given the close proximity of previous records, the presence of potential habitat in the project footprint and the low number of surveys undertaken, the likelihood of occurrence is considered high.	Potential for impacts to species habitat.
Prasophyllum keltonii	Kelton's Leek Orchid	CE		CE	BON: 1 ¶SNO: 31	BON: 1 ¶SNO: 61	BON: 1 ¶SNO: 61	The species is known only from a highly restricted habitat on the treeless McPhersons Plain, an area that includes sub-alpine grassland, sphagnum bogs, and open heathland, at an elevation of 1,100 m. The species has a preference for grassland. The species apparently has a	BON: **High –** Suitable habitat is present. Only one record in the broader IBRA subregion, however it occurs within 5 km of the project footprint.	Potential for impacts to species habitat.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
								preference for moderately boggy ground, though not sphagnum-dominated areas, but also occurs on some drier patches. Kelton's Leek Orchid is known from a single population that occurs in a small area known as McPhersons Plain, about 30 km north-west of Cabramurra and about 17 km south of Talbingo, in the Tumbarumba Local Government Area. The known population, which is intermingled with the Bago Leek Orchid, is recorded as comprising approximately 400 plants, of which about 380 occur on the Brandy Marys State Forest Crown Leases, and about 20 on an adjacent private property. Surveys over six years up to 2005 have found no plants in the adjoining Bago State Forest. The species is not known to occur in any conservation reserves.	SNO: **High –** 19 surveys in Jan-22 (6.3 person hrs). 14 individuals were recorded adjacent to the project footprint within the Snowy Mountains IBRA subregion. 330 individuals have been historically recorded by the NSW Forestry Corporation (all during 2016) within the vicinity of the project footprint. Three of these historic records directly intersected the project footprint.	
Prasophyllum petilum	Tarengo Leek Orchid	E		E			INL: 26	Grows in open sites within Natural Temperate Grassland at the Boorowa and Delegate sites. Also grows in grassy woodland in association with River Tussock *Poa labillardieri*, Black Gum *Eucalyptus aggregata* and tea-trees *Leptospermum* spp. near Queanbeyan and within the grassy groundlayer dominated by Kangaroo Grass under Box-Gum Woodland at Ilford (and Hall, ACT). Apparently highly susceptible to grazing, being retained only at little-grazed travelling stock reserves (Boorowa & Delegate) and in cemeteries (near Queanbeyan, Ilford and Hall). Flowers in October at Boorowa and Ilford, and December at sites near Queanbeyan and Delegate. Population density at the Boorowa site is higher in the open grassland dominated by wallaby grasses *Austrodanthonia* spp., compared to that within the denser stands of Kangaroo Grass *Themeda triandra*. Highly colonial, with very large numbers present and very conspicuous at the Boorowa site, but cryptic at the Queanbeyan, Ilford and Delegate sites where low numbers are recorded. The population near Muswellbrook is also small. Flowers are followed by fleshy seed capsules in summer. Plants retreat into	INL: **Low -** 124 surveys in Oct-21; 70 in Nov-21; 135 in Dec-21 (109.7 person hrs). Was not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys for the project. There are 26 previous records in the IBRA subregion, none of which occur within 20 km of the project footprint. The survey effort is considered sufficient to consider this species likelihood of occurrence as low within this subregion of the project footprint. MUR: **Low -** 64 surveys in Sep-21; 38 in Oct-21; 87 in Nov-21; 150 in Dec-21 (113 person hrs). Was not identified during targeted surveys and the species has not been	Direct/indirect impacts to species as a result of the project are highly unlikely.

								subterranean tubers after fruiting, so are not visible above-ground outside of growing periods. Natural populations are known from a total of five sites in NSW. These are near Boorowa, Queanbeyan area, Ilford. Delegate and a newly recognised population 10 km west of Muswellbrook. It also occurs at Hall in the Australian Capital Territory. This species has also been recorded at Bowning Cemetery where it was experimentally introduced, though it is not known whether this population has persisted.	incidentally identified during any other flora surveys for the project. There are no previous records in the IBRA subregion, however this species is predicted to occur within the subregion. The survey effort is considered sufficient to consider this species likelihood of occurrence as low within this subregion of the project footprint.	
Prasophyllum retroflexum	Kiandra Leek Orchid	V		V			SNO: 12	The species occurs in subalpine grasslands and woodlands. Flowering has been recorded between October and December. Flowers are followed by a fleshy seed capsule. Plants retreat into subterranean tubers after fruiting, so are not visible above-ground. All populations are thought to occur within Kosciuszko National Park (in the Long Plain, Kiandra, Tantangara area).	SNO: **Unlikely -** The species is restricted to treeless vegetation above 1000 m in altitude in Kosciuszko National Park. There are 12 previous records in the IBRA subregion, none of which occur within 20 km of the project footprint.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Prasophyllum sp. *Wybong*	*Prasophyllum* sp. *Wybong*	-		CE				A perennial orchid, appearing as a single leaf over winter and spring. Flowers in spring and dies back to a dormant tuber over summer and autumn. Known to occur in open eucalypt woodland and grassland. Endemic to NSW, it is known from near Ilford, Premer, Muswellbrook, Wybong, Yeoval, Inverell, Tenterfield, Currabubula and the Pilliga area. Most populations are small, although the Wybong population contains by far the largest number of individuals.	INL: **Low -** 124 surveys in Oct-21 (41.3 person hrs). The species was not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys for the project. Whilst this species is predicted to occur within the subregion, there are no previous records in the IBRA subregion. The survey effort is considered sufficient to consider this species likelihood of occurrence as low within this subregion of the project footprint.	Direct/indirect impacts to species as a result of the project are highly unlikely.

Scientific name (Data source)	**Common name**	**NSW BC Act**	**NSW FM Act**	**EPBC Act**	**Records within 5km**	**Records within 20km**	**Records within IBRA Subregion**	**Habitat**	**Likelihood of occurrence (per IBRA subregion)***	**Likelihood to be impacted by the project**
Pterostylis oreophila	Blue-tongued Greenhood	CE		CE	BON: 1 ¶SNO: 3	BON: 1 SNO: 4	BON: 1 SNO: 8	Grows along sub-alpine watercourses under more open thickets of Mountain Tea-tree in muddy ground very close to water. Less commonly grows in peaty soils and sphagnum mounds. While more frequently found in low-light conditions it appears to also be able to tolerate full sun. In New South Wales, the Blue-tongued Greenhood is known from a few small populations within Kosciuszko National Park and a population of about 40 plants (possibly now extinct) in Bago State Forest and adjoining Crown Leases south of Tumut. The known distribution includes parts of the Snowy River, Tumbarumba and possibly Tumut Local Government Areas. The Blue-tongued Greenhood is also known from the Australian Capital Territory (Brindabella Range) and in montane areas of far north-eastern Victoria.	BON: **High –** Suitable habitat is present. Only one record in the broader IBRA subregion, however it occurs within 5 km of the project footprint. SNO: **High -** 19 surveys in Jan-22 (6.3 person hrs). Was not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys for the project. There are eight previous records in the IBRA subregion, four of which occur within 20 km of the project footprint, and three of which occur within 5 km of the project footprint. Given the low number of surveys undertaken, the likelihood of occurrence is considered high.	Potential for impacts to species habitat.
Pultenaea baeuerlenii	Budawangs Bush-pea	V		V			BUN: 10	Budawangs Bush-pea appears to prefer swampy heathland on sandstone. Flowering is mainly in spring but has been observed in summer and autumn. The species is known from a few sites in Morton and Budawang National Parks (Mt Currockbilly, Bhundoo Hill, Little Forest, Burrumbeet Brook and Corang Trig).	BUN: **Unlikely -** There are no associated PCTs mapped in the project footprint. Additionally, there are only 10 previous records in the IBRA subregion, none of which occur within 20 km of the project footprint. Given the conspicuous nature of the species, the survey effort is considered sufficient.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Ranunculus anemoneus	Anemone Buttercup	V		V			SNO: 2136	The Anemone Buttercup generally occurs in environments with late melting snow; on south to east facing, steep grassy slopes, or rocky crevices, or short alpine herb fields. The species has also been collected along watercourses, in grassland, heathland (below snow patches) and on roadside batters. Soils at Anemone	SNO: **Unlikely –** The species is restricted to areas above 1400 m altitude, the entire project footprint is below that altitude. Whilst there are 2,136 previous records in the IBRA subregion,	Direct/indirect impacts to species as a result of the project are highly unlikely.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
								Buttercup sites include loams (alpine humus soils), peats and decomposing granite. It is probably palatable to domestic stock and therefore grazing sensitive. Part of the reason for the susceptibility of Anemone Buttercup to grazing might be its early flowering. This is because species in the high country that flower soon after snow melt form their flower buds in the autumn before flowering; grazing of Anemone Buttercup flower buds in autumn could significantly impact on populations if plants are short-lived. The Anemone Buttercup occurs in a narrow band, only about 8km wide and 32km long, along the Great Dividing Range within Kosciuszko National Park (comprising the Main Range between Mt Kosciuszko and Mt Twynam; the Charlottes Pass resort; the Mt Perisher - Mt Blue Cow area; the Guthega - Mt Tate area; the Schlink Pass - Gungarten Pass area, the Rams Head Range and Upper parts of Thredbo, and Mt Jagungal).	none occur within 20 km of the project footprint.	
Rhizanthella slateri	Eastern Australian Underground Orchid	V		E				Habitat requirements are poorly understood, and no vegetation type has been associated with the species, although it is known to occur in sclerophyll forest. Highly cryptic given that it grows almost completely below the soil surface, with flowers being the only part of the plant that can occur above ground. Therefore, usually located only when the soil is disturbed. Flowers September to November. Occurs from south-east Queensland to south-east NSW. In NSW, currently known from fewer than 10 locations, including near Bulahdelah, the Watagan Mountains, the Blue Mountains, Wiseman's Ferry area, Agnes Banks and near Nowra.	BUN: **Unlikely -** There are no associated PCTs mapped in the project footprint. Additionally, there are no previous records in the IBRA subregion, however this species is predicted to occur within the subregion.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Rutidosis leiolepis	Monaro Golden Daisy	V		V			SNO: 51	Found in Natural Temperate Grassland on the Monaro. Occurs in sub-alpine grasslands in Kosciuszko National Park. Grows on basalt, granite and sedimentary substrates. Apparently highly susceptible to grazing, being retained in only a small number of populations on roadsides, un-grazed reserves and very lightly grazed pastures on private lands.	SNO: **Low -** 19 surveys in Jan-22; 9 in Mar-22; 32 in Nov-21 (20 person hrs). The species was not identified during targeted surveys and has not been incidentally identified during any other flora surveys	Direct/indirect impacts to species as a result of the project are highly unlikely.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
								The Monaro Golden Daisy is found in scattered populations on the Monaro, and in low subalpine plains of Kosciuszko National Park (eg. Long Plain and Happy Jacks Plain).	for the project. There are 51 previous records in the IBRA subregion, none of which occur within 20 km of the project footprint. Potential grassland habitat occurs in the IBRA subregion.	
Rytidosperma pumilum	Feldmark Grass	V		V			SNO: 71	Feldmark Grass is found only in the feldmark - the sparse low vegetation of the bare rocky alpine slopes and ridges, one of the harshest environments in Australia. There is little snow cover in winter because the prevailing westerly winds blow it off into lee snow patches. The absence of snow cover means that extremely low temperatures and strong winds are experienced for long periods during winter. Surface soil temperatures are high in summer and soil moisture levels are often limiting at that time. Judging from its habit and habitat, distribution and preferred habitat, this species presumably resprouts following disturbance, is remarkably tolerant of low temperature and has a limited capacity for dispersal of seeds to other areas of similar habitat nearby. Felmark Grass is limited to a tiny area - about 3 ha - of the Main Range of Kosciuszko National Park between Mt Northcote and Mt Lee. This species also occurs in alpine parts of New Zealand.	SNO: **Unlikely -** There are no associated PCTs mapped in the project footprint. Additionally, there are 71 previous records in the IBRA subregion, however none occur within 20 km of the project footprint. The known habitat for the species (sparse low vegetation of the bare rocky alpine slopes and ridges) is not found within the project footprint.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Senecio macrocarpus	Large-fruit Fireweed			V			MUR:4	The Large-fruit Groundsel is a small perennial plant endemic to south-eastern Australia, where it occurs in South Australia and Victoria, and formerly occurred in Tasmania. There are about 15 populations containing about 36,000 plants, although almost all plants (about 35,000) occur in just one population. This species is associated with Goulburn Tableland Box-Gum Grassy Forest and Southern Tableland Grassy Box Woodland.	MUR: **Unlikely** - There are no associated PCTs mapped in the project footprint. Additionally, there are only four records within the IBRA subregion, none of which occur within 20 km of the project footprint.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Swainsona recta	Small Purple-pea	E		E		INL: 2	INL: 734 MUR: 4	Before European settlement Small Purple-pea occurred in the grassy understorey of woodlands and open-forests dominated by Blakely's Red Gum *Eucalyptus blakelyi*, Yellow Box *E. melliodora*, Candlebark Gum *E. rubida* and Long-leaf Box *E. goniocalyx*. Grows in association with	INL: **Low -** 124 surveys in Oct-21; 70 in Nov-21 (64.7 person hrs). The species was not identified during targeted surveys and the species has not	Direct/indirect impacts to species as a result of the

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
								understorey dominants that include Kangaroo Grass *Themeda triandra*, poa tussocks *Poa* spp. and spear-grasses *Austrostipa* spp. Plants die back in summer, surviving as a rootstocks until they shoot again in autumn. Flowers throughout spring, with a peak in October. Seeds ripen at the end of the year. Individual plants have been known to live for up to 20 years. Generally tolerant of fire, which also enhances germination by breaking the seed coat and reduces competition from other species. Small Purple-pea was recorded historically from places such as Carcoar, Culcairn and Wagga Wagga where it is probably now extinct. Populations still exist in the Queanbeyan and Wellington-Mudgee areas. Over 80% of the southern population grows on a railway easement.	been incidentally identified during any other flora surveys for the project. There are 734 previous records in the IBRA subregion, two of which occur within 20 km of the project footprint, however none occur within 5 km of the project footprint. The survey effort is considered sufficient to consider this species likelihood of occurrence as low. MUR: **Low -** 64 surveys in Sep-21; 38 in Oct-21; 87 in Nov-21 (63 person hrs). The species was not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys for the project. There are four previous records in the IBRA subregion, none of which occur within 20 km of the project footprint. The survey effort is considered sufficient to consider this species likelihood of occurrence as low.	project are highly unlikely.
Thesium australe	Austral Toadflax	V		V		BON: 8 SNO: 11	BON: 9 SNO: 17	Occurs in grassland on coastal headlands or grassland and grassy woodland away from the coast. Often found in association with Kangaroo Grass (*Themeda australis*). A root parasite that takes water and some nutrient from other plants, especially Kangaroo Grass. Austral Toad-flax is found in very small populations scattered across eastern NSW, along the coast, and from the Northern to Southern Tablelands. It is also found in Tasmania and Queensland and in eastern Asia. Although originally described from material collected in the SW	BON: **Low -** 5 surveys in Nov-21 (1.7 person hours). The species was not identified during targeted surveys and has not been incidentally identified during any other flora surveys for the project. There are nine previous records in the IBRA subregion, eight of which occur within 5 km of the project	Potential for impacts to species habitat.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
								Sydney area, populations have not been seen in a long time. It may persist in some areas in the broader region.	footprint. However, there are no associated PCTs within the Bondo IBRA region, therefore the likelihood of occurrence is low. BUN: **Low -** 10 surveys in Jan-22; 24 in Feb-22; 55 in Dec-21 (29.7 person hrs). The species was not identified during targeted surveys and has not been incidentally identified during any other flora surveys for the project. There are no previous records in the IBRA subregion, however this species is predicted to occur within the subregion. CRO: **Low -** 26 surveys in Jan-22; 88 in Feb-22; 59 in Dec-21 (57.7 person hrs). The species was not identified during targeted surveys and has not been incidentally identified during any other flora surveys for the project. Whilst the species is predicted to occur in Crookwell, there are no previous records in the IBRA subregion. The survey effort is considered sufficient to consider this species likelihood of occurrence as low. MUR: **Low -** 29 surveys in Feb-22; 87 in Nov-21; 150 in Dec-21 (88.7 person hrs). The species was not identified during targeted surveys and has not been incidentally identified	

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
									during any other flora surveys for the project. Whilst the species is predicted to occur in Murrumbateman, there are no previous records in the IBRA subregion. The survey effort is considered sufficient to consider this species likelihood of occurrence as low. SNO: **Moderate -** 19 surveys in Jan-22; 32 in Nov-21 (17 person hrs). The species was not identified during targeted surveys and has not been incidentally identified during any other flora surveys for the project. There are 17 previous records in the IBRA subregion, 11 of which occur within 20 km of the project footprint, however none occur within 5 km of the project footprint. Given the low number of surveys undertaken, and the cryptic nature of the species, the likelihood of occurrence is considered moderate.	
Tylophora linearis	-	V		E			INL: 25	Grows in dry scrub and open forest. Recorded from low-altitude sedimentary flats in dry woodlands of *Eucalyptus fibrosa*, *Eucalyptus sideroxylon*, *Eucalyptus albens, Callitris endlicheri, Callitris glaucophylla* and *Allocasuarina luehmannii*. Also grows in association with *Acacia hakeoides*, *Acacia lineata, Melaleuca uncinata, Myoporum* species and *Casuarina* species. Flowers in spring, with flowers recorded in November or May and is suspected to be related to rainfall, with fruiting probably 2 to 3 months later. Altitudes are generally in the range of 300 - 400 m a.s.l.	INL: **Low -** 7 surveys in Jan-22; 4 in Feb-22; 41 in Mar-22; 11 in May-22; 124 in Oct-21; 70 in Nov-21; 135 in Dec-21 (130.7 person hrs). The species was not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys for the project. There are 25 previous records in the IBRA	Direct/indirect impacts to species as a result of the project are highly unlikely.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
								Occurs from southern Queensland into central NSW, as far south near Temora with the majority of records occurring in the central western region. Records from Goonoo, Pillaga West, Pillaga East, Bibblewindi, Cumbil, and Eura State Forests, Coolbaggie NR, Goobang NP and Beni SCA. Also has been recorded in Hiawatha State Forest near West Wyalong in the south and there are old records as far north as Crow Mountain near Barraba and near Glenmorgan in the western Darling Downs.	subregion, none of which occur within 20 km of the project footprint. The survey effort is considered sufficient to consider this species likelihood of occurrence as low within this subregion of the project footprint.	
Xerochrysum palustre	Swamp Everlasting	-		V			SNO: 5	*Xerochrysum palustre* has been recorded in Kosciuszko National Park and the eastern escarpment south of Badja. The species grows in swamps and bogs which are often dominated by heaths. It also grows at the edges of bog margins on peaty soils with a cover of shrubs or grasses and sometimes grows in bogs with Sphagnum.	SNO: **Known (recorded)** - 19 surveys in Jan-22; 9 in Mar-22; 32 in Nov-21 (20 person hrs) and 7.93 km of random meander in Feb-21 (ELA). Six individuals were identified in the Snowy Mountains IBRA subregion portion of the project footprint outside of the indicative disturbance footprint.	Potential for impacts to species habitat.
Zieria obcordata	Granite Zieria	E		E			INL: 26	Grows in eucalypt woodland or shrubland dominated by species of Acacia on rocky hillsides. Also occurs in *Eucalyptus* and *Callitris* dominated woodland with an open, low shrub understorey, on moderately steep, mainly west to north-facing slopes in sandy loam amongst granite boulders. The altitude range of sites is 500 to 830 metres. Associated vegetation includes *Eucalyptus blakelyi, Brachychiton populneus* and *Acacia implexa* woodland with pockets of low shrub understorey. Also in *E. goniocalyx, E. blakelyi, E. macrorhyncha*, *A. doratoxylon, A. vestita* and *Callitris glaucophylla* woodland with a shrubby understorey. Understorey species include *Pandorea pandorana, Isotoma axillaris, Westringia eremicola, Leucopogon attenuatus, Dillwynia sericea, Olearia ramulosa, Stypandra glauca, Stellaria pungens, Acacia vestita, Melichrus urceolatus, Cryptandra amara, Lepidosperma, Styphelia, Kunzea, Haloragis* and *Cheilanthes* species.	INL: **Low -** 124 surveys in Oct-21 (41.3 person hrs). The species was not identified during targeted surveys and the species has not been incidentally identified during any other flora surveys for the project. There are 26 previous records in the Inland Slopes IBRA subregion, however, all of these occur over 100 km north near Bathurst. Given the project footprint's distance from known records, the survey effort is considered sufficient to consider this species likelihood of occurrence as low.	Direct/indirect impacts to species as a result of the project are highly unlikely.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
								Main flowering period is in spring (September-October), but plants tend to have flowers present throughout the year. In wild populations, plants tend to grow in crevices between granite boulders, often in lines running downslope. The species has proved to be very difficult to cultivate. Best growth has been achieved with plants in a very sandy well-drained soil. Wild plants have strongly aromatic leaves. *Zieria obcordata* is extremely sensitive to grazing and browsing disturbances by domestic stock and native herbivores. Heavily browsed plants and vigorous regrowth (following severe browsing by wallabies) have been recorded at sites. Plants are tolerant of prolonged moderate drought conditions but highly susceptible to extreme summer heatwaves that occur over more than five consecutive days. Mass regeneration events can occur after above-average rainfall seasons, otherwise very low levels of recruitment occur each year. Plants known to first flower at 10cm high. Occurs at two sites with a geographic range of 105 km. These are in the Wuuluman area near Wellington, comprising of a single subpopulation over 3 sites comprising up to 200 plants and Crackerjack Rock/Rock Forests area NW of Bathurst, with a subpopulation comprising of 14 sites, totalling to approximately 700 adult plants after good seasons.		

*INL – Inland Slopes IBRA sub-region; BUN – Bungonia IBRA sub-region; MUR – Murrumbateman IBRA sub-region; SNO – Snowy Mountains IBRA sub-region; CRO – Crookwell IBRA sub-region; BON – Bondo IBRA sub-region

Acknowledgements

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the Administrative Guidelines on Significance.

World Heritage Properties:	None
National Heritage Places:	2
Wetlands of International Importance (Ramsar	7
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	None
Listed Threatened Ecological Communities:	6
Listed Threatened Species:	89
Listed Migratory Species:	13

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at http://www.environment.gov.au/heritage

A permit may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	304
Commonwealth Heritage Places:	2
Listed Marine Species:	20
Whales and Other Cetaceans:	None
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	None
Habitat Critical to the Survival of Marine Turtles:	None

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	22
Regional Forest Agreements:	1
Nationally Important Wetlands:	2
EPBC Act Referrals:	32
Key Ecological Features (Marine):	None
Biologically Important Areas:	None
Bioregional Assessments:	1
Geological and Bioregional Assessments:	None

Listed Threatened Ecological Communities			[Resource Information]

For threatened ecological communities where the distribution is well known, maps are derived from recovery plans, State vegetation maps, remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.
Status of Vulnerable, Disallowed and Ineligible are not MNES under the EPBC Act.

Community Name	Threatened Category	Presence Text	Buffer Status
Alpine Sphagnum Bogs and Associated Fens	Endangered	Community known to occur within area	In feature area

Community Name	Threatened Category	Presence Text	Buffer Status

MAMMAL			
Chalinolobus dwyeri			
Large-eared Pied Bat, Large Pied Bat [183]	Vulnerable	Species or species habitat known to occur within area	In feature area
Dasyurus maculatus maculatus (SE mainland population)			
Spot-tailed Quoll, Spotted-tail Quoll, Tiger Quoll (southeastern mainland population) [75184]	Endangered	Species or species habitat known to occur within area	In feature area
Mastacomys fuscus mordicus			
Broad-toothed Rat (mainland), Tooarrana [87617]	Vulnerable	Species or species habitat known to occur within area	In feature area
Nyctophilus corbeni			
Corben's Long-eared Bat, South-eastern Long-eared Bat [83395]	Vulnerable	Species or species habitat may occur within area	In feature area
Petauroides volans			
Greater Glider [254]	Vulnerable	Species or species habitat known to occur within area	In feature area
Petaurus australis australis			
Yellow-bellied Glider (south-eastern) [87600]	Vulnerable	Species or species habitat known to occur within area	In feature area
Petrogale penicillata			
Brush-tailed Rock-wallaby [225]	Vulnerable	Species or species habitat known to occur within area	In feature area
Phascolarctos cinereus (combined populations of Qld, NSW and the ACT)			
Koala (combined populations of Queensland, New South Wales and the Australian Capital Territory) [85104]	Endangered	Species or species habitat known to occur within area	In feature area
Pseudomys fumeus			
Smoky Mouse, Konoom [88]	Endangered	Species or species habitat known to occur within area	In feature area
Pseudomys novaehollandiae			
New Holland Mouse, Pookila [96]	Vulnerable	Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
[Pteropus poliocephalus](#) Grey-headed Flying-fox [186]	Vulnerable	Roosting known to occur within area	In feature area
PLANT			
[Acacia bynoeana](#) Bynoe's Wattle, Tiny Wattle [8575]	Vulnerable	Species or species habitat known to occur within area	In feature area
[Ammobium craspedioides](#) Yass Daisy [20758]	Vulnerable	Species or species habitat known to occur within area	In feature area
[Amphibromus fluitans](#) River Swamp Wallaby-grass, Floating Swamp Wallaby-grass [19215]	Vulnerable	Species or species habitat likely to occur within area	In feature area
[Austrostipa wakoolica](#) [66623]	Endangered	Species or species habitat may occur within area	In buffer area only
[Brachyscome muelleroides](#) Mueller Daisy [15572]	Vulnerable	Species or species habitat may occur within area	In buffer area only
[Caladenia arenaria](#) Sand-hill Spider-orchid [9275]	Endangered	Species or species habitat may occur within area	In feature area
[Caladenia concolor](#) Crimson Spider-orchid, Maroon Spider-orchid [5505]	Vulnerable	Species or species habitat likely to occur within area	In feature area
[Caladenia tessellata](#) Thick-lipped Spider-orchid, Daddy Long-legs [2119]	Vulnerable	Species or species habitat may occur within area	In buffer area only
[Calotis glandulosa](#) Mauve Burr-daisy [7842]	Vulnerable	Species or species habitat may occur within area	In feature area
[Colobanthus curtisiae](#) Curtis' Colobanth [23961]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Commersonia prostrata Dwarf Kerrawang [87152]	Endangered	Species or species habitat likely to occur within area	In buffer area only
Cynanchum elegans White-flowered Wax Plant [12533]	Endangered	Species or species habitat may occur within area	In buffer area only
Diuris aequalis Buttercup Doubletail [21588]	Endangered	Species or species habitat known to occur within area	In feature area
Diuris ochroma Pale Golden Moths [64565]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Dodonaea procumbens Trailing Hop-bush [12149]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Eucalyptus aggregata Black Gum [20890]	Vulnerable	Species or species habitat known to occur within area	In feature area
Eucalyptus macarthurii Camden Woollybutt, Paddys River Box [7827]	Endangered	Species or species habitat likely to occur within area	In buffer area only
Genoplesium baueri Yellow Gnat-orchid, Bauer's Midge Orchid, Brittle Midge Orchid [7528]	Endangered	Species or species habitat may occur within area	In buffer area only
Genoplesium vernale East Lynne Midge-orchid [68379]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Glycine latrobeana Clover Glycine, Purple Clover [13910]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Grevillea iaspicula Wee Jasper Grevillea [22024]	Endangered	Species or species habitat known to occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Grevillea raybrownii [65665]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Grevillea wilkinsonii Tumut Grevillea [56396]	Critically Endangered	Species or species habitat known to occur within area	In feature area
Hakea dohertyi a shrub [66701]	Endangered	Species or species habitat may occur within area	In buffer area only
Helichrysum calvertianum [5702]	Vulnerable	Species or species habitat may occur within area	In buffer area only
Kunzea cambagei [11420]	Vulnerable	Species or species habitat known to occur within area	In feature area
Lepidium aschersonii Spiny Pepper-cress [10976]	Vulnerable	Species or species habitat may occur within area	In feature area
Lepidium hyssopifolium Basalt Pepper-cress, Peppercress, Rubble Pepper-cress, Pepperweed [16542]	Endangered	Species or species habitat likely to occur within area	In feature area
Lepidium monoplocoides Winged Pepper-cress [9190]	Endangered	Species or species habitat may occur within area	In buffer area only
Leucochrysum albicans subsp. tricolor Hoary Sunray, Grassland Paper-daisy [89104]	Endangered	Species or species habitat known to occur within area	In feature area
Persoonia mollis subsp. revoluta [56094]	Vulnerable	Species or species habitat known to occur within area	In buffer area only
Phyllota humifusa Dwarf Phyllota [10133]	Vulnerable	Species or species habitat may occur within area	In buffer area only

Scientific Name	Threatened Category	Presence Text	Buffer Status
Pimelea bracteata [8125]	Critically Endangered	Species or species habitat known to occur within area	In feature area
Pomaderris brunnea Rufous Pomaderris, Brown Pomaderris [16845]	Vulnerable	Species or species habitat likely to occur within area	In buffer area only
Pomaderris cotoneaster Cotoneaster Pomaderris [2043]	Endangered	Species or species habitat known to occur within area	In feature area
Pomaderris pallida Pale Pomaderris [13684]	Vulnerable	Species or species habitat likely to occur within area	In feature area
Prasophyllum bagoense Bago Leek-orchid [84276]	Critically Endangered	Species or species habitat known to occur within area	In feature area
Prasophyllum innubum Brandy Marys Leek-orchid [83603]	Critically Endangered	Species or species habitat known to occur within area	In feature area
Prasophyllum keltonii Kelton's Leek-orchid [83604]	Critically Endangered	Species or species habitat known to occur within area	In feature area
Prasophyllum petilum Tarengo Leek Orchid [55144]	Endangered	Translocated population known to occur within area	In feature area
Pterostylis oreophila Blue-tongued Orchid, Kiandra Greenhood [22903]	Critically Endangered	Species or species habitat known to occur within area	In feature area
Rhizanthella slateri Eastern Underground Orchid [11768]	Endangered	Species or species habitat may occur within area	In feature area
Rutidosis leptorhynchoides Button Wrinklewort [67251]	Endangered	Species or species habitat may occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
Senecio macrocarpus Large-fruit Fireweed, Large-fruit Groundsel [16333]	Vulnerable	Species or species habitat may occur within area	In feature area
Swainsona recta Small Purple-pea, Mountain Swainson-pea, Small Purple Pea [7580]	Endangered	Species or species habitat may occur within area	In feature area
Thelymitra kangaloonica Kangaloon Sun Orchid [81861]	Critically Endangered	Species or species habitat may occur within area	In buffer area only
Thesium australe Austral Toadflax, Toadflax [15202]	Vulnerable	Species or species habitat known to occur within area	In feature area
Xerochrysum palustre Swamp Everlasting, Swamp Paper Daisy [76215]	Vulnerable	Species or species habitat may occur within area	In buffer area only
REPTILE			
Aprasia parapulchella Pink-tailed Worm-lizard, Pink-tailed Legless Lizard [1665]	Vulnerable	Species or species habitat known to occur within area	In feature area
Delma impar Striped Legless Lizard, Striped Snake-lizard [1649]	Vulnerable	Species or species habitat known to occur within area	In feature area

Listed Migratory Species		[Resource Information]
Scientific Name	Threatened Category	Presence Text	Buffer Status
Migratory Marine Birds			
Apus pacificus Fork-tailed Swift [678]		Species or species habitat likely to occur within area	In feature area
Migratory Terrestrial Species			
Hirundapus caudacutus White-throated Needletail [682]	Vulnerable	Species or species habitat known to occur within area	In feature area
Monarcha melanopsis Black-faced Monarch [609]		Species or species habitat known to occur within area	In feature area

Scientific Name	Threatened Category	Presence Text	Buffer Status
[Motacilla flava](#) Yellow Wagtail [644]		Species or species habitat may occur within area	In feature area
[Myiagra cyanoleuca](#) Satin Flycatcher [612]		Breeding known to occur within area	In feature area
[Rhipidura rufifrons](#) Rufous Fantail [592]		Species or species habitat known to occur within area	In feature area
Migratory Wetlands Species			
[Actitis hypoleucos](#) Common Sandpiper [59309]		Species or species habitat may occur within area	In feature area
[Calidris acuminata](#) Sharp-tailed Sandpiper [874]		Species or species habitat known to occur within area	In feature area
[Calidris ferruginea](#) Curlew Sandpiper [856]	Critically Endangered	Species or species habitat likely to occur within area	In feature area
[Calidris melanotos](#) Pectoral Sandpiper [858]		Species or species habitat may occur within area	In feature area
[Gallinago hardwickii](#) Latham's Snipe, Japanese Snipe [863]		Species or species habitat known to occur within area	In feature area
[Numenius madagascariensis](#) Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat may occur within area	In feature area
[Pandion haliaetus](#) Osprey [952]		Species or species habitat likely to occur within area	In buffer area only

Other Matters Protected by the EPBC Act

Commonwealth Lands [Resource Information]

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Commonwealth Land Name	State	Buffer Status
Commonwealth Bank of Australia		
Commonwealth Land - Commonwealth Bank of Australia [14796]	NSW	In buffer area only
Commonwealth Land - Commonwealth Bank of Australia [14932]	NSW	In buffer area only
Commonwealth Land - Commonwealth Bank of Australia [14772]	NSW	In buffer area only
Commonwealth Land - Commonwealth Bank of Australia [14775]	NSW	In buffer area only

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

Acknowledgements

This database has been compiled from a range of data sources. The department acknowledges the following custodians who have contributed valuable data and advice:

Attachment 18. Matters of National Environmental Significance

1. Introduction

1.1 Background

This attachment is intended to address requirement 15 of the Supplementary SEARs, as follows:

15. The EIS must identify each EPBC Act listed threatened species and community and migratory species likely to be impacted by the action. For any species and communities that are likely to be impacted, the proponent must provide a description of the nature, quantum, and consequences of the impacts. For species and communities potentially located in the project footprint or in the vicinity that are not likely to be impacted, provide evidence why they are not likely to be impacted.

Matters of National Environmental Significance (MNES) relevant to the project are outlined in Section 1.2 of this attachment and include threatened species and communities and migratory species:

- recorded within the project footprint during field surveys
- identified as having a moderate or higher potential to occur in the project footprint based on the presence of habitat, or a transient species identified as a potential collision risk (Attachment 16)
- were EPBC Act listed species specifically noted in the SEARs.

A significant impact assessment (SIA) has been undertaken for each MNES in accordance with the *Matters of National Environmental Significance Significant Impact Guidelines 1.1* (Significant Impact Guidelines) (DoE, 2013). Key terms used throughout this attachment are defined in Table A18- 1 in accordance with the Significant Impact Guidelines.

The outcomes of each assessment are summarised in the following section below and detailed in the pages that follow.

Table A18- 1: Key terms used as a part of the assessment

Term	Definition from Significant Impact Guidelines
Significant impact	An impact which is important, notable, or of consequence, having regard to its context or intensity. Whether or not an action is likely to have a significant impact depends upon the sensitivity, value, and quality of the environment that is affected, and upon the intensity, duration, magnitude and geographic extent of the impacts. To be likely, it is not necessary for a significant impact to have a greater than 50 per cent chance of happening; it is sufficient if a significant impact on the environment is a real or not remote chance or possibility. If there is scientific uncertainty about the impacts of an action and potential impacts are serious or irreversible, the precautionary principle is applicable.
Population of a species	A '*population of a species*' is defined under the EPBC Act as an occurrence of the species in a particular area. In relation to critically endangered, endangered or vulnerable threatened species, occurrences include but are not limited to: • a geographically distinct regional population, or collection of local populations, or • a population, or collection of local populations, that occurs within a particular bioregion.

Term	Definition from Significant Impact Guidelines
Important population	An '*important population*' is defined by the Significant Impact Guidelines as "a population that is necessary for a species' long-term survival and recovery". This may include populations identified as such in recovery plans, and/or that are: • key source populations either for breeding or dispersal • populations that are necessary for maintaining genetic diversity, and/or • populations that are near the limit of the species range."
Habitat critical to the survival of a species or ecological community	'*Habitat critical to the survival of a species or ecological community*' refers to areas that are necessary: • for activities such as foraging, breeding, roosting, or dispersal • for the long-term maintenance of the species or ecological community (including the maintenance of species essential to the survival of the species or ecological community, such as pollinators) • to maintain genetic diversity and long-term evolutionary development, or • for the reintroduction of populations or recovery of the species or ecological community. Such habitat may be, but is not limited to: • habitat identified in a recovery plan for the species or ecological community as habitat critical for that species or ecological community; and/or • habitat listed on the Register of Critical Habitat maintained by the Minister under the EPBC Act. Critical habitat can be further explained as an identified area of viable habitat that contains habitat attributes that are essential for the conservation of a threatened species. These areas are typically under a regime of special protection and management to ensure the critical habitat remains a stronghold for the species to ensure its long-term survival and viability in the wild. Critical habitat may also include an area of land not currently occupied by the species but can act as a sanctuary by possessing the necessary whole of life cycle habitat attributes to facilitate the recovery of a declining population of the species.
Important habitat for migratory species	An area of '*important habitat'* for a migratory species is: • habitat utilised by a migratory species occasionally or periodically within a region that supports an ecologically significant proportion of the population of the species, and/or • habitat that is of critical importance to the species at particular life-cycle stages, and/or • habitat utilised by a migratory species which is at the limit of the species range, and/or • habitat within an area where the species is declining.
Ecologically significant proportion (migratory species)	Listed migratory species cover a broad range of species with different life cycles and population sizes. Therefore, what is an 'ecologically significant proportion' of the population varies with the species (each circumstance will need to be evaluated). Some factors that should be considered include the species' population status, genetic distinctiveness, and species-specific behavioural patterns (for example, site fidelity and dispersal rates).

Term	Definition from Significant Impact Guidelines
Population of a migratory species	'*Population*', in relation to migratory species, means the entire population or any geographically separate part of the population of any species or lower taxon of wild animals, a significant proportion of whose members cyclically and predictably cross one or more national jurisdictional boundaries including Australia.
Invasive species	An *'invasive species'* is an introduced species, including an introduced (translocated) native species, which out-competes native species for space and resources, or which is a predator of native species. Introducing an invasive species into an area may result in that species becoming established. An invasive species may harm listed threatened species or ecological communities by direct competition, modification of habitat or predation.

1.2 Relevant Matters of National Environmental Significant

Table A18- 2 provides a summary of the outcome of the Significant Impact Assessment for each of the MNES identified relevant to the project.

Table A18- 2: Significant impact assessment outcomes for relevant MNES

MNES	Likelihood of occurrence	Significant impact
Threatened Ecological Communities (TEC)		
Box Gum Woodland	Known	Likely significant impact
Alpine Sphagnum Bogs and Associated Fens	Known	Potential significant impact (precautionary)
Flora		
Bynoe's Wattle (*Acacia bynoeana*)	Likely	Potential significant impact (precautionary)
Yass Daisy (*Ammobium craspedioides*)	Known	Potential significant impact
Black Gum (*Eucalyptus aggregata*)	Likely	Significant impact unlikely
Cambage Kunzea *(Kunzea cambagei)*	Likely	Potential significant impact (precautionary)
Hoary Sunray (*Leucochrysum albicans* var. *tricolor*)	Known	Potential significant impact
Cotoneaster Pomaderris *(Pomaderris cotoneaster)*	Likely	Potential significant impact (precautionary)
Bago Leek-orchid (*Prasophyllum bagoense*)	Known	Potential significant impact
Brandy Mary's Leek-orchid (*Prasophyllum innubum*)	Likely	Significant impact unlikely
Kelton's Leek Orchid *(Prasophyllum keltonii)*	Likely	Potential significant impact
Blue-tongued Greenhood *(Pterostylis oreophila)*	Likely	Potential significant impact (precautionary)
Austral Toadflax *(Thesium australe*)	Likely	Potential significant impact (precautionary)
Swamp Everlasting *(Xerochrysum palustre)*	Known	Potential significant impact (precautionary)
Fauna		
Sloane's Froglet (*Crinia sloanei*)	Likely	Significant impact unlikely

MNES	Likelihood of occurrence	Significant impact
Booroolong Frog (*Litoria booroolongensis*)	Likely	Significant impact unlikely
Yellow-spotted Tree Frog (*Litoria castanea*)	Likely	Significant impact unlikely
Regent Honeyeater (*Anthochaera phrygia*)	Likely	Potential significant impact (precautionary)
Gang-gang Cockatoo (*Callocephalon fimbriatum*)	Known	Likely significant impact
Glossy Black-Cockatoo (*Calyptorhynchus lathami*)	Known	Potential significant impact
Painted Honeyeater (*Grantiella picta*)	Likely	Potential significant impact
Swift Parrot (*Lathamus discolor)*	Likely	Potential significant impact
Superb Parrot (*Polytelis swainsonii*)	Known	Potential significant impact
Pilotbird (*Pycnoptilus floccosus*)	Likely	Potential significant impact (precautionary)
Golden Sun Moth (*Synemon plana*)	Likely	Potential significant impact
Bogong Moth (*Agrotis infusa*)	SEARs	N/A (not a listed threatened species)
Key's Matchstick Grasshopper (*Keyacris scurra)*	Likely	Potential significant impact
Large-eared Pied Bat (*Chalinolobus dwyeri*)	Likely	Significant impact unlikely
Spotted-tailed Quoll (*Dasyurus maculatus*)	Likely	Potential significant impact
Broad-toothed Rat (*Mastacomys fuscus*)	Likely	Significant impact unlikely
Greater Glider (*Petauroides volans*)	Known	Potential significant impact
Yellow-bellied Glider (*Petaurus australis*)	Known	Potential significant impact
Koala (*Phascolarctos cinereus*)	Likely	Likely significant impact
Smoky Mouse (*Pseudomys fumeus*)	Likely	Significant impact unlikely
Grey-headed Flying-fox (*Pteropus poliocephalus*)	Likely	Potential significant impact (foraging habitats only)
Pink-tailed Legless Lizard (*Aprasia parapulchella*)	Known	Likely significant impact
Striped Legless Lizard (*Delma impar*)	Likely	Potential significant impact
Aquatic		
Flatheaded Galaxias (*Galaxias rostratus*)	Potential	Significant impact unlikely
Southern Pygmy Perch (*Nannoperca australis*)	Potential	Significant impact unlikely
Macquarie Perch (*Macquaria australasica*)	Potential	Significant impact unlikely
Trout Cod (*Maccullochella macquariensis*)	Potential	Significant impact unlikely
Silver Perch (*Bidyanus bidyanus*)	Potential	Significant impact unlikely
Migratory species		
Fork-tailed Swift (*Apus pacificus*)	Known	Potential significant impact (precautionary)
Sharp-tailed Sandpiper (*Calidris acuminata*)	Likely	Potential significant impact

MNES	Likelihood of occurrence	Significant impact
Red-necked Stint (*Calidris ruficollis*)	Likely	Potential significant impact
Latham's Snipe (*Gallinago hardwickii*)	Likely	Potential significant impact
White-throated Needletail (*Hirundapus caudacutus*)	Likely, From Appendix A of Supplementary SEARs	Significant impact unlikely
Black-faced Monarch (*Monarcha melanopsis*)	From Appendix A of Supplementary SEARs	Significant impact unlikely
Satin Flycatcher (*Myiagra cyanoleuca*)	Known, From Appendix A of Supplementary SEARs	Significant impact unlikely
Rufous Fantail (*Rhipidura rufifrons*)	Known, From Appendix A of Supplementary SEARs	Significant impact unlikely
Common Greenshank (*Tringa nebularia*)	Likely	Potential significant impact
Marsh Sandpiper (*Tringa stagnatilis*)	Likely	Potential significant impact

2. Significant impact assessments for relevant MNES

2.1 Threatened ecological communities

2.1.1 White Box-Yellow Box-Blakely's Red Gum Grassy Woodland and Derived Native Grassland

White Box Yellow Box Blakely's Red Gum Woodland (Box Gum Woodland) ecological community is listed Critically Endangered under both the EPBC Act and the BC Act.

Description

Box Gum Woodland is characterised by a species-rich understorey of native tussock grasses, herbs and scattered shrubs, and the dominance, or prior dominance, of White Box (*Eucalyptus albens*), Yellow Box (*Eucalyptus melliodora*) and Blakely's Red Gum (*Eucalyptus blakelyi*). Tree-cover is generally discontinuous and consists of widely-spaced trees of medium height (TSSC, 2006).

In its pre-1750 state, this ecological community was characterised by (TSSC, 2006):

- A ground layer dominated by tussock grasses
- An overstorey dominated or co-dominated by White Box, Yellow Box or Blakely's Red Gum
- A sparse or patchy shrub layer.

Box Gum Woodland listed under the EPBC Act is defined as follows (DECCW, 2010):

- The ecological community must be, or have previously been, dominated or co-dominated by one or more of the following overstorey species (or hybrids of these species with any other Eucalyptus species): White Box (*Eucalyptus albens*), Yellow Box (*E. melliodora*) or Blakely's Red Gum (*E. blakelyi*).
- It must have a predominately native understorey (ie more than 50% of the perennial vegetative groundlayer must comprise native species).
- The area covered by the ecological community (ie the patch size) must be greater than 0.1 hectares (ha) and contain 12 or more native understorey species (excluding grasses), including one or more important species (as defined in the listing advice).
- If the groundlayer does not meet this last criterion (ie does not contain 12 or more native forb species and one or more important species) then the patch size must be 2 ha or greater in area and have an average of 20 or more mature trees per ha, or natural regeneration of the identified dominant overstorey eucalypts (Department of Environment and Heritage, 2006).

Areas which do not meet the criteria are not considered to be part of the listed ecological community. In addition, communities with a continuous shrub layer of more than 30% cover are excluded from the listed ecological community, as they are considered to be shrubby woodland and do not constitute Box-Gum Grassy Woodland (DECCW, 2010).

Box Gum Woodland occurs along the western slopes and tablelands of the Great Dividing Range from southern Queensland through New South Wales and the Australian Capital Territory to Victoria (TSSC, 2006).

Due to the ecological community's occurrence on fertile soils it has been extensively cleared for agriculture and intact remnants are now extremely rare (DECCW, 2010). Clearing and fragmentation for urban, rural residential, agricultural and infrastructure development remain ongoing threats to this ecological community, while degradation resulting from inappropriate management and weed invasion by introduced perennial grasses continues to erode the conservation value of remnant areas (DECCW, 2010).

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this TEC is as follows:

- Approved listing advice for the TEC (TSSC, 2006): *Commonwealth Listing Advice on White Box-Yellow Box-Blakely's Red Gum Grassy Woodland and Derived Native Grassland*. Available from: http://www.environment.gov.au/biodiversity/threatened/communities/box-gum.html.
- The "White Box-Yellow Box-Blakely's Red Gum Grassy Woodland and Derived Native Grassland National Recovery Plan" (2010) was developed by New South Wales Department of Environment, Climate Change and Water (DECCW). Key objectives include:
  - increasing protection of sites in good condition
  - increasing landscape function of the ecological community through management and restoration of degraded sites
  - increasing transitional areas around remnants and linkages between remnants
  - bringing about enduring changes in participating land manager attitudes and behaviours towards environmental protection and sustainable land management practices to increase extent, integrity and function of Box-Gum Grassy Woodland.

Specific impacts

The following vegetation types recorded within the project footprint are considered consistent with the EPBC Act Box Gum Woodland listing based on condition criteria:

- PCT 266 White Box grassy woodland in the upper slopes sub-region of the NSW South Western Slopes Bioregion.
- PCT 268 White Box – Blakely's Red Gum - Long-leaved Box – Norton's Box - Red Stringybark grass-shrub woodland on shallow soils on hills in the NSW South Western Slopes Bioregion.
- PCT 277 Blakely's Red Gum – Yellow Box grassy tall woodland of the NSW South Western Slopes Bioregion.
- PCT 278 Riparian Blakely's Red Gum - box - shrub - sedge - grass tall open forest of the central NSW South Western Slopes Bioregion.
- PCT 280 Red Stringybark - Blakely's Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South-Western Slopes Bioregion
- PCT 283 Apple Box – Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion.
- PCT 352 Red Stringybark - Blakely's Red Gum hillslope open forest on meta-sediments in the Yass - Boorowa - Crookwell region of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion.
- PCT 1330 Yellow Box – Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion.

Based on these assessments, the project would result in direct impacts to 111.47 ha (12%) of EPBC Act listed Box Gum Woodland within the project footprint. Approximately 73.82 ha (66%) of this would be subject to total clearing (ie total clearing zone) within the footprint of proposed structures, construction compounds and access tracks. Another 37.65 ha (34%) would be partially cleared (ie retention of the understorey) within the transmission line easement. 33% of Box Gum Woodland subject to direct impacts is in a low condition and 63% of this has already been cleared and exists as derived grassland. Another 22% is in moderate condition and less than half of all Box Gum Woodland impacted (ie 44%) is in high to very high condition.

Significant impact criteria

An action is likely to have a significant impact on a Critically Endangered ecological community if there is a real chance or possibility that it will:

Reduce the extent of an ecological community

The project is proposed to impact approximately 111.47 ha of Box Gum Woodland, comprising 8% of Box Gum Woodland and 2% of native vegetation within the project footprint. The national extent of Box Gum Woodland is approximately 416,326 ha, with 250,729 ha (60%) occurring in NSW (DECCW, 2010). The project would impact less than 0.03%of extant Box Gum Woodland on a national scale, and 0.04% of extant Box Gum Woodland in NSW. As such, the project would impact upon relatively small proportion of Box Gum Woodland present within NSW and across its range.

Fragment or increase fragmentation of an ecological community, for example by clearing vegetation for roads or transmission lines

EPBC Act Box Gum Woodland situated within the project footprint is already subject to considerable fragmentation as a result of existing land use within the locality.

Of the Box Gum woodland occurring within the project footprint, approximately 35% is in moderate condition, 38% is in high to very high condition and 36 % is in low condition. 26 % of that occurring in the project footprint occurs as derived native grassland. Despite the existing condition of Box Gum Woodland within the project footprint, proposed work is likely to result in further fragmentation and degradation of this TEC given the linear nature of the development. Linear infrastructure (including transmission lines) is known to cause ecosystem fragmentation (Nayak et al., 2020). This in turn leads to habitat and biodiversity loss, as well as edge effects[1], alterations to hydrology patterns and the disruption of ecosystem processes (Nayak et al., 2020; Laurance et al., 2009; Goosem, 2007).

It is unlikely that proposed clearing would result in the complete isolation of any Box Gum Woodland remnants. Rather, the size of remaining fragments would be further reduced making these more susceptible to ongoing degradation and stochastic events and may potentially compromise long-term viability.

Adversely affect habitat critical to the survival of an ecological community

While there are limitations to defining and locating habitat critical for the survival of Box Gum Woodland, it generally consists of PCTs consistent with the ecological community both in high and low condition (DECCW, 2010). It must be noted that clearing and fragmentation for urban, rural residential, agricultural and infrastructure development are identified as the main threats to this ecological community (DECCW, 2010). Vegetation integrity plots undertaken for PCTs considered consistent with Box Gum Woodland, and the vegetation condition of these PCTs ranged from low to very high. The “White Box-Yellow Box-Blakely's Red Gum Grassy Woodland and Derived Native Grassland National Recovery Plan” (DECCW, 2010) advises that all areas of Box Gum Woodland which meet minimum condition criteria as well as some degraded areas should be considered critical to the survival of the Box Gum Woodland.

[1] Changes in abiotic and biotic environment associated with the abrupt, artificial margins between natural habitat and cleared areas (Goosem, 2007).

The project may directly impact up to 111.47 ha of Box Gum Woodland (0.3% of extant Box Gum Woodland within NSW) (TSSC 2006). Remaining TEC remnants may be subject ongoing indirect impacts through mechanisms such as edge effects, resource partitioning, changes in community structure and reduced genetic exchange (Goosem, 2022; Laurance et al, 2009).

Given the above, the project would adversely affect habitat considered critical to the survival of Box Gum Woodland.

Modify or destroy abiotic (non-living) factors (such as water, nutrients, or soil) necessary for an ecological community's survival, including reduction of groundwater levels, or substantial alteration of surface water drainage patterns

Direct impacts such as vegetation clearing and potential increased erosion associated with the project, as well as indirect impacts of edge effects have the potential to cause alterations to groundwater levels and surface water drainage patterns within the project. Changes to surface water runoff patterns and soil hydrological regimes are a known threat to Box Gum Woodland (DECCW, 2010). Mitigation measures such as preparation of a Soil and Water Management Plan (SWMP) including Erosion and Sediment Control Plans (ESCP) and a Water Quality Monitoring Plan (WQMP) are likely to mitigate construction impacts to groundwater and surface water drainage patterns such that any impacts to Box Gum Woodland are expected to be minimal.

Cause a substantial change in the species composition of an occurrence of an ecological community, including causing a decline or loss of functionally important species, for example through regular burning or flora or fauna harvesting

Key impacts of the project to Box Gum Woodland relate to vegetation clearing including total and partial clearing work. Mitigation measures for the project to avoid impacts include micro-siting infrastructure and disturbance areas within previously disturbed/cleared areas, use of existing tracks and clearings (where possible) and implementation of a Biodiversity Management Plan to minimise/mitigate indirect impacts and evaluate effectiveness of all mitigation measures.

Remaining areas of Box Gum Woodland that would be retained immediately adjacent to the project footprint may be subject to ongoing edge effects, which may alter species composition (eg through weed incursion). Weed management and protocols for managing the spread of weeds will be included within the CEMP to minimise the potential for this to occur. Edge effects are restricted to the periphery of any patch and thus are considered unlikely to cause a substantial change in species composition that may lead to a decline or loss of functionally important species.

Will the action cause a substantial reduction in the quality or integrity of an occurrence of an ecological community, including, but not limited to:

1. ***assisting invasive species, that are harmful to the listed ecological community, to become established***
2. ***causing regular mobilisation of fertilisers, herbicides or other chemicals or pollutants into the ecological community which kill or inhibit the growth of species in the ecological community***

The project may directly impact up to 111.47 ha of Box Gum Woodland or 0.1% of native vegetation within the project footprint, with the potential to indirectly impact any adjacent areas of Box Gum Woodland located outside the project footprint. In particular, edge effects and the promotion or introduction of

invasive species are likely to occur as a result of construction and operational activities for the project. While weed control and monitoring programs are to be implemented during the construction and early operation, the ongoing and compounding impacts during operation/maintenance phase such as weed invasion, increased erosion and a loss of structural composition is likely to further reduce the quality and integrity of Box Gum Woodland adjacent to the project footprint, beyond existing levels of degradation.

Interfere with the recovery of an ecological community

Land use and management change, development of linear public infrastructure and weed invasion are listed as drivers and ongoing threats to the decline of Box Gum Woodland.

Recovery and threat abatement actions for Box Gum includes (TSSC 2006):

- protection, expansion and connection of remnants of the ecological community
- avoiding the use of fertilisers or soil disturbance in or near remnants
- in very small derived grassland sites, avoiding planting trees as they may reduce the floral diversity through competition for light, nutrients and water
- planting and other rehabilitation-focussed disturbance focussed on the edge of patches, expanding them, rather than within the patches
- exclusion of continuous grazing from remnants, strategic grazing in areas containing diverse native understorey and burning/slashing to allow tree seedlings, forbs and shrubs to establish.

The project is considered likely to interfere with the abovementioned recovery actions given it would result in further direct and indirect impacts to Box Gum Woodland. Efforts to further avoid, mitigate and manage impacts to Box Gum Woodland would be considered during detailed design and addressed as a part of any construction and operational management plans.

Conclusion

The project is considered likely to have a significant impact on Box Gum Woodland, through the removal of 111.47 ha of habitat, considered likely to constitute habitat that is critical to the survival of the TEC. A summary of the NSW assessment bilateral requirements for the TEC are presented in below. A summary of the NSW assessment bilateral requirements for the TEC are presented in Table A18-3 below.

Table A18- 3: NSW assessment bilateral requirements for Box Gum Woodland

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of habitat for this community, important populations, habitat critical for survival and relevant Commonwealth documents are provided above, with a map showing its modelled distribution provided below. The extent of EPBC Act listed Box Gum Woodland TEC is shown in Figure 6-1 of Attachment 1. Current distribution map for Box-Gum Grassy Woodland (DECCW, 2010) The "White Box-Yellow Box-Blakely's Red Gum Grassy Woodland and Derived Native Grassland National Recovery Plan" (DECCW, 2010) is the key recovery plan for this community. This Plan notes that all areas of Box Gum Woodland which meet minimum condition criteria as well as some degraded areas should be considered critical to the survival of the Box Gum Woodland.
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	Survey guidelines for Box Gum Woodland are provided in the recovery plan for this community (DECCW, 2010) and field data was used to assign vegetation integrity score for any given observed patch. The field survey techniques used to undertake surveys were in accordance with the BAM (DPIE 2020a) with a detailed field validation method provided in Section 4.4 of the BDAR. Native vegetation survey methods were undertaken in accordance with the BAM (DPIE, 2020a) within the project footprint during the following dates: • 16 October to 27 November 2020. • 22 to 26 February 2021. • 1 March to 28 May 2021. • 21 July to 12 August 2021. • 13 September to 30 November 2021. • 1 December to 28 February 2021/2022. • 1 September to 31 November 2022. More specifically, the following methods were implemented to identify, map and assess TECs within the project footprint: • Desktop searches of public databases to identify potentially occurring TEC • Field validation of vegetation carried out by Eco Logical Australia and Niche for all accessible lands (survey timing above). • In relation to the inaccessible lands, the TECs mapped during the field survey were used in conjunction with desktop assessments, to extrapolate the likely presence and distribution of TECs therein. • An assessment of PCT alignment with each potentially occurring EPBC Act TEC using information within the BioNet Vegetation Classification Database (DPE, 2022) and relevant key criteria and thresholds documented within the relevant Commonwealth conservation advice.
Description of the relevant impacts and its regard to the full national extent of the species or community's range	Direct impacts of the project on Box Gum Woodland includes the removal of approximately 111.47 ha of habitat. The area of potential impact for Box Gum Woodland is shown in Figure 13-2 of the BDAR. The national extent of Box Gum Woodland is approximately 416,326 ha

NSW Assessment Bilateral requirements	
	and 250,729 ha in NSW (DECCW, 2010). The project would impact less than 0.03% of extant Box Gum Woodland on a national scale, and 0.04% of extant Box Gum Woodland in NSW. Remaining TEC remnants may be subject ongoing indirect impacts through mechanisms such as edge effects, resource partitioning, changes in community structure and reduce genetic exchange.
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to the TEC: • Project design refinement to potentially avoid impacts to Box Gum Woodland wherever possible as a part of the detailed design • Micro-siting of transmission line infrastructure and associated construction work sites to avoid impacts to Box Gum Woodland, where possible. • Using existing cleared areas and access tracks, where possible. • Biodiversity exclusion zones, which would prioritise more intact (high and very high condition) Box Gum Woodland remnants at the interface to construction • Vegetation clearing and maintenance guidelines and procedures that addresses avoiding access and disturbance in biodiversity exclusion zones identified during the construction and avoiding maintenance of vegetation that does not need to be maintained during operation • Vegetation clearing and maintenance guidelines and procedures for operation to ensure maintenance commitments in the BDAR and EIS are met, avoid access and disturbance in biodiversity exclusion zones and areas of high biodiversity conservation significance and avoid disturbance of vegetation that does not require maintenance during operation. • Soil and Water Management Plan (SWMP) including Erosion and Sediment Control Plans and Water Quality Monitoring Plan to mitigate construction impacts to groundwater and surface water drainage patterns. • Biodiversity Management Plan to be implemented during construction, including measures to reduce disturbance to sensitive vegetation areas, procedures for the demarcation and protection of retained vegetation, rehabilitation strategies for the management and maintenance of rehabilitated areas and monitoring requirements and compliance management (including weed control and management).
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	The residual impact to Box Gum Woodland is estimated at 111.47 ha of habitat removal. There is the potential for indirect impacts (such as edge effects and weed incursion) to occur to any retained areas of Box Gum Woodland within or adjacent to the project footprint, however, it is expected that these impacts would be largely mitigated and managed through implementation of measures noted above. The residual impact to this TEC are considered to be significant as per the outcomes of the SIA (see above).
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Potential residual impacts to Box Gum Woodland TEC are considered likely to be significant as detailed above. Residual impacts to the TEC would be offset through the NSW Biodiversity Offsets Scheme (BOS). 4,917 ecosystem credits are estimated to be required to address residual impacts for this TEC. Offsets would be established/satisfied as detailed below. Details of offset requirements and obligations for this TEC as a result of residual impacts of the project are addressed further in Chapter 15 of the BDAR.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements.

NSW Assessment Bilateral requirements	
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met by implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project/ • Through making a payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. Any significant residual impacts not addressed by the BAM will be addressed in accordance with the EPBC Act Environmental Offset Policy.

2.1.2 Alpine Sphagnum Bogs and Associated Fens

Alpine Sphagnum Bogs and Associated Fens ecological community is listed as Endangered under the EPBC Act and not listed under the BC Act.

Description

The Alpine Sphagnum Bogs and Associated Fens (Alpine Sphagnum Bogs) ecological community generally has sharp boundaries and is easily delineated from other alpine vegetation communities. Many of its plant species rarely occur in other vegetation assemblages.

Although it is not always the dominant genus, the Alpine Sphagnum Bogs ecological community can usually be defined by the presence or absence of *Sphagnum spp*., the most common of which is *Sphagnum cristatum.* A 'Sphagnum bog' ecological community is often defined as a community where the *Sphagnum* spp. ground cover is more than thirty per cent. However, there are some sites within the Alpine Sphagnum Bogs ecological community that are dominated by shrubs or *Restionaceae* spp., where *Sphagnum* spp. are only a minor component, and other sites where *Sphagnum* has been depleted or lost due to disturbance. In these cases, the sites may still be considered to be part of this ecological community if other key species are present and a peat substratum is evident.

The Alpine Sphagnum Bogs ecological community is scattered throughout alpine, subalpine and montane regions of mainland Australia and Tasmania, often (but not always) found above the climatic treeline. Bogs are found in permanently wet areas, such as along streams, valleys edges and valley floors. They are situated on slopes where soils are waterlogged. The key to bog formation is a good supply of groundwater and an impeded drainage system that keeps the water table at or near the surface. The major threats to this ecological community are impacts of wildfires, climate change, weed incursions, feral horses and human activities in alpine parks (TSSC, 2009).

There are no specific areas listed as critical habitat, however it is considered likely that all areas of habitat are important for the long-term survival of the community.

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species is as follows:

- "Approved Conservation Advice for Alpine Sphagnum Bogs and Associated Fens ecological community" (DEWHA, 2008d) in effect under the EPBC Act from 7 January 2009.
- Approved listing advice for the TEC (TSSC, 2009): "*Commonwealth Listing Advice on Alpine Sphagnum Bogs and Associated Fens*". Available from: http://www.environment.gov.au/biodiversity/threatened/communities/pubs/29-listing-advice.pdf
- The "*National Recovery Plan for the Alpine Sphagnum Bogs and Associated Fens Ecological Community*" (DECCW, 2015) was developed by the ACT Department of Environment. The primary objective of this plan is to "maintain or extend the current known extent (area) and maintain or improve the condition of the Alpine Sphagnum Bogs over the life of the recovery plan. Increasing landscape function of the ecological community through management and restoration of degraded sites".

Specific impacts

The following vegetation type recorded within the project footprint was considered to be consistent with the Alpine Sphagnum Bogs listing criteria:

- PCT 939 – Tableland swamp meadow on impeded drainage sites of the western Sydney Basin Bioregion and South-eastern Highlands Bioregion.

The project could directly impact up to 0.56 ha (22%) of the 2.5 ha of Alpine Sphagnum Bogs situated within the project footprint. Alpine Sphagnum Bog remnants within and adjacent to the project footprint occur as four discrete remnant patches predominantly located at the interface and within the existing transmission line easement situated along a 6.5 km stretch of the Bago State Forest. These remnants are situated within boggy areas at the head waters of streams and were delineated by the presence of Sphagnum cristatum. All Alpine Sphagnum Bog communities within the project footprint are in a high condition. As the remnant patches are easy to identify it is likely that impacts to this TEC can be avoided during the detailed design phase.

Of the 0.56 ha of Alpine Sphagnum Bogs proposed to be directly impacted by the project, only 0.32 ha (57%) could be subject to full clearing if it cannot not be avoided during the detailed design phase. The remaining 0.24 ha (43%) situated within the proposed easement (including the Easement Clearance Zone (ECZ) and Hazard Tree Zone (HTZ) disturbance areas) is unlikely to be subject to clearing impacts given the community is predominantly treeless. Despite this, temporary disturbance of these areas is likely during construction. Similarly, Alpine Sphagnum Bog communities to be retained immediately adjacent to the project footprint may be subject to ongoing prescribed impacts in the form of changed hydrology and water quality. Given the persistence of the community in a high condition within the existing transmission line easement however, it is reasonable to conclude project operations will have little impact on Alpine Sphagnum Bogs retained within and adjacent to the project footprint.

Design opportunities to further avoid and minimise project impacts to the TEC will be investigated during detailed design. Mitigation measures including the preparation and implementation of the SWMP, ESCP and WQMP are also recommended to ensure any impacts associated with the project

are effectively mitigated.

Significant impact criteria

An action is likely to have a significant impact on an endangered ecological community if there is a real chance or possibility that it will:

Reduce the extent of an ecological community

The project could directly impact up to 0.56 ha of Alpine Sphagnum Bogs, comprising 22% of the total extent of Alpine Sphagnum Bogs occurring within the project footprint. This ecological community consists of highly fragmented, isolated remnants, and its present geographic extent on a national scale is estimated at approximately 8,000 ha (TSSC, 2009). The potential impact of the project is limited to less than 0.01% of the national extent of the ecological community.

Four discrete remnant patches of the community were recorded within and adjacent to the project footprint during field surveys within the Bago State forest. Two of the four patches are situated completely outside the proposed clearing footprint. A very small incursion (ie 0.01 ha) could occur at the edge of the third remnant patch. In relation to the fourth and northern-most patch, approximately 0.55 ha (61%) of the 0.90 ha patch could be subject to direct impacts if not avoided during the detailed design phase.

The project proposes to impact approximately 0.56 ha of Alpine Sphagnum Bogs comprising less than 0.01% of the national extent of the ecological community. The project would impact only two of the four remnant patches within the project footprint and all four patches are expected to persist in a very high condition state post-construction. Despite this, the project has the potential to reduce the extent of the ecological community if avoidance is not possible given total clearing works are proposed within the extent of the community.

Fragment or increase fragmentation of an ecological community, for example by clearing vegetation for roads or transmission lines

Four discrete remnant patches of the Alpine Sphagnum Bog TEC were recorded within and adjacent to the project footprint during field surveys within a 6.5 km stretch of the Bago State Forest. Two of the four patches are situated completely outside of the indicative disturbance area. A very small incursion (ie 0.01 ha) will occur at the edge of the third remnant patch. In relation to the fourth and northern-most patch, the western half (0.55 ha) of the patch would be subject to total and partial clearing impacts. Given the location and extent of proposed clearing, it is unlikely that the project would result in any increased fragmentation of the community within the project footprint. This is particularly true given all four patches are expected to persist in a very high condition state post-construction, based on occurrence of the community within the existing transmission line easement within Bago State Forest.

Adversely affect habitat critical to the survival of an ecological community

Habitat critical to the survival of Alpine Sphagnum Bogs has not been established (TSSC, 2009; DEWHA, 2008a). However, due to the restricted and highly fragmented nature of this ecological community across its range, all known locations of this ecological community, whether in high or low condition, are considered to be of high conservation value (DoE, 2015a). As such, the project's impact to 0.56 ha or 0.01% of that remaining has the potential to adversely affect habitat critical to the survival of the Alpine Sphagnum Bogs TEC.

Modify or destroy abiotic (non-living) factors (such as water, nutrients, or soil) necessary for an ecological community's survival, including reduction of groundwater levels, or substantial alteration of surface water drainage patterns

Since Alpine Sphagnum Bogs have specific requirements for waterlogged soils, a good supply of groundwater and an impeded drainage system/high water table, any alterations to groundwater levels and surface drainage patterns as a result of the project have the potential to impact this ecological community. Whist there is potential for increased erosion and impacts to ground and surface water drainage as a result of the proposed development, persistence of high condition Alpine Sphagnum Bogs TEC remnants within the existing transmission line easement suggests that this community is unlikely to be significantly affected. Mitigation measures including the preparation and implementation of the SWMP, ESCP and WQMP are recommended to ensure any impacts associated with the proposed work are effectively mitigated. Given the above, the project is unlikely to modify or destroy abiotic factors necessary for the TECs survival.

Cause a substantial change in the species composition of an occurrence of an ecological community, including causing a decline or loss of functionally important species, for example through regular burning or flora or fauna harvesting

Four discrete remnant patches of the Alpine Sphagnum Bog TEC occur within and adjacent to the project footprint, predominantly at the interface to and within the existing transmission line easement in Bago State Forest. Though these patches are predominantly situated within an operational transmission line easement, they have persisted in a very high condition state. Whilst some total and partial clearing is proposed within two of the four Alpine Sphagnum Bog remnants within the project footprint (22% of the total TEC extent) if unable to be avoided, the proposed project activities are not considered likely to result in further degradation of the community by means of changed floristic composition such that the TEC is likely to further decline or lose functionally important species. This is demonstrated by the persistence of high condition patches of the TEC within the existing transmission easement.

Design opportunities to further avoid and minimise project impacts to the TEC will be investigated during detailed design. Mitigation measures including the preparation and implementation of the SWMP, ESCP and WQMP are also recommended to ensure any impacts associated with the project are effectively mitigated.

Will the action cause a substantial reduction in the quality or integrity of an occurrence of an ecological community, including, but not limited to:

1. ***assisting invasive species, that are harmful to the listed ecological community, to become established***
2. ***causing regular mobilisation of fertilisers, herbicides or other chemicals or pollutants into the ecological community which kill or inhibit the growth of species in the ecological community***

Four discrete remnant patches of the Alpine Sphagnum Bog TEC occur within and adjacent to the project footprint, predominantly at the interface to and within the existing transmission line easement in Bago State Forest. Whilst these patches are predominantly situated within an operational transmission line easement, they have persisted in a very high condition state. Given this, it is reasonable to conclude that remaining TEC remnants are unlikely to be subject to ongoing degradation as a result of the proposed works.

The project would not involve the use of fertilisers and herbicides. Hydrocarbon spills pose a risk to the TEC during project construction and operation. Other chemicals required to facilitate construction may also pose a risk. However, controls implemented during the construction and operation phases of the project (such as bunding at construction compounds, regular vehicle maintenance and hydrocarbon spill kits) will ensure that these risks are mitigated as much as practicable.

Whilst there is potential for weed introduction and spread as a result of the development, these risks are considered low once effective controls (such as hygiene protocols) are implemented during project construction and operation.

Interfere with the recovery of an ecological community

Recovery and threat abatement actions for Alpine Sphagnum Bogs include (TSSC, 2009):

- map current extent of the ecological community and create centralised database that will provide a timeline for decline and recovery process
- prevent further loss of the ecological community
- ensure development or maintenance activities do not result in adverse impacts
- eradicate or control weed infestations within the ecological community
- manage adverse trampling, browsing and grazing within the ecological community
- develop and implement suitable fire management strategies to prevent further loss
- undertake trial for successful reestablishment of the ecological community
- implement appropriate restoration and translocation sites for the ecological community.

Potential impacts as a result of the project include the direct loss of up to 0.56 ha of the Alpine Sphagnum Bogs TEC, which would interfere with the abovementioned recovery actions.

Efforts to further avoid, mitigate and manage impacts to Alpine Sphagnum Bogs will be considered during detailed design and described within the associated management plans as required.

Conclusion

Based on the above assessments, project activities have the potential to reduce the extent of the Alpine Sphagnum Bogs TEC, adversely affect habitat critical to the community's survival and interfere with its recovery. Under the precautionary principle, the project is considered likely to have a potential significant impact on the Alpine Sphagnum Bogs TEC.

A summary of the NSW assessment bilateral requirements for the TEC are presented in Table A18- 4.

Table A18- 4: NSW assessment bilateral requirements for the Alpine Sphagnum Bogs TEC

NNSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of habitat for this community, important populations, habitat critical for survival and relevant Commonwealth documents are provided above, with a map showing its modelled distribution provided below. The extent of EPBC Act listed Alpine Sphagnum Bogs TEC is shown in Figure 6-1 of Attachment 1. Current distribution map for Alpine Sphagnum Bogs and Associated Fens (DCCEEW, 2022o) The "*National Recovery Plan for the Alpine Sphagnum Bogs and Associated Fens*" (DoE, 2015a) is the key recovery plan for this community. This Plan notes that all occurrences of Alpine Sphagnum Bogs and Associated Fens are of high conservation value and should be considered critical to the survival of the community.
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	Survey guidelines for Alpine Sphagnum Bogs and Associated fens are provided in the recovery plan for this community (DoE 2015a). Field data was used to assign condition classes for all observed patches. The field survey techniques used to undertake surveys were also in general accordance with the BAM (Department of Planning, Industry and Environment (DPIE) 2020a) with a detailed field verification method provided in Section 4.4 of the BDAR. Native vegetation survey methods were undertaken in accordance with the BAM (DPIE, 2020a) within the project footprint during the following dates: • 16 October to 27 November 2020 • 22 to 26 February 2021 • 1 March to 28 May 2021 • 21 July to 12 August 2021 • 13 September to 30 November 2021 • 1 December to 28 February 2021/2022 • 1 September to 31 November 2022. More specifically, the following methods were implemented to identify, map and assess TECs within the project footprint: • Desktop searches of public databases to identify potentially occurring TEC • Field validation of vegetation carried out by Eco Logical Australia and Niche for all accessible lands (survey timing above). • In relation to the inaccessible lands, the TECs mapped during the field survey were used in conjunction with desktop assessments, to extrapolate the likely presence and distribution of TECs therein. An assessment of PCT alignment with each potentially occurring EPBC Act TEC using information within the BioNet Vegetation Classification Database (DPE, 2022) and relevant key criteria and thresholds documented within the relevant Commonwealth conservation advice.
Description of the relevant impacts and its regard to the full national	Direct impacts of the project on Alpine Sphagnum Bogs include removal of approximately 0.56 ha of habitat. The area of potential impact for Alpine Sphagnum

NNSW Assessment Bilateral requirements	
extent of the species or community's range	Bogs is shown in Figure 13-2 of the BDAR. The distribution map above shows the current generalised national extent of 8,000 ha for the ecological community (TSSC, 2009). The project proposes to directly impact 0.01% of extant Alpine Sphagnum Bogs on a national scale. Indirect and prescribed impacts associated with changed hydrology, water quality, erosion and weed invasion are considered low risk where appropriate mitigation measures are implemented during the construction and operation of the project.
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to the TEC: • Project design refinement to avoid impacts to Alpine Sphagnum Bogs and Associated Fens wherever possible during detailed design. • Micro-siting of transmission line infrastructure and associated construction working areas to avoid impacts to Alpine Sphagnum Bogs and Associated Fens, where possible. • Using existing cleared areas and access tracks, where possible. • Biodiversity exclusion zones, which could consider Alpine Sphagnum Bogs and Associated Fens areas with high value/high VI score. • Vegetation clearing and maintenance guidelines and procedures that address avoiding access and disturbance in biodiversity exclusion zones identified during construction and avoiding maintenance of vegetation that does not need to be maintained during operation. • Vegetation clearing and maintenance guidelines and procedures for operation to ensure maintenance commitments in the BDAR and EIS are met, avoid access and disturbance in biodiversity exclusion zones and areas of high biodiversity conservation significance and avoid disturbance of vegetation that does not require maintenance during operation. • Soil and Water Management Plans (SWMP) including Erosion and Sediment Control Plans and Water Quality Monitoring Plans to mitigate construction impacts to groundwater and surface water drainage patterns. • Biodiversity Management Plan to be implemented during construction, including measures to reduce disturbance to sensitive vegetation areas, procedures for the demarcation and protection of retained vegetation, rehabilitation strategies for the management and maintenance of rehabilitated areas and monitoring requirements and compliance management (including weed control and management).
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	The residual impact to Alpine Sphagnum Bogs is estimated at 0.56 ha of habitat removal. There is the potential for indirect impacts (such as edge effects and weed incursion) to occur to any retained areas of Alpine Sphagnum Bogs within or adjacent to the project footprint, however, it is expected that these impacts would be largely mitigated and managed through implementation of measures noted above.
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Potential residual impacts to the Alpine Sphagnum Bogs TEC are considered likely to be significant as detailed above. Residual impacts to the TEC would be offset through the NSW Biodiversity Offsets Scheme (BOS). 12 ecosystem credits are estimated to be required to address residual impacts for this TEC. Offsets would be established/satisfied as detailed below. Details of offset requirements and obligations for this TEC as a result of residual impacts of the project are addressed further in Chapter 15 of the BDAR.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements.
Details of the offset package to compensate for significant residual impacts including details of the credit	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options:

NNSW Assessment Bilateral requirements	
profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	• The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project • Through making a payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. Any significant residual impacts not addressed by the BAM will be addressed in accordance with the EPBC Act Environmental Offset Policy.

2.2 Threatened flora

2.2.1 Bynoe's Wattle (*Acacia bynoeana*)

Bynoe's Wattle is listed as Vulnerable under the EPBC Act and Endangered under the BC Act.

Description

Bynoe's Wattle is an erect or spreading shrub to a metre high mainly found in heath and dry sclerophyll forest on sandy soils. It is often found in open, slightly disturbed sites including trail margins, edges of roadside spoil mounds and in recently burnt patches. Associated overstorey species for Bynoe's Wattle include *Eucalyptus gummifera, Eucalyptus haemastoma, Eucalyptus parramattensis, Eucalyptus sclerophylla, Banksia serrata and Angophora bakeri.* It is also found among the shrub species *Banksia spinulosa, Acacia oxycedrus, Acacia myrtifolia and Kunzea spp*. Bynoe's Wattle flowers between September and March (DoE, 2013a).

Bynoe's Wattle is found in central eastern NSW, from the Hunter District (Morisset) south to the Southern Highlands and west to the Blue Mountains. It is currently known from about 30 locations, with the size of the populations at most locations being very small (1-5 plants) (DoE, 2013a). There are three known records of the species within 20km of the footprint. Indicative distribution mapping from the Species Profile and Threats Database (DCCEEW 2022p) indicates that the portion of the project around the Goulburn area is mapped with both 'species and species habitat likely to occur' and 'species and species habitat may occur'. As such, the species is considered to have the potential to occur within the project footprint.

Is this part of an important population?

No important populations have been defined for Bynoe's Wattle. However, potential habitat for Bynoe's Wattle within the project footprint is located within the southern extent of the species range, in areas where it is predicted the species habitat is likely to, or may occur, according to the species SPRAT profile. Therefore, any individuals present within the project footprint are likely to occur on the edge of the species range and thus may be considered part of an important population.

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species is as follows:

- Approved conservation advice for Bynoe's Wattle: Department of the Environment (DoE, 2013a) *Approved Conservation Advice for* Bynoe's Wattle *(Bynoe's wattle).* Available from: https://www.environment.gov.au/biodiversity/threatened/species/pubs/8575-conservation-advice.pdf
- There is no adopted or made Recovery Plan for this species.

Specific impacts

The Bynoe's Wattle is considered to have a moderate likelihood of occurrence in the Bungonia and Crookwell IBRA subregions based on the presence of suitable habitat and associated PCT 1093.

The project would result in the clearing of approximately 1.2 ha of potential habitat in the Bungonia IBRA subregion (PCT 1093), and 1.8 ha of potential habitat in the Crookwell IBRA subregion (PCT 1093). Modelled habitat within the project footprint was 81.44 ha, from which 36 targeted flora searches did not detect the species. There are three Bionet records (DPIE 2021) within 20 kilometres of the project footprint (these occur within the Bungonia, Crookwell and adjacent Burragarong subregions). Due to incomplete coverage of threatened flora surveys, the species' presence could not be discounted and it is still considered to have the potential to occur within the project footprint.

Bynoe's Wattle has moderate potential to occur within the project footprint in the Bungonia and Crookwell IBRA subregions. In the associated subregions there is:

- 25.32 ha of potential habitat (comprising PCTs 679, 1191 and 1256) in Bungonia, of which 1.2 ha would be impacted by the project (4.7%)
- 56.12 ha of potential habitat (comprising PCT 1256) in Crookwell, of which 1.8 ha would be impacted by the project (3.2%).

Significant impact criteria

An action is likely to have a significant impact on a Vulnerable species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of an important population of a species

As the project footprint is towards the southern extent of the known range of Bynoe's Wattle, any individuals present could form part of an important population of the species. It is noted however that there are three records further south of the project area.

No individuals of Bynoe's Wattle were recorded within the project footprint during targeted surveys. However, due to the incomplete coverage of targeted surveys, the species' presence could not be discounted and it is considered to have the potential to occur within the project footprint. The project would result in the removal of 3.0 ha of potential habitat for Bynoe's Wattle (1.2 ha within the Bungonia IBRA subregion, and 1.8 ha within the Crookwell IBRA subregion).

The project is considered to have some chance of leading to a long-term decrease in and important population of the species if the species occurs within the disturbance area and a reasonable portion of the associated habitat is impacted, such that a long-term decrease would occur.

It is noted that the species tolerates and in some cases may prefer some level of disturbance, being known to occur on road verges and slashed easements. Avoidance and mitigation measures for the project would occur. These factors reduce the likelihood of a long-term decrease in population.

Further detailed recommendations as to specific mitigation measures to prevent impacts to potential habitat for the species have been included in this report.

Reduce the area of occupancy of an important population

The species is not known to occur in the project footprint. The extent of impact within the project footprint on the species is 3.0 ha of potential habitat. It is considered unlikely that the species would be entirely removed from any potential area of occurrence such that area of occupancy would be reduced (e.g. on a 2km grid square basis).

Of the potential habitat within the project footprint, it is unlikely that the species is restricted to the area being directly impacted should it occur, and thus its area of occupancy may include all potential habitat within the project footprint (81.44 ha). However, based on the removal of 3.0 ha of potential habitat, should the species occur, the project may reduce the area of occupancy of the species.

Fragment an existing important population into two or more populations

While no individuals of Bynoe's Wattle have been recorded within the project footprint, the species is still considered to have a moderate likelihood of occurrence and if present, may form part of an important population.

The project would directly impact potential habitat for the species and has the potential to result in indirect impacts to the habitat. The potential habitat for the species, PCT 1093, is present in both continuous and fragmented states within the project footprint. The indicative disturbance area is patchily distributed within the project footprint, with few areas of continuous clearing likely to fragment an area of potential habitat. Where the indicative disturbance area does intersect potential habitat across the footprint, it is mostly along the edge of habitat patches adjacent to previously cleared areas, impacting less than a hectare continuously, and minimally affecting connectivity. Bynoe's Wattle usually reproduces clonally, rarely setting seed. This clonal nature can result in the species occurring in clusters, rather than scattered widely in an area, making it easier to avoid damage to the whole population through avoidance and mitigation measures, like pre-construction surveys and micro siting structures.

Given this information, the project is considered unlikely to fragment an existing population into two or more populations.

Adversely affect habitat critical to the survival of a species

To date, no Critical Habitat as defined under section 207A of the EPBC Act has been identified or included in the Register of Critical Habitat for the species or identified in the Conservation Advice for the species.

The project would result in the removal of 3.0 ha of potential habitat for the species.

As per DoE (2013) 'Habitat critical to the survival of a species or ecological community' refers to areas that are necessary:

- for activities such as foraging, breeding, roosting, or dispersal
- for the long-term maintenance of the species or ecological community (including the maintenance of species essential to the survival of the species or ecological community, such as pollinators)
- to maintain genetic diversity and long-term evolutionary development, or
- for the reintroduction of populations or recovery of the species or ecological community.

Given there are no known populations of the species within the project footprint, it is considered unlikely that the project would affect habitat critical to the survival of the species.

Indirect impacts such as edge effects, weed incursion weed spraying along roadsides, road widening and habitat degradation, also have the potential to negatively impact species habitat, however implementation of the proposed mitigation measures would mitigate the risk of indirect impacts.

Disrupt the breeding cycle of an important population

Bynoe's Wattle flowers anytime from September to March and has mature seedpods from September to January.

The project would remove up to 3.0 ha of potential habitat that has the potential to support an important population. The project would impact about 11% of the potential habitat present within the project footprint. If it is assumed that all of the potential habitat may support an important population, then the project has the potential to impact on the breeding cycle of the population through removal of potential habitat for 11% of the population, however this is unlikely as none have been recorded within or near the project footprint.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

The project would result in the removal of 3.0 ha of potential habitat. While the species was not recorded, the removal of 3.0 ha (which comprises 11% of the total habitat mapped within the project footprint) of potential habitat that may support an important population is considered to have the potential to lead to species decline if the species occurs. The species tolerates and sometimes prefers some level of disturbance, being known to occur on road verges and slashed easements. As mentioned above, avoidance and mitigation measures for the project are likely to reduce the likelihood of a long-term decrease in population.

Result in invasive species that are harmful to a vulnerable species becoming established in the vulnerable species' habitat

The project is not likely to result in the introduction of invasive species that may become established in habitat for this species. The area of potential habitat is generally already affected by weeds where soil disturbance has occurred with some areas also subject to grazing. Proposed measures to mitigate the risk of indirect impacts, such as weed invasion, will be implemented. Mitigation measures to control the spread of weeds and pest animals would be detailed in the Biodiversity Management Plan.

Introduce disease that may cause the species to decline, or

Mitigation measures to control the spread of pathogens would be detailed in the Biodiversity Management Plan. There is low potential for any plant or machinery used in construction to transport pathogens, to which Bynoe's Wattle are susceptible. It has been recommended that this risk be managed through the use of wash down procedures for in-stream plant between crossing locations.

Interfere substantially with the recovery of the species

A Recovery Plan has not been prepared for Bynoe's Wattle. The approved Conservation Advice for the species lists a number of research priorities and priority actions to support the recovery of the species. While the project would not substantially interfere with these actions, it would result in disturbance to areas of potential habitat for the species which would contribute to two of the main identified threats to Bynoe's Wattle. These are land clearing leading to habitat loss and fragmentation and inappropriate habitat disturbance (DoE, 2013a).

Conclusion

The project is considered to have the potential to have a significant impact on Bynoe's Wattle due to removal of 3.0 ha of potentially suitable habitat where it has been assumed present on a precautionary basis.

A summary of the NSW assessment bilateral requirements for Bynoe's Wattle are presented in Table A18-5.

Table A18- 5: NSW assessment bilateral requirements for Bynoe's Wattle

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of habitat for this species, important populations, habitat critical for survival and relevant Commonwealth documents are provided above with a map showing its modelled habitat distribution provided below.  Current distribution map for Box-Gum Grassy Woodland (DCCEEW, 2022p). A Recovery Plan has not been prepared for Bynoe's Wattle. The approved Conservation Advice for the species lists a number of research priorities and priority actions to support the recovery of the species.
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	Field surveys for threatened flora were carried out using a combination of parallel field traverses and a two-phase grid-based systematic survey approach as set out in the DPIE (2020b) guideline for *Surveying threatened plants and their habitats*. Parallel field traverses involved searching along a grid of parallel transects at a set distance apart according to the lifeform and density of habitat for target candidate flora species. Each traverse was surveyed at walking pace by one ecologist. Two-phase systematic surveys involved a grid spaced at 100-square-metres nested within a one-square-kilometre grid from a topographic map image and then overlayed

NSW Assessment Bilateral requirements	
	onto the project footprint using a geographic information system (GIS). Surveys are undertaken where the 100-square-metre gridlines intersect within suitable habitat for a target species. At each grid-based flora survey location (grid intersect), a 40-metre diameter area (i.e., 1,256 square-metres) was systematically surveyed for the target species by at least two ecologists. Survey effort and dates of targeted surveys for Bynoe's Wattle within the project footprint comprised: • Bungonia subregion: 10 surveys in Jan-22; 24 in Feb-22; 1 in May-22; 51 Sep-21; 9 in Oct-21 (122.27 person hours) • Crookwell subregion: 26 surveys in Jan-22; 86 in Feb-22; 7 in Mar-22; 5 in May-22; 50 in Sep-21; 32 in Oct-21 (276.47 person hours)
Description of the relevant impacts and its regard to the full national extent of the species or community's range	No individuals of Bynoe's Wattle were recorded within the project footprint, however approximately 3.0 ha of potential habitat for the species is to be removed as a result of the project. The current distribution of Bynoe's Wattle stretches from Hunter District (Morisset) south to the Southern Highlands and west to the Blue Mountains. It is currently known from about 30 locations, with the size of the populations at most locations being very small (1-5 plants) while some sites have between 30 and 50 individuals (DoE, 2013a). The figure above shows the current likely and possible extent of habitat for the species.
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Bynoe's Wattle: • Project design refinement to potentially avoid impacts to the species wherever possible. • Micro-siting of transmission line infrastructure and associated construction working areas to avoid impacts to the species, where possible. • Using existing cleared areas and access tracks, where possible. • Biodiversity exclusion zones, which could consider the species habitat and known locations. • Vegetation clearing and maintenance guidelines and procedures that addresses avoiding access and disturbance in biodiversity exclusion zones identified during the construction and avoiding maintenance of vegetation that does not need to be maintained during operation. • Soil and Water Management Plans (SWMP) including Erosion and Sediment Control Plans and Water Quality Monitoring Plans to mitigate construction impacts to groundwater and surface water drainage patterns. • Biodiversity Management Plan to be implemented during construction, including measures to reduce disturbance to sensitive vegetation areas, procedures for the demarcation and protection of retained vegetation, rehabilitation strategies for the management and maintenance of rehabilitated areas and monitoring requirements and compliance management (including weed control and management).
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	The residual impact to Bynoe's Wattle is estimated at 3.0 ha of habitat removal. There is the potential for indirect impacts (such as edge effects and weed incursion) to occur to any retained areas of Bynoe's Wattle habitat within or adjacent to the project footprint, however, it is expected that these impacts would be largely mitigated and managed through implementation of measures noted above. The residual impact to this species was considered to have the potential to be significant as per the SIA (see above).
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Residual, potentially significant impacts to the species would be offset under the NSW BOS. Details of offset requirement and obligations for this species as a result of residual impacts due to the project are addressed in Section 14 of the BDAR.

NSW Assessment Bilateral requirements	
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • the purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register • establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project • through making a payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All significant residual impacts to the species have been addressed under the NSW BOS. There are no significant residual impacts to the species that have not been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required.

2.2.2 Vulnerable daisies: Yass Daisy *(Ammobium craspedioides)*, Swamp Everlasting *(Xerochrysum palustre)*

The Yass Daisy is listed as Vulnerable under the EPBC Act and the BC Act. The Swamp Everlasting is listed as Vulnerable under the EPBC Act and is not listed under the BC Act.

Description

Yass Daisy

From the *Asteraceae* family, Yass Daisy is a rosette-forming perennial herb that flowers in spring. Leaves are spoon-shaped and are 3–12 cm long, 10–17 mm wide, hairy on top and woolly underneath. The yellow flowers are hemispherical buttons about 10–20 mm wide and are surrounded by straw-coloured papery leaf-like structures, known as bracts. The flowerheads are borne on stems usually 30–60 cm high which are sparsely leafed and edged with narrow 'wings'. Rosettes die off after fruiting.

Yass Daisy is known from localities in NSW near Crookwell, on the southern tablelands to near Wagga Wagga, on the south-western slopes. Most populations occur in the Yass District, at Lake Burrinjuck, Bookham, Rye Park and Dalton. A small population exists in Livingstone National Park, about 30 km south of Wagga Wagga. Other populations are found in Bigga, north of Crookwell and Tumut. Vegetation surveys for the proposed Conroy's Gap Wind Farm found a sizeable population of a few hundred plants on private property near McCullums Creek. Yass Daisy occurs in dry forest, Box-Gum Woodland and secondary grassland derived from clearing of these communities. It grows in association with a large range of eucalypts (*Eucalyptus blakelyi*, *E. bridgesiana, E. dives, E. goniocalyx, E. macrorhyncha, E. mannifera, E. melliodora*, *E. polyanthemos* and *E. rubida*). Yass Daisy is apparently unaffected by light grazing, as populations persist in some grazed sites and it is also found in a number of cemeteries in the region. Yass Daisy occurs within the Murrumbidgee and Lachlan (NSW) Natural Resource Management Regions.

Indicative distribution mapping from the Species Profile and Threats Database (DCCEEW 2022q) indicates that the portion of the project east of Wagga Wagga through to west Goulburn is mapped with both 'species and species habitat likely to occur' and 'species and species habitat may to occur'. As such, the species is considered to have the potential to occur within the project footprint.

The distribution of this species overlaps with the following EPBC Act-listed TECs:

- White Box-Yellow Box-Blakely's Red Gum Grassy Woodland and Derived Native Grassland, and
- Natural Temperate Grassland of the Southern Tablelands of NSW and the Australian Capital Territory.

Swamp Everlasting

Swamp Everlasting, Family Asteraceae, is a perennial, erect herb growing to 30–100 cm tall (DAWE 2021a). Leaves are narrow, to 100 x 8 mm, and more or less hairless except for cobweb-like hairs along their margins (DAWE 2021a). The large yellow 'daisy' flowers are up to 50 mm across (DAWE 2021a). Flowering occurs predominantly from November to March (DAWE 2021a). The fruit is a narrow dry seed to 3 mm long with a crown of yellow bristles about twice as long as the seed (DAWE 2021a).

Swamp Everlasting is endemic to south-eastern Australia, where it is widely distributed from south-eastern New South Wales, through Victoria, to north-eastern Tasmania (DAWE 2021a). In New South Wales, Swamp Everlasting occurs from the Victorian border near Delegate as far north as Lithgow and ranges up to about 1,300 m altitude (DAWE 2021a).

Since 1990, about 80 subpopulations of Swamp Everlasting have been recorded, with a total abundance estimated at over 30,000 plants (DAWE 2021a). The 2011 Recovery Plan estimated the population size of Swamp Everlasting at approximately 35 subpopulations and 10,000 plants (DAWE 2021a). In some instances, estimates of abundance have been based on area rather than number of individuals (DAWE 2021a). There is incomplete population information from NSW, although there are probably over 15,000 plants occurring in subpopulations throughout escarpment swamps west of the Bega Valley, usually in patches of less than 100 m^2 (DAWE 2021a). Indicative distribution mapping from the Species Profile and Threats Database (DCCEEW 2022q) indicates that the portion of the project south of Tumut is mapped with both 'species and species habitat likely to occur' and 'species and species habitat may to occur'. As such, the species is considered likely to occur within the project footprint.

Swamp Everlasting grows in wetlands including sedge-swamps and shallow freshwater marshes, often on heavy black clay soils (DAWE 2021a). Plants grow in 1 m depth of water on French Island (DAWE 2021a). The species will also grow in more marginal wetland habitats such as seasonally wet areas of native grassland and heath communities (DAWE 2021a). At higher altitudes in NSW Swamp Everlasting also grows in Sphagnum moss bogs (DAWE 2021a). It may occur in the threatened ecological community: Alpine Sphagnum Bogs and Associated Fens, however they have only been recorded in this community outside of NSW (DAWE 2021a).

Is this part of an important population?

No important populations have been defined for the Yass Daisy and the species is known only from near Crookwell to Wagga Wagga and may be locally 'common'. The majority of the recorded individuals and the habitat within the project footprint span the predicted range, however the records and habitat in the project footprint north of Goulburn are on the edge of the predicted range according to the species SPRAT profile. Therefore, the records and habitat in the project footprint likely comprise an important population.

No important populations have been defined for Swamp Everlasting. Swamp Everlasting has a wide but scattered distribution, with a population estimate of about 10,000 plants nationally. Within the areas surveyed, this species was not recorded occurring in large populations (i.e. only six individuals recorded). Swamp Everlasting was recorded in the Snowy Mountains IBRA subregion portion of the project footprint, and these records are just outside the western edge of the predicted habitat as per the species SPRAT profile. Therefore, it is likely that these individuals may constitute part of an important population.

Specific impacts

Seventy-seven clusters of Yass Daisy were recorded within or directly adjacent to the project footprint, representing approximately 7,500 individuals in the following IBRA subregions and PCTs: Crookwell (PCT 1093), Murrumbateman (PCT 278), Bondo (PCT 295, 299 and a pine plantation) and Inland Slopes (PCT 280). The area of known and potential habitat is located through the southern and eastern portion of the project footprint, particularly in the vicinity of Tumut through to Goulburn. With reference to associated TEC/PCTs present in the project footprint, the known and potential habitat comprises of following:

- 375.75 ha of potential habitat (comprising PCTs 679, 1191 and 1256) in Crookwell, of which 32.83 ha would be impacted by the project (8.7%).
- 704.97 ha of potential habitat (comprising PCTs 266, 277, 283, 287, 352 and 1330) in Murrumbateman, of which 40.39 ha would be impacted by the project (5.7%).
- 1,879.02 ha of potential habitat (comprising PCTs 268, 277, 287, 290, 294, 343 and 352) in Inland Slopes, of which 101.44 ha would be impacted by the project (5.4%).
- 8.22 ha of potential habitat (comprising PCT 290) in Bondo, of which 1.56 ha would be impacted by the project (19%).

In total there is 2,967.96 ha of potential and known habitat for the Yass Daisy, of which 176.22ha would be impacted by the project (5.9%). Further, there is an additional 11.60 ha of impacts to non-native habitats (prescribed impacts). Therefore, the total impact to Yass Daisy habitat, including prescribed impacts, is 187.82 ha.

Six Swamp Everlastings were recorded within the project footprint in the Snowy Mountains IBRA subregion in PCT 679. The Swamp Everlasting is associated with the following PCTs: 679, 939. There is 17.54 ha of habitat mapped in the project footprint within the Snowy Mountains IBRA Subregion, of which 1.50 ha of potential habitat would be directly impacted by the project (8.6%).

Whilst both species have been recorded during targeted surveys, given the extent of habitat unsurveyed and the ability of both species to survive on rootstock, both are considered unlikely to be restricted to known habitat areas. Therefore, this assessment employs the precautionary principle and assumes both species have the potential to be present in all areas of suitable habitat.

While the overall impact to potential habitat covers a significant area, management of the transmission line easement would aim to avoid complete vegetation removal, and hence avoid damage to species in the groundcover layer. After mitigation and avoidance measures have been implemented, such as micro-siting transmission line structure locations and avoiding the large scale clearing of treeless areas, the realised scale of the impact to these species is likely to be much smaller.

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for these species is as follows:

- Approved Conservation Advice for the Yass Daisy (DEWHA 2008b), in effect under the EPBC Act from 1 October 2008,
- Approved Conservation Advice for the Swamp Everlasting (DAWE 2021a), in effect under the EPBC Act from 23-Nov-2021.
- National Recovery Plan for the Swamp Everlasting (Carter & Walsh 2011), in effect from 10 February 2012.
- Threat Abatement Plan relevant to the Yass Daisy
- Threat abatement plan for competition and land degradation by rabbits, in effect under the EPBC Act from 7 January 2017.

No Threat Abatement Plan has been identified as being relevant for Swamp Everlasting. There is no Recovery Plan for the Yass Daisy. There are no relevant Commonwealth survey guidelines for either of these species.

Significant impact criteria

An action is likely to have a significant impact on a Vulnerable species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of an important population of a species

The project would result in the clearance of approximately 176.22ha (187.82 ha including prescribed impacts) of potential habitat for the Yass Daisy and 1.50 ha of potential habitat for the Swamp Everlasting.

As discussed above, both species have the potential to constitute an important population within the project footprint due to the records being at or near the limit of the species range.

The project is considered to have the potential to lead to a long-term decrease in these species or a population of the species. This is due to the removal of around 5.9% and 8.6% respectively, of known and potential habitat present across the project footprint for the Yass Daisy and Swamp Everlasting. Recommendations detailing specific avoidance and mitigation measures to prevent impacts to potential habitat for the species have been included in the BDAR.

Reduce the area of occupancy of an important population

There is no defined area of occupancy for these species. The extent of impact within the project footprint on the Yass Daisy is 176.22ha (comprising 5.9% of the total habitat in the project footprint; 187.82 ha including prescribed impacts) and 1.50 ha (comprising 8.6% of the total habitat in the project footprint) on the Swamp Everlasting.

The project would directly impact known and potential habitat for the species and may cause indirect impacts to potential habitat. It is considered likely that the scale of these impacts would render any potential habitats no longer suitable, although mitigation measures aim to reduce this impact. Given that the populations may be considered important as they exist at the limit of their known ranges, the project has the potential to reduce the area of occupancy of an important population, should they occur.

Fragment an existing important population into two or more populations

The project would include construction of transmission line structures, access tracks, substations and construction compounds, however groundcover would not be removed and vegetation maintained up to a certain height within the ECZ and HTZ. It is assumed that both Yass Daisy and Swamp Everlasting records and habitat within the project footprint comprise important populations.

The indicative disturbance area is patchily distributed within the project footprint, with few areas of continuous clearing which are likely to fragment an important population. Where the indicative disturbance area does intersect potential habitat for these species across the project footprint, it is mostly along the edges of habitat patches adjacent to previously cleared areas, removing less than a hectare from each patch and minimally affecting connectivity.

Potential habitat for Yass Daisy is represented by multiple PCTs associated with Box Gum Woodland, as above, in both continuous and fragmented states within the project footprint. While there are known records of this species that intersect the indicative disturbance area, these areas are discontinuous and less than a hectare, and unlikely to cause fragmentation within the surrounding population. It is also assumed that additional, unobserved individuals would be present in appropriate surrounding habitat. The estimated area of habitat affected is minimal and is very unlikely to lead to fragmentation of populations (5.9% of habitat in the project footprint).

Potential habitat for Swamp Everlasting within PCTs 939 and 679, is present in both continuous and fragmented states within the project footprint. There are also known records found in areas adjacent to the associated PCTs. No known records of this species intersect with the indicative disturbance area, and while it is assumed that this species would be present in suitable surrounding habitat, the estimated area of habitat impacted is minimal (8.6% of habitat in the project footprint) and considered very unlikely to lead to fragmentation of populations.

Both species are known to die off at the end of summer before resprouting in winter, and also post disturbance. Minimising any temporary ground storey clearing required outside of flowering times will prevent disruption to the breeding cycle. Mitigation and avoidance strategies, such as pre-clearance surveys and micro siting of transmission line structures will further ensure that impact on important populations for both species is further minimised during construction.

Considering the above information, the project is considered unlikely to fragment an existing population into two or more populations.

Adversely affect habitat critical to the survival of a species

To date, no Critical Habitat as defined under section 207A of the EPBC Act has been identified or included in the Register of Critical Habitat for the Yass Daisy or the Swamp Everlasting.

Yass Daisy has been recorded at four separate locations within the project footprint, and the project would result in the removal of 176.22 ha (187.82 ha including prescribed impacts) of potential habitat.

Swamp Everlasting has been recorded in the Snowy Mountains IBRA subregion portion of the project footprint, and the project would result in the removal of 1.50 ha of known and potential habitat.

As per DoE (2013) 'Habitat critical to the survival of a species or ecological community' refers to areas that are necessary:

- for activities such as foraging, breeding, roosting, or dispersal

- for the long-term maintenance of the species or ecological community (including the maintenance of species essential to the survival of the species or ecological community, such as pollinators)
- to maintain genetic diversity and long-term evolutionary development, or
- for the reintroduction of populations or recovery of the species or ecological community.

Known and potential habitat for the Yass Daisy is relatively prevalent within the project footprint (2,967.96 ha). The species is also associated with relatively broadly distributed PCTs (including Box-Gum Woodland) with populations of the species persisting in grazed sites. Thus, the habitat within the project footprint is unlikely to be critical to the survival of the species.

The 2011 Recovery Plan estimated the population size of Swamp Everlasting at approximately 35 subpopulations and 10,000 plants. While the individuals recorded within the project footprint have the potential to constitute an important population, given the relatively small area of known and potential habitat to be impacted, it is considered unlikely that the habitat to be impacted would be critical to the survival of the species.

Disrupt the breeding cycle of an important population

Yass Daisy

As stated above, the records and habitat mapped in the eastern portion of the project footprint likely comprise an important population. Yass Daisy flowers from October to November, the leaves then shrivel in summer after fruiting, and the plants survive on below-ground storage material, resprouting with autumn rains (DCCEEW 2022q; NSW NPWS 1999ji). Given the species ability to survive on below-ground storage material, and the retention of groundcover and mid-stratum vegetation throughout much of the project footprint, the project is considered unlikely to disrupt the breeding cycle of any potentially important population.

Swamp Everlasting

As stated above, the individuals and suitable habitat mapped in the Snowy Mountain IBRA Subregion portion of the project footprint are likely to comprise an important population. Swamp Everlasting flowers from November to March and fruits from December to April. The species is a colonial, extensively rhizomatous perennial, dying off in late summer, and, depending on rainfall, resprouting in winter. Reproduction appears to be largely vegetative via an extensive rhizome system (DCCEEW, 2022y; Flann, 1998). Given the species' ability to survive on below-ground storage material, and the retention of groundcover and mid-stratum vegetation throughout much of the project footprint, the project is considered unlikely to disrupt the breeding cycle of any potentially important population.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

The project would result in the removal of 176.22 ha (comprising 5.9% of the total habitat mapped in the project footprint, 187.82 ha including prescribed impacts) of potential and known habitat for the Yass Daisy and 1.50 ha (comprising 8.6% of the total habitat mapped in the project footprint) of potential habitat for the Swamp Everlasting. This mapped suitable habitat and associated records have the potential to constitute an important population, thus the project has the potential to lead to species decline.

Result in invasive species that are harmful to a vulnerable species becoming established in the vulnerable species' habitat

The project is not likely to result in the introduction of invasive species that may become established in habitat for these species. Areas of known and potential habitat are already affected by weeds where soil disturbance has occurred with some areas also subject to grazing. Proposed measures to mitigate the risk of indirect impacts, such as weed invasion, will be implemented. Mitigation measures to control the spread of weeds and pest animals would be detailed in the Biodiversity Management Plan.

Introduce disease that may cause the species to decline, or

Mitigation measures to control the spread of pathogens would be detailed in the Biodiversity Management Plan. There is low potential for any plant or machinery used in construction to transport pathogens to which these species are susceptible. It has been recommended that this risk be managed through the use of wash down procedures for in-stream plant between crossing locations.

Interfere with the recovery of the species

Yass Daisy

The Conservation Advice (DEWHA 2008b) for the species identifies the following strategies to achieve the recovery objectives:

- Habitat Loss, Disturbance and Modification
  - Monitor known populations to identify key threats.
  - Monitor the progress of recovery, including the effectiveness of management actions and the need to adapt them if necessary.
  - Identify populations of high conservation priority.
  - Manage threats to areas of vegetation that contain populations/occurrences/remnants of Yass Daisy.
  - Ensure road widening and maintenance activities (or other infrastructure or development activities) involving substrate or vegetation disturbance, especially the Hume Highway duplication, do not adversely impact on known populations.
  - Manage any changes to hydrology that may result in changes to the water table levels, such as improving the drainage of the Daisy Trail in Livingstone National Park so that runoff is diverted (NPWS, 2006).
  - Manage any disruptions to water flows.
  - Investigate formal conservation arrangements, management agreements and covenants on private land, and for crown land and private land investigate inclusion in reserve tenure if possible.
  - Implement regular monitoring to ensure that Yass Daisy populations are not threatened by recreational or park management activities in Livingstone National Park (NPWS, 2006).
  - Implement appropriate mowing or slashing regimes in cemetery sites where the species occurs.
  - Suitably control and manage access on private land.
  - Minimise adverse impacts from land use at known sites.
  - Ensure the development of Conroy's Gap wind farm does not have a significant adverse impact on Yass Daisy populations (DOP, 2007).
  - Protect populations of the listed species through the development of conservation agreements and/or covenants.
- Invasive Weeds
  - Develop and implement a management plan the control of weeds in the local region.
  - Ensure chemicals or other mechanisms used to eradicate weeds do not have a significant adverse impact on Yass Daisy.

    - Identify and remove weeds in the local area, in particular species such as Serrated Tussock, Scotch Thistle and St John's Wort, which could become a threat to Yass Daisy, using appropriate methods (Harden Shire Council, 2004).
    - Manage sites to prevent introduction of invasive weeds, which could become a threat to Yass Daisy, using appropriate methods.
- Trampling, Browsing or Grazing
    - Develop and implement a stock management plan for roadside verges and travelling stock routes.
    - Implement management actions for the control and eradication of rabbits outlined in the Threat Abatement Plan for Competition and Land Degradation by Feral Rabbits (EA, 1999).
    - Manage known sites on private property to ensure appropriate stock grazing regimes are conducted.
    - Prevent grazing pressure at known sites on leased crown land through exclusion fencing or other barriers.
- Conservation Information
    - Raise awareness of Yass Daisy within the local community, particularly landholders and owners and caretakers of local cemeteries where Yass Daisy occurs.
- Enable Recovery of Additional Sites and/or Populations
    - Undertake appropriate seed collection and storage.
    - Investigate options for linking, enhancing or establishing additional populations.
    - Implement national translocation protocols (Vallee et al., 2004) if establishing additional populations is considered necessary and feasible.
    - Establish if other populations of Yass Daisy exist in areas in between the southern population near Wagga Wagga and the Yass District populations.

The project may impede or interfere with targeted recovery action objectives associated with: Habitat Loss, Disturbance and Modification.

Swamp Everlasting

The National Recovery Plan (Carter and Walsh 2011) for the species identifies the following recovery objectives:

- acquire information on population abundance and trends for management and conservation
- identify habitat that is critical, common or potential
- ensure that key populations and their habitat are protected and managed appropriately
- identify and manage threats to populations
- identify key biological characteristics
- monitor the growth response and viability of populations to allow adaptive management
- build community support for conservation.

The project is unlikely to impede or interfere with any of targeted recovery objectives for this species.

Conclusion

Largely due to the area of known and potential habitat to be impacted, the project is considered likely to have a significant impact on the Yass Daisy.

Whilst the known and potential habitat of Swamp Everlasting proposed to be impacted is relatively small, this habitat is on the edge of the species' predicted range, therefore the project has the potential to cause

a significant impact on the Swamp Everlasting based on the precautionary principle. A summary of the NSW assessment bilateral requirements for these vulnerable daisies are presented in Table A18- 6.

Table A18- 6: NSW assessment bilateral requirements for vulnerable daises

NSW Assessment Bilateral requirements	Yass Daisy	Swamp Everlasting
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of habitat for the Yass Daisy, important populations, habitat critical for survival and relevant Commonwealth documents are provided above, with a map showing its modelled habitat distribution provided below.  Current distribution map for Yass Daisy (DCCEEW, 2022q) Relevant Commonwealth guidelines for the Yass Daisy include Approved Conservation Advice (DEWHA 2008b) and the Threat Abatement Plans relevant to the Yass Daisy. 	Murrumbateman • 138 surveys in Sep-21 • 72 surveys in Oct-21 • 89 surveys in Nov-21 Inland Slopes • 147 surveys in Oct-21 • 47 surveys in Nov-21 Bondo • 5 surveys in Nov-21	• 9 surveys in Mar-22; 32 in Nov-21 • 7.93 km of random meander in Feb-21 (ELA)
Description of the relevant impacts and its regard to the full national extent of the species or community's range	A description of relevant impacts is provided in the 'Specific impacts' section of this assessment.	A description of relevant impacts is provided in the 'Specific impacts' section of this assessment.
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Yass Daisy and Swamp Everlasting: • Project design refinement to potentially avoid impacts to the species wherever possible • Micro-siting of transmission line infrastructure and associated construction work sites to avoid impacts to the species, where possible. • Using existing cleared areas and access tracks, where possible. • Biodiversity exclusion zones, which could consider the species habitat and known locations • Vegetation clearing and maintenance guidelines and procedures that addresses avoiding access and disturbance in biodiversity exclusion zones identified during the construction and avoiding maintenance of vegetation that does not need to be maintained during operation. • Soil and Water Management Plans (SWMP) including Erosion and Sediment Control Plans and Water Quality Monitoring Plans to mitigate construction impacts to groundwater and surface water drainage patterns. • Biodiversity Management Plan to be implemented during construction, including measures to reduce disturbance to sensitive vegetation areas, procedures for the demarcation and protection of retained vegetation, rehabilitation strategies for the management and maintenance of rehabilitated areas and monitoring requirements and compliance management (including weed control and management).	
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	The residual impact to the Yass Daisy is estimated at 176.22 ha (187.82 ha including prescribed impacts) of known and potential habitat removal. There is the potential for indirect impacts (such as edge effects and weed incursion) to occur to any retained areas of the species habitat within or adjacent to the project footprint, however, it is expected that these impacts would be largely mitigated and managed through implementation of measures noted above. The residual impact to this species was considered to have the potential to be significant as per the SIA (see above).	The residual impact to the Swamp Everlasting is estimated at 1.50 ha of known and potential habitat removal. There is the potential for indirect impacts (such as edge effects and weed incursion) to occur to any retained areas of the species habitat within or adjacent to the project footprint, however, it is expected that these impacts would be largely mitigated and managed through implementation of measures noted above. Under the precautionary principle, the residual

NSW Assessment Bilateral requirements	Yass Daisy	Swamp Everlasting
		impact to this species was considered to have the potential to be significant as per the SIA (see above).
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Residual, potentially significant impacts to the species would be offset under the NSW BOS. Details of offset requirements and obligations for this species as a result of residual impacts due the project is addressed in Section 14 of the BDAR.	
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations.	
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project • Through making a payment into the Biodiversity Conservation Fund.	
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All significant residual impacts to the species have been addressed under the NSW BOS. There are no significant residual impacts to the species that have not been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required.	

2.2.3 Black Gum (*Eucalyptus aggregata*)

The Black Gum is listed as Vulnerable under the EPBC Act and the BC Act.

Description

Black Gum is a small to medium sized woodland tree that grows 18-20 m tall, although the Victorian Department of Sustainability and Environment (DSE) states it grows to 25 m. The bark on the trunk and main branches is dark grey to black, deeply fibrous or flaky, which does not shed annually. The smaller branches (<8 cm diameter) are covered in smooth white, cream or grey bark which does shed yearly. The adult leaves are slightly curved and round-ended, approximately 5-12 cm long and 1-2 cm wide. They are a glossy dark green, have the same colour on each surface and contain leaf oils with a distinctive, clove-like odour. Juvenile leaves are narrow or oval-shaped, are arranged opposite each other and are a dull green in colour, although they may vary considerably in a single seed lot. The buds, flowers and fruits occur in tight clusters of seven on stalks 3-4 mm long. The buds are egg-shaped, 3-5 mm long and 2-3 mm wide. The flowers are white or cream and are followed by capsules which are cone or cup shaped, 2-4 mm long and 3-5 mm wide.

Black Gum is endemic to south-eastern Australia and is found in the ACT, NSW and in a small isolated sub-population in Victoria. It is likely that these regions were connected in a colder paleoclimate. The species occurs mainly in the wetter, cooler and higher parts of the tablelands, and is found at altitudes of 600–1200 m and in areas with annual rainfall of 600–900 mm, although at least one sub-population is known to occur in an area of higher rainfall (~1800 mm per year). This species is likely to occur within at least one TEC, the Upland Basalt Eucalypt Forests of the Sydney Basin Bioregion, which was listed as endangered in 2011. Indicative distribution mapping from Species Profile and Threats Database (DCCEEW 2022r) has mapped 'species and species habitat likely to occur' and 'species and species habitat may to occur' north and south of Goulburn and as far west of Gunning. As such, the species is considered likely to occur within the project footprint.

Is this part of an important population?

According to the Conservation Advice for Black Gum, the Wingecarribee local government area sub-population has been listed as an endangered population by the NSW Scientific Committee. The larger and more viable stands of Black Gum in NSW are important and include locations at Black Springs, Wallerawang, south of Braidwood near the Shoalhaven River, and the Bendoura Travelling Stock Reserve (Commonwealth of Australia 2015). None of the defined important populations are located within the project footprint, however, the eastern end of the footprint is approximately 1 kilometer west of the Wingecarribee local government border.

No associated habitat has been mapped in Bungonia, however, given Crookwell and Murrumbateman IBRA Subregions occur on the edge of the species predicted habitat distribution, potential habitat within the project footprint may be used by an important population if it occurs.

Specific impacts

Black Gum is considered to have a high likelihood of occurrence within the project footprint in the Crookwell IBRA subregion and a moderate likelihood of occurrence within the Murrumbateman IBRA subregion. The species is also known to occur in the Bungonia and Inland Slopes IBRA subregions, however due to no associated PCTs mapped in the Bungonia portion of the project footprint and limited previous

records in the Inland Slopes, the potential for the species to occur within the project footprint within these Subregions has not been considered further.

Thirty-nine records are known to occur (DPIE 2021) within 20 km of the project footprint in the Goulburn and Yass region. In the remaining associated subregions there is:

- 40.73 ha of potential habitat (comprising PCTs 679, 1191 and 1256) in Crookwell, of which 1.10 ha would be impacted by the project (3%).
- 9.2 ha of potential habitat (comprising PCT 1256) in Murrumbateman, of which 0 ha would be impacted by the project (0%)
- In Inland Slopes 0.15 ha would be impacted by the project.

In total there is 49.93 ha of potential habitat mapped within the project footprint, of which 1.25 ha would be removed as a result of the project (2.5%). Further, there is an additional 0.13 ha of impacts on non-native habitats for Black Gum (prescribed impacts). Therefore, the total impact to black Gum habitat, including prescribed impacts, is 1.38 ha.

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species is as follows:

- Approved Conservation Advice for the Black Gum (TSSC 2015a), in effect under the EPBC Act from 17 November 2015.
- The SPRAT database indicates that there is no Recovery Plan for the Black Gum.
- The SPRAT database indicates that the species is not referred to in any Threat Abatement Plans.

There are no Relevant Commonwealth survey guidelines for this species.

Significant impact criteria

An action is likely to have a significant impact on a Vulnerable species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of an important population of a species

As mentioned above the project footprint is near the extent of the known range of Black Gum, and as such any individuals present could form part of an important population of the species.

Given the conspicuous nature of the species, it is considered highly likely that it would have been detected during targeted surveys. Given the project would only impact a relatively small proportion (2.54%) of the potential habitat within the project footprint, it is considered unlikely that the project would lead to a long-term decrease in the size of a potentially important population should it occur.

Reduce the area of occupancy of an important population

The conservation advice for Black Gum has estimated the area of occupancy for Black Gum to be 808 km^2 in NSW. The project would directly impact potential habitat for the species through clearing about 2.5% of potential habitat available within the project footprint. The project also has the potential to result in indirect impacts to habitats (such as edge effect and weed invasion). Given no individuals are known to

occur, and the relatively small proportion of potential habitat to be impacted, the project is considered unlikely to reduce the area of occupancy of the species.

Fragment an existing important population into two or more populations

While no individuals of Black Gum have been recorded within the project footprint, the species is still considered a moderate likelihood of occurrence and if present, may form part of an important population. Potential habitat for this species, PCTs 679, 1191 and 1256, is present in both continuous and fragmented states within the project footprint. The indicative disturbance area is patchily distributed within the footprint, with few areas of continuous clearing most likely to fragment an important population. Where the indicative disturbance area does intersect habitat across the footprint, it is mostly along the edge of habitat patches adjacent to previously cleared areas, removing less than a hectare from each patch and minimally affecting connectivity. This impact is also unlikely to impact pollination and dispersal of genetic material by wind or flying pollinators.

The project will directly impact potential habitat for the species and although the project has the potential to result in indirect impacts to the habitats, these would be localised. Given that the 1.25ha to be impacted by the project (1.38 ha including prescribed impacts) comprises about 11% of the habitat mapped within the project footprint, the project is considered unlikely to fragment an existing population into two or more populations.

Adversely affect habitat critical to the survival of a species

There is no Critical Habitat in NSW defined under section 207A of the EPBC Act that has been identified or included in the Register of Critical Habitat for the species. However, due to the species association with at least one EPBC-listed TEC, this habitat will have high conservation value that benefits the species (TSSC 2015a).

Given Black Gum is not known to occur within the project footprint, the habitat to be impacted is considered unlikely to be critical to the survival of the species.

Disrupt the breeding cycle of an important population

The project would remove up to 1.25 ha of potential habitat (1.38 ha including prescribed impacts) that has the potential to support an important population (about 2.5% of the potential habitat present within the project footprint). If it is assumed that all of the potential habitat may support an important population, then the project has the potential to impact on the breeding cycle of the population through removal of potential habitat for about 2.5% of the population.

Black Gum flowers from November through to May (Benson and McDougall, 1998) and pollination is likely to occur by a range of insects, birds and mammals. Seed is dispersed locally by wind, water and gravity and there is no dormancy phase. Given this, the project is unlikely to limit pollinator activity and the method of seed dispersion for Black Gums. Therefore, due to the relatively small area of impact, and the species method of reproduction, the project is considered unlikely to disrupt the breeding cycle of an important population of Black Gum, should it occur.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

The project would result in the removal of 1.25 ha (2.5% of the total habitat mapped in the project footprint) of potential habitat. While the species was not recorded, the removal of 1.25 ha of potential habitat (1.38 ha including prescribed impacts) that may support an important population, thus the project has the potential to lead to species decline.

Result in invasive species that are harmful to a vulnerable species becoming established in the vulnerable species' habitat

The project is considered unlikely to result in the introduction of invasive species that may become established in habitat for the species. The area of potential habitat is already affected by weeds where soil disturbance has occurred with some areas also subject to grazing. Proposed measures to mitigate the risk of indirect impacts, such as weed invasion, will be implemented. Mitigation measures to control the spread of weeds and pest animals would be detailed in the Biodiversity Management Plan.

Introduce disease that may cause the species to decline, or

There is low potential for any plant or machinery used in construction to transport pathogens, such as *Phytophthora cinnamomi* (Cinnamon Fungus) and *Puccinia psidii* (Myrtle Rust) to which Black Gum are susceptible.

Mitigation measures to control the spread of pathogens would be detailed in the Biodiversity Management Plan. It has been recommended that this risk be managed through the use of wash down procedures for in-stream plant between crossing locations.

Interfere with the recovery of the species

The Conservation Advice (TSSC 2015a) for the species identifies the following strategies to achieve the recovery objectives:

- Avoid the use of fertilisers in or around stands of Black Gum where weeds may flourish.
- Advise landholders of presence and encourage and support appropriate conservation practices.
- Manage sites to identify, control and reduce the spread of invasive weeds.
- If maintenance activities occur in the area (eg roadside maintenance, mowing, spraying, slashing etc.), ensure landowners/managers use an appropriate management regime that does not detrimentally affect this species and will allow regeneration from seedlings.
- Manage the population to maintain genetic diversity.
- Implement an appropriate fire management regime for protecting key habitat.
- If livestock grazing occurs in the area, ensure landowners/managers use an appropriate management regime and density that does not detrimentally affect this species, will allow regeneration from seedlings and manage total grazing pressure at important sites through exclusion fencing or other barriers.
- In collaboration with the Australian Seed Bank Partnership, use known protocols to establish ex-situ seed collections that capture genetic representation of the remaining populations as an insurance policy, to aid in re-establishing populations if needed in the future and to bolster stands where regeneration is not occurring.
- Undertake translocations using the Australian Network for Plant Conservation (ANPC) guidelines to augment small stands identified as being at significant risk from hybridisation.
- Consider the removal of hybrids in the context of maintaining evolutionary potential and reducing risk of species loss through hybridisation.

- Work with local groups to ensure the ANPC guidelines are followed when undertaking revegetation work using Black Gum.
- Implement appropriate vehicle and footwear hygiene protocols where possible to avoid the spread of Phytophthora and Myrtle Rust.

The project would not impede or interfere with any of the targeted recovery actions for this species.

Conclusion

In line with the above findings, the project is considered unlikely to have a significant impact on the Black Gum. A summary of the NSW assessment bilateral requirements for Black Gum is presented in Table A18-7.

Table A18- 7: NSW assessment bilateral requirements for Black Gum

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of habitat for this species, important populations, habitat critical for survival and relevant Commonwealth documents are provided above, with a map showing its modelled habitat distribution provided below.  Current distribution map for Black Gum habitat (DCCEEW 2022r)
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	Field survey techniques used to undertake surveys were in general accordance with the NSW guide for the BAM (DPIE, 2020b) with a detailed field verification method provided in Section 4 of the BDAR. Mapping of native vegetation and habitat extent within the project is required under section 4.1 of the BAM, with detailed requirements outlined in section 3.2 of the BAM 2020 Operational Manual. Field data was used to assign condition classes for any given observed habitat patch, where relevant. Field surveys for threatened flora were carried out using a combination of parallel field traverses and a two-phase grid-based systematic survey approach as set out in the DPIE (2020b) Guideline for Surveying threatened plants and their habitats. Crookwell • 26 surveys in Jan-22 • 86 surveys in Feb-22 • 7 surveys in Mar-22 • 5 surveys in May-22 • 50 surveys in Sep-21 • 32 surveys in Oct-21 Murrumbateman • 30 surveys in Feb-22 • 3 surveys in Mar-22 • 3 surveys in May-22 • 138 surveys in Sep-21

NSW Assessment Bilateral requirements	
	• 72 surveys in Oct-21 • 89 surveys in Nov-21 • 150 surveys in Dec-21
Description of the relevant impacts and its regard to the full national extent of the species or community's range	A description of relevant impacts is provided in the 'Specific impacts' section of this assessment.
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Black Gum: • Project design refinement to potentially avoid impacts to the species wherever possible. • Micro-siting of transmission line infrastructure and associated construction work sites to avoid impacts to the species, where possible. • Using existing cleared areas and access tracks, where possible. • Biodiversity exclusion zones, which could consider the species habitat and known locations. • Vegetation clearing and maintenance guidelines and procedures that addresses avoiding access and disturbance in biodiversity exclusion zones identified during the construction and avoiding maintenance of vegetation that does not need to be maintained during operation. • Soil and Water Management Plans (SWMP) including Erosion and Sediment Control Plans and Water Quality Monitoring Plans to mitigate construction impacts to groundwater and surface water drainage patterns. • Biodiversity Management Plan to be implemented during construction, including measures to reduce disturbance to sensitive vegetation areas, procedures for the demarcation and protection of retained vegetation, rehabilitation strategies for the management and maintenance of rehabilitated areas and monitoring requirements and compliance management (including weed control and management).
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	The residual impact to Black Gum is estimated at 1.25 ha (1.38 ha including prescribed impacts) of habitat removal. There is the potential for indirect impacts (such as edge effects and weed incursion) to occur to any retained areas of Black Gum habitat within or adjacent to the project footprint, however, it is expected that these impacts will be largely mitigated and managed through implementation of measures noted above. The residual impact to this species was considered unlikely to be significant as per the SIA (see above).
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Not required. As per the SIA, residual impacts to this species were considered unlikely to be significant. Details of offset requirements and obligations for this species as a result of residual impacts due to the project are addressed in Section 14 of the BDAR. Impacts to Black Gum would be offset under the NSW BOS.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • the purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register • establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project

NSW Assessment Bilateral requirements	
descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	• through making a payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. As detailed above, all residual impacts to the species would be offset under the NSW BOS and, as per the SIA, significant residual impacts to this species are considered unlikely. Therefore, application of the EPBC Act Environmental Offset Policy is not required.

2.2.4 Cambage Kunzea (*Kunzea cambagei*)

The Cambage Kunzea is listed as Vulnerable under the BC Act and the EPBC Act.

Description

From the Myrtaceae family, *Kunzea cambagei*, commonly referred to as Cambage Kunzea, is a prostrate shrub at 0.6 m high. Leaves are sweetly-scented, 3–8 mm long and 3 mm wide, with a rounded tip. Flowers are cream to yellow coloured and are grouped in clusters at the ends of branches. Fruits are a hairy capsule 3 mm long (DEWHA 2008c).

Cambage Kunzea occurs in the western and southern parts of the Blue Mountains, NSW, with four main populations with 20–150 individuals. Populations are located west of Berrima, along the Wingecarribee River; Loombah Plateau east of Mount Werong; the Oberon–Colong Stock Route within Kanangra–Boyd National Park (NP); and Wangaderry Plateau within the Nattai NP (DEWHA 2008c). Indicative distribution mapping from the Species Profile and Threats Database (DCCEEW 2022w) indicates that the portion of the project north-east of Goulburn is mapped with both 'species and species habitat likely to occur' and 'species and species habitat may to occur'. As such, the species is considered likely to occur within the project footprint.

The habitat required by Cambage Kunzea includes wet heath and woodland on coarse sandy soil on sandstone and quartzite. This species is associated with the following EPBC Act-listed TECs (TEC; DEWHA 2008c):

- White Box-Yellow Box-Blakely's Red Gum Grassy Woodland and Derived Native Grassland
- Natural Temperate Grassland of the Southern Tablelands of NSW and the Australian Capital Territory
- Temperate Highland Peat Swamps on Sandstone.

Is this part of an important population?

No important populations have been defined for Cambage Kunzea. However, potential habitat for Cambage Kunzea within the project footprint is located within the south-western extent of the species range, in areas where it is predicted the species habitat is likely to, or may occur, according to the species SPRAT profile. Therefore, any individuals present within the project footprint are likely to occur on the edge of the species range and be considered part of an important population due to their location at the extent of the species range.

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species is as follows:

- Approved Conservation Advice for the Cambage Kunzea (DEWHA 2008c), in effect under the EPBC Act from 3 July 2008.
- The SPRAT database indicates that there is no Recovery Plan for the Cambage Kunzea.
- There are no relevant Commonwealth survey guidelines for this species.

Specific impacts

Cambage Kunzea is considered to have moderate likelihood of occurrence within the project footprint in the Bungonia IBRA subregion due to the presence of suitable habitat and five previous records within 20 km of the project footprint (DPIE 2021). In the project footprint there is 71.18 ha of potential habitat (comprising PCT 1150) mapped, of which, 12.20 ha (17%) would be cleared as a result of the project. Further, there is an additional 0.14 ha of impacts on non-native habitats for Cambage Kunzea (prescribed impacts). Therefore, the total impact to Cambage Kunzea habitat, including prescribed impacts, is 12.34 ha. General flora and vegetation surveys conducted did not detect presence of this species. Given the relatively conspicuous nature of the species, it is considered likely that it would have been detected if present. However, given that targeted surveys were not conducted within the required season, its presence could not be ruled out and it has been included on a precautionary basis.

Significant impact criteria

An action is likely to have a significant impact on a Vulnerable species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of an important population of a species

As stated above, the potential habitat within the project footprint is on the edge of Cambage Kunzea's predicted distribution. Therefore, any individuals within the project footprint would likely comprise an important population.

Within the project footprint there is 71.18 ha of potential habitat mapped (comprising PCT 1150), of which, 12.2 ha (17%) would be cleared as a result of the project. Given the relatively large area of impact, the project is considered to have the potential to lead to a long-term decrease in the species or a population of the species, should it occur.

Reduce the area of occupancy of an important population

There is no defined area of occupancy for this species. The extent of impact within the project footprint on the species is 12.20 ha (12.34 ha including prescribed impacts) (17% of the total mapped potential habitat). The project would directly impact potential habitat and has the potential to result in indirect impacts to habitat (such as edge effects and weed invasion).

Of the potential habitat within the project footprint, it is unlikely that the species would be restricted to the area being directly impacted, and thus its area of occupancy may include all potential habitat within the project footprint. However, based on the removal of over 12.2 ha of potential habitat, should the species occur, the project could reduce the area of occupancy of the species.

Fragment an existing important population into two or more populations

The project would include construction of transmission line structures, access tracks, substations and construction compounds. Whilst total clearance has been assumed within Total Clearance Zone (TCZ), the groundcover would not be removed in the ECZ and HTZ.

As mentioned above, given surveys were not conducted within the required season, its presence could not be ruled out and it has been assumed present in all areas of potential habitat based on the precautionary principle.

Potential habitat is mapped according to the extent of woody PCT 1150, where the species is assumed to have a moderate likelihood of occurrence. This PCT occurs in two distinct patches within the Bungonia subregion. While the indicative disturbance area is patchily distributed within most of the footprint, the TCZ within the indicative disturbance area that bisects the potential Cambage Kunzea habitat is continuous and requires full clearance to ground layer across the majority of the patch. The proposed indicative disturbance area is also placed centrally in the middle of the patch of potential habitat, physically separating the patch into two sections.

As the species is likely to be pollinated by flying insects, and its seeds dispersed by wind, permanent structures, such as access tracks and transmission line structures, are unlikely to completely prevent pollination and gene flow between individuals post construction. However, as fire appears to play a role in seed germination, any disparity in fire or land management regimes between the separated populations may result in changes to fecundity and possibly result in two distinct populations.

The project would directly impact 12.20 ha of potential habitat (12.34 ha including prescribed impacts), which constitutes 17% of the total 71.18 ha mapped in the project footprint. Given the relatively large area of impact and the placement of the indicative TCZ in the middle of potential habitat (which has the potential to physically bisect the patch), if the species is present in the area, the project is considered to have the potential to fragment any existing important population into two or more populations.

Adversely affect habitat critical to the survival of a species

To date, no Critical Habitat as defined under section 207A of the EPBC Act has been identified or included in the Register of Critical Habitat for the species or identified in the Conservation Advice for the species.

The project would not impact on known habitat or habitat that supports any of the extant four populations of the species. The species has a moderate likelihood of occurrence within all areas of potential habitat within the project footprint, therefore the removal of 17% of identified potential habitat is considered unlikely to affect habitat critical to the survival of the species.

Disrupt the breeding cycle of an important population

The project would result in the removal of 12.20 ha (12.34 ha including prescribed impacts) of potential habitat for the species. The proposed vegetation removal is unlikely to significantly disrupt the breeding cycle in the long-term, given the species is likely to be pollinated by mobile insects and its seeds dispersed by wind.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

The project would result in the removal of 12.20 ha of potential habitat (12.34 ha including prescribed impacts), which comprises 17% of the total (71.18 ha) habitat mapped in the project footprint. Indirect impacts (such as edge effect and weed incursion), as mentioned above, also have the potential to negatively impact species habitat, however implementation of proposed mitigation measures would mitigate the risk of indirect impacts. Given the relatively large area of impact, should the species occur, the project has the potential to decrease habitat to an extent that may lead to a decline in the species.

Result in invasive species that are harmful to a vulnerable species becoming established in the vulnerable species' habitat

The project is not likely to result in the introduction of invasive species that may become established in habitat for the species. The area of potential habitat is already affected by weeds where soil disturbance has occurred and land has been subject to grazing. Several mitigation measures have also been proposed to further mitigate the risk of indirect impacts. Mitigation measures to control the spread of weeds and pest animals would be detailed in the Biodiversity Management Plan.

Introduce disease that may cause the species to decline, or

There is a low potential for any plant or machinery used in construction to transport pathogens, to which Cambage Kunzea may be susceptible.

Mitigation measures to control the spread of pathogens would be detailed in the Biodiversity Management Plan. It has been recommended that this risk be managed through the use of wash down procedures for in-stream plant between crossing locations.

Interfere with the recovery of the species

The Conservation Advice (DEWHA 2008c) for the species identifies the following strategies to achieve the recovery objectives:

- Habitat Loss, Disturbance and Modification
  - Identify populations of high conservation priority.
  - Negotiate with Department of Lands and relevant landowners in the Berrima area to prepare management statements to manage threats to areas of vegetation that contain populations/occurrences/remnants of *Kunzea cambagei.*
  - Ensure road widening and maintenance activities (or other infrastructure or development activities as appropriate) in areas where *Kunzea cambagei* occurs do not adversely impact on known populations and that personnel are able to identify this species and its habitat (DECC, 2005b).
  - Ensure chemicals or other mechanisms used to eradicate weeds do not have a significant adverse impact on *Kunzea cambegei.*
  - Control access routes to suitably constrain public access to known sites in public land.
  - Investigate formal conservation arrangements such as the use of covenants, conservation agreements or inclusion in reserve tenure, especially sites in the Berrima area on private land and Crown lands.
- Fire
  - Develop and implement a suitable fire management strategy for *Kunzea cambagei*, timing any prescribed burn to after seed has been released (autumn to winter) (NSW NPWS, 2000a).
  - Identify appropriate intensity and interval of fire to promote seed germination and vegetation regeneration.

- Provide maps of known occurrences to local and state rural fire services and seek inclusion of mitigative measures in bush fire risk management plans, risk register and/or operation maps.

- Conservation Information
  - Raise awareness of *Kunzea cambagei* within the local community, particularly among landowners.
- Enable Recovery of Additional Sites and/or Populations
  - Undertake appropriate seed collection and storage.
  - Investigate options for linking, enhancing or establishing additional populations.
  - Implement national translocation protocols (Vallee et al., 2004) if establishing additional populations is considered necessary and feasible.

The project would not impede or interfere with any of targeted recovery actions for this species.

Conclusion

The project is considered to have the potential to have a significant impact on Cambage Kunzea due to the removal of 12.20 ha (12.34 ha including prescribed impacts) of potentially suitable habitat where it is considered to have a moderate likelihood of occurrence based on the precautionary principle. A summary of the NSW assessment bilateral requirements for Cambage Kunzea is presented in Table A18- 8.

Table A18- 8: NSW assessment bilateral requirements for Cambage Kunzea

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of habitat for Cambage Kunzea, important populations, habitat critical for survival and relevant Commonwealth documents are provided above, with a map showing its modelled habitat distribution provided below. Current habitat distribution map for Cambage Kunzea (DEECCW, 2022w) 'Approved Conservation Advice for Kunzea cambagei' (DEECCW 2008) is the key conservation advice for this species.
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published	Due to the species' limited survey period (October to November), no targeted surveys were conducted for this species.

NSW Assessment Bilateral requirements	
Australian Government guidelines and policy statements	
Description of the relevant impacts and its regard to the full national extent of the species or community's range	A description of relevant impacts is provided in the 'Specific impacts' section of this assessment.
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Cambage Kunzea: • Project design refinement to potentially avoid impacts to the species wherever possible • Micro-siting of transmission line infrastructure and associated construction work sites to avoid impacts to the species, where possible. • Using existing cleared areas and access tracks, where possible. • Biodiversity exclusion zones, which could consider the species habitat and known locations • Vegetation clearing and maintenance guidelines and procedures that addresses avoiding access and disturbance in biodiversity exclusion zones identified during the construction and avoiding maintenance of vegetation that does not need to be maintained during operation. • Soil and Water Management Plans (SWMP) including Erosion and Sediment Control Plans and Water Quality Monitoring Plans to mitigate construction impacts to groundwater and surface water drainage patterns. • Biodiversity Management Plan to be implemented during construction, including measures to reduce disturbance to sensitive vegetation areas, procedures for the demarcation and protection of retained vegetation, rehabilitation strategies for the management and maintenance of rehabilitated areas and monitoring requirements and compliance management (including weed control and management).
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	The residual impact to the Cambage Kunzea is estimated at 12.2 ha (12.34 ha including prescribed impacts) of potential habitat removal. There is the potential for indirect impacts (such as edge effects and weed incursion) to occur to any retained areas of the species habitat within or adjacent to the project footprint, however, it is expected that these impacts will be largely mitigated and managed through implementation of the measures noted above. The residual impact to this species was considered to have the potential to be significant as per the SIA (Attachment 18).
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Not required. As per the SIA, residual impacts to this species were considered unlikely to be significant. Details of offset requirements and obligations for this species as a result of residual impacts due to the project are addressed in Section 14 of the BDAR. Impacts to Cambage Kunzea will be offset under the NSW BOS.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register.

NSW Assessment Bilateral requirements	
with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	• Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project • Through making a payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. As detailed above, all residual impacts to the species would be offset under the NSW BOS and, as per the SIA, significant residual impacts to this species are considered unlikely. Therefore, application of the EPBC Act Environmental Offset Policy is not required.

2.2.5 Hoary Sunray (*Leucochrysum albicans* var. *Tricolor*)

Hoary Sunray is listed as Endangered under the EPBC Act.

Description

Hoary Sunray is a perennial everlasting daisy belonging to the family Asteraceae. Stems are 10– 15 cm tall, and have narrow leaves 2–10 cm long, covered in white cottony hairs. The yellowish flower heads are 2-5 cm in diameter and surrounded by numerous white overlapping ovate oblong bracts, with the outer layer often tinged purple or brown. The fruits are brown, ovoid, 2– 3 mm long, with 14–20 pappus bristles. The flowering period for Hoary Sunray is November–December in Victoria (Vic), October–January (earlier at lower elevations and later at higher elevation sites) in Tasmania (Tas) and probably October– December in New South Wales (NSW) and the Australian Capital Territory (ACT). Surveys should be undertaken during its flowering period, when the taxon is most conspicuous, as non-flowering plants can be difficult to locate in grassy habitat.

Hoary Sunray is endemic to south-eastern Australia, where it occurs in three geographically separate areas.

The majority of Hoary Sunray subpopulations are in NSW and the ACT where the taxon is still locally common although some roadside subpopulations may be declining. The species currently occurs on the Southern Tablelands roughly from Bombala to Goulburn, with several records from further north near Mudgee. The species once occurred more widely in NSW, with records from near Tarcutta, Bega Valley, Moss Vale and Delegate. Large subpopulations of a *Leucochrysum* from subalpine parts of Kosciuszko National Park (eg Happy Jacks Plain) are referring to *Leucochrysum alpinum* (Alpine Sunray) and not Hoary Sunray.

In Tasmania, Hoary Sunray is scattered across the midlands, particularly around Ross, Tunbridge and Campbelltown. It also occurs in the north near Stanley and in several locations in the Great Western Tiers. Current distribution includes the Tasmanian Southeast, Tasmanian Northern Midlands, Tasmanian Central Highlands and King IBRA bioregion (DEH, 2000). It once occurred in southern Tasmania, between Buckland and Oatlands, on the north coast near Wynyard, in some areas of western Tasmania (GTSpot, Tasmania Parks and Wildlife Service GIS Webserver) and may once have occurred on the west coast. The taxon is now absent from the Tasmanian Northern Slopes bioregion.

In Victoria, Hoary Sunray occurs in the south-west, between Colac, Inverleigh, Ballarat, Ararat and Hamilton, in the Victorian Volcanic Plain bioregion. It was once more widespread in the region, with records from Port Fairy, Macarthur, Creswick and Mt Cole.

Indicative distribution mapping from the Species Profile and Threats Database (DCCEEW 2022s) indicates that the portion of the project from west of Yass to east of Goulburn is mapped with both 'species and species habitat likely to occur' and 'species and species habitat may to occur'. As such, the species is considered likely to occur within the project footprint.

Specific impacts

Hoary Sunray has been recorded in the project footprint. A total of 119,311 individuals were recorded in PCT 1330 in the Crookwell IBRA-subregion, and 8,792 individuals were recorded in PCT 727 in the Murrumbateman IBRA subregion. The species was recorded in grasslands, in areas with existing or past disturbance, or on the edges of the existing easement. With reference to associated PCTs present within the project footprint, the known and potential habitat comprises of following:

- 184.49 ha of potential habitat (comprising PCTs 1093, 1097 and 1330) in Bungonia, of which 11.38 ha would be impacted by the project (6%).
- 648.77 ha of potential habitat (comprising PCTs 679, 727, 731, 952, 1093, 1191 and 1330) in Crookwell, of which 31.81 ha would be impacted by the project (5%)
- 906.95 ha of potential habitat (comprising PCTs 349, 351, 352, 731, 1093 and 1330) in Murrumbateman, of which 32.44 ha would be impacted by the project (4%)
- 518.14 ha of potential habitat (comprising PCTs 268, 352, 731, 1191 and 1330) in Inland Slopes, of which 12.17 ha would be impacted by the project (2%)
- 172.57 ha of potential habitat (comprising PCT 953) in Bondo, of which 30.82 ha would be impacted by the project (18%)
- 343.47 ha of potential habitat (comprising PCTs 679, 953 and 1196) in Snowy Mountains, of which 64.02 ha would be impacted by the project (19%).

In total there is 2,774.39 ha of potential and known habitat for the Hoary Sunray, of which, 182.63 ha would be impacted by the project (6.5%). Further, there is an additional 17.60 ha of impacts on non-native habitats for Hoary Sunray (prescribed impacts). Therefore, the total impact to Hoary habitat, including prescribed impacts, is 200.23 ha.

Populations recorded within the project footprint were large and could be necessary for maintaining genetic diversity or dispersal across the region. As such, any individuals or population of this species recorded within the project footprint are considered to form part of an important population.

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species is as follows:

- Approved Conservation Advice for the Hoary Sunray (DAWE 2021b), in effect under the EPBC Act from 20 December 2021.
- Recovery Plan for the Hoary Sunray (Sinclair, 2010), in effect under the EPBC Act from 10 February 2012.
- The SPRAT database indicates that the species is not referred to in any Threat Abatement Plans.

There are no relevant Commonwealth survey guidelines for this species.

Significant impact criteria

An action is likely to have a significant impact on an Endangered or Critically Endangered species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of a population of a species

The species has been verified as known in the project footprint and is considered to have the potential to occur in all areas of suitable habitat based on indicative mapping and habitat assessments. The species was recorded in the Crookwell IBRA-subregion in PCT 1330 and in the Murrumbateman IBRA subregion in PCT 727. The species was mainly recorded in grasslands, in areas with existing or past disturbance, or on the edges of the existing easement.

The project is considered to have the potential to lead to a long-term decrease in the species or a population of the species. This is taking into consideration that there would be direct impacts to the mapped known and indicative habitat of the species and its presence within the project footprint. Avoidance and mitigation measures have been incorporated into the project. Further detailed recommendations as to specific mitigation measures to prevent impacts to potential habitats for the species have been included in this report.

Reduce the area of occupancy of the species

The conservation advice for this species has the area of occupancy as less than 2,000 km^2. The project would impact on 182.63 ha of known and potential habitat (200.23 ha including prescribed impacts), equating to 6.5% of the habitat mapped within the project footprint. This includes mapped populations of the species. Of the potential habitat within the project footprint, it is unlikely that the species is restricted to the area being directly impacted, and thus its area of occupancy may be greater than the mapped populations. However, based on the removal of over 300 ha of potential habitat and impacts to populations within the project footprint, the project may reduce the area of occupancy of the species.

Fragment an existing population into two or more populations

The project would include construction of transmission line structures, access tracks, substations and construction compounds. Whilst it is assumed all vegetation will be removed but would maintain groundcover and vegetation up to a certain height within the TCZ. Groundcover would not be removed in the ECZ and HTZ.

Potential habitat for this species is present in both continuous and fragmented states within the project footprint. In total there is 2,774.39 ha of potential and known habitat for the Hoary Sunray, of which, 182.63 ha (200.23 ha including prescribed impacts) would be impacted by the project (6.5%). The indicative disturbance area is patchily distributed within the footprint, with few areas of continuous clearing that are most likely to fragment an important population. Where the indicative disturbance area does intersect with potential habitat for this species, it is most commonly along the edge of habitat patches adjacent to previously cleared areas, with continuous TCZ impact areas of less than a hectare. While populations of Hoary Sunray may be more commonly found along edges, potential habitat was widespread throughout the footprint. Where the species was found in the footprint, it was locally abundant within both cleared and forested areas. This species is an obligate out-breeder and thought to be pollinated by bees and other flying insects, with a seed that is thought to be able disperse over many kilometres. This suggests that the construction of transmission line structures and access tracks would not prevent genetic flow and seed dispersal between populations. Some level of disturbance appears to be required for successful germination of the species. Ensuring any temporary ground storey clearing required is undertaken outside

of flowering times will prevent disruption to the breeding cycle and may even increase the population size. Mitigation and avoidance strategies, such as pre-clearance surveys and micro siting of transmission line structures would ensure that impact on important populations for both species is minimised during construction.

Considering the above information, the project is considered unlikely to fragment an existing population into two or more populations.

Adversely affect habitat critical to the survival of a species

There is no Critical Habitat defined under section 207A of the EPBC Act that has been identified or included in the Register of Critical Habitat for the species.

The current Conservation advice (DAWE 2021b) describes Hoary Sunray critical habitat in NSW as two EPBC Act-listed TECs: Natural Temperate Grassland of the South-eastern Highlands and White Box–Yellow Box–Blakely's Red Gum Grassy Woodlands and Derived Native Grasslands. These are not officially listed as 'Critical Habitat' for the species; however, their protection will serve as a direct benefit to the species.

The project would result in the removal of 182.63 ha (200.23 ha including prescribed impacts) of potential and known habitat. Indirect impacts such as edge effects, weed incursion weed spraying along roadsides, road widening and habitat degradation, also have the potential to negatively impact species habitat, however implementation of the proposed mitigation measures will mitigate the risk of indirect impacts.

Populations recorded within the project footprint were large and could be necessary for maintaining genetic diversity or dispersal across the region. The removal of over 300 ha of known and potential habitat is considered to have the potential to adversely affect habitat that may be critical to the survival of the species.

Disrupt the breeding cycle of a population

The Hoary Sunray is pollinated by many different insects, including bees and flies (Berechree 2003). It is thought that the seed can disperse over many kilometres, would germinate fairly rapidly under a wide range of conditions, and can remain viable in the soil for at least a few months, although probably not for long periods (Gilfedder & Kirkpatrick 1994c, 1994d, 1994e).

Given this the removal of 182.63 ha (200.23 ha including prescribed impacts), which comprises 6.5% of all known and potential habitat within the project footprint, is unlikely to significantly disrupt the breeding cycle of any populations within the project footprint.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

The project would result in the removal of 182.63 ha (200.23 ha including prescribed impacts) of potential and known habitat for the Hoary Sunray, this comprises 6.5% of all known and potential habitat within the project footprint. This mapped habitat and the associated records are likely to support an important population and potentially habitat critical to the survival of the species, thus the project has the potential to lead to species decline.

Result in invasive species that are harmful to an endangered or critically endangered species becoming established in the endangered or critically endangered species' habitat

The project is not likely to result in the introduction of invasive species that may become established in habitat for the species. Within the project footprint the species was recorded in grasslands, in areas with existing or past disturbance, or on the edges of the existing easement. The area of potential habitat is already affected by weeds where soil disturbance has occurred and some areas that have been subject to grazing. Mitigation measures have been proposed to mitigate the risk of indirect impacts. Mitigation measures to control the spread of weeds and pest animals would be detailed in the Biodiversity Management Plan.

Introduce disease that may cause the species to decline, or

There is a low potential for any plant or machinery used in construction to transport pathogens, to which Hoary Sunray are susceptible.

Mitigation measures to control the spread of pathogens would be detailed in the Biodiversity Management Plan. It has been recommended that this risk be managed through the use of wash down procedures for in-stream plant between crossing locations.

Interfere with the recovery of the species

Conservation Advice (DAWE 2021b) for the species identifies the following strategies to achieve recovery objectives:

- Primary conservation outcome
  - No important populations are damaged, destroyed, or decline
- Inappropriate fire regimes
  - Continue appropriate burning of grassland subpopulations of Hoary Sunray in late summer to mid-autumn. In Victoria, cessation of such management will likely result in the decline or local extinction of Hoary Sunray. Country Fire Authority brigades in Western Victoria should be encouraged and supported to implement frequent burning of roadside grassland sites containing Hoary Sunray subpopulations. Recommended frequency of fire is typically 2–5 years in Kangaroo Grass-dominated grasslands (McDougall 1989).
  - If burning is unfeasible, explore options for slashing (noting that high biomass may necessitate the removal of slash) or temporary grazing over the summer and early autumn periods.
- Habitat loss, disturbance and modifications
  - Explore options to purchase areas of key populations and incorporate into the conservation reserve system.
  - Ensure all subpopulations of Hoary Sunray are recorded in relevant databases used by decision makers and land managers so that subpopulations are not destroyed or damaged unknowingly, eg during road maintenance work.
  - Ensure contractors undertaking road maintenance activities are aware of the significance and location of Hoary Sunray subpopulations.
  - Explore options for signage or permanent markers around roadside subpopulations to reduce the risk of accidental destruction.
  - Engage with private landowners with subpopulations of Hoary Sunray on their properties and explore options to covenant or protect unsecured subpopulations on private land.
- Invasive species
  - Where weeds are in strong competition with Hoary Sunray, organise control of high threat weeds in significant subpopulations, if possible, to coincide with burning (ie post-fire).
  - Burning programs should include planned and funded post-fire weed control.
- Genetic threats resulting from small and fragmented subpopulations

- Collect and maintain ex situ seed and living collections (to ensure a supply of fresh seed is maintained as viability is likely to decline rapidly) from across the subspecies range at Botanic Gardens or appropriate institutions to manage the risk of losing genetic diversity. Ensure collections are large, monitored for viability and cover a broad spread of subpopulations within each State, particularly declining subpopulations, to ensure genetic diversity is captured. Refer to the Plant Germplasm Conservation Guidelines (Martyn Yenson et al. 2021).
- Investigate the potential for conservation translocations to create new subpopulations of Hoary Sunray in Tasmania and Victoria. Translocated subpopulations could include genetic mixing, although careful consideration should be given to risks associated with gene pool mixing as demonstrated in other Asteraceae (eg, ploidy differences between subpopulations). Any conservation translocations should be undertaken in accordance with the Guidelines for the Translocation of Threatened Plants in Australia (Commander et al. 2018) and monitored to maturity and seed set to ensure new subpopulations contribute to a decrease in the threatened status of Hoary Sunray.
- Monitor gene flow among declining subpopulations, particularly where there are no obvious physical threats driving the decline. Exchange of self-incompatibility alleles (S alleles) is important for population viability in this self-incompatible species, and such knowledge could inform genetic rescue attempts for affected subpopulations (Young and Pickup 2010; Thrall et al. 2014).
- Restore habitat following the National Restoration Standards (Standards Reference Group SERA 2021).

- Climate Change
  - Identify and protect current and future habitat likely to remain or become suitable for Hoary Sunray under future climate conditions.
  - Undertake a review of monitoring data to determine the role of drought in population decline of Hoary Sunray.
- Herbivory
  - Continue grazing regimes where they have been shown to be effective at managing Hoary Sunray. If there is evidence of a decline in Hoary Sunray in a grazed subpopulation, the role of grazing should be carefully considered, and other options for biomass reduction (eg fire) could be investigated to determine if grazing is a factor in the decline.
  - Undertake herbivore control where necessary.

The project may impede or interfere with targeted recovery action objectives associated with: Habitat Loss, Disturbance and Modification.

Conclusion

Based on the removal of a relatively large area of known and potential habitat, that likely supports what is likely an important population and habitat that may be critical to the species survival, the project is considered likely to have a significant impact on the Hoary Sunray.

A summary of the NSW assessment bilateral requirements for Hoary Sunray is presented in Table A18- 9.

Table A18- 9: NSW assessment bilateral requirements for Hoary Sunray

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging	A description of habitat for the Hoary Sunray important populations, habitat critical for survival and relevant Commonwealth documents are provided above, with a map showing its modelled habitat distribution provided below.

NSW Assessment Bilateral requirements	
habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	 Current distribution map for the Hoary Sunray (DCCEEW, 2022s) The commonwealth guidelines for this species include the 'National Recovery Plan for the Hoary Sunray *Leucochrysum albicans var. tricolor*' and the 'Conservation Advice for *Leucochrysum albicans subsp. Tricolor* (Hoary Sunray)'.
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	Field survey techniques used to undertake surveys were in general accordance with the NSW guide for the BAM (DPIE, 2020b) with a detailed field verification method provided in Section 4 of the BDAR. Mapping of native vegetation and habitat extent within the project is required under section 4.1 of the BAM, with detailed requirements outlined in Section 3.2 of the BAM 2020 Operational Manual. Field data was used to assign condition classes for any given observed habitat patch, where relevant. Field surveys for threatened flora were carried out using a combination of parallel field traverses and a two-phase grid-based systematic survey approach as set out in the DPIE (2020b) Guideline for Surveying threatened plants and their habitats. Bungonia • 10 surveys in Jan-22 • 24 surveys in Feb-22 • 1 survey in May-22 • 51 surveys in Sep-21 • 9 surveys in Oct-21 Crookwell • 26 surveys in Jan-22 • 86 surveys in Feb-22 • 7 surveys in Mar-22 • 5 surveys in May-22 • 50 surveys in Sep-21 • 32 surveys in Oct-21 Murrumbateman • 30 surveys in Feb-22 • 3 surveys in Mar-22 • 3 surveys in May-22 • 138 surveys in Sep-21 • 72 surveys in Oct-21 • 89 surveys in Nov-21

NSW Assessment Bilateral requirements	
	• 150 surveys in Dec-21 Inland Slopes • 7 surveys in Jan-22 • 4 surveys in Feb-22 • 41 surveys in Mar-22 • 11 surveys in May-22 • 69 surveys in Sept • 147 surveys in Oct-21 • 47 surveys in Nov-21 • 14 surveys in Dec-21 Bondo • 5 surveys in Nov-21 Snowy Mountains • 19 surveys in Jan-22 • 1 survey in Feb-22 • 9 surveys in Mar-22 • 32 surveys in Nov-21 • 10.08 km of random meander in Feb-21 (ELA)
Description of the relevant impacts and its regard to the full national extent of the species or community's range	A description of relevant impacts is provided in the 'Specific impacts' section of this assessment.
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Hoary Sunray: • Project design refinement to potentially avoid impacts to the species wherever possible • Micro-siting of transmission line infrastructure and associated construction work sites to avoid impacts to the species, where possible. • Using existing cleared areas and access tracks, where possible. • Biodiversity exclusion zones, which could consider the species habitat and known locations • Vegetation clearing and maintenance guidelines and procedures that addresses avoiding access and disturbance in biodiversity exclusion zones identified during the construction and avoiding maintenance of vegetation that does not need to be maintained during operation. • Soil and Water Management Plans (SWMP) including Erosion and Sediment Control Plans and Water Quality Monitoring Plans to mitigate construction impacts to groundwater and surface water drainage patterns. • Biodiversity Management Plan to be implemented during construction, including measures to reduce disturbance to sensitive vegetation areas, procedures for the demarcation and protection of retained vegetation, rehabilitation strategies for the management and maintenance of rehabilitated areas and monitoring requirements and compliance management (including weed control and management).
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	The residual impact to Hoary Sunray is estimated at 182.63 ha (200.23 ha including prescribed impacts) of known and potential habitat removal. There is the potential for indirect impacts (such as edge effects and weed incursion) to occur to any retained areas of the species habitat within or adjacent to the project footprint, however, it is expected that these impacts will be largely mitigated and managed through implementation of measures noted above. The residual impact to this species was considered to have the potential to be significant as per the SIA (see above).
A description of any offsets proposed to address residual adverse significant impacts	Residual, potentially significant impacts to the species would be offset under the NSW BOS. Details of offset requirements and obligations for this species as a result of residual impacts due to the project are addressed in Section 14 of the BDAR.

NSW Assessment Bilateral requirements	
and how these offsets will be established	
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project • Through making a payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All significant residual impacts to the species have been addressed under the NSW BOS. There are no significant residual impacts to the species that have not been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required.

2.2.6 Cotoneaster Pomaderris (*Pomaderris cotoneaster*)

Cotoneaster Pomaderris is listed as Endangered under the BC Act and the EPBC Act.

Description

From the *Rhamnaceae* family, *Pomaderris cotoneaster*, commonly referred to as Cotoneaster Pomaderris, is an erect shrub at 4 m high. Leaves are broad-ovate to broad-obovate, 20-50 mm long, 15-30 mm wide (DAWE, 2021c). The upper surface of the leaf is generally bristly, with hairs scattered to very sparse; at least some hairs are stellate (DCCEEW, 2022x). Flowers are cream, externally whitish with stellate and sparse simple hairs, pedicels are 1.5–2.5 mm long, hypanthium 0.5–1 mm long, sepals are 1.6–2 mm long, deciduous, petals and disc are absent, the ovary is virtually inferior with a villous summit and a style branched in the lower half (DAWE, 2021c).

The distribution of Cotoneaster Pomaderris is split across south-eastern Australia, from Lue, near Mudgee, north-west of Sydney, to far eastern Victoria. In total, 19 subpopulations have been recorded. The total number of plants known to exist in the wild is at least 3,200, although accurate population counts have not been made for all known subpopulations (DAWE, 2021c). The species has been recorded from private land, roadsides and conservation reserves (Southeast Forests National Park, Morton National Park, Kosciuszko National Park, Bungonia National Park, Bungonia State Conservation Area, Coopracambra National Park, Cambewarra Range Nature Reserve and Kanangra Boyd National Park; DAWE, 2021c). Indicative

distribution mapping from the Species Profile and Threats Database (DCCEEW, 2022x) indicates that the portion of the project around the Tumut and Goulburn area is mapped with both 'species and species habitat likely to occur' and 'species and species habitat may occur'. As such, the species is considered to have a moderate likelihood of occurrence within the project footprint.

The habitat required by Cotoneaster Pomaderris includes a very broad mix of vegetation communities, from tall open eucalypt forest to dry open eucalypt woodland, sometimes (but not always) in sites physically protected from fire, such as along rivers, gorges or escarpments (DAWE, 2021c).

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species is as follows:

- Approved Conservation Advice for Cotoneaster Pomaderris (DAWE, 2021c), in effect under the EPBC Act from 23 November 2021.
- Recovery Plan for Cotoneaster Pomaderris (DECCW, 2009b), in effect under the EPBC Act from 13 August 2010.
- There are no relevant Commonwealth survey guidelines for this species.

Specific impacts

Cotoneaster Pomaderris has a moderate likelihood of occurrence based on the presence of suitable habitat in the associated PCT 1150. Flora and vegetation surveys conducted did not detect the presence of this species. Given the relatively conspicuous nature of the species, it is considered likely that it would have been detected if present. However, given targeted surveys were not conducted within the required season, its presence could not be ruled out and it has been assumed to have the potential to occur in all areas of potential habitat. There is 64.32 ha of potential habitat in Bungonia, of which 11.70 ha would be impacted by the project (18%). Additionally, there are 141 records (DPIE, 2021) within 20 km of the project footprint in the Bungonia region.

The species is known to occur in the Inland Slopes and Bondo IBRA subregions, however due to no associated PCTs mapped in these two IBRA subregions, the species is considered unlikely to occur in these portions of the project footprint.

A total of 11.70 ha (18%) of potential habitat within the project footprint would be directly impacted due to the project with the potential to cause associated indirect impacts including edge effects and weed incursion.

Significant impact criteria

An action is likely to have a significant impact on an Endangered species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of a population of a species

Cotoneaster Pomaderris was not recorded in the project footprint but is considered to have a moderate likelihood of occurrence in the Bungonia IBRA Subregion based on indicative mapping and habitat assessments. Additionally, there are 141 known records (DPIE, 2021) within 20 km of the project footprint in the Bungonia region.

Within the project footprint there is 64.32 ha of potential habitat mapped (comprising PCT 1150), of which, 11.70 ha (18%) would be cleared as a result of the project. Given the relatively large area of impact and the potential for the species to occur based on numerous records within the vicinity, the project is considered to have the potential to lead to a long-term decrease in the species or a population of the species, should it occur.

Reduce the area of occupancy of the species

There is no defined area of occupancy for this species. The extent of impact within the project footprint on the species is 11.70 ha (18% of the total mapped potential habitat within the project footprint). The project would directly impact potential habitat and has the potential to result in indirect impacts to potential habitat.

Of the potential habitat within the project footprint, it is unlikely that the species is restricted to the area being directly impacted, and thus its area of occupancy may be greater than the habitat within the Bungonia subregion alone. However, based on the removal of over 11.70 ha of potential habitat, should the species occur, the project may reduce the area of occupancy of the species.

Fragment an existing population into two or more populations

As mentioned above, since surveys were not conducted within the required season, species presence could not be ruled out and it has been assumed as having the potential to occur in all areas of potential habitat based on the precautionary principle.

Potential habitat is defined as the extent of woody PCT 1150, where the species has been considered to have a moderate likelihood of occurrence. This PCT occurs in two distinct patches within the Bungonia subregion. The indicative disturbance area bisects the potential Cotoneaster Pomaderris habitat within these patches. Total (6.57 ha) and partial (5.13 ha) clearing is proposed within the indicative disturbance area.

As the species is likely to be pollinated by flying insects, and its seeds dispersed by wind, permanent structures, such as access tracks and towers, are unlikely to completely prevent pollination and gene flow between individuals post construction.

The project would directly impact 11.70 ha of potential habitat, which constitutes 18% of the total 64.32 ha mapped in the project footprint. Given the relatively large area of impact and the placement of the indicative TCZ in the middle of potential habitat (which has the potential to physically bisect the patch), if the species is present in the area the project is considered to have the potential to fragment any existing important population into two or more populations.

Adversely affect habitat critical to the survival of a species

There is no Critical Habitat in NSW defined under section 207A of the EPBC Act or in the Register of Critical Habitat for the species. However, due to the species eligibility for listing (restricted range and/or severe fragmentation), all habitat is considered critical to the survival of the species (DAWE, 2021c).

While Cotoneaster Pomaderris has not been recorded in the project footprint, the project will result in the removal of 11.7 ha of potential habitat. Indirect impacts, such as edge effects, weed incursion, weed spraying along roadsides, road widening and habitat degradation, also have the potential to negatively impact species habitat where it occurs adjacent to the project, however implementation of the proposed

mitigation measures would mitigate the risk of indirect impacts. Should the species occur, the project has the potential to impact habitat that may be critical to the survival of the species.

Disrupt the breeding cycle of a population

Cotoneaster Pomaderris is known to flower from October to November (VicFlora, 2020) and fruit matures in summer with seed being released predominantly in late January and early February (DECCW, 2009). Time to reproductive maturity for other Pomaderris is estimated at 2–6 years (Maryott-Brown & Wilks, 1993; Patykowski et al., 2014), and may be assumed to be similar for Cotoneaster Pomaderris. The pollinators of Cotoneaster Pomaderris are unknown, although insects are thought to be the primary pollinators of the Pomaderris genus generally (Patykowski et al., 2014).

The project would remove up to 11.7 ha of potential habitat for the species. This proposed vegetation removal is unlikely to significantly disrupt the reproduction of Cotoneaster Pomaderris in the long-term, given that the species is likely to be pollinated by mobile insects and its seeds wind dispersed.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

The project would result in the removal of 11.7 ha of potential habitat, which comprises 18% of the total 64.32 ha habitat mapped in the project footprint. Indirect impacts, as mentioned above, have the potential to negatively impact species habitat, however implementation of proposed mitigation measures would minimise the risk of indirect impacts. Given the relatively large area of impact and that targeted surveys were not undertaken for this species, the project is considered to have the potential to decrease habitat to an extent that leads to a decline in the species.

Result in invasive species that are harmful to an endangered or critically endangered species becoming established in the endangered or critically endangered species' habitat

The project is not likely to result in the introduction of invasive species that may become established in habitat for the species. The area of potential habitat is already affected by weeds where soil disturbance has occurred and where areas have been subject to grazing. Mitigation measures have been proposed to minimise the risk of indirect impacts. Mitigation measures to control the spread of weeds and pest animals would be detailed in the Biodiversity Management Plan.

Introduce disease that may cause the species to decline, or

Mitigation measures to control the spread of pathogens would be detailed in the Biodiversity Management Plan. There is low potential for any plant or machinery used in construction to transport pathogens to which Cotoneaster Pomaderris are susceptible. It has been recommended that this risk be managed through the use of wash down procedures for in-stream plant between crossing locations.

Interfere with the recovery of the species

The Recovery Plan (DECCW, 2009b) for the species identifies the following strategies to achieve the recovery objectives:

- Conduct further survey
- Determine habitat critical to the survival of *Pomaderris cotoneaster* and monitor populations
- Remove threatening weeds

- Erect a barrier at Badgerys Lookout
- Population enhancement
- Investigate genetic diversity
- Obtain management agreements for populations on non-reserve tenure
- Provide information to affected parties
- Ensure adequate data management
- Co-ordinate recovery actions.

The project would not impede or interfere with any of targeted recovery actions for this species.

Conclusion

The project is considered to have the potential to significantly impact Cotoneaster Pomaderris due to the removal of 11.7 ha of potentially suitable habitat where it is considered to have a moderate likelihood of occurrence based on the precautionary principle. A summary of the NSW assessment bilateral requirements for Cotoneaster Pomaderris is presented in Table A18- 10.

Table A18- 10: NSW assessment bilateral requirements for Cotoneaster Pomaderris

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of habitat for Cotoneaster Pomaderris, populations, habitat critical for survival and relevant Commonwealth documents are provided above, with a map showing its modelled habitat distribution provided below. Current distribution map for Cotoneaster Pomaderris (DEECCW 2022x) According to Conservation Advice (DAWE, 2021c), "There is sufficient evidence through the species eligibility for listing, to declare all populations/the national population as important populations of this species under particular pressure of survival and which therefore require protection to support the recovery of the species."
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	Due to the species' limited survey period (October to November), no surveys were conducted for this species within associated habitat in Bungonia.

NSW Assessment Bilateral requirements	
Description of the relevant impacts and its regard to the full national extent of the species or community's range	A description of relevant impacts is provided in the 'Specific impacts' section of this assessment.
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Cotoneaster Pomaderris: • Project design refinement to potentially avoid impacts to the species wherever possible • Micro-siting of transmission line infrastructure and associated construction work sites to avoid impacts to the species, where possible. • Using existing cleared areas and access tracks, where possible. • Biodiversity exclusion zones, which could consider the species habitat and known locations • Vegetation clearing and maintenance guidelines and procedures that addresses avoiding access and disturbance in biodiversity exclusion zones identified during the construction and avoiding maintenance of vegetation that does not need to be maintained during operation. • Soil and Water Management Plans (SWMP) including Erosion and Sediment Control Plans and Water Quality Monitoring Plans to mitigate construction impacts to groundwater and surface water drainage patterns. • Biodiversity Management Plan to be implemented during construction, including measures to reduce disturbance to sensitive vegetation areas, procedures for the demarcation and protection of retained vegetation, rehabilitation strategies for the management and maintenance of rehabilitated areas and monitoring requirements and compliance management (including weed control and management).
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	The residual impact to Cotoneaster Pomaderris is estimated at 11.7 ha of potential habitat removal. There is the potential for indirect impacts (such as edge effects and weed incursion) to occur to any retained areas of the species habitat within or adjacent to the project footprint, however, it is expected that these impacts would be largely mitigated and managed through implementation of measures noted above. The residual impact to this species was considered to have the potential to be significant as per the SIA (see above).
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Residual, potentially significant impacts to the species would be offset under the NSW BOS. Details of offset requirements and obligations for this species as a result of residual impacts due to the project are addressed in Section 14 of the BDAR.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project • Through making a payment into the Biodiversity Conservation Fund.

NSW Assessment Bilateral requirements	
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All significant residual impacts to the species have been addressed under the NSW BOS. There are no significant residual impacts to the species that have not been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required.

2.2.7 Critically Endangered orchids: Bago Leek Orchid (*Prasophyllum bagoense*), Brandy Mary's Leek-orchid (*Prasophyllum innubum*), Kelton's Leek Orchid (*Prasophyllum keltonii*), Blue-tongued Greenhood (*Pterostylis oreophila*)

The Bago Leek Orchid, Brandy Mary's Leek-orchid, Kelton's Leek Orchid and Blue-tongued Greenhood are listed as Critically Endangered under the EPBC Act and the BC Act.

Description

Bago Leek-orchid

The Bago Leek Orchid is a slender, tuberous, terrestrial herb growing singly or in loose groups, with an erect leaf 20–35 cm long, and 15–30 pale tawny-green, sometimes pink, scented flowers in a moderately dense spike (DSEWPaC, 2012a). The species is easily identified by its strongly twisted and recurved dorsal sepal, upswept petals and S-shaped labellum (DSEWPaC, 2012a).

The Bago Leek Orchid is known from a single population at McPhersons Plain, east of Tumbarumba in the Southern Tablelands of New South Wales (DSEWPaC, 2012a). Both its extent of occurrence and area of occupancy are less than 1 km^2 (DSEWPaC, 2012a). This species occurs within the Australian Alps Bioregion and the Murrumbidgee Natural Resource Management Region (DSEWPaC, 2012a). The distribution of this species is associated with the Alpine Bog Communities EPBC Act-listed TEC (DSEWPaC, 2012a). Indicative distribution mapping from the Species Profile and Threats Database (DCCEEW, 2022ab) indicates that the portion of the project south of Tumut is mapped with both 'species and species habitat likely to occur' and 'species and species habitat may to occur'. As such, the species is considered likely to occur within the project footprint.

The species' habitat is wet grasslands in sub-alpine treeless plains at an elevation of approximately 1200 m and extends into adjacent eucalypt woodland (DSEWPaC, 2012a). Plants are insect-pollinated, probably by a wasp species (DSEWPaC, 2012a). They are not known to reproduce vegetatively but are reliant on seed-set and germination for recruitment of new plants. There are no data on the effects of fire on this species, although it does flower freely without fire stimulation (DSEWPaC, 2012a).

Brandy Mary's Leek-orchid

The Brandy Mary's Leek-orchid is a terrestrial herb growing singly or in loose groups, with an erect leaf 25–50 cm long and with 6–20 small brownish-purple flowers with white or pinkish labellums (DoE, 2014a).

Brandy Mary's Leek-orchid occurs east of Tumbarumba in the Southern Tablelands in Bago State Forest Crown leases and on adjacent private land (DoE, 2014a). It has an extent of occurrence of 45 km^2 and an area of occupancy of 1.5 ha (0.015 km^2). Its population size fluctuates between 0 and 200 visible plants in eight small populations, with one population now thought to be extinct (DoE, 2014a). The population has declined from around 400 plants since 2004 (DoE, 2014a).

This species occurs within the Australian Alps Bioregion and the Murrumbidgee Natural Resource Management Region (DoE, 2014a). The distribution of this species is associated with the Alpine Sphagnum Bogs and Associated Fens EPBC Act-listed TEC (DoE, 2014a). Indicative distribution mapping from the Species Profile and Threats Database (DCCEEW, 2022z) indicates that the portion of the project south of Tumut is mapped with both 'species and species habitat likely to occur' and 'species and species habitat may to occur'. As such, the species is considered likely to occur within the project footprint.

Brandy Mary's Leek-orchid grows beside small streams and peatland Sphagnum hummocks, in adjacent grassy flats and extending into open woodland, at approximately 1,200 m above sea level (DoE, 2014a). Plants are self-pollinating, although small bees have been observed on flowers and may affect some pollination (DoE, 2014a).

Kelton's Leek-orchid

The Kelton's Leek-orchid is a terrestrial herb growing singly or in loose groups, with an erect leaf 25–35 cm long and with 12–22 green, brownish, red or purple fragrant flowers in a dense spike (DoE 2014b).

Kelton's Leek-orchid occurs on McPhersons Plain in Bago State Forest, east of Tumbarumba in the Southern Tablelands, in Brandy Mary's Crown Leases and on adjacent private land (DoE 2014b). It has an extent of occurrence of approximately 12 ha (0.12 km^2) and area of occupancy of less than 1 ha (0.01 km^2) (DoE 2014b). Its population size fluctuates between 10 and 250 individuals (DoE 2014b). The population has declined from around 400 plants since 2004 (DoE 2014b).

This species occurs within the Australian Alps Bioregion and the Murrumbidgee Natural Resource Management Region (DoE 2014b). The distribution of this species is associated with the 'Alpine Sphagnum Bogs and Associated Fens' EPBC listed ecological community (DoE 2014b). Indicative distribution mapping from the Species Profile and Threats Database (DCCEEW 2022aa) indicates that the portion of the project south of Tumut is mapped with both 'species and species habitat likely to occur' and 'species and species habitat may to occur'. As such, the species is considered likely to occur within the project footprint.

Kelton's Leek-orchid grows on a tussock grassland plain, in moisture retentive brown loam at approximately 1,200 m above sea level (DoE 2014b). The flowers are insect-pollinated, probably by a wasp species (DoE 2014b). The species is not known to reproduce vegetatively (DoE 2014b).

Blue-tongued Greenhood

The Blue-tongued Greenhood is a terrestrial orchid growing to 200 mm tall, with dark green, fleshy, flat leaves (DSEWPaC 2012b). Basal leaves are stalked, whilst the other leaves are stalkless and are scattered up the stem (DSEWPaC 2012b). The flower stem is smooth. The solitary flowers are erect, light green and white, and 25–30 x 12–16 mm in size (DSEWPaC 2012b). The recurved labellum is a distinctive bluish or blue-green (aqua) colour (DSEWPaC 2012b). The sharply pointed dorsal sepal is of a similar length to the petals (DSEWPaC 2012b).

The Blue-tongued Greenhood occurs in 20 locations in four distinct geographic locations: the Brindabella Ranges in the Australian Capital Territory (ACT); the Kiandra and Bago areas of New South Wales (NSW); and north-east Victoria (DSEWPaC 2012b). Its total estimated population is 240 mature individuals (DSEWPaC 2012b). The extent of occurrence and area of occupancy of this species are unknown, however due to the low number of mature individuals and severe fragmentation it is likely that the species has a

very restricted geographic distribution (DSEWPaC 2012b). Given the current threats impacting on the species, it is likely that the number of plants will decline in the future (DSEWPaC 2012b).

The Blue-tongued Greenhood occurs in the following Natural Resource Management regions: ACT (ACT); Murrumbidgee, Murray, Southern Rivers (NSW); North-east, East Gippsland (Vic) (DSEWPaC 2012b). It occurs in the South-east Highlands, Australian Alps and South-east Corner Bioregions. The distribution of this species overlaps with the 'Alpine Sphagnum Bogs and Associated Fens' EPBC Act-listed TEC (DSEWPaC 2012b). Indicative distribution mapping from the Species Profile and Threats Database (DCCEEW 2022ac) indicates that the portion of the project south and east of Tumut is mapped with both 'species and species habitat likely to occur' and 'species and species habitat may to occur'. As such, the species is considered likely to occur within the project footprint.

The species is restricted to growing beside small montane and subalpine streams under tall dense thickets of *Leptospermum grandiflorum* (mountain tea tree), in black oozing mud or less commonly in peaty soils and sphagnum mounds (DSEWPaC 2012b). This type of habitat occurs throughout much of the upper areas of Kosciuszko National Park and the Alpine National Park areas in Victoria (DSEWPaC 2012b).

Specific impacts

Bago Leek Orchid

Bago Leek Orchid was directly recorded within the project footprint within PCTs 1196 and 1224 in the Snowy Mountains IBRA Subregion. 101.56 ha of potential and known habitat for the species has been mapped within the project footprint and comprises PCTs 1196 and 1224. Of this, 31.90 ha (31%) would be impacted by the project. Whilst the project would not directly clear any recorded individuals, 31.90 ha of adjacent habitat would be impacted and there is a high probability that undetected individuals occupy these habitats. Associated indirect impacts (including edge effects and weed incursion) are likely to occur due to the project, however avoidance and mitigation measures have been set out in Sections 12 and 14 of the BDAR to address these. Given the species occupies the ground layer and prefers treeless habitats, there is considerable potential for impact avoidance through sensitive design and the micro-siting of transmission line structures and access tracks. Avoidance measures would be fully explored during detailed design.

Brandy Mary's Leek-orchid

Brandy Mary's Leek-orchid was not recorded during targeted surveys but has a high likelihood of occurrence within potential habitat mapped in the project footprint and three previous known records (DPIE 2021) are located within 1 km of the project footprint. A total of 8.83 ha of potential habitat comprising PCT 1224, has been mapped within the Snowy Mountains portion of project footprint, of which 0.25 ha (0.3%) would be impacted by the project. Associated indirect impacts (including edge effects and weed incursion) are likely to occur due to the project, however avoidance and mitigation measures have been set out in Sections 12 and 14 of the BDAR to address these. Given the species occupies the ground layer and prefers treeless habitats, there is considerable potential for impact avoidance through sensitive design and the micro-siting of transmission line structures and access tracks. Avoidance measures would be fully explored during detailed design.

Kelton's Leek Orchid

Kelton's Leek Orchid was recorded immediately adjacent to the project footprint within PCT 1196 in the Snowy Mountains IBRA Subregion. 92.74 ha of potential habitat for the species has been mapped within

the project footprint and comprises PCTs 1196. Of this, 31.70 ha (34%) would be impacted by the project. Whilst the project would not directly clear any recorded individuals, 31.70 ha of adjacent habitat would be impacted and there is a high probability that undetected individuals occupy these habitats. Associated indirect impacts (including edge effects and weed incursion) are likely to occur due to the project, however avoidance and mitigation measures have been set out in Sections 12 and 14 of the BDAR to address these. Given the species occupies the ground layer and prefers treeless habitats, there is considerable potential for impact avoidance through sensitive design and the micro-siting of transmission line structures and access tracks. Avoidance measures would be fully explored during detailed design.

Blue-tongued Greenhood

Blue-tongued Greenhood was not recorded during targeted surveys but has a high likelihood of occurrence within potential habitat mapped in the project footprint. Four previous known records (DPIE 2021) are located within 1 km of the project footprint. A total of 2.95 ha of potential habitat comprising PCT 939, has been mapped within the Snowy Mountains portion of project footprint, of which 0.56 ha (19%) would be impacted by the project. Associated indirect impacts (including edge effects and weed incursion) are likely to occur due to the project, however avoidance and mitigation measures have been set out in Sections 12 and 14 of the BDAR to address these. Given the species occupies the ground layer and prefers treeless habitats, there is considerable potential for impact avoidance through sensitive design and the micro-siting of transmission line structures and access tracks. Avoidance measures would be fully explored during detailed design.

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for these species is as follows:

- Approved conservation advice for the Bago Leek Orchid (DSEWPaC, 2012a) in effect under the EPBC Act from 3 May 2012; the Brandy Mary's Leek-orchid (DoE, 2014a) in effect under the EPBC Act from 24 January 2014; the Kelton's Leek Orchid (DoE, 2014b) in effect under the EPBC Act from 24 January 2014; and the Blue-tongued Greenhood (DSEWPaC, 2012b) in effect under the EPBC Act from 03-May-2012
- Listing advice for the Bago Leek Orchid (TSSC, 2012a), the Brandy Mary's Leek-orchid (TSSC, 2014a), the Kelton's Leek Orchid (TSSC, 2014b), and the Blue-tongued Greenhood (TSSC, 2012b).
- There is no adopted or made Recovery Plan for any of these species. The SPRAT database indicates that a Recovery Plan is not required as the approved conservation advice for these species provides sufficient direction to implement priority actions and mitigate against key threats.
- No Threat Abatement Plan has been identified as being relevant for these species.
- Relevant Commonwealth survey guidelines for this species include:
  - Draft survey guidelines for Australia's threatened orchids (DoE, 2013b).

Significant impact criteria

An action is likely to have a significant impact on an Endangered or Critically Endangered species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of a population of a species

The Bago Leek Orchid and Kelton's Leek Orchid have been verified as known within, or directly adjacent to the project footprint and are considered to have the potential to occur in all areas of suitable habitat based on indicative mapping, habitat assessments and nearby records. Whilst the Blue-tongued Greenhood was not detected during the targeted surveys, known records (DPE, 2021a) are in close proximity (less than 1 km) to the project footprint, and the species is considered to have the potential to occur in all areas of suitable habitat.

The project is considered to have the potential to lead to a long-term decrease in the Bago Leek Orchid, Kelton's Leek Orchid and Blue-tongued Greenhood populations. This is taking into consideration that there would be direct impacts to the mapped indicative habitat of the species and its presence within, or directly adjacent to the project footprint. Avoidance and mitigation measures have been incorporated into the project. Further detailed recommendations as to specific mitigation measures to prevent impacts to potential habitats for the species have been included in this report.

The Brandy Mary's Leek-orchid also has a high likelihood of occurrence in the project footprint, however only 0.25 ha (3%) of potential habitat would be directly impacted by the project. Given the small area of impact and that no individuals were recorded within it, the project is considered unlikely to lead to a long-term decrease in the size of the population of Brandy Mary's Leek-orchid, should it occur.

Reduce the area of occupancy of the species

The Bago Leek Orchid and Kelton's Leek Orchid were detected in the project footprint during field surveys. The conservation advice for the Bago Leek Orchid states that the species has an area of occupancy of less than 100 ha and the conservation advice for the Kelton's Leek Orchid states that the species has an area of occupancy of less than 1 ha. A total of 31.90 ha of potential habitat for the Bago Leek Orchid, and 31.7 ha of potential habitat for the Kelton's Leek Orchid would be cleared as a result of the project. This would potentially reduce the area of occupancy of the Bago Leek Orchid by up to 32%, however it is considered unlikely that all areas of suitable habitat within the subject actually contain this species and therefore the reduction to the area of occupancy is likely to be less. The area of potential habitat to be cleared is greater than the area of occupancy for the Kelton's Leek Orchid. Given the very small area of occupancy of this species, the reduction would potentially be substantial.

The Brandy Mary's Leek-orchid and Blue-tongued Greenhood were not detected in the project footprint during field surveys, however if these species are present in areas that would be cleared as a result of the project, then the area of occupancy of these species would potentially be reduced. As these species have not been recorded within the project footprint, the extent that clearing could reduce the area of occupancy of these species is unknown.

A total of 0.56 ha of potential habitat for the Blue-tongued Greenhood would be cleared as a result of the project. The area of occupancy of the is Blue-tongued Greenhood is unknown, however the conservation advice for the species indicates it is likely to be low. Therefore, the amount of potential habitat for the Blue-tongued Greenhood within the clearing footprint may represent a substantial area of habitat for the species, should it occur.

A total of 0.25 ha (3%) potential habitat for the Brandy Mary's Leek-orchid would be cleared as a result of the project. Should the species occur within all areas of potential habitat, then the removal of 3% is unlikely to substantially reduce the area of occupancy of the species, should it occur.

These impacts may be avoided through design changes and micro siting of infrastructure. It is recommended that the habitats are avoided and protected.

Fragment an existing population into two or more populations

The project would include construction of transmission line structures, access tracks and other facilities but would maintain groundcover and vegetation up to a certain height within the TCZ. Groundcover would not be removed in the ECZ and HTZ. Where the indicative disturbance area intersects habitat across the footprint, it is along the edge of habitat patches adjacent to previously cleared easement, removing less than a hectare from each patch and minimally affecting connectivity.

Potential and known habitat for Bago Leek Orchid is comprised of PCTs 1196 and 1224 and is mostly present as a continuous state within the project footprint. However, the area of impact would occur adjacent to the existing easement, so whist habitat would be removed, it would not further fragment existing populations or their habitat.

Potential habitat for Brandy Mary's Leek-orchid comprises PCT 1224, which forms an open grass and/or heath. TCZ transmission line structures would clear a small portion on either side of the mapped potential habitat. Given only the edges of the habitat would be impacted, fragmentation of any existing population is unlikely to occur as a result of the project.

Potential and known habitat for Kelton's Leek Orchid comprises PCT 1196 and is mostly present as a continuous state within the project footprint. However, the area of impact would occur adjacent to the existing easement, so whist habitat would be removed, it would not further fragment existing populations or their habitat.

Potential habitat for Blue-tongued Greenhood comprises PCT 939 which forms wet heath and bog. The majority of the mapped habitat occurs in the existing easement directly adjacent to the project footprint and would not be impacted by the project. However, the indicative disturbance area cuts through one patch of mapped habitat, and may cause fragmentation to any potential population of Blue-tongued Greenhood.

Adversely affect habitat critical to the survival of a species

To date, no Critical Habitat as defined under section 207A of the EPBC Act has been identified or included in the Register of Critical Habitat or identified in the conservation advice for any of the orchid species discussed in this assessment. Conservation Advice for these species indicates that the distribution and area of occupancy of these species is very limited. Therefore, should these species occur in these areas of potential habitat, these areas of habitat may be considered critical to the survival of the species. Given the project would result in impacts to these areas of potential habitat, the project has the potential to adversely affect habitat that may be critical to the survival of the species.

All four orchid species discussed in this assessment inhabit ecological communities that are listed nationally as EPBC Act-listed TECs. Therefore, implementation of proposed measures to avoid/mitigate impacts to these TECs would also potentially benefit these species.

Disrupt the breeding cycle of a population

Orchid seeds are adapted to long-distance wind dispersal (Phillips *et al.* 2020). As such, the narrow, linear nature of the clearing footprint is unlikely to impede seed dispersal. In addition, no barriers that would

restrict pollinator movement would occur as a result of the project. While orchid seeds can disperse long distances, and the project would not necessarily affect pollinators, any impacts to the habitats or the populations themselves is likely to disrupt the breeding cycle. This is because:

- where recorded, few individual plants were/are known to be present
- the areas of occupancy are very small
- flowering and seeding are likely to be dynamic spatially.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

The Bago Leek Orchid, Kelton's Leek Orchid and Blue-tongued Greenhood have a limited area of occupancy and, where recorded, only a few individual plants were/are known to be present. Given this, in conjunction with the large area of clearing of species habitat (31% of Bago Leek Orchid habitat, 34% of Kelton's Leek Orchid habitat and 19% of Blue-tongued Greenhood habitat), if the species are present within all areas of potential habitat, the project has the potential to result in species decline.

The Brandy Mary's Leek-orchid has a larger area of mapped habitat within the project footprint, of which, only 3% would be impacted by the project. Given majority of the species habitat would remain within the project footprint, it is unlikely that the project would cause the species to decline.

Result in invasive species that are harmful to an endangered or critically endangered species becoming established in the endangered or critically endangered species' habitat

The project is not likely to result in the introduction of invasive species that may become established in habitat for these species. Mitigation measures have been proposed to mitigate the risk of indirect impacts. Mitigation measures to control the spread of weeds and pest animals would be detailed in the Biodiversity Management Plan.

Introduce disease that may cause the species to decline, or

There is a low potential for any plant or machinery used in construction to transport pathogens, to which these species are susceptible.

Mitigation measures to control the spread of pathogens would be detailed in the Biodiversity Management Plan. It has been recommended that this risk be managed through the use of wash down procedures for in-stream plant between crossing locations.

Interfere with the recovery of the species

The project has the potential to interfere with the following recovery action listed in conservation advice for the Bago Leek Orchid, the Kelton's Leek Orchid and the Blue-tongued Greenhood;

- Ensure there is no disturbance in areas where the species occurs, excluding necessary actions to manage the conservation of the species/ecological community.

The same recovery action is listed in the conservation advice for the Brandy Mary's Leek-orchid, however only 3% of habitat suitable for this species would be removed the project is unlikely to interfere with the recovery action for this species.

Conclusion

In line with the above findings, the project is considered unlikely to have a significant impact on the Brandy Mary's Leek-orchid.

Due to the factors described above, it is considered that the project has the potential to have a significant impact on Kelton's Leek Orchid, the Bago Leek Orchid, and the Blue-tongued Greenhood.

A summary of the NSW assessment bilateral requirements for critically endangered orchids is presented in Table A18- 11 and Table A18- 12.

Table A18- 11: NSW assessment bilateral requirements for Bago Leek Orchid and Brandy Mary's Leek-orchid

NSW Assessment Bilateral requirements	Bago Leek Orchid	Brandy Mary's Leek-orchid
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of habitat for the Bago Leek Orchid, populations, habitat critical for survival and relevant Commonwealth documents are provided above, with a map showing its habitat distribution provided below. Current distribution map for Bago Leek Orchid (DEECCW, 2010DCCEEW, 2022ab) Relevant Commonwealth guidelines for this species includes: Approved conservation advice for the Bago Leek Orchid (DSEWPaC, 2012a) and Draft survey guidelines for Australia's threatened orchids (DoE, 2013b).	A description of habitat for the Brandy Mary's Leek-orchid, populations, habitat critical for survival and relevant Commonwealth documents are provided above, with a map showing its habitat distribution provided below.  Current distribution map for Brandy Mary's Leek-orchid (DEECCW, 2010DCCEEW, 2022z) Relevant Commonwealth guidelines for this species includes: Approved conservation advice for the Brandy Mary's Leek-orchid (DoE 2014a) and Draft survey guidelines for Australia's threatened orchids (DoE, 2013b).
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	Field survey techniques used to undertake surveys were in general accordance with the NSW guide for the BAM (DPIE, 2020b) with a detailed field verification method provided in Section 4 of the BDAR. Mapping of native vegetation and habitat extent within the project is required under section 4.1 of the BAM, with detailed requirements outlined in section 3.2 of the BAM 2020 Operational Manual. Field data was used to assign condition classes for any given observed habitat patch, where relevant. Field surveys for threatened flora were carried out using a combination of parallel field traverses and a two-phase grid-based systematic survey approach as set out in the DPIE (2020b) Guideline for Surveying threatened plants and their habitats. Survey for the Bago Leek Orchid: Snowy Mountains - No targeted surveys conducted for this species. Survey for Brandy Mary's Leek-orchid: Snowy Mountains - 9 surveys in Mar-22	
Description of the relevant impacts and its regard to the full national extent of the species or community's range	A description of relevant impacts is provided in the 'Specific impacts' section of this assessment.	
Description of the specific proposed avoidance and	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to orchid species:	

NSW Assessment Bilateral requirements	Bago Leek Orchid	Brandy Mary's Leek-orchid
mitigation measures to deal with relevant impacts of the action	• Project design refinement to potentially avoid impacts to the species wherever possible • Micro-siting of transmission line infrastructure and associated construction work sites to avoid impacts to the species, where possible. • Using existing cleared areas and access tracks, where possible. • Biodiversity exclusion zones, which could consider the species habitat and known locations • Vegetation clearing and maintenance guidelines and procedures that addresses avoiding access and disturbance in biodiversity exclusion zones identified during the construction and avoiding maintenance of vegetation that does not need to be maintained during operation. • Soil and Water Management Plans (SWMP) including Erosion and Sediment Control Plans and Water Quality Monitoring Plans to mitigate construction impacts to groundwater and surface water drainage patterns. • Biodiversity Management Plan to be implemented during construction, including measures to reduce disturbance to sensitive vegetation areas, procedures for the demarcation and protection of retained vegetation, rehabilitation strategies for the management and maintenance of rehabilitated areas and monitoring requirements and compliance management (including weed control and management).	
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	The residual impact to the Bago Leek Orchid is predicted to be 31.90 ha of potential and known habitat removal. The residual impact to this species was considered to have the potential to be significant as per the SIA (see above).	The residual impact to the Brandy Mary's Leek-orchid is predicted to be 0.25 ha of potential habitat removal. This is considered unlikely to be a potentially significant impact.
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Residual, potentially significant impacts to the species would be offset under the NSW BOS. Details of offset requirements and obligations for this species as a result of residual impacts due to the project are addressed in Section 14 of the BDAR.	Not required. As per the SIA, residual impacts to this species were considered unlikely to be significant. Details of offset requirements and obligations for this species as a result of residual impacts due to the project are addressed in Section 14 of the BDAR. Impacts to Brandy Mary's Leek-orchid would be offset under the NSW BOS.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.	
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project/ Through making a payment into the Biodiversity Conservation Fund.	
Any significant residual impacts not addressed by the BAM may need to be addressed in	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All significant residual impacts to	As detailed above, all residual impacts to the species would be offset under the NSW BOS and, as per the SIA, significant residual impacts to this

NSW Assessment Bilateral requirements	Bago Leek Orchid	Brandy Mary's Leek-orchid
accordance with the EPBC Act Environmental Offset Policy.	the species have been addressed under the NSW BOS. There are no significant residual impacts to the species that have not been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required.	species are considered unlikely. Therefore, application of the EPBC Act Environmental Offset Policy is not required.

Table A18- 12: NSW assessment bilateral requirements for Kelton's Leek Orchid and Blue-tongued Greenhood

NSW Assessment Bilateral requirements	Kelton's Leek Orchid	Blue-tongued Greenhood
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of habitat for the Kelton's Leek Orchid, populations, habitat critical for survival and relevant Commonwealth documents are provided above, with a map showing its habitat distribution provided below. Current distribution map for Kelton's Leek Orchid (DCCEEW, 2022aa) Relevant Commonwealth guidelines for this species includes: Approved conservation advice for the Kelton's Leek Orchid (DoE, 2014b) and Draft survey guidelines for Australia's threatened orchids (DoE, 2013b).	A description of habitat for the Blue-tongued Greenhood, populations, habitat critical for survival and relevant Commonwealth documents are provided above, with a map showing its habitat distribution provided below.  Current distribution map for Blue-tongued Greenhood (DCCEEW 2022ac) Relevant Commonwealth guidelines for this species includes: Approved conservation advice for the Blue-tongued Greenhood (DSEWPaC, 2012b) and Draft survey guidelines for Australia's threatened orchids (DoE, 2013b).
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	Field survey techniques used to undertake surveys were in general accordance with the NSW guide for the BAM (DPIE, 2020b) with a detailed field verification method provided in Section 4 of the BDAR. Mapping of native vegetation and habitat extent within the project is required under section 4.1 of the BAM, with detailed requirements outlined in section 3.2 of the BAM 2020 Operational Manual. Field data was used to assign condition classes for any given observed habitat patch, where relevant. Field surveys for threatened flora were carried out using a combination of parallel field traverses and a two-phase grid-based systematic survey approach as set out in the DPIE (2020b) Guideline for Surveying threatened plants and their habitats. Surveys conducted: • Snowy Mountains - 19 surveys in Jan-22.	
Description of the relevant impacts and its regard to the full national extent of the species or community's range	A description of relevant impacts is provided in the 'Specific impacts' section of this assessment.	
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to orchid species: • Project design refinement to potentially avoid impacts to the species wherever possible • Micro-siting of transmission line infrastructure and associated construction work sites to avoid impacts to the species, where possible. • Using existing cleared areas and access tracks, where possible. • Biodiversity exclusion zones, which could consider the species habitat and known locations • Vegetation clearing and maintenance guidelines and procedures that addresses avoiding access and disturbance in biodiversity exclusion zones identified during the construction and avoiding maintenance of vegetation that does not need to be maintained during operation.	

NSW Assessment Bilateral requirements	Kelton's Leek Orchid	Blue-tongued Greenhood
	• Soil and Water Management Plans (SWMP) including Erosion and Sediment Control Plans and Water Quality Monitoring Plans to mitigate construction impacts to groundwater and surface water drainage patterns. • Biodiversity Management Plan to be implemented during construction, including measures to reduce disturbance to sensitive vegetation areas, procedures for the demarcation and protection of retained vegetation, rehabilitation strategies for the management and maintenance of rehabilitated areas and monitoring requirements and compliance management (including weed control and management).	
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	The residual impact to the Kelton's Leek Orchid is 31.7 ha of potential and known habitat removal. The residual impact to this species was considered to have the potential to be significant as per the SIA (see above).	The residual impact to the Blue-tongued Greenhood is 0.56 ha of potential habitat removal. The residual impact to this species was considered to have the potential to be significant as per the SIA (see above).
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Residual, potentially significant impacts to the species would be offset under the NSW BOS. Details of offset requirements and obligations for this species as a result of residual impacts due to the project are addressed in Section 14 of the BDAR.	
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.	
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project • Through making a payment into the Biodiversity Conservation Fund.	
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All significant residual impacts to the species have been addressed under the NSW BOS. There are no significant residual impacts to the species that have not been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required.	

2.2.8 Austral Toadflax (*Thesium australe*)

The Austral Toadflax is listed as Vulnerable under the EPBC Act and the BC Act.

Description

The distribution of the Austral Toadflax is along the Eastern border of Australia from Queensland down to Victoria. Its current distribution is sporadic but widespread. In NSW to species is found as far as the southern, central, and northern tablelands (DoE, 2013c). Indicative distribution mapping from the Species Profile and Threats Database (DCCEEW, 2022ad) indicates that the portion of the project around the Tumut through to the Goulburn is mapped with both 'species and species habitat likely to occur' and 'species and species habitat may to occur'. As such, the species has a moderate likelihood of occurrence within the Snowy Mountains portion of the project footprint, but a low likelihood in Bungonia, Crookwell, Murrumbateman and Bondo based on limited habitat, geographic constraints, survey coverage and minimal previous records within 20 km of the project footprint. The species is predicted to occur in the Inland Slopes IBRA Subregion.

The habitat required by the Austral Toadflax includes subtropical, temperate and subalpine climates over a wide range of altitudes on soils derived from sedimentary, igneous and metamorphic geology. This species is associated with inhabiting the following EPBC Act-listed TECs (TEC; DoE, 2013c):

- Lowland Grassy Woodland in the Southeast Corner Bioregion
- New England Peppermint (*Eucalyptus nova-anglica*) Grassy Woodlands
- Natural Grasslands of the Queensland Central Highlands and the northern Fitzroy Basin
- Natural grasslands on basalt and fine-textured alluvial plains of northern New South Wales and southern Queensland
- Natural Temperate Grassland of the Southern Tablelands of NSW and the Australian Capital Territory
- White Box-Yellow Box-Blakely's Red Gum Grassy Woodland and Derived Native Grassland.

Is this part of an important population?

No important populations have been defined for Austral Toadflax. However, the potential habitat for Austral Toadflax within the project footprint is located at the western extent of the species range, in areas where it is predicted the species habitat is likely to, or may occur, according to the species SPRAT profile. Therefore, any individuals present within the project footprint are likely to occur on the edge of the species range and be considered part of an important population due to their location at the extent of the species range.

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species is as follows:

- Approved Conservation Advice for the Austral Toadflax (DoE, 2013c), in effect under the EPBC Act from 17 December 2013.
- The SPRAT database indicates that there is no Recovery Plan for the Austral Toadflax.
- The following Threat Abatement Plan is relevant to the species:

- Threat abatement plan for competition and land degradation by rabbits in effect under the EPBC Act from 7 January 2017.

There are no relevant Commonwealth survey guidelines for this species.

Specific impacts

The Austral Toadflax was not recorded within the project footprint but is considered to have a moderate likelihood of occurrence in the Snowy Mountains IBRA subregion based on indicative mapping and habitat assessments. Potential habitat for the species occurs within the within PCTs 679, 191, 1224 and 1330. As mentioned above, the potential for the species to occur in the other subregions has been discounted due to low likelihood of occurrence.

Whilst the species was not recorded during targeted surveys, there are 19 previous records within 20 kilometres of the project footprint (DPIE, 2021). In the Snowy Mountains portion of the project footprint there is 117.61 ha of potential habitat (comprising PCTs 679, 1196 and 1224) mapped, of which, 23.70 ha (20%) would be cleared as a result of the project.

Significant impact criteria

An action is likely to have a significant impact on a Vulnerable species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of an important population of a species

The Conservation advice (DoE, 2013c) does not describe any populations as 'Important Populations' for the Austral Toadflax. However, as mentioned above, the potential habitat for Austral Toadflax within the project footprint is located at the western extent of the species range and therefore any individuals within the potential habitat may comprise an important population.

A relatively large area of potential habitat is proposed to be cleared (ie 23.70 ha comprising 20% of the total habitat within the project footprint). If an unaccounted-for population was present in the potential habitat that is as yet unsurveyed it is possible under the precautionary approach that the project could lead to a long term decrease in the size of an important population.

Reduce the area of occupancy of an important population

There is no defined area of occupancy for this species. The extent of impact within the project footprint on the species is 23.70 ha (20% of the total mapped potential habitat within the project footprint). The project would directly impact potential habitat for the species and has the potential to result in indirect impacts to habitats (such as edge effects and weed incursion). It is considered likely that the scale of these impacts would render any potential habitats no longer suitable. Under the precautionary approach and considering the relatively large area of impact on potential habitat, the project is considered to have the potential to reduce the area of occupancy of the species, should it occur within the project footprint.

Fragment an existing important population into two or more populations

While no individuals of Austral Toadflax have been recorded within the project footprint, the species is still considered to have a moderate likelihood of occurrence and if present, may form part of an important population.

The project would directly and indirectly impact potential habitat for the species. The potential habitat for the species, comprising PCTs 679, 1191, 1196, 1224 and 1330, is present in both continuous and fragmented states within the project footprint. The indicative disturbance area is patchily distributed within the footprint, with few areas of continuous clearing most likely to fragment an area of potential habitat. Where the indicative disturbance area does intersect habitat across the footprint, it is mostly along the edge of habitat patches adjacent to previously cleared areas, removing less than a hectare from each patch and minimally affecting connectivity.

In subalpine and tableland climates Austral Toadflax dies back to rootstock during winter and resprouts in spring. Ensuring any temporary ground storey clearing required is undertaken outside of flowering times will prevent disruption to the breeding cycle. Mitigation and avoidance strategies, such as pre-clearance surveys and micro siting of transmission line structures would further ensure that impact on important populations, if present, is being minimised during construction.

Given the above, the project is considered unlikely to fragment an existing population into two or more populations.

Adversely affect habitat critical to the survival of a species

There is no Critical Habitat in NSW defined under section 207A of the EPBC Act that has been identified or included in the Register of Critical Habitat for the species. However, due to the species association with six EPBC Act listed TECs, this habitat will have high conservation value that potentially also benefits the species (DoE, 2008c).

The species has a widespread distribution including being known to occur within subtropical, temperate and subalpine environments over a wide range of altitudes. Due to its large distribution across a variety of climates and soil types, the habitat to be impacted within the project footprint is unlikely to be critical to the survival of the species.

Disrupt the breeding cycle of an important population

Austral Toadflax flowers and fruits during summer at higher altitudes and is known to die back to rootstock during winter and resprouts in spring (Griffith, 1996). Given the species-specific life cycle, while the vegetation removal would result in loss of about 23.70 ha of potential habitat, the proposed vegetation removal is unlikely to significantly disrupt the breeding cycle in the long-term, as there would be other suitable habitats still in-tact in the project footprint (83.64 ha of potential habitat) that would not be directly affected by the project.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

The project could result in the removal of 23.70 ha of potential habitat, which comprises 20% of the total 117.61 ha of potential habitat mapped in the project footprint. Indirect impacts as mentioned above, have the potential to negatively impact species habitat (eg through edge effects and weed incursion). However, implementation of the proposed mitigation measures would mitigate the risk of indirect impacts. Should the species occur, the removal of about one third of the potential habitat available, may have the potential to result in species decline.

Result in invasive species that are harmful to a vulnerable species becoming established in the vulnerable species' habitat

The project is not likely to result in the introduction of invasive species that may become established in habitat for the species. The area of potential habitat is already affected by weeds where soil disturbance has occurred and where areas have been subject to grazing. Mitigation measures have been proposed to mitigate the risk of indirect impacts. Mitigation measures to control the spread of weeds and pest animals would be detailed in the Biodiversity Management Plan.

Introduce disease that may cause the species to decline, or

There is a low potential for any plant or machinery used in construction to transport pathogens, to which Austral Toadflax are susceptible.

Mitigation measures to control the spread of pathogens would be detailed in the Biodiversity Management Plan. There is low potential for any plant or machinery used in construction to transport pathogens, to which Austral Toadflax may be susceptible. It has been recommended that this risk be managed through the use of wash down procedures for in-stream plant between crossing locations.

Interfere with the recovery of the species

The Conservation Advice (DoE, 2013c) for the species identifies the following strategies to achieve the recovery objectives:

- Habitat Loss, Disturbance and Modification
  - Monitor known populations to identify key threats.
  - Monitor the progress of recovery, including the effectiveness of management actions and the need to adapt them if necessary.
  - Undertake survey work in suitable habitat and potential habitat to locate any additional populations/occurrences/remnants (OEH, 2013).
  - Mark sites and potential habitat onto maps used for planning (OEH, 2013).
  - Minimise adverse impacts from land use at known sites.
  - Do not undertake road works, pasture modification and other land use changes that will impact on this listed species (OEH, 2013).
  - Protect populations of the listed species through the development of conservation agreements and/or covenants.
- Invasive Weeds
  - Identify and remove weeds in the local area that could become a threat to the austral toadflax, using appropriate methods.
  - Manage site/s to prevent introduction of invasive weeds that could become a threat to the austral toadflax, using appropriate methods.
- Trampling, Browsing or Grazing
  - If livestock grazing occurs in the area, ensure land owners/managers use an appropriate management regime and density that does not detrimentally affect this species and limit the overgrazing of grassland species.
  - Where appropriate, manage total grazing pressure at important sites through exclusion fencing or other barriers.
- Fire
  - Implement an appropriate fire management regime for local populations.

The project could impede or interfere with targeted recovery action objectives relating to: Habitat Loss, Disturbance and Modification.

Conclusion

In line with the above findings and the precautionary principal, the project is considered to have the potential to have a significant impact on the Austral Toadflax. A summary of the NSW assessment bilateral requirements for Austral Toadflax is presented in Table A18- 13.

Table A18- 13: NSW assessment bilateral requirements for Austral Toadflax

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of habitat for the Austral Toadflax, important populations, habitat critical for survival and relevant Commonwealth documents are provided above, with a map showing its modelled distribution provided below. Current distribution map for Austral Toadflax (DCCEEW, 2022ad) The Approved Conservation Advice for the Austral Toadflax (DoE, 2013c) is the key conservation advice for the species.
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	Field survey techniques used to undertake surveys were in general accordance with the NSW guide for the BAM (DPIE, 2020b) with a detailed field verification method provided in Chapter 4 of the BDAR. Mapping of native vegetation and habitat extent within the project is required under Section 4.1 of the BAM, with detailed requirements outlined in Section 3.2 of the BAM 2020 Operational Manual. Field data was used to assign condition classes for any given observed habitat patch, where relevant. Field surveys for threatened flora were carried out using a combination of parallel field traverses and a two-phase grid-based systematic survey approach as set out in the DPIE (2020b) Guideline for Surveying threatened plants and their habitats. Snowy Mountains • 19 surveys in Jan-22 • 9.6 km field traverse in Feb-21 (ELA)
Description of the relevant impacts and its regard to the full national extent of the species or community's range	A description of relevant impacts is provided in the 'Specific impacts' section of this assessment.
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Austral Toadflax: • Project design refinement to potentially avoid impacts to the species wherever possible • Micro-siting of transmission line infrastructure and associated construction working areas to avoid impacts to the species, where possible.

NSW Assessment Bilateral requirements	
	• Using existing cleared areas and access tracks, where possible. • Biodiversity exclusion zones, which could consider the species habitat and known locations • Vegetation clearing and maintenance guidelines and procedures that addresses avoiding access and disturbance in biodiversity exclusion zones identified during the construction and avoiding maintenance of vegetation that does not need to be maintained during operation. • Soil and Water Management Plans (SWMP) including Erosion and Sediment Control Plans and Water Quality Monitoring Plans to mitigate construction impacts to groundwater and surface water drainage patterns. • Biodiversity Management Plan to be implemented during construction, including measures to reduce disturbance to sensitive vegetation areas, procedures for the demarcation and protection of retained vegetation, rehabilitation strategies for the management and maintenance of rehabilitated areas and monitoring requirements and compliance management (including weed control and management).
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	The residual impact to the Austral Toadflax is estimated at 23.70 ha of habitat removal. As detailed in the SIA above, it is considered that the impact may potentially be significant.
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Residual, potentially significant impacts to the species would be offset under the NSW BOS. Details of offset requirements and obligations for this species as a result of residual impacts due to the project are addressed in Section 14 of the BDAR.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project • Through making a payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All significant residual impacts to the species have been addressed under the NSW BOS. There are no significant residual impacts to the species that have not been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required.

2.3 Threatened fauna

2.3.1 Endangered/Critically Endangered frogs: Sloane's Froglet (*Crinia sloanei*), Booroolong Frog (*Litoria booroolongensis*) and Yellow-spotted Tree Frog (*Litoria castanea*)

The Sloane's Froglet is listed as Endangered under the EPBC Act and Vulnerable under the BC Act. The Booroolong Frog is listed as Endangered under the EPBC Act and the BC Act. The Yellow-spotted Tree Frog is listed as Critically Endangered under the EPBC Act and the BC Act.

Description

Sloane's Froglet

Sloane's Froglet is a small sized frog with a brown or browny-grey body growing up to 15-18 mm in length, depending on sex (TSSC, 2019a). Individuals have a distinct dark brown or olive markings over the back, and males specifically have orange-coloured spots.

The distribution of Sloane's Froglet is endemic to the Murray-Darling Basin locations in North Central Victoria and Central Western NSW to Queensland border (TSSC, 2019a). This extent range has become restricted to a very small area of NSW near Albury and Corowra. Indicative habitat distribution mapping from the Species Profile and Threats Database (DCCEEW, 2022ae) indicates that the western portion of the project from the Wagga Wagga area through to Tumut is mapped as 'species habitat may occur'. As such, the species is considered to potentially occur within the project footprint.

The habitat required by Sloane's Froglet includes ephemeral and permanent waterbodies for various life cycle activities. Waterbodies, such as oxbows off creeks and rivers, farm dams, large and small natural wetlands, constructed frog ponds and temporary puddles are utilised by the species (TSSC, 2019a). Waterbodies containing aquatic vegetation such as grasses and reeds of medium height and small stem diameter are essential for breeding. For foraging and dispersal, the Sloane's Froglet requires connections between refuge sites to move across the landscape when it is wet (TSSC, 2019a).

Booroolong Frog

The Booroolong Frog is a medium-sized frog with grey, olive, or reddish-brown body growing up to 40-55 mm, depending on sex (TSSC, 2021a). Individuals have indistinct black markings and scattered salmon-coloured flecks with granular, cream to white in colour on the ventral surface (TSSC, 2021a).

The distribution of the Booroolong Frog is restricted along the western-flowing streams of the Great Dividing Range from NSW to North-eastern Victoria (OEH, 2012). There are three broad regions of subpopulations: Northern Tablelands, Central Tablelands, and Southern Tablelands (OEH, 2012). Indicative habitat distribution mapping from the Species Profile and Threats Database (DCCEEW, 2022af) indicates that the western portion of the project from the Wagga Wagga area down through to Tumut and across to Yass is mapped with both 'species habitat likely to occur' and 'species habitat may occur'. As such, the species is considered to have the potential to occur within the project footprint.

The habitat required by the Booroolong Frog includes rocky, permanent waterbodies in wet and dry forest, woodland, and cleared grazed land (TSSC, 2021a). The species favour headwater streams with gravel, rock rapids, riffles, and pools. Dominated by a range of rock sizes and high sunlight exposures (TSSC, 2021a). Booroolong frogs shelter under rocks or amongst vegetation near the ground (OEH, 2012). For breeding the Booroolong Frog moves from daytime sheltering sites to cobble banks where females laid oviposit in rock crevices (TSSC, 2021a).

Yellow-spotted Tree Frog:

The Yellow-spotted Tree Frog is a large-sized, long-snouted frog with dull olive to emerald, green body growing up to 85 mm (TSSC, 2019b). Individuals have distinct scattered black spots and irregular bronze spotting, and a pale green stripe along the centreline of the back (TSSC, 2019b).

The distribution of the Yellow-spotted Tree Frog occurs two separate biogeographical regions in south-east Australia (TSSC, 2019b). Two disjunct populations are defined as the New England Tableland Bioregion around Guyra, and the South-eastern Highlands Bioregion around Lake George, Canberra (TSSC, 2019b). However, the species has not been located in the wild for 30 years. Indicative habitat distribution mapping from the Species Profile and Threats Database (DCCEEW, 2022ag) indicates that the portion of the project south of Yass and Goulburn is mapped with both 'species habitat likely to occur' and 'species habitat may occur'. As such, the species is considered to have potential to occur within the project footprint.

The habitat required by the Yellow-spotted Tree Frog includes permanent ponds, swamps, lagoons, farm dams and slow-flowing streams with emergent aquatic vegetation such as tall reeds and grassy banks (TSSC, 2019b). Breeding habitat includes slow-flowing waterbodies following reasonable rainfall, laying large spawn masses on the water surface attached to emergent vegetation (TSSC, 2019b). Over-winter, the species shelters in hollow-logs and buried in roots of fallen trees (TSSC, 2019b).

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for these species as indicated by the SPRAT database is as follows:

- Approved conservation advice for the Sloane's Froglet (TSSC, 2019a), in effect under the EPBC Act from 4 July 2019,
- Approved conservation advice for the Booroolong Frog (TSSC, 2021a), in effect under the EPBC Act from 19 October 2021
- Approved conservation advice for the Yellow-spotted Tree Frog (TSSC, 2019b), in effect under the EPBC Act from 04 July 2019
- Recovery Plan for the Booroolong Frog (OEH, 2012), in effect under the EPBC Act from 19 September 2012
- Recovery Plan for the Yellow-spotted Tree Frog (NSW NPWS, 2001), in effect under the EPBC Act from 19 February 2004
- The Minister for the Environment has determined that a Recovery Plan is not required for the Sloane's Froglet as it is located in a relatively small area on the border between two jurisdictions and the Conservation Advice sufficiently outlines the priority research and conservation actions needed to support the recovery of this species.
- The Sloane's Froglet is not referred to in Threat Abatement Plans.
- The Booroolong Frog and Yellow-spotted Tree Frog are referred to in the Threat Abatement Plan for infection of amphibians with chytrid fungus resulting in *chytridomycosis*, in effect under the EPBC Act from 7 September 2016.
- In addition, the Yellow-spotted Tree Frog is referred to in the Threat Abatement Plan: for predation by feral cats, in effect under the EPBC Act from 23 July 2015.
- Relevant Commonwealth survey guidelines are not available for Sloane's Froglet.
- Relevant Commonwealth survey guidelines for the Booroolong Frog and Yellow-spotted Tree Frog include:

- Survey Guidelines for Australia's Threatened Frogs. EPBC Act survey guidelines 6.3 (DEWHA, 2010a).

Specific Impacts

PCTs associated with these species are present in the project footprint and include:

- Sloane's Froglet – PCTs 5, 285
- Booroolong Frog – PCTs 85, 268, 277, 278, 280, 283, 287, 290, 295, 298, 299, 306, 322, 343, 349, 351, 352, 727; 731, 858, 870, 1097, 1107, 1150, 1256, 1330
- Yellow-spotted Tree Frog – PCTs 85, 335, 939, 1256.

Potential habitat in terms of aquatic resources was very limited within the project footprint. Targeted surveys were carried out when potential habitats were identified. Targeted surveys for the Sloane's Froglet, Booroolong Frog and Yellow-spotted Tree Frog included spotlighting transects when conditions were optimal (ie after moderate rainfall events). There were no Sloane's Froglet, Booroolong Frog or Yellow-spotted Tree Frog recorded during targeted surveys. However, due to the inability to conclusively survey all areas of potential habitat, the species are assumed present within the project footprint due to the presence of potential habitat.

Potential terrestrial habitat to be cleared includes 2.60 ha of PCTs associated with the Sloane's Froglet (there is an additional 0.05 ha of impacts on non-native habitats for Sloane's Froglet (prescribed impacts); therefore, the total impact to Sloane's Froglet habitat, including prescribed impacts, is 2.65 ha), 0.11 ha of PCTs associated with the Booroolong Frog and 0.05 ha of prescribed impacts associated with the Yellow-spotted Tree Frog.

The construction process for the transmission line structures avoids direct impacts to major waterways and none of the waterways that have been mapped as within the species indicative distribution (DoE, 2022a) would be crossed by any proposed access tracks for waterway crossings.

As such, this assessment focusses on the potential for residual indirect impacts to potential terrestrial habitats following the implementation of avoidance and mitigation measures, to the species (ie the removal of native riparian vegetation, erosion and sedimentation risk) during construction.

Significant impact criteria

An action is likely to have a significant impact on an Endangered or Critically Endangered species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of a population of a species

Population declines in these species have been attributed to Chytridiomycosis. Additional factors that contribute to population decline in these species are as follows:

- Sloane's Froglet populations have declined due to drought, habitat degradation and fragmentation.
- The Booroolong Frog is reliant on permanent water and populations have declined due to streams that dried during recent severe droughts.
- The cause of the apparent declines observed in populations of the Yellow-spotted Tree Frog are unclear, however it is believed that tadpole predation by the introduced fish Gambusia may be a contributing factor.

These species have not been verified as known in the project footprint but are considered likely to occur based on indicative habitat mapping and habitat assessments. Suitable aquatic habitats are located throughout the project footprint.

These species have not been verified as known in the project footprint but are considered likely to occur based on indicative habitat mapping and habitat assessments. Suitable aquatic habitats are located throughout the project footprint.

Potential habitat within the project footprint includes 2.60 ha of PCTs associated with the Sloane's Froglet (2.65 ha including prescribed impacts), 0.11 ha of PCTs associated with the Booroolong Frog, and 0.05 ha of prescribed impacts associated with the Yellow-spotted Tree Frog (no PCTs associated with the Yellow-spotted Tree Frog would be impacted).

The area of occupancy for Booroolong Frog is 1,000 ha (AmphibiaWeb, 2023a). The project has the potential to reduce the area of terrestrial occupancy for the species by 0.11 ha. The project is considered to reduce habitat by 0.01%.

The area of occupancy for Sloane's Froglet is approximately 10,830,000 ha (AmphibiaWeb, 2023b). The project has the potential to reduce the area of terrestrial occupancy for the species by 2.60 ha (2.65 ha including prescribed impacts). The project is considered to reduce habitat by less than 0.001%.

The area of occupancy for Yellow-spotted Tree Frog is approximately 900,000 ha (Mahony, 1999). The project has the potential to reduce the area of terrestrial occupancy for the species by 0.05 ha. The project is considered to reduce habitat by less than 0.001%. While potentially associated PCTs occur within the project footprint, there would be no direct impacts within areas mapped within the indicative distribution (DCCEEW, 2022ae; DCCEEW, 2022af; DCCEEW, 2022agoE, 2022a) of these species. Changes to surface and ground water availability and quality have the potential to impact these species. The groundwater report (Technical Report 12 – Surface Water and Groundwater Impact Assessment) indicates that impacts to ground water will be negligible. Impacts to surface water will be mitigated through implementation of the following measures:

- Preparation of a Construction Environmental Management Plan (CEMP) to manage water quality impacts during construction of the project
- Preparation of Erosion and Sediment Control Plans (ESCPs) and Water Quality Monitoring Program (WQMP) within the Surface Water Management Plans (SWMPs), given erosion is identified as a key impact risk.
- Consideration of appropriately designed scour protection at new stormwater management points.
- The SWMP would include a combination of the following plans:
  - ESCPs
  - Water Quality Monitoring Program
  - Emergency Spill Plans
  - Unexpected Contaminants Finds Protocol
  - Acid Sulfate Soils Management Plan.

Given there would be no direct impact to aquatic habitat, the area of potential terrestrial habitat to be impacted is relatively small, and the fact that surface water impacts would be mitigated and temporal in nature, the project is considered unlikely to lead to a long-term decrease in the species or population of these species.

Reduce the area of occupancy of the species

The extent of impact within the project footprint on these species is 2.60 ha (2.65 ha including prescribed impacts) for Sloane's Froglet, 0.11 ha for Booroolong Frog and 0.05 ha for Yellow-spotted Tree Frog. The project would not directly impact potential aquatic habitats for these species and although the project has the potential to result in prescribed impacts to associated aquatic habitats, these would be temporary (mainly related to the construction of the project). It is considered unlikely that the scale of these prescribed impacts would render any potential habitats no longer suitable. For these reasons the project is considered unlikely to reduce the area of occupancy of these species.

Fragment an existing population into two or more populations

The project would not directly impact potential aquatic habitats for these species and although the project has the potential to result in direct and indirect impacts to potential terrestrial habitat, these would be localised and temporary. The Sloane's Froglet has potential habitat within the project footprint as it is known to occur in widely scattered sites in the floodplains of the Murray-Darling Basin and is known to utilise both natural and man-made waterbodies, including temporary puddles, for dispersal. Permanent streams with cobble banks, woody debris and fringing riparian vegetation found in the project footprint is considered potential habitat for Booroolong Frogs. Suitable permanent streams providing habitat for Yellow-spotted Tree Frogs occur within the project footprint. It is considered unlikely that the scale of any potential indirect impacts would be such that they would isolate any potential habitats in the long-term. The project is considered unlikely to fragment any existing populations into two or more populations.

Adversely affect habitat critical to the survival of a species

To date, no Critical Habitat as defined under section 207A of the EPBC Act has been identified or included in the Register of Critical Habitat for these species.

Given the project footprint supports a relatively small area of potential aquatic habitat only and that there were no records of these species found during the surveys, the habitat is considered unlikely to constitute habitat that is critical to the survival of the species.

Further, key potential indirect impact to these species that could occur would be the potential for temporary change to vegetation and hydrology around waterbodies that these species may potentially inhabit. These changes would be mitigated as per the proposed mitigation measures, would be temporal in nature and these areas would be expected to recover once the activities have been ceased post construction.

Disrupt the breeding cycle of a population

The key impacts that could occur would be the potential for hydrological and physical change in the waterbodies associated with construction work that could temporarily remove necessary vegetation for egg laying. The expected area to be impacted is 2.60 ha (2.65 ha including prescribed impacts) for Sloane's Froglet, 0.11 ha for Booroolong Frog and 0.05 ha for the Yellow-spotted Tree Frog. However, this is considered unlikely to occur given mitigation measures proposed to mitigate these impacts. The proposed waterway crossings are unlikely to disrupt the breeding cycle in the long-term, as there would be suitable habitats still in-tact in adjacent habitats, either side of the crossings.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

The project would result in the removal of potential foraging and breeding habitat; 2.60 ha (2.65 ha including prescribed impacts) for Sloane's Froglet, 0.11 ha for the Booroolong Frog and 0.05 ha for the Yellow-spotted Tree Frog. The project is considered unlikely to isolate or decrease habitat to an extent that leads to a decline in the species due to the relatively small area of potential habitat that is variously distributed throughout the project footprint, to be impacted. Mitigation measures have been proposed to further mitigate the risk of indirect impacts. As such, the project is considered unlikely to modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline.

Result in invasive species that are harmful to an endangered or critically endangered species becoming established in the endangered or critically endangered species' habitat

The project is not likely to result in the introduction of invasive species that may become established in habitat for the species. The Sloane's Froglet is known to live and breed in disturbed areas such as farm dams. However, infestations of willow (*Salix* spp.) and Blackberry (*Rubus fruticosus*) has the potential to smother rocky habitat critical for the Booroolong Frog and modify flow regimes (TSSC, 2021a). Several mitigation measures have been proposed to mitigate the risk of indirect impacts such as weed invasion and changes to water quality. Mitigation measures to control the spread of weeds and pest animals would be detailed in the Biodiversity Management Plan and SWMP within the CEMP.

Introduce disease that may cause the species to decline, or

There is a low potential for any instream plant or machinery used in crossing construction to transport chytridiomycosis, to which these species are susceptible, or *Myxosporean* parasites, to which, Yellow-spotted Tree Frogs are susceptible. Mitigation measures to control the spread of pathogens would be detailed in the Biodiversity Management Plan. It has been recommended that this risk be managed through the use of wash down procedures for in-stream plant between crossing locations.

Interfere with the recovery of the species

There is no National Recovery Plan for Sloane's Froglet due to its small distribution, however the Conservation Advice (TSSC, 2019a) identifies the following strategies to achieve the recovery plan objectives:

- The primary conservation action for the Sloane's Froglet is to identify important extant populations and ensure suitable habitat for this species is being maintained and restored
- Habitat loss and disturbance
  - Implement a program ensuring suitable habitat is maintained and protected in areas supporting extant Sloane's Froglet populations and investigate options for enhancing the resilience of the species' current habitat to climate change.
  - Investigate opportunities to restore and enhance areas of degraded habitat.
  - Develop and implement translocation strategies for Sloane's Froglet to create additional populations whilst preventing the accidental spread of the amphibian chytrid fungus.
- Disease
  - Minimise the spread of the amphibian chytrid fungus by implementing suitable hygiene protocols to protect priority populations
  - Provide disease identification and prevention protocols (methods of handling, diagnostic keys, etc.) to researchers and land managers for use in the field.

- Manage priority sites to reduce the impacts of habitat destruction by feral species or livestock by using fencing and controlling feral pig numbers.
- Stakeholder Engagement
  - Interested nature conservation, land management and land holder groups could be engaged in conservation management activities, such as survey and monitoring, but should be made aware of the need to follow correct field practices and hygiene protocols to mitigate the risks of trampling and disease transmission. If necessary, use workshops to aid stakeholders in developing the skills and knowledge required to manage threats to this species while undertaking these activities.
  - Provide advice and information to land holders on the use of herbicides / biocides against pests and diseases in areas with threatened frogs.
  - Inform the public about the status and recovery efforts for the, eg, by providing information to visitors to the area and publicising the species through the media.

There is no National Recovery Plan for the Booroolong Frog due to its small distribution, however the Conservation Advice (TSSC, 2021a) identifies the following strategies to achieve the recovery plan objectives:

- Determine the species distribution in areas that have not been the focus of targeted surveys.
- Determine the taxonomic status of northern and southern Booroolong Frog populations and identify further genetic sub-division within these populations.
- Reduce the impact of known or perceived threats contributing to the ongoing decline of the Booroolong Frog.
- Determine population trends across the species range, and in areas subject to different management regimes.
- Identify the potential impacts of climate change and determine management responses to reduce these impacts.
- Identify other potentially threatening processes.
- Increase community awareness and involvement in the Booroolong Frog recovery program.
- Achieve the effective implementation of the recovery plan.

The National Recovery Plan (NSW NPWS, 2004) for the Yellow-spotted Tree Frog identifies the following objectives:

- Assess the current status of the species through community involvement and scientific research.
- Encourage the location and identification of any remaining extant populations in the wild.
- Increase protection of potential habitat through community awareness and involvement.
- Effectively protect and manage any extant populations which may be located in the future.
- Determine agents which contributed to the species' decline; and
- Resolve the taxonomic status of the New England and Southern Tableland forms of The Yellow-spotted Bell Frog.

The project would not impede or interfere with any of targeted recovery actions listed above for any of these species.

Conclusion

The project is considered unlikely to have a significant impact on Sloane's Froglet, Booroolong Frog, or Yellow-spotted Tree Frog due to the relatively small area of potential terrestrial habitat to be impacted, the

highly localised (and temporal nature) of impact adjacent to nominated waterway crossings, and implementation of proposed measures for mitigation of indirect impacts to water quality.

A summary of the NSW assessment bilateral requirements for endangered and critically endangered frog species is presented in Table A18- 14.

Table A18- 14: NSW assessment bilateral requirements for endangered to critically endangered frogs

NSW Assessment Bilateral requirements	Sloane's Froglet	Booroolong Frog	Yellow-spotted Tree Frog
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of habitat for this community, important populations, habitat critical for survival and relevant Commonwealth documents are provided above, with a map showing its modelled distribution provided below. Current distribution map for Sloane's Froglet (DCCEEW, 2022ae). The "Conservation Advice *Crinia sloanei* (Sloane's Froglet)" (TSSC, 2016) is the key conservation advice for this species. A recovery plan is not recommended because Sloane's Froglet is located in a relatively small area on the border between two jurisdictions and the Conservation Advice sufficiently outlines the priority research and conservation actions needed to support the recovery of this species (TSSC, 2016).	A description of habitat for this community, important populations, habitat critical for survival and relevant Commonwealth documents are provided above, with a map showing its modelled distribution provided below. Current distribution map for Booroolong Frog (DCCEEW, 2022af).  The "National Recovery Plan for Booroolong Frog (*Litoria booroolongensis"*) is the key recovery plan for this species (OEH, 2012).	A description of habitat for this community, important populations, habitat critical for survival and relevant Commonwealth documents are provided above, with a map showing its modelled distribution provided below. Current distribution map for Yellow-spotted Tree Frog (DCCEEW, 2022ag).  The "Yellow-spotted Bell Frog (*Litoria castanea*) and Peppered Tree Frog (*Litoria piperata*) recovery plan" is the key recovery plan for the species (OEH, 2001).
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	Threatened frog surveys completed within the project footprint were carried out in accordance with the Survey Guidelines for Australia's Threatened Frogs. EPBC Act survey guidelines 6.3 (Department of the Environment Water Heritage and the Arts, 2010). Habitat assessments were undertaken to assess the likelihood of threatened species of animal (those species known or predicted to occur within the locality from the literature and database review) occurring within the project footprint. Targeted surveys occurred when opportunities were available which included spotlighting transects when conditions were optimal (ie after moderate rainfall events).		

NSW Assessment Bilateral requirements	Sloane's Froglet	Booroolong Frog	Yellow-spotted Tree Frog
Description of the relevant impacts and its regard to the full national extent of the species or community's range	The direct impact of the project on the Sloane's Froglet includes removal of approximately 2.60 ha of potential terrestrial habitat in the form of associated PCTs (2.65 ha including prescribed impacts). The area of occupancy for Sloane's Froglet is approximately 10,830,000 ha (AmphibiaWeb, 2023b). The project has the potential to reduce the area of terrestrial occupancy for the species by 2.60 ha (2.65 ha including prescribed impacts). The project is considered to reduce habitat by less than 0.001%. The construction process for the transmission line structures avoids direct impacts to major waterways. None of the waterways that have been mapped as within the species indicative distribution (DoE, 2022a) would be crossed by any proposed access tracks by waterway crossings.	The direct impacts of the project on the Booroolong Frog includes removal of approximately 0.11 ha of potential terrestrial habitat in the form of associated PCTs. The area of occupancy for Booroolong Frog is 1000 ha (AmphibiaWeb, 2023a). The project has the potential to reduce the area of terrestrial occupancy for the species by 2.04 ha. The project is considered to reduce habitat by 0.2%. The construction process for the transmission line structures avoids direct impacts to major waterways. None of the waterways that have been mapped as within the species indicative distribution (DoE, 2022a) would be crossed by any proposed access tracks by waterway crossings.	The direct impacts of the project on the Yellow-spotted Tree Frog includes removal of approximately 0.05 ha of potential terrestrial habitat in the form of prescribed impacts. The area of occupancy for Yellow-spotted Tree Frog is approximately 900,000 ha (Mahony, 1999). The project has the potential to reduce the area of terrestrial occupancy for the species by 0.05 ha. The project is considered to reduce habitat by less than 0.001%. The construction process for the transmission line structures avoids direct impacts to major waterways. None of the waterways that have been mapped as within the species indicative distribution (DoE, 2022a) would be crossed by any proposed access tracks by waterway crossings.
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Sloane's Froglet: • Pre-construction surveys and micro siting of infrastructure/roads • Implementation of sediment, erosion, and hygiene controls • Development of a connectivity strategy, and Biodiversity Management Plan	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the Additional site-specific avoidance measures relevant to Booroolong Frog habitats identified as potentially at risk include: • Opportunities to avoid installing a waterway crossing should be considered during detailed design. • Where possible, design access tracks to avoid disturbance within 50 m of the top of bank of the waterway including riparian vegetation and waterway banks.	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Yellow-spotted Tree Frog: • Pre-construction surveys and micro siting of infrastructure/roads • Implementation of sediment, erosion, and hygiene controls • Development of a connectivity strategy, and Biodiversity Management Plan • A suitably qualified Ecologist should be engaged to conduct monitoring surveys

NSW Assessment Bilateral requirements	Sloane's Froglet	Booroolong Frog	Yellow-spotted Tree Frog
	• A suitably qualified Ecologist should be engaged to conduct monitoring surveys for the species at the crossing site and in downstream receiving environments. A monitoring plan would be developed as part of the BMP in consultation with the BCD.	If waterway crossings or access tracks within the stream habitat buffer/riparian zone at these locations cannot be avoided, additional site-specific avoidance measures include: • The crossing design should preference installing a single bridge structure spanning the waterway (no instream structures) to minimise the potential for hydrological change, erosion and sedimentation impacts of downstream environments. • A suitably qualified Ecologist should be engaged to complete a site inspection to guide micro-siting of the waterway crossing to avoid impacts to potential habitats or ecological features. • Develop site specific erosion and sedimentation control plans to ensure the potential for erosion and sedimentation impacts are minimised as far as practicable, including monitoring the success of erosion and sediment control measures. • A suitably qualified Ecologist should be engaged to monitoring surveys for the species at the crossing site and in downstream receiving environments. A monitoring plan would be developed as part of the BMP in consultation with the BCD.	for the species at the crossing site and in downstream receiving environments. A monitoring plan would be developed as part of the BMP in consultation with the BCD.
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	While the project would result in residual impacts to potential terrestrial habitat for Sloane's Froglet (2.60 ha, 2.65 ha including prescribed impacts), no significant residual adverse impacts to the Sloane's Froglet are considered likely to occur. Proposed activities to	While the project would result in residual impacts to potential terrestrial habitat for Booroolong Frog (0.11 ha), no significant residual adverse impacts to the Booroolong Frog are considered likely to occur. Proposed activities to avoid and mitigate all potential direct and indirect impacts would be undertaken.	While the project would result in residual impacts to potential terrestrial habitat for Yellow-spotted Tree Frog (0.05 ha), no significant residual adverse impacts to the Yellow-spotted Tree Frog are considered likely to occur. Proposed activities to avoid and mitigate all potential direct and indirect impacts would be undertaken.

NSW Assessment Bilateral requirements	Sloane's Froglet	Booroolong Frog	Yellow-spotted Tree Frog
	avoid and mitigate all potential direct and indirect impacts would be undertaken.		
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Not required. As per the SIA, residual impacts to these species were considered unlikely to be significant. Details of offset requirements and obligations for these species as a result of residual impacts due to the project are addressed in Section 14 of the BDAR. Impacts to all these species would be offset under the NSW BOS.		
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.		
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project/ • Through making a payment into the Biodiversity Conservation Fund.		
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. as detailed above, all residual impacts to the species would be offset under the NSW BOS and, as per the SIA, significant residual impacts to these species are considered unlikely. Therefore, application of the EPBC Act Environmental Offset Policy is not required.		

2.3.2 Regent Honeyeater (*Anthochaera phrygia*)

The Regent Honeyeater is listed as Critically Endangered under the EPBC Act and BC Act.

Description

The Regent Honeyeater is a predominantly black and yellow, medium-sized honeyeater with a sturdy, curved bill. Its head, neck, throat, upper breast, and bill are black, while its back and lower breast are a pale yellow to white colour with a black scalloped pattern. The lower belly is a pure pale yellow and the wing and tail feathers have broad lemon-yellow edges. There is a characteristic patch of warty pink or cream facial skin around the eye (DCCEEW, 2022m). Adults weigh 35-50 grams, are 20-24 cm long and have a wingspan of 30 cm. Males are larger, darker and have a bigger patch of bare facial skin, however the sexes appear relatively similar. They are most vocal in non-breeding seasons and have a soft metallic bell-like song (DPE, 2022a).

The Regent Honeyeater has a fragmented distribution extending from south-east QLD, through to NSW, ACT, and central Victoria. It is endemic to mainland south-eastern Australia and mainly inhabits the temperate woodlands and open forests of the Inland Slopes (DCCEEW, 2022m). Currently, there are three known key breeding regions remaining: north-east Victoria (Chiltern-Albury), and in NSW at Capertee Valley and the Bundarra-Barraba region. In NSW, their distribution is mainly confined to the two main breeding areas and surrounding fragmented woodlands, though flocks occasionally converge on flowering coastal woodland and forests (DPE, 2022a). The indicative habitat distribution mapping for the species includes the entirety of the project footprint (DCCEEW, 2022m) and overall, the species is considered likely to occur within the project footprint.

Habitat commonly associated with the Regent Honeyeater includes Box-Ironbark eucalypt woodland and dry sclerophyll forest in areas of low to moderate relief on moist, fertile soils. It also uses a range of other habitats, such as remnant vegetation patches, and is known to utilise lowland coastal forests in periods of drought (DCCEEW, 2022m; DPE, 2022a). The species is considered a generalist forager; however, it prefers woodlands with many mature trees, a high canopy cover and an abundance of mistletoes. It predominantly feeds on a small number of eucalypts that produce high volumes of nectar, including *Eucalyptus sideroxylon, E. melliodora, E. albans, E. robusta* and *Corymbia maculata*, with a preference for mature forage trees. The nectar and fruit from mistletoes are also often utilised. When nectar is scarce, lerp and honeydew can comprise a large portion diet and are important in the diet of nestlings (DCCEEW, 2022m; DPE, 2022a).

The species breeds between July and January in Box-Ironbark and other temperate woodlands, as well as riparian vegetation dominated by Casuarina spp. It usually nests in horizontal branches or forks, in tall mature eucalyptus and *Casuarina* spp., or mistletoe haustoria (DCCEEW, 2022m; DPE, 2022a).

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for Regent Honeyeater are as follows:

- Approved conservation advice for *Anthochaera phrygia* Regent Honeyeater, in effect under the EPBC Act from 8 July 2015.
- National Recovery Plan for the Regent Honeyeater (*Anthochaera Phrygia*), in effect under the EPBC Act from 04 May 2016

- *Threat abatement plan for competition and land degradation by rabbits*, is relevant to the Regent Honeyeater. In effect under the EPBC Act from 07 January 2017.

Relevant survey guidelines for this species include:

- Survey Guidelines for Australia's Threatened Birds. EPBC Act survey guidelines 6.2 (DEWHA, 2010b).

Specific Impacts

The project footprint is geographically removed from, and would have no impact on, the Bundarra-Barraba, Capertee Valley or Hunter Valley Regent Honeyeater key breeding areas. Hence, no impact on breeding habitat of the Regent Honeyeater is expected. Within the project footprint, the Regent Honeyeater has a moderate likelihood of occurrence as a nomadic forager in all IBRA subregions of the project footprint due to the presence of suitable myrtaceous and lerp foraging resources. The project footprint would result in the loss of approximately 149.34 ha (12%) of potential foraging habitat for the species.

PCTs present in the project footprint that are associated with the Regent Honeyeater are PCT 5, 266, 268, 277, 278, 280, 283, 285, 287, 288, 290, 295, 296, 297, 299, 300, 306, 314, 322, 343, 351, 352, 638, 679, 727, 731, 870, 952, 953, 1093, 1097, 1107, 1150, 1151, 1191, 1196, 1330 and 9997.

Significant impact criteria

An action is likely to have a significant impact on a Critically Endangered species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of a population

The Regent Honeyeater has a fragmented distribution extending from south-east QLD, through to NSW, ACT and to central Victoria. In NSW, their distribution is mainly confined to the two main breeding areas in the Capertee Valley and the Bundarra-Barraba region and surrounding fragmented woodlands, and there are approximately 350-400 mature individuals left in the wild (DoE, 2016b; DPE, 2022a).

No important habitat for the Regent Honeyeater, as identified in the Important Habitat Mapping for the Species (DPE, 2021), occurs within the project footprint and as such, under the BAM, no targeted surveys were required for this species. Important habitat maps identify areas that are considered essential to support critical life stages of the species including breeding areas or locations important for foraging/over-wintering for migratory species. For the Regent Honeyeater this includes the key breeding areas in the Mudgee-Wollar, Capertee Valley and Bundarra-Barraba regions. However, potentially suitable foraging habitat was found in all IBRA subregions and associated PCTs impacted by the project during vegetation and habitat mapping.

The Regent Honeyeater is highly mobile and is considered to have a moderate likelihood of occurrence within the project footprint as a nomadic forager. The impacts of the project on the species include the removal of approximately 149.34 ha of potential foraging and refuge habitat.

The Regent Honeyeater has not been recorded within the project footprint. However, there are 35 records of the species within 20 kilometres of the project footprint, with most distributed east of the project footprint, in close proximity to Canberra and Lake George. While there is potential for the species to use areas of potential foraging habitat within the project footprint, given key areas of foraging and breeding habitat will not be impacted, it is considered unlikely that the project would lead to a long-term decrease in the size of the population.

Reduce the area of occupancy of the species

There are 35 records of the species within 20 kilometres of the project footprint, with most distributed east of the project footprint, in close proximity to Canberra and Lake George. There are some scattered records around Wagga Wagga, Tarcutta, Bondo State Forest, Goulburn, and Wee Jasper, indicating that the species occurs across the entire project footprint during annual migrations. However, based on the patchy distribution and low number of Regent Honeyeater records across the entire project footprint, it is likely that the foraging resources and refugia within the project footprint are considered opportunistic. However, habitat impacted by the project is considered opportunistic foraging habitat only (which is relatively widespread in the region) and no important habitat (as described above) for the Regent Honeyeater occurs within the project footprint. Therefore, a reduction in the area of occupancy of the Regent Honeyeater as a result of the project is considered unlikely.

Fragment an existing population into two or more populations

The Regent Honeyeater is a highly mobile, nomadic species, and the project would result in the construction of transmission lines and associated infrastructure that would be highly permeable. These developments would not lead to any significant barriers that would limit the species use of potential foraging habitat within or outside of the project footprint. A connectivity strategy would also be implemented to mitigate potential habitat fragmentation impacts. Therefore, the fragmentation of an existing population into two or more populations as a result of the project is considered unlikely.

Adversely affect habitat critical to the survival of a species

The Recovery Plan of the Regent Honeyeater defines habitat critical for the survival of the species as any breeding or foraging areas where the species is likely to occur. The species is considered to have a moderate likelihood of occurrence within the project footprint based on the presence of suitable foraging resources. There are 35 records of the species within 20 kilometres of the project footprint, with most distributed east of the project footprint, in close proximity to Canberra and Lake George. There are some scattered records around Wagga Wagga, Tarcutta, Bondo State Forest, Goulburn, and Wee Jasper, indicating that the species occurs across the entire project footprint during annual migrations. However, based on the patchy distribution and low number of Regent Honeyeater records across the entire project footprint, it is likely that the foraging resources and refugia within the project footprint are considered opportunistic.

While there is the possibility for the species to use areas of potential foraging habitat within the project footprint, given that key areas of foraging and breeding habitat (as identified in the Important Habitat Map for the species) would not be impacted, it is considered unlikely that the project would affect habitat critical to the survival of the species.

Disrupt the breeding cycle of a population

The project would not affect breeding habitat/sites for this species which are known to occur in the Capertee Valley and the Bundarra-Barraba region, NSW. It is therefore considered unlikely that the project would disrupt the breeding cycle of the Regent Honeyeater population.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

The project would result in the removal of 149.34 ha of potential foraging and refuge habitat. The species is not reliant on the habitat within the project footprint for breeding, and their nomadic nature means that they move large distances across their range in search of seasonal foraging resources. It is unknown if they use the resources within the project footprint but given their dependence on widely distributed resources throughout their range, it is possible that the project may impact potential foraging habitat such that the species may decline.

Result in invasive species that are harmful to a critically endangered or endangered species becoming established in the endangered or critically endangered species' habitat

The Regent Honeyeater relies on nectar from a few key tree species which predisposes them to resource competition. Noisy Miners (*Manorina melanocephala*) and Honeybees (*Apis mellifera*) are listed as a Key Threatening Process and a Threatening Process for nectivorous birds, respectively (DE, 2016; Saunders and Tzaros, 2011). Noisy Miners are known to aggressively exclude Regent Honeyeaters.

Clearance of vegetation and creation of new edges can facilitate the incursion of Noisy Miners into habitat as Noisy Miners tend to occur on the edges of cleared and vegetated areas.

Introduce disease that may cause the species to decline, or

Whilst there is a risk that construction machinery and workers may disperse soil and plant pathogens that could affect forage species of the Regent Honeyeater, this risk would be mitigated through hygiene protocols to be implemented via the Biodiversity Management Plan to be prepared for the project. It is therefore considered unlikely that the project would introduce a disease that may cause the Regent Honeyeater to decline.

Interfere with the recovery of the species

Mitigation and avoidance measures would be refined and implemented where practicable to reduce the impact of the project on suitable foraging resources.

As suitable foraging and refuge habitat would be unavoidably cleared as a result of the project, the project therefore has the potential to interfere with the recovery of the species.

Conclusion

In line with the above findings, the project is considered to have the potential to have a significant impact on the Regent Honeyeater under the precautionary principle. A summary of the NSW assessment bilateral requirements for Regent Honeyeater is presented in Table A18- 15.

Table A18- 15: NSW assessment bilateral requirements for Regent Honeyeater

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of suitable breeding and foraging habitat for the Regent Honeyeater, habitat critical for survival and relevant Commonwealth documents are provided above. A map showing its modelled distribution is provided in below. Indicative distribution map of the likely to occur and may occur distributions of the Regent Honeyeater *Anthochaera phrygia*) (DCCEEW, 2022m; SPRAT 2022).
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	Field surveys were undertaken in accordance with the Survey guidelines for Australia's threatened birds, EPBC Act survey guidelines 6.2 (DEWHA, 2010b). These included diurnal bird surveys across the project footprint in areas with an abundance of flowering eucalypts. Detailed methods, survey effort and survey timing, can be found in Section 3.6 of the BDAR.
Description of the relevant impacts and its regard to the full national extent of the species or community's range	The Regent Honeyeater has a fragmented distribution extending from south-east QLD, through to NSW, ACT and to central Victoria (see distribution map above). In NSW, their distribution is mainly confined to the two main breeding areas and surrounding fragmented woodlands, and there are approximately 350-400 mature individuals left in the wild (DE 2016; DPE, 2022a). The Regent Honeyeater is highly mobile and has a moderate likelihood of occurrence within the project footprint as a nomadic forager. The impacts of the project footprint on the species include the removal of approximately 149.34 ha of potential foraging habitat. The area of occupancy for Regent Honeyeater cannot be defined due to their nomadic nature. Therefore, the extent of impact on habitat is unknown on a national scale.

Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Regent Honeyeater:
	• Micro-siting during detailed design and pre-clearance surveys to avoid and minimise the clearing of:
	  ○ vegetation communities associated with the Regent Honeyeater, particularly box-ironbark eucalypt woodland and dry sclerophyll forest occurring on moist, fertile soils.
	  ○ mature forage trees, in particular *E. sideroxylon, E. melliodora, E. albans, and C. maculata.*
	  ○ riparian vegetation dominated by *Casuarina* spp.
	  ○ habitat containing mistletoes.

Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	Important breeding habitat (important mapped areas) would not be impacted by the project. However, as detailed above in the SIA above, it is considered that the removal of a relatively large area of potential foraging habitat has the potential to have a significant residual impact on the species.
A description of any offsets proposed to address residual adverse significant	Potential residual impacts to the Regent Honeyeater are considered likely to be significant under the precautionary principle as detailed above.

NSW Assessment Bilateral requirements	
impacts and how these offsets will be established	Residual impacts to the Regent Honeyeater would be offset under the NSW BOS through impacts to potential habitat (ecosystem credits). The species was not identified as a species credit species under the BAM (DPIE, 2020a) as the project does not impact any habitat as mapped on the Important Habitat Map for the species. Offsets would be established/satisfied as detailed below. Details of offset requirements and obligations for the Regent Honeyeater as a result of residual impacts of the project are addressed in Chapter 15 of the BDAR.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project/ • Through making a payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All adverse impacts to the species' potential habitat have been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required.

2.3.3 Gang-gang Cockatoo (*Callocephalon fimbriatum*)

The Gang-gang Cockatoo is listed as Endangered under the EPBC Act and Vulnerable under the BC Act.

Description

The Gang-gang Cockatoo is small and stocky, being 32-36cm in length and 230-334 grams in weight, with a wingspan of 20-26 cm. Gang-gang cockatoos are primarily slate-grey in colour with broad wings and short tails. However, adult males have a scarlet-coloured head and wispy, filamentous crest that curls forward while adult females are entirely slate-grey in colour (DAWE, 2022a). Juveniles are smaller and similar in appearance to females; however, their colouring appears washed green, particularly on their underparts and upper wing (DAWE, 2022a).

Gang-gang Cockatoos are distributed in south Victoria, and south to central-eastern NSW and the ACT. They are adapted to cooler climates and are mostly found at higher elevations and more southern latitudes. In NSW, they are restricted to the lower Hunter and Northern Blue Mountains to the Southwestern slopes, contiguous with the Victorian population (DAWE, 2022a; NSW SC, 2008). They are rare at the extremities of its range, including west of Mudgee and as far north Coffs Harbour, with north records thought to be escaped captive birds. A population on King Island has been extirpated (DAWE, 2022a; NSW SC, 2008).

Gang-gang Cockatoos occur in temperate eucalypt forest and woodland habitats and are altitudinal migrants. However, overlapping of winter and summer ranges is common. During summer, the species primarily occurs in mature, wet sclerophyll forests dominated by eucalypts, with the highest density of birds occurring in assemblages with dense, shrubby acacia and banksia (DAWE, 2022a). However, it has also been recorded in more open eucalypt assemblages, subalpine snow gum woodland, temperate rainforest

and regenerating forests (DAWE, 2022a). During winter, Gang-gang Cockatoos are primarily found in open eucalypt assemblages at lower, drier altitudes. They have also been observed in the suburban areas of cities, assemblages of *Eucalyptus camaldulensis*, dense coastal thickets of *Leptopermum* and *Casurina,* as well as healthland (DAWE, 2022a). Gang-gang Cockatoos prefer to nest and breed in old growth forest, in suitable tree hollows (> 10 cm in diameter) which are essential to their breeding habitat (DAWE, 2022a).

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species is as follows:

- Approved Conservation Advice for the Gang-gang Cockatoo, in effect under the EPBC Act from 2 March 2022.
- A Recovery Plan is required, the species has a large range throughout southeast Australia and requires a complex suite of recovery and threat abatement actions across multiple state boundaries and involving a wide variety of land managers and other stakeholders (16 February 2022).

Specific Impacts

The Gang-gang Cockatoo is known to occur in all IBRA subregions within the project footprint, with multiple species sightings and suitable foraging and potential nesting habitat recorded. Breeding pairs were identified in the Bungonia IBRA subregion, with breeding habitat likely nearby. The project would result in the removal of 423.78 ha (17%) of foraging habitat and potential breeding habitat used by this species and has the potential to cause direct impacts to the species via injury or mortality during clearing and construction work.

Significant impact criteria

An action is likely to have a significant impact on an Endangered species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of a population of a species

The Gang-gang Cockatoo was recorded within the project footprint in all IBRA subregions being impacted by the project. There is also potential breeding habitat present within the project footprint in all IBRA subregions, and breeding pairs were identified in the Bungonia IBRA subregion.

Approximately 423.78 ha of foraging and breeding habitat is present within the project footprint, and the project would implement avoidance and mitigation measures to minimise impact on this habitat. However, due to the extremely small number of suitable hollow-bearing trees remaining in the environment, the removal of any suitable hollow-bearing trees as a result of the project has the potential to lead to a long-term decrease in the size of the Gang-gang Cockatoo population.

Reduce the area of occupancy of the species

The project has the potential to reduce the area of occupancy of the Gang-gang Cockatoo via the removal of suitable nesting hollows within the project footprint and the removal of up to 423.78 ha of foraging habitat across its range.

Fragment an existing population into two or more populations

Gang-gang Cockatoo is a highly mobile species, and the project would result in the construction of transmission lines and associated infrastructure that would be highly permeable. These developments would not lead to any significant barriers that would limit the species use of potential foraging and breeding habitat within or outside of the project footprint. A connectivity strategy would also be implemented to mitigate any impacts of habitat fragmentation on this species. Therefore, the fragmentation of an existing important population into two or more populations as a result of the project is considered unlikely.

Adversely affect habitat critical to the survival of a species

To date, no Critical Habitat as defined under section 207A of the EPBC Act has been identified or included in the Register of Critical Habitat for the species. However, Conservation Advice for *Callocephalon fimbriatum* (Gang-gang Cockatoo) (DAWE, 2022a) identifies habitat critical to the survival of the species as:

- All foraging habitat during both the breeding and non-breeding season, excluding exotic vegetation within urban and suburban areas.
- Stands of suitable hollow bearing trees, these include known or potentially suitable hollows, with chambers that are generally around 20 cm in floor diameter, around 50.5 cm deep (range 22–90 cm) and occur between around 7.5 m (range 5–9.4 m) above the ground.
- Stands of trees within or adjacent to known breeding areas, that are likely to become hollow bearing in future years.

The project would result in the clearing of known foraging and potential breeding habitat for the species. Following the above definitions, the project has the potential to adversely affect habitat critical to the survival of the Gang-gang Cockatoo.

Disrupt the breeding cycle of a population

The project has the potential to disrupt the breeding cycle of Gang-gang Cockatoos via the removal of suitable hollows that are used or could potentially be used by the species. As stated above, the removal of any suitable hollows or tree stands identified as critical habitat has the potential to disrupt the breeding cycle of this species. The project therefore has the potential to disrupt the breeding cycle of the Gang-gang Cockatoo.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

The removal of suitable hollow-bearing trees within the project footprint and 423.78 ha of known foraging and potential breeding habitat has the potential to decrease the availability of habitat to such an extent that the species may decline.

Result in invasive species that are harmful to an endangered or critically endangered species becoming established in the endangered or critically endangered species' habitat

Species which compete with Gang-gang Cockatoos for nesting hollows include feral European Honeybees (*Apis mellifera*), Common Brushtail Possums (*Trichosurus vulpecula*), and other bird species such as Rainbow Lorikeets (*Trichoglossus moluccanus*), Eastern Rosellas (*Platycercus eximius*), Galahs (*Eolophus roseicapilla*) and Common Mynas (*Acridotheres tristis*). Over-abundant Noisy Miners (*Manorina*

melanocephala) and Bell Miners (*Manorina melanophrys*) are also known to aggressively exclude the Gang-gang Cockatoo from woodland habitat (DAWE, 2022a).

The project would result in the removal of suitable hollow bearing trees within known foraging and potential breeding habitat that could be utilised for breeding. Due to the extremely limited number of suitable hollows remaining in the landscape, the loss of these nest sites may result in increased competition with invasive hollow-using species which could be harmful to the Gang-gang Cockatoo.

Introduce disease that may cause the species to decline, or

Whilst there is a risk that construction machinery and workers may disperse soil and plant pathogens that can affect forage species, this risk would be mitigated through hygiene protocols throughout the development and management of the project and detailed within the Biodiversity Management Plan.

The Gang-gang Cockatoo may also be affected by Psittacine Beak and Feather Disease (PBFD), a deadly disease that naturally occurs in parrot populations. The disease is prevalent in parrots that are injured, rehabilitated and released back into the wild, where they could interact with the Gang-gang Cockatoo. The loss of suitable hollow bearing trees as a result of the project is likely to increase competition for suitable hollow bearing trees and may result in the increased likelihood of PBFD infection in this species. Therefore, while the project is unlikely to introduce disease that may lead to species decline, it may increase the exposure of these animals to disease.

Interfere with the recovery of the species

There are no made or adopted recovery plans for this species, although the SPRAT database indicates a Recovery Plan is required. The Gang-gang Cockatoo has been assigned a landscape-managed species by the Saving Our Species program, which suggests the following management practices at a site, regional and state scale:

- Protect known or potential remnant species' habitat, particularly tall, wet forest and dry sclerophyll vegetation communities consisting of large trees with hollows >10 cm in diameter.
- Restore species' habitat in strategic locations close to known habitat and movement corridors, using appropriate local tree, shrub and ground cover species.
- Minimise loss of hollow bearing trees and stags when carrying out prescribed burns.

As suitable foraging and potential breeding habitat would be cleared as a result of the project, the project is considered to have the potential to interfere with the recovery of the species.

Conclusion

In line with the above findings, the project is considered likely to have a significant impact on the Gang-gang Cockatoo. A summary of the NSW assessment bilateral requirements for Gang-gang Cockatoo is presented in Table A18- 16.

Table A18- 16: NSW assessment bilateral requirements for Gang-gang Cockatoo

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with	A description of suitable breeding and foraging habitat for the Gang-gang Cockatoo, habitat critical for survival and relevant Commonwealth documents are provided above. A map showing its modelled distribution is provided below, and a map showing the field verified locations of suitable foraging, nesting and breeding habitat within the project footprint are provided in Attachment 1.

NSW Assessment Bilateral requirements	
consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	 Indicative distribution map of the known, likely to occur and may occur distributions of the Gang-gang cockatoo *Callocephalon fimbriatum* (DAWE, 2022a).
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	Field surveys were undertaken in accordance with the Survey guidelines for Australia's threatened birds, EPBC Act survey guidelines 6.2 (DEWHA, 2010b). These included diurnal bird surveys across the project footprint in areas with an abundance of flowering eucalypts. Detailed methods, survey effort and survey timing, can be found in section 3.6 of the BDAR.
Description of the relevant impacts and its regard to the full national extent of the species or community's range	The Gang-gang Cockatoo is known to occur within all IBRA subregions of the project footprint. The direct impacts of the project on the species include the removal of approximately 423.78 ha of foraging and potential breeding habitat. The national distribution of the Gang-gang Cockatoo extends from southern Victoria through to south and central eastern New South Wales (see distribution map above). The approximate population of mature individuals in the wild is 25,300 (range 17,600 – 35,200) (Cameron *et al.,* 2021).
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Gang-gang Cockatoo: • Micro-siting during detailed design and pre-clearance surveys to: ▪ avoid and mitigate the clearing of foraging and potential breeding habitat. ▪ avoid and mitigate the clearing of suitable hollow bearing trees that could potentially be used for nesting (through pre-clearance surveys and micro siting). • Development of a connectivity strategy.
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	After the proposed activities are undertaken to avoid and mitigate these impacts, there is still likely to be significant residual adverse impacts on the Gang-gang Cockatoo, given the scale of the habitat loss as a result of the project.
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Potential residual impacts to the Gang-gang Cockatoo are considered likely to be significant as detailed above. Residual impacts to the Gang-gang Cockatoo would be offset under the NSW BOS (species credit requirement). Offsets would be established/satisfied as detailed below. Details of offset requirements and obligations for Gang-gang Cockatoo as a result of residual impacts of the project are addressed in Chapter 15 of the BDAR.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements.

NSW Assessment Bilateral requirements	
	The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.NSW BOS.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project/ • Through making a payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All adverse impacts to the species habitat have been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required.

2.3.4 Glossy Black-Cockatoo (*Calyptorhynchus lathami*)

The Glossy Black-Cockatoo is listed as Vulnerable under the EPBC Act and BC Act.

Description

Glossy Black-Cockatoos are the smallest of the Black Cockatoos (*Calyptorhynchus* and *Zanda* spp.), with a body length of around 48 cm and weight of 420 g. Plumage is mostly dull black, with a blackish-brown head, an inconspicuous crest, and a broad bulbous bill. Adult males have bright red panels in the tail. Adult females have yellowish-red panels in the tail, and variable yellow patches on their heads. Juveniles are similar to adult females but with spotted pale-yellow patches on their heads, lower breast, belly and flanks, and barred undertail (DCCEEW, 2022b).

South-eastern Glossy Black Cockatoos are uncommon but widespread. They can be found from Mitchell, Queensland, through eastern New South Wales to East Gippsland, Victoria. Their distribution is continuous through the forested parts of the Great Dividing Range but becomes more scattered inland, to as far west as the Riverina in New South Wales (DCCEEW, 2022b).

South-eastern Glossy Black Cockatoos feed almost exclusively on the seeds of she oaks (*Allocasuarina spp*. and *Casuarina spp.*), usually relying on one or two species within a region. This preference may explain the patchy distribution of the subspecies in parts of its range. Alongside the already narrow dietary requirement, the birds also show strong preference to individual feed trees and will not feed on many other proximate trees of the same tree species. South-eastern Glossy Black Cockatoos are hollow nesters, utilising large hollows in both living and dead eucalypt trees. As a guide, potential nest hollows for the subspecies have the following traits (DCCEEW, 2022b):

- Less than 8 m above ground
- Located in branches >30 cm in diameter
- Branch or stem no more than 45o from vertical
- Minimum entrance diameter of >15 cm.

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species is as follows:

- The SPRAT database indicates that there is an Approved conservation advice for the Glossy Black-Cockatoo (DCCEEW, 2022b), in effect under the EPBC Act from 10 August 2022.
- The SPRAT database indicates that there is no Recovery Plan for the Glossy Black-cockatoo. A Recovery Plan is required, the species has a large range throughout southeast Australia and requires a complex suite of recovery actions across multiple state boundaries and involving a wide variety of land managers and other stakeholders (24 July 2022).

The SPRAT database indicates that the Glossy Black-Cockatoo is not referred to in any Threat Abatement Plans

There are no relevant Commonwealth survey guidelines for this species.

Specific Impacts

The Glossy Black-Cockatoo is known to occur within the Bungonia IBRA subregion, with multiple species sightings during surveys and suitable foraging and potential nesting habitat recorded. It also has a high likelihood of occurrence in the Inland Slopes IBRA subregion in intact remnants, with moderate to high connectivity. The project would result in the removal of 19.31 ha (6%) of known foraging habitat and potential breeding habitat used by this species, and 22.98 ha (7%) of potential foraging and breeding habitat.

Significant impact criteria

An action is likely to have a significant impact on Vulnerable species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of an important population of a species

The Glossy Black-Cockatoo was recorded within the project footprint of the Bungonia IBRA subregion impacted by the project. There is also potential foraging and breeding habitat present within the Inland Slopes IBRA subregion portion of the project footprint. Approximately 19.31 ha of known foraging and potential breeding habitat, and 22.98 ha of potential foraging and breeding habitat within the project footprint will be removed (total of 42.29 ha). The project would implement avoidance and mitigation measures to minimise impact on this habitat. However, due to the extremely small number of suitable hollow-bearing trees remaining in the environment and the exclusive nature of their feed trees within a region, the removal of any suitable trees as a result of the project has the potential to lead to a long-term decrease in the size of the Glossy Black-Cockatoo population.

Reduce the area of occupancy of an important population

The project has the potential to reduce the area of occupancy of an important population of Glossy Black-Cockatoo via the removal of suitable nesting hollows within the project footprint.

Fragment an existing important population into two or more populations

Glossy Black-Cockatoo is a highly mobile species, and the project would result in the construction of transmission lines and associated infrastructure that would be highly permeable. These developments would not lead to any significant barriers that would limit the species use of potential foraging and

breeding habitat within or outside of the project footprint. A connectivity strategy would also be implemented to mitigate any impacts of habitat fragmentation on this species. Therefore, the fragmentation of an existing important population into two or more populations as a result of the project is considered unlikely.

Adversely affect habitat critical to the survival of a species

To date, no Critical Habitat as defined under section 207A of the EPBC Act has been identified or included in the Register of Critical Habitat for the species. However, Conservation Advice (DCCEEW, 2022b) for the Glossy Black-cockatoo identifies habitat critical to the survival of the species as habitat:

- for activities such as foraging, breeding, roosting, or dispersal
- for the long-term maintenance of the species or ecological community (including the maintenance of species essential to the survival of the species or ecological community, such as pollinators)
- to maintain genetic diversity and long-term evolutionary development
- for the reintroduction of populations or recovery of the species or ecological community.

The project would result in the clearing of known foraging and breeding habitat for the species. Following the above definitions, the project has the potential to adversely affect habitat critical to the survival of the Glossy Black-Cockatoo.

Disrupt the breeding cycle of an important population

The project has the potential to disrupt the breeding cycle of Glossy Black-Cockatoos via the removal of suitable nesting hollows and foraging resources. As stated above, the removal of any suitable hollows or tree stands identified as critical habitat has the potential to disrupt the breeding cycle of this species. The project therefore has the potential to disrupt the breeding cycle of the Glossy Black-Cockatoo.

Modify, destroy, remove, or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

The project would result in the removal of 19.31 ha of known habitat and 22.98 ha of potential habitat within the project footprint. The removal of suitable hollow-bearing trees within the project footprint in known foraging and potential breeding habitat coupled with the species' exclusive requirement for one or two feed trees in a region, has the potential to decrease the availability of habitat to such that the species may decline.

Result in invasive species that are harmful to a vulnerable species becoming established in the vulnerable species' habitat

Grazing by rabbits (*Oryctolagus cuniculus*), other feral herbivores and livestock may cause a decline in extent and productivity of foraging habitat of the Glossy Black-Cockatoo and may also impede the regeneration ability of native vegetation, including feed tree species. Vegetation clearing and increased habitat fragmentation may increase grazing by these species (DCCEEW, 2022b).

Nest predation by native species such as the Common Brushtail Possums may be a threat. The project may result in the removal of suitable hollow-bearing trees within known and potential habitats. Due to the scarcity of suitable hollows remaining in the landscape, the loss of these nest sites may result in increased competition with invasive hollow-using species which could be harmful to the Glossy Black-Cockatoo.

These invasive and potentially harmful exotic and native species are already well established throughout the landscape and the project footprint generally. As such the project is considered unlikely to further result in invasive species that may be harmful to the Glossy Black-Cockatoo, becoming established.

Introduce disease that may cause the species to decline, or

Whilst there is a risk that construction machinery and workers may disperse soil and plant pathogens that can affect forage species, this risk would be mitigated through implementation of hygiene protocols throughout the development and management of the project.

The Glossy Black-Cockatoo may be at risk of Psittacine Beak and Feather Disease (PBFD), a deadly disease that naturally occurs in parrot populations. The disease is prevalent in parrots that are injured, rehabilitated and released back into the wild, which could interact with the Glossy Black-Cockatoo (DCCEEW, 2022b). The loss of suitable hollow bearing trees as a result of the project is likely to increase competition of suitable hollow bearing trees and may result in the increased the likelihood of PBFD infection in this species. Therefore while the project is unlikely to introduce the disease that may lead to species decline, it may increase exposure of these animals to the disease.

Interfere substantially with the recovery of the species

The Conservation Advice (DCCEEW, 2022b) for the species identifies the following strategies to achieve the recovery objectives:

- Clearing of native vegetation/timber harvesting and habitat fragmentation
  - Protect, restore and enhance the quality of known suitable habitat and increase the extent of habitat (both breeding and foraging) for south-eastern glossy black cockatoo across the subspecies' range (both current and future) to maintain viability in response to threats, including climate change.
  - Establish appropriate buffer zones (eg, 1 km) of native forests or woodlands around important nesting areas to minimise incursions by competitors.
  - Protect large old trees and smaller trees that contain large hollows, including those affected by fires. Ensure the recruitment of large old trees by retaining medium-sized trees, facilitating regeneration, and undertaking replanting.
  - Maintain connectivity within and between regions:
  - At a local scale, ensure that birds can move safely between food, water and roosting resources via corridors that provide cover in the form of woodland or forest vegetation
  - Identify regional corridors that connect inland populations with those along the Great Dividing Range and the coast.
  - Enhance or restore regional corridors through strategic revegetation and other works that ensure the availability of food, shelter and water resources.
  - Ensure the year-round availability of surface water in close proximity to foraging and nesting habitat. Where necessary, install or maintain artificial water recourses to ensure continued access to food and nest sites during periods when natural surface water is absent.
  - Maintain vegetation in proximity to water points, including the presence of smaller trees immediately adjacent to the water's edge, to provide cover and resting place for drinking birds.
  - Identify important populations and engage stakeholders in the development and implementation of a local area management plan (a map-based document detailing the works necessary to secure the long-term viability of the population). Undertake baseline studies to support the preparation of these management plans.

    - Develop or improve forestry policies across the range of the subspecies that promote the retention and recruitment of old hollow-bearing trees and other important habitat for the south-eastern glossy black cockatoo.
    - Promote and encourage revegetation programs or groups to include a *Allocasuarina/Casuarina* mix in their planting, where appropriate.
- Inappropriate fire regimes
    - Provide fire and land managers with specific advice to support decision making in wildfire prevention, preparation, response, and recovery. Develop a landscape-scale fire management strategy which minimises the risk of extensive wildfire, whilst considering the ecological needs of the subspecies. For example:
    - Ensure fire suppression strategies also consider impacts on the population or its habitat.
    - Fire management activities to protect key sites and those identified as most at risk from wildfires should be prioritised.
    - Protect unburnt areas within or adjacent to recently burnt ground that may provide refuge, from planned back burns, clearing and other disturbance until the burnt areas have recovered sufficiently to support the subspecies once again.
    - Apply adaptive management to inform future fire management plans and actions.
    - Identify appropriate fire regimes and management practices for feeding and breeding habitat, including under future fire risk scenarios due to climate change.
    - Implement appropriate fire planning and land management for conservation reserves and other public land with feeding and breeding habitat.
    - Review proposed fire management plans at an appropriate interval to ensure remaining suitable habitat for the subspecies is protected.
- Competition for nest hollows
    - Identify sites where hollows are limiting and develop and implement strategies to increase hollow availability that have clear objectives and include monitoring, maintenance, and reporting requirements. Actions include:
    - Nest box and/or other artificial/augmented hollow installation
    - The humane control of introduced species
    - The protection of trees having the potential to develop hollows.

The removal of known and potential habitat including breeding hollows may impede or interfere with targeted recovery actions directed at minimising habitat clearance and increase competition for nest hollows.

Conclusion

In line with the above findings, the project is likely to have a significant impact on the Glossy Black-Cockatoo. A summary of the NSW assessment bilateral requirements for Glossy Black-Cockatoo is presented in Table A18- 17.

Table A18- 17: NSW assessment bilateral requirements for Glossy Black-cockatoo

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	 A description of suitable breeding and foraging habitat for the Glossy Black-Cockatoo, habitat critical for survival and relevant Commonwealth documents are provided above. A map showing its modelled distribution is provided above, and a map showing the field verified locations of suitable foraging, nesting and breeding habitat within the project footprint are provided in Attachment 1.
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	Field surveys were undertaken in accordance with the Survey guidelines for Australia's threatened birds, EPBC Act survey guidelines 6.2 (DEWHA, 2010b). These included diurnal bird surveys across the project footprint in areas with an abundance of flowering eucalypts. Description of the relevant impacts and its regard to the full national extent of the species or community's range	The Glossy Black-Cockatoo is known to occur within the project footprint of the Bungonia subregion portion of the project footprint. It also has a high likelihood of occurrence in the Inland Slopes IBRA subregion in intact remnants, with moderate to high connectivity. The direct impacts of the project on the species include the removal of approximately 19.31 ha of known habitat and 22.98 ha of potential habitat (total impact 42.29 ha). The area of occupancy of the Glossy Black-Cockatoo is estimated at 4,000,000 ha and the national distribution of this species extends from Victoria, along the south-east coast of NSW, through to the south-east coast of Queensland (see distribution map above). The project would impact 0.001 % of Glossy Black-Cockatoo habitat on a national scale.
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Glossy Black-cockatoo: • Micro-siting during detailed design and pre-clearance surveys to: ▪ Avoid and mitigate the clearing of foraging and potential breeding habitat. ▪ Avoid and mitigate the clearing of suitable hollow bearing trees that could potentially be used for nesting (through pre-clearance surveys and micro siting). • Development of a connectivity strategy.
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	As detailed in the SIA above, the project is considered likely to have a significant impact on the Glossy Black-Cockatoo. The project would result in the removal of 42.29 ha of known and potential habitat.
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Residual impacts to the Glossy Black-Cockatoo are considered likely to be significant as detailed above. Residual impacts to Glossy Black-Cockatoo would be offset under the NSW BOS (species credit requirement). Offsets would be established/satisfied as detailed

NSW Assessment Bilateral requirements	
	below. Details of offset requirements and obligations for Glossy Black-Cockatoo because of residual impacts of the project are addressed in Section 14 of the BDAR.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.NSW BOS.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project/ • Through making a payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All adverse impacts to the species known and potential habitat have been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required.

2.3.5 Painted Honeyeater (*Grantiella picta*)

The Painted Honeyeater is listed as Vulnerable under the EPBC Act and the BC Act.

Description

The Painted Honeyeater is a small to medium honeyeater. It has black upperparts, white underparts, black spots on its flanks and yellow edges to the flight and tail feathers. The bill is a deep pink and the eye red. The females are smaller and browner on the back than the male, frequently with fewer streaks or spots on their breast and flanks. Juveniles are even paler than the female, appearing more brown than black, with fainter yellow colouring to feathers and with a grey bill rather than the pink seen on adults (DAWE, 2021d).

The Painted Honeyeater is endemic to Australia. The species is sparsely distributed from south-eastern Australia to north-western Queensland and eastern Northern Territory. The greatest concentrations and almost all records of breeding come from south of 26°S, on inland slopes of the Great Dividing Range between the Grampians, Victoria and Roma, Queensland. The species exhibits seasonal north-south movements governed principally by the fruiting of mistletoe, with which its breeding season is closely aligned. Considering its dispersive, nomadic habits, the species is considered to comprise a single population (DAWE, 2021d2).

The Painted Honeyeater is the most specialised of Australia's honeyeaters. Its diet mainly consists of mistletoe fruits, but also includes nectar (from flowering mistletoe, eucalypts and possibly banksias) and arthropods, especially in the non-breeding season. The species inhabits mistletoes in eucalypt forests, woodlands, riparian woodlands of Black Box (*Eucalyptus largiflorens*) and River Red Gum (*E. camaldulensis*), Box-Ironbark Yellow Gum woodlands, Acacia-dominated woodlands, paperbarks, Casuarinas, Callitris, and trees on farmland or gardens. The species prefers woodlands which contain a higher number of mature

trees, as these host more mistletoes. It is more common in wider blocks of remnant woodland than in narrower strips, although it breeds in quite narrow roadside strips if ample mistletoe fruit is available.

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species is as follows:

- Approved Conservation Advice for the Painted Honeyeater (DoE, 2015d), in effect under the EPBC Act from 08 July 2015.
- Recovery Plan for the Painted Honeyeater (DAWE, 2021d), in effect under the EPBC Act from 16 June 2022.
- The Painted Honeyeater is not referred to in any Threat Abatement Plans.

Relevant survey guidelines for this species include:

- Survey guidelines for Australia's threatened birds, EPBC Act survey guidelines 6.2 (DEWHA, 2010b).

Specific Impacts

The Painted Honeyeater has a high likelihood of occurrence in the Inland Slopes IBRA subregion portion of the project footprint. There is potentially suitable foraging and nesting habitat within open woodland habitats, but no individuals were sighted during targeted surveys. The project would result in the clearing of 85.10 ha (11%) of potential habitat in the Inland Slopes IBRA subregion.

Significant impact criteria

An action is likely to have a significant impact on a Vulnerable species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of an important population of a species

Currently, no Important Population of this species has been defined, however, given the dispersive, nomadic habits, this species is considered to comprise of a single population (DAWE, 2021d). The Painted Honeyeater does persist in five Key Biodiversity Areas (KBA) in NSW, one located within the project footprint. The project traverses a Priority Management Area for the species under the NSW Save Our Species (SoS) program, and a KBA in the South-west Slopes of NSW in which the Painted Honeyeater is a Trigger Species (DAWE, 2021d). Therefore, a precautionary approach has been taken and it is assumed that the project footprint contains an important population within the meaning of the guideline.

The Painted Honeyeater has a high likelihood of occurrence in Inland Slopes IBRA subregion within potentially suitable foraging and breeding habitat. The project would result in the loss of 85.10 ha of potential habitat.

Mature trees are more likely to host more mistletoes utilised by the species (DAWE, 2021d). Therefore, the retention of mature trees, particularly large mature trees (DBH ≥ 113 cm), and the avoidance of areas containing a high density of mature trees will minimise impacts to the species. Mature trees are more likely to host more mistletoes utilised by the species (DAWE, 2021d).

The project footprint would result in the clearing of mature trees which the Painted Honeyeater potentially requires as foraging and nesting habitat (DAWE, 2021d). There is therefore a possibility that the removal of 85.10 ha of potential foraging and nesting habitat has the potential to lead to a long-term decrease in the size of the population.

Reduce the area of occupancy of an important population

Due to the factors outlined above, the loss of 85.10 ha of potential habitat for the Painted Honeyeater, across its range may reduce the area of occupancy for the Painted Honeyeater.

Fragment an existing important population into two or more populations

The Painted Honeyeater is a highly mobile species, and the project would result in the construction of transmission lines and associated infrastructure that would be highly permeable. These developments would not lead to any significant barriers that would limit the species use of potential foraging and breeding habitat within or outside of the project footprint. A connectivity strategy would also be implemented to mitigate any impacts of habitat fragmentation on this species. Therefore, the fragmentation of an existing important population into two or more populations as a result of the project is considered unlikely.

Adversely affect habitat critical to the survival of a species

Habitat critical to the survival of the species is defined in the Recovery Plan of the Painted Honeyeater (DAWE, 2021d). It is divided into breeding, foraging and long-term maintenance habitat, and includes the following:

- Breeding Habitat
  - Known or likely breeding habitat in Boree/Weeping Myall (*Acacia pendula*), Brigalow (*A. harpophylla*) woodlands, box-gum woodlands and box-ironbark forests on the inland slopes of the Great Dividing Range in New South Wales, Victoria and southern Queensland.
- Foraging Habitat
  - All preferred foraging species within known and likely foraging habitat particularly mistletoes of the genus *Amyema* growing on forest and woodland eucalypts and acacias.
- Habitat for the long-term maintenance of the species
  - All Key Biodiversity Areas with Painted Honeyeater as a Trigger species.
  - Suitable habitat in future climate niches as information becomes available.

The project would result in the clearing of potential breeding and foraging habitat, including the clearing of preferred foraging habitat and vegetation within the South-west Slopes KBA. It is therefore considered likely that the project would adversely affect habitat that may be critical to the survival of this species.

Disrupt the breeding cycle of an important population

The project would result in the clearing of potential breeding habitat for the species. Given the extent of habitat clearance over its range, the project may disrupt the breeding cycle of a proportion of the population.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

As described above, the project would result in the clearing of 85.10 ha of potential breeding and foraging habitat, and vegetation within the South-west Slopes KBA. Thus there is a possibility that the population of the Painted Honeyeater may decline as a result of the project.

Result in invasive species that are harmful to a vulnerable species becoming established in the vulnerable species' habitat

The Painted Honeyeater is predated by introduced predators such as Black Rats *(Rattus rattus)* and nest-predation by native birds such as Pied Currawongs (*Strepera graculina*), Pied and Grey Butcherbirds (C*racticus nigrogularis* and *Cracticus torquatus*), and crows and ravens (Corvidae) (DAWE, 2021d).

The Painted Honeyeater also competes for resources with larger and/or more aggressive honeyeaters such as the Noisy Miner, Yellow-throated Miner, Noisy Friarbird and the Red Wattlebird. Reducing foraging and breeding habitat availability is likely to exacerbate this threat.

While the project is unlikely to result in further invasive species becoming established, it would result in the removal of potential breeding and foraging habitat for the Painted Honeyeater, exacerbating the threat posed by already present invasive and native competitor/predators.

Introduce disease that may cause the species to decline, or

Whilst there is a risk that construction machinery and workers may disperse soil and plant pathogens that can affect forage species of the Painted Honeyeater, this risk would be mitigated through implementation of hygiene protocols throughout the development and management of the project.

Interfere with the recovery of the species

The Recovery Plan (DAWE, 2021d) for the species identifies the following strategies to achieve the recovery objectives:

- Protect, manage and restore Painted Honeyeater breeding and foraging habitats at the local, regional and landscape scales
- Monitor, reduce and manage threats and sources of mortality
- Develop and apply techniques to measure changes in population trajectory in order to measure the success of recovery actions
- Improve understanding of habitat use at a landscape scale in order to better target protection and restoration measures
- Engage local communities and stakeholders in Painted Honeyeater conservation
- Coordinate, review and report on recovery progress.

The project would impede or interfere with the targeted recovery actions for this species through removal of potential habitat for the species.

Conclusion

Due to the factors described above, the project is considered to have the potential to have a significant impact on the Painted Honeyeater. A summary of the NSW assessment bilateral requirements for Painted Honeyeater is presented in Table A18- 18.

Table A18- 18: NSW assessment bilateral requirements for Painted Honeyeater

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of habitat for this species, important populations, habitat critical for survival and relevant Commonwealth documents are provided above, with a map showing its modelled distribution provided below. A map showing the field verified locations of this vegetation within the project footprint is provided in Attachment 1. Indicative distribution map of the known or likely to occur and may occur distributions of the Painted Honeyeater (DAWE, 2021d).
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	Field surveys were undertaken in accordance with the Survey guidelines for Australia's threatened birds, EPBC Act survey guidelines 6.2 (DEWHA, 2010b). These included diurnal bird surveys across the project footprint in areas with an abundance of flowering eucalypts. Detailed methods, survey effort and survey timing, can be found in Section 3.6 of the BDAR.
Description of the relevant impacts and its regard to the full national extent of the species or community's range	The Painted Honeyeater is known to occur within the Inland Slopes IBRA Subregion portion of the project footprint. The direct impacts of the project on the species include the removal of approximately 85.10 ha of potential foraging and breeding habitat. The national distribution of the Painted Honeyeater extends from southern Victoria through to Queensland and north of the Northern Territory (see distribution map above).
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Painted Honeyeater: • Micro-siting during detailed design and pre-clearance surveys to: ▪ Avoid and mitigate the removal of potential foraging and breeding habitat. ▪ Avoid and mitigate vegetation clearing to minimise habitat fragmentation and increase connectivity.
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	As detailed above, the project would result in residual impacts to 85.10 ha of potential breeding and foraging habitat of the Painted Honeyeater. As detailed in the SIA above, these impacts are considered to have the potential to be significant.
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Residual impacts to the Painted Honeyeater are considered likely to be significant as detailed in the SIA above. Residual impacts to potential habitat of the Painted Honeyeater would be offset under the NSW BOS (ecosystem credits). Offsets will be established/satisfied as detailed below. Details of offset requirements and obligations for Painted Honeyeater because of residual impacts of the project are addressed in Section 14 of the BDAR.

NSW Assessment Bilateral requirements	
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.NSW BOS.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project • Through making a payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All adverse impacts to the species habitat have been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required.

2.3.6 Swift Parrot (*Lathamus discolor*)

The Swift Parrot is listed as Critically Endangered under the EPBC Act and Endangered under the BC Act.

Description

The Swift Parrot is a medium-sized species with a slim body, approximately 25 cm long. The body is mostly bright green with a dark blue-purple crown and red around the face, and a red chin and throat edged with yellow. Bright red patches are also found under the wings. From a distance, it's 12 cm long, dark red thin tail and angular pointed wings give it a characteristic streamlined silhouette, distinguishing it from similar lorikeets. It has a flute-like chirruping or metallic "kik-kik-kik" call (TSSC, 2016a; DPE, 2021).

The Swift Parrot is migratory, breeding in Tasmania during spring and summer, and the entire population then migrates north to mainland Australia during autumn and winter. The breeding range of the Swift Parrot is largely restricted to the Tasmanian east and south-east coast, closely mirroring the distribution of blue gum (*Eucalyptus globulus*) (TSSC, 2016a). On mainland Australia, it is distributed in the south-east, from Victoria and the eastern regions of SA to south-east QLD. In NSW, the species is found on the coast and south-west slopes, and the indicative habitat distribution mapping for the species includes the entirety of the project footprint (TSSC, 2016a; DPE, 2022b; DCCEEW, 2022ai). Overall, the species is considered likely to occur within the project footprint.

On the mainland, the Swift Parrot is primarily found in Victoria and NSW, although it disperses widely throughout its indicative distribution. It is dependent on the flowering resources in a variety of habitats, primarily the flowers and psyllid lerps of eucalyptus. In Victoria, they are predominantly found on the inland slopes of the Great Dividing Range in the dry forests and woodlands of the box-ironbark region. Whereas in NSW, they occur in woodlands and forests of the coastal and western slopes and key foraging include *Eucalyptus sideroxylon, E. microcarpa, E. albens and E. melliodora*. Larger, mature specimens of

these species are more likely to be used for foraging than younger plants (Saunders et al., 2010; Saunders and Tzaros, 2011; TSSC, 2016a). During periods of drought in Victoria, the species may occur in coastal drought refuge habitats in NSW which tend to support a larger number of birds (TSSC, 2016a).

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species are as follows:

- Approved conservation advice for *Lathamus discolor* Swift Parrot, in effect under the EPBC Act from 05 May 2016
- National Recovery Plan for the Swift Parrot (*Lathamus discolor*). In effect under the EPBC Act from 10 Feb 2012
- *Threat abatement plan for predation by feral cats*, is relevant to the Sift Parrot. In effect under the EPBC Act from 23 July 2015.

Relevant survey guidelines for this species include:

- Survey Guidelines for Australia's Threatened Birds. EPBC Act survey guidelines 6.2 (Department of the Environment, Water, Heritage and the Arts (DEWHA), 2010b).

Specific Impacts

The project footprint does not include important habitat areas for the Swift Parrot according to important habitat mapping (DPE, 2022b), but does occur between disjunct areas of mapped important foraging habitat areas for the species. The Swift Parrot has a moderate likelihood of occurrence as a nomadic forager in the Bungonia and Murrumbateman IBRA subregion portions of the project footprint due to the presence of suitable myrtaceous and lerp foraging resources. In the Inland Slopes IBRA subregion, it has a high likelihood of occurrence due to both the presence of suitable myrtaceous and lerp foraging resources. Further, the project footprint intersects a Priority Management Area for the species under the NSW Save our Species (SoS) program (though does not impact priority management sites). The project footprint would result in the loss of approximately 190.73 ha (12%) of potential foraging habitat for the species. The estimated area of occupancy for this species is 33,500 ha (TSSC, 2016a), therefore the project has the potential to decrease the area of occupancy of an important population by 0.57%.

Significant impact criteria

An action is likely to have a significant impact on a Critically Endangered species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of a population

Suitable myrtaceous and lerp foraging resources for the Swift Parrot are found within the project footprint in the Bungonia, Murrumbateman, and Inland Slopes IBRA subregions, and these subregions also contain recent species records. In the Inland Slopes IBRA subregion, the project footprint intersects a Priority Management Area for the species (though does not impact priority management sites). The project would result in the removal of 190.73 ha of potential foraging habitat.

The species is highly mobile, and therefore, unlikely to be at risk during vegetation clearing. It breeds in Tasmania so the project would not impact on any breeding events for the species. However, due to the

presence of suitable foraging habitat within the project footprint, recent species records in the impacted subregions, and the fact that the project traverses a Priority Management Area for the species, it is considered that the removal of 190.73 ha of potential foraging habitat has the potential to lead to a long-term decrease in the population size of the Swift Parrot.

Reduce the area of occupancy of the species

As outlined above, the Swift Parrot has an uncertain and dynamic area of occupancy within its range and recent species records occur in all IBRA subregions within the project footprint. Although the project would not impact breeding areas, it would result in the removal of 190.73 ha of potential foraging habitat. It is therefore considered likely that the project may reduce the area of occupancy of the Swift Parrot.

Fragment an existing population into two or more populations

The Swift Parrot occurs as a single, migratory population (Saunders and Tzaros, 2011) and the project footprint does not impact breeding habitat. The species is highly mobile, and the project footprint would not act as a barrier to movement. It is therefore considered unlikely that the project would fragment the existing population into two or more populations.

Adversely affect habitat critical to the survival of a species

The National Recovery Plan for the Swift Parrot identifies habitat critical to the species' survival as areas of priority habitat for which the Swift Parrot has a level of site fidelity or possess phenological characteristics likely to be of importance to the Swift Parrot or are otherwise identified by the recovery team.

The Recovery Plan does not explicitly identify any sites of priority habitat or of high site fidelity. However, the project footprint intersects a Priority Management Area for the species under the NSW Save our Species (SoS) program in the Inland Slopes IBRA subregion, and the important areas mapping under the BAM for the species (DPE, 2022b).

It is therefore considered that there is some potential that the project would adversely affect habitat critical to the survival of the Swift Parrot given a priority management site (NSW Save our Species program) is located approximately 1km to the south i.e. similar feed habitat may occur within the project area.

Disrupt the breeding cycle of a population

The project does not affect breeding habitat for this species and is a considerable distance from the species known breeding sites in Tasmania. It therefore considered unlikely the project would disrupt the breeding cycle of a population of the Swift Parrot.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

The project would result in the removal of 190.73 ha of potential foraging and refuge habitat. The species is not reliant on the habitat within the project footprint for breeding, and their nomadic nature means that they move large distances across their range in search of seasonal foraging resources. It is likely that the species uses the resources within the project footprint but given their dependence on widely distributed resources throughout their range, it is possible that the project may impact important foraging habitat such that the species may decline.

Result in invasive species that are harmful to a critically endangered or endangered species becoming established in the endangered or critically endangered species' habitat

The Swift Parrot relies on nectar from a few key species which predisposes the species to resource competition. Noisy Minors (*Manorina melanocephala*) and Honeybees (*Apis mellifera*) are listed as a Key Threatening Process and a Threatening Process for nectivorous birds (DE 2016; Saunders and Tzaros, 2011). The Swift Parrot is also known to experience resource competition from Sugar Gliders (*Petaurus breviceps*) and European Starlings (*Sturnus vulgaris*) (Saunders and Tzaros, 2011). These species are already present throughout the project footprint and broader landscape.

However, the project would result in the removal of foraging habitat only, which is relatively widespread in the region and across the species range. Given the availability of potential foraging habitat in the region, an increase in resource competition between the Swift Parrot, Noisy Miners and Honeybees and other competitive species as a result of the project is considered unlikely.

Introduce disease that may cause the species to decline, or

Whilst there is a risk that construction machinery and workers may disperse soil and plant pathogens that can affect forage species of the Swift Parrot, this risk would be mitigated through hygiene protocols implemented through the Biodiversity Management Plan to be prepared for the project.

The Swift Parrot may also be affected by Psittacine Beak and Feather Disease (PBFD), a deadly disease that naturally occurs in parrot populations. The disease is prevalent in parrots that are injured, rehabilitated and release back into the wild, which could interact with the Swift Parrot. The disease already exists in the wild and the project would not result in the increased likelihood of diseased birds interacting with the Swift Parrot.

It is therefore considered unlikely that the project would introduce a disease that may cause the Swift Parrot to decline.

Interfere with the recovery of the species

Mitigation and avoidance measures would be refined and implemented where practicable to reduce the impact of the project on suitable foraging resources. However, the project would impact vegetation within a Priority Management Area for the species and due to this, the project is considered to potentially interfere with the recovery of the Swift Parrot.

Conclusion

In line with the above findings, the project is considered to potentially have a significant impact on the Swift Parrot. A summary of the NSW assessment bilateral requirements for Swift Parrot is presented in Table A18- 19.

Table A18- 19: NSW assessment bilateral requirements for Swift Parrot

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any	A description of suitable breeding and foraging habitat for the Swift Parrot, habitat critical for survival and relevant Commonwealth documents are provided above.

NSW Assessment Bilateral requirements	
relevant Commonwealth guidelines and policy statements	 Indicative distribution map of the likely to occur and may occur distributions of the Swift Parrot (*Lathamus discolor*) (DCCEEW, 2022ai).
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	No important habitat for the Swift Parrot (as identified on the Important Habitat Map, DPE, 2022b) was mapped within the project footprint and as such, no targeted surveys were required for this species. However, potentially suitable foraging habitat was found in the Bungonia, Murrumbateman, and Inland Slopes IBRA subregions, within associated PCTs impacted by the project. The flora species characterising suitable foraging habitat were determined from the information provided in the SPRAT profile for the Swift Parrot, and details of the fauna habitat assessments performed can be found in Section 6.3 of the BDAR.
Description of the relevant impacts and its regard to the full national extent of the species or community's range	In NSW, the species is found on the coast and south-west slopes (see distribution map above) and there are approximately 300 individuals remaining in the wild (Olah et al. 2021). The species has a moderate likelihood of occurrence as a nomadic forager in the Bungonia and Murrumbateman IBRA subregions, due to the presence of suitable myrtaceous and lerp foraging resources within the project footprint and recent species records in these subregions. Importantly, the species has a high likelihood of occurrence in the Inland Slopes IBRA subregion, which contains suitable myrtaceous and lerp foraging resources within the project footprint and many recent species records in the subregion. The project footprint also intersects a Priority Management Area for the species. Currently, the project footprint would result in the removal of 190.73 ha of potential suitable foraging habitat. It is unclear how much preferred habitat remains nationally and where it is spatially located. This is further obfuscated due to movement of the species in response to flowering events, which vary spatially and temporally (TSSC 2016a).
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Swift Parrot: • Micro-siting during detailed design and pre-clearance surveys to: ▪ Avoid/minimise the clearing of vegetation communities associated with the Swift Parrot, particularly woodland and forest containing mature eucalyptus trees and psyllid lerps. ▪ Avoid/ minimise the clearing of key foraging species, including *Eucalyptus sideroxylon, E. microcarpa, E. albens and E. melliodora.* ▪ Avoid/minimise the clearing of any vegetation within the Priority Management Area for the species located in the Inland Slopes IBRA subregion.

NSW Assessment Bilateral requirements	
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	Given the project footprint intersects with the Priority Management Area for the Swift Parrot in the Inland Slopes IBRA subregion and the scale of potential habitat loss (190.73 ha), it is considered that there is likely to be significant residual adverse impact on the Swift Parrot.
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Potential residual impacts to Swift Parrot are considered likely to be significant as detailed in the SIA above. Residual impacts to the Swift Parrot would be offset under the NSW BOS through impacts to potential habitat (ecosystem credits). The species was not identified as a species credit species under the BAM (DPIE, 2020a) as the project does not impact any habitat as mapped on the Important Habitat Map for the species. Offsets will be established/satisfied as detailed below. Details of offset requirements and obligations for Swift Parrot as a result of residual impacts of the project are addressed in Chapter 15 of the BDAR.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.NSW BOS.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project/ • Through making a payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All adverse impacts to the species habitat have been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required.

2.3.7 Superb Parrot (*Polytelis swainsonii*)

Superb Parrot is listed as Vulnerable under the EPBC Act and the BC Act.

Description

The Superb Parrot is a medium-sized, slender, long-tailed bright grass-green parrot, which has sharply back-angled wings in flight. They are 36-42 cm long and weigh between 133 and 157 grams. Adult males have a bright yellow forehead, throat and cheeks, and a red crescent separates the yellow throat from the green breast. Adult females are duller green and lack red and yellow markings, which are instead a dull light blue in colour. Immature birds are similar in appearance to females, however young males are a slightly brighter green (OEH, 2017a; TSSC, 2016b).

The Superb Parrot is found throughout eastern inland NSW. Its core range is west of the Great Dividing Range in NSW from Canberra, Goulburn and as far west as Nyngan and Swan Hill. They predominantly breed in the South-western Slopes, in an area roughly bounded by Cowra and Yass in the east, and Grenfell, Cootamundra and Coolac in the west. During winter, birds are absent from this area where they migrate

north to the region of the upper Namoi and Gwydir Rivers (OEH, 2017a; TSSC, 2016b). However, this is not considered a regular migration, as it strongly correlated with plant productivity in the region which varies from year to year (TSSC, 2016b). Other breeding areas occur in the Riverina where birds are present year-round, along the corridors of the Murray, Edward and Murrumbidgee Rivers (OEH, 2017a).

Superb Parrots inhabit a variety of woodlands and other habitat types, including box-gum, box-cypress-pine, Boree woodlands, River Red Gum forest, artificial crops and recreational reserves (OEH, 2017a; DAWE, 2021e). In the Riverina, they mainly nest in tall riparian River Red Gum forest or woodland in the hollows of large trees or stags. In the South-west Slopes, nest trees can be in open box-gum woodland or isolated paddock trees. They are known to known to nest in *Eucalyptus blakelyii, E. melliodora, E. bridgesiana,* and *E. polyanthemos* (OEH, 2017a). They mostly feed on the ground consuming native and exotic seeds, including wallaby grass *Rytidosperma spp*., barley grass *Critesion spp.*, wheat *Triticum aestivum* and oats *Avena sativa.* They also feed on numerous wattle species eg, *Acacia dealbata*, *A. deanei, A. acinacea,* and Elms *Ulmus spp,* the flowers, fruits and lerps of eucalypts, mistletoe eg, *Amyema miquelii* and *A. quandang,* dwarf cherry *Exocarpos strictus* and Plums *Prunus spp.* (DAWE, 2021e).

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species is as follows:

- Approved conservation advice for *Polytelis swainsonii* (Superb Parrot) (TSSC, 2016b). In effect under the EPBC Act from 02 May 2015.
- National Recovery Plan for the Superb Parrot Polytelis swainsonii. In effect under the EPBC Act from 08 June 2022 (DAWE, 2021e).

Relevant survey guidelines for this species include:

- Survey guidelines for Australia's threatened birds, EPBC Act survey guidelines 6.2 (DEWHA, 2010b).

Specific Impacts

The Superb Parrot is known to occur within the project footprint in the Murrumbateman and Inland Slopes IBRA subregions portion of the project footprint, with suitable foraging and potential nesting habitat occurring in grassy box woodland. It also has a high likelihood of occurrence in Crookwell (foraging habitat), with suitable open woodland habitats occurring but no species sightings during targeted surveys. The project would result in the clearing of 125.41 ha (12%) of known habitat in Murrumbateman and Inland Slopes IBRA subregions, and 18.21 ha (2%) of potential habitat in the Crookwell IBRA subregion.

Significant impact criteria

An action is likely to have a significant impact on a Vulnerable species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of an important population of a species

Currently, no important populations of this species have been defined by the literature. However, there are two main populations of the Superb Parrot, including the Riverina population and the Southwest Slopes and Southern Tablelands population (SoS, 2018), the latter being potentially impacted by the project. The

project also traverses a Priority Management Area for the species under the NSW Save Our Species (SoS) program, and a Key Biodiversity Area (KBA) in the South-west Slopes of NSW in which the Superb Parrot is considered a Trigger species (DAWE, 2021e). Therefore, a precautionary approach has been taken and it is assumed that the project footprint contains an important population within the meaning of the guideline.

The Superb Parrot was recorded within the project footprint in the Murrumbateman and Inland Slopes portion of the project footprint, during targeted surveys and has a high likelihood of occurrence in Crookwell. The project would result in the loss of 125.41 ha of known habitat and 18.21 ha of potential habitat.

The project footprint may result in the clearing of suitable hollows (nesting habitat) which the Superb Parrot requires to nest and raise their young (DAWE, 2021e). Therefore, it is considered that the project may potentially lead to a long-term decrease in the size of an important population of this species.

Reduce the area of occupancy of an important population

Due to the factors outlined above, namely the loss of 125.41 ha of known habitat and 18.21 ha of potential habitat across its range, there is a possibility that the project would reduce the area of occupancy of an important population the Superb Parrot.

Fragment an existing important population into two or more populations

The Superb Parrot is a highly mobile species, and the project would result in the construction of transmission lines and associated infrastructure that are highly permeable. These developments would not lead to any significant barriers that would limit the species use of potential foraging and breeding habitat within or outside of the project footprint. A connectivity strategy would also be implemented to mitigate any impacts of habitat fragmentation on this species. Therefore, the fragmentation of an existing important population into two or more populations as a result of the project is considered unlikely.

Adversely affect habitat critical to the survival of a species

Habitat critical to the survival of the species is defined in the Recovery Plan of the Superb Parrot (DAWE 2021e). It is divided into breeding, foraging and long-term maintenance habitat, and includes the following:

- Two distinct habitat types are used for breeding: riverine forests in the Riverina and box-gum woodlands in the tablelands and slopes of Victoria, NSW and the ACT.
- Any known breeding colonies with a 10 km buffer zone. A buffer zone can be included in contiguous habitat only. Where a 10 km buffer zone cannot be implemented, the minimum convex polygon area containing all known nesting events with a 200 m buffer should be considered as habitat critical to the survival of the species.
- Hollow-bearing trees with the following characteristics: a DBH of approximately 113 cm and tree height between 12-24 m, hollows with an entrance diameter of 8-12 cm, depth of 59-122 cm, floor diameter of 15-22 cm and hollows located on a branch or stem with a diameter of 36-49 cm.
- Any potential nest trees captured within the buffer zone.
- All preferred foraging habitat during both breeding and non-breeding season, excluding exotic feeding grounds such as agricultural lands and exotic street trees.
- Habitat for the long-term maintenance of the species.
- All Key Biodiversity Areas (KBA) with the Superb Parrot as a Trigger species.
- Any potential suitable foraging habitat within the projected south-eastward range shift.

The project would result in the clearing of suitable hollows in known and potential habitat, as well as the clearing of preferred foraging habitat and vegetation within a Priority Management Area and the South-west Slopes Key Breeding Areas. Therefore, the project would adversely affect habitat considered critical to the survival of the species.

Disrupt the breeding cycle of an important population

The project would result in the clearing of potentially suitable hollow-bearing trees which the Superb Parrot requires to nest and raise their young, and the loss of foraging resources. Therefore, it is considered that the project has potential to disrupt the breeding cycle of an important population of the Superb Parrot.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

The project would result in the removal of 125.41 ha of known habitat and 18.21 ha of potential habitat for the Superb Parrot, which may be used for breeding and foraging purposes. Therefore, the project has the potential to modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species may decline.

Result in invasive species that are harmful to a vulnerable species becoming established in the vulnerable species' habitat

The Superb Parrot is predated upon by introduced predators such as feral cats (*Felis catus*) and European Red Foxes (*Vulpes vulpes*), however this is currently considered a minor threat (DAWE, 2021e). Mitigation measures to manage feral and invasive pest plants and animals will be implemented and detailed within the Biodiversity Management Plan.

Species that are known to compete with the Superb Parrot for hollows include the Common Starling (*Sturnus vulgaris*), Sulphur-crested Cockatoo (*Cacatua galerita*), Eastern Rosella (*Platycercus eximius*), Common Myna (*Acridotheres tristis*), Galah (*Eolophus roseicapilla*), Little Corella (*Cacatua sanguinea*) and Long-billed Corella (*Cacatua tenuirostris*). European honeybees (*Apis mellifera*) may also compete with this species for hollows, while the non-native, invasive Common Starling (*Sturnus vulgaris*) and Common Myna (*Acridotheres tristis*) have been observed removing Superb Parrot eggs from active nests (DAWE, 2021e).

The project may result in the removal of suitable hollow-bearing trees within known or potential habitat for the Superb Parrot that could potentially be utilised for nesting. Due to the extremely limited number of suitable hollows for this species remaining in the landscape (Stojanovic *et al.,* 2020), the loss of these nest sites may result in increased competition with invasive hollow-using species. However, these species as well as feral cats and foxes are already present throughout the project footprint and broader landscape. As such, the project is unlikely to result in potentially harmful invasive species becoming established.

Introduce disease that may cause the species to decline, or

Whilst there is a risk that construction machinery and workers may disperse soil and plant pathogens that can affect forage species of the Superb Parrot, this risk would be mitigated through hygiene protocols to be implemented throughout the development and management of the project and detailed within the Biodiversity Management Plan.

The Superb Parrot may also be affected by *Psittacine* Beak and Feather Disease (PBFD), a deadly disease that naturally occurs in parrot populations. The disease is prevalent in parrots that are injured, rehabilitated and released back into the wild, which could interact with the Superb Parrot. The loss of suitable hollow-bearing trees and foraging resources as a result of the project is likely to increase competition for suitable hollow bearing trees and may result in the increased likelihood of PBFD infection in this species. Therefore while the project is unlikely to introduce disease that may lead to species decline, it may increase exposure of these animals to the disease.

Interfere with the recovery of the species

Although various avoidance and mitigation measures would be implemented to reduce the impact on the Superb Parrot (such as pre-clearing surveys, survey for and avoidance of nest trees where possible) to be detailed within the Biodiversity Management Plan, the project will result in the clearing of known and suitable habitat containing potential nest trees, preferred foraging habitat and vegetation in the South-west Slopes KBA. As outlined in the Recovery Plan for the Superb Parrot (DAWE, 2021e), this habitat is considered critical to the survival of the species. It is therefore considered that the project would interfere with the recovery of the Superb Parrot.

Conclusion

Due to the factors described above, it is considered likely that the project would have a significant impact on the Superb Parrot. A summary of the NSW assessment bilateral requirements for Superb Parrot is presented in Table A18- 20.

Table A18- 20: NSW assessment bilateral requirements for Superb Parrot

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	 A description of habitat for this species, important populations, habitat critical for survival and relevant Commonwealth documents are provided above, with a map showing its modelled distribution provided below. A map showing the field verified locations of this vegetation within the project footprint is provided in Attachment 1. Indicative distribution map of the known or likely to occur and may occur distributions of the Superb Parrot *Polytelis swainsonii* (DCCEEW, 2022t).
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	Surveys for the species were conducted in accordance with the Survey guidelines for Australia's threatened birds, EPBC Act survey guidelines (DEWHA, 2010b). These included diurnal bird surveys in pockets of good quality habitat within the project footprint. Detailed methods can be found in Section 4.6 of the BDAR.

NSW Assessment Bilateral requirements	
Description of the relevant impacts and its regard to the full national extent of the species or community's range	The Superb Parrot is found throughout eastern inland NSW with the estimated habitat extent unknown (DAWE, 2021e). The species is known to occur within the project footprint in the Murrumbateman and Inland Slopes IBRA subregions and has a moderate likelihood of occurrence in the Crookwell IBRA subregion. The project would result in the clearing of 125.41 ha of known in Murrumbateman and Inland Slopes IBRA subregions, and 18.21 ha of potential habitat in the Crookwell IBRA subregion. Currently, the population is estimated to range between 6,500-100,000 mature individuals; however, this estimate has low reliability (DAWE, 2021e).
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Superb Parrot: • Micro-siting during detailed design and pre-clearance surveys to: ▪ Avoid and mitigate the removal of known and potential species habitat, particularly large eucalypts (DBH ≥ 113 cm) with suitable nesting hollows. ▪ Avoid and mitigate vegetation clearing to minimise habitat fragmentation and increase connectivity. ▪ Avoid and mitigate clearing of vegetation in the Superb Parrot Priority Management Area and the South-west Slopes KBA.
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	As detailed in the SIA above, the residual adverse impact to 143.62 ha of known and potential breeding habitat for an important population, including habitat that may be critical to the survival of the species, is considered likely to be significant.
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Potential residual impacts to Superb Parrot are considered likely to be significant as detailed above. Residual impacts to Superb Parrot would be offset under the NSW BOS (species credits). Offsets would be established/satisfied as detailed below. Details of offset requirements and obligations for Superb Parrot as a result of residual impacts of the project are addressed in Chapter 15 of the BDAR.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.NSW BOS
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project/ • Through making a payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All adverse impacts to the species habitat have been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required.

2.3.8 Pilotbird (*Pycnoptilus floccosus*)

The Pilotbird is listed as Vulnerable under the EPBC Act and is not listed under the BC Act.

Description

Pilotbirds are small, plump, ground-dwelling birds, about 18 cm long with a wingspan and weight of around 23 cm and 27 grams, respectively (DAWE, 2022b). Pilotbirds are large headed with cinnamon frons, amber eyes and slender, pointed, dusky bills (DAWE, 2022b). Their upperparts are a deep rufous-brown, while their tails are long, broad, and wedge-tipped (DAWE, 2022b). The species' throat, breast and underbelly are cinnamon, scalloped brown (DAWE, 2022b). Their lower underparts are dull white, and they have brown flanks and rufous tail coverts (DAWE, 2022b).

Pilotbirds are endemic to south-east Australia (DAWE, 2022b). Upland Pilotbirds occur above 600 m in the Brindabella Ranges in the Australian Capital Territory, and in the Snowy Mountains in New South Wales and north-east Victoria (DAWE, 2022b). Lowland Pilotbirds occur in forests from the Blue Mountains west of Newcastle, around the wetter forests of eastern Australia, to Dandenong near Melbourne (DAWE, 2022b).

Pilotbirds are strictly terrestrial, living on the ground in dense forests with heavy undergrowth (DAWE, 2022b). Largely sedentary, they are typically seen hopping briskly over the forest floor and foraging on insects, fruits and seeds on damp ground or among leaf-litter (DAWE, 2022b). Flight is described as weak, though, if disturbed, birds can sometimes ascend into shrubs (but no more than 1–2 m from the ground) (DAWE, 2022b). They are typically seen in pairs or occasionally in family parties, occupying small territories all year round (DAWE, 2022b).

The species was not recorded during field surveys and has been assumed present in the Snowy Mountains, Bondo and Inland Slopes IBRA subregion portions of the project footprint, in higher quality, intact remnants.

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species is as follows:

- Approved conservation advice for the Pilotbird (DAWE, 2022b), in effect under the EPBC Act from 2 March 2022.
- A Recovery Plan is not required for this species - the approved Conservation Advice is considered to provide sufficient guidance on the recovery of the species.
- No Threat Abatement Plan has been identified as being relevant for this species.
- There are no survey guidelines for this species.

Specific Impacts

The Pilotbird has a high likelihood of occurrence in the Bondo, Inland Slopes, and Snowy Mountains IBRA subregions with suitable woodland habitats for foraging and breeding, however no species were sighted during targeted surveys. There were 324 Pilotbird records within 20 kilometers of the project footprint (DPE, 2023), with records primarily distributed near Tumut, Bago State Forest and Bondo State Forest.

The project would result in the clearing of 130.5 ha of potential habitat in the Bondo, Inland Slopes and Snowy Mountains IBRA subregions. Assessment of potential habitat is based on the presence of suitable

wet sclerophyll and dry sclerophyll vegetation formations which is in high condition within the project footprint. The species requires dense midstorey and groundcover for refuge and foraging purposes. The estimated area of occupancy for this species is 2,660,000 ha (Loyn *et al.,* 2021). The project therefore has the potential to reduce the area of occupancy for this species by 0.01%.

Significant impact criteria

An action is likely to have a significant impact on a Vulnerable species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of an important population of a species

Important populations are not defined in the conservation advice for this species. The species consists of two subspecies distributed in two areas: Upland Pilotbirds which occur in the Snowy Mountains (11,000 mature individuals), and Lowland Pilotbirds which occur around the wetter forests of eastern Australia. Given that potential habitat for both subspecies occurs in the project footprint, a precautionary approach has been taken and it is assumed that the project footprint could contain an important population.

The project would result in an increased risk of vehicular strike or machine trampling of this species, and the loss of 130.5 ha of potential habitat. In addition, the total population for the Upland and Lowland subspecies has very likely declined due to the 2019/2020 fires (DAWE, 2022b). There is therefore potential for the project to lead to a long-term decrease in the size of an important population of this species. A connectivity strategy will be implemented as part of the Biodiversity Management Plan to facilitate species movement throughout the project footprint.

Reduce the area of occupancy of an important population

As stated above, important populations have not been defined for this species, however a precautionary approach has been taken and it is assumed that the project footprint contains habitat that may support an important population within the meaning of the guideline. Due to the factors outlined above, and notably the loss of 130.5 ha of potential habitat for the Pilotbird, there is a possibility that the project may reduce the area of occupancy of an important population of this species.

Fragment an existing important population into two or more populations

As stated above, important populations have not been defined for this species, however a precautionary approach has been taken and it is assumed that the project footprint contains habitat that may support an important population within the meaning of the guideline. Potential habitat for this species is intersected by the project footprint and may become fragmented as a result of clearing. The project footprint is relatively narrow and would not impede movement of the species from patches of vegetation to be retained on either side. Retained midstories and ground cover within the project footprint would also enable the species to continue to traverse the project footprint and therefore it is considered unlikely that an existing population of the Pilotbird would be fragmented into two or more populations.

Adversely affect habitat critical to the survival of a species

No Critical Habitat as defined under section 207A of the EPBC Act has been identified or included in the Register of Critical Habitat for this species. The conservation advice states that habitat critical to the survival of the Pilotbird includes:

- Wet sclerophyll forests in temperate zones in moist gullies with dense undergrowth, and
- Dry sclerophyll forests and woodlands occupying dry slopes and ridges
- As well as any breeding or foraging habitat in areas where the species is known or likely to occur.

The project would result in the clearing of potential habitat (130.5 ha) for this species in areas where the species is likely to occur based on conservation advice mapping. There were 324 Pilotbird records within 20 kilometres of the project footprint (DPE, 2023), with records primarily distributed near Tumut, Bago State Forest and Bondo State Forest. The species has a high likelihood of occurrence within the Snowy Mountains and Bondo IBRA subregion portions of the project footprint. The estimated area of occupancy for this species is 2,660,000 ha (Loyn *et al.* 2021). The project therefore has the potential to reduce the area of occupancy for this species by 0.01%.

Disrupt the breeding cycle of an important population

As stated above, important populations have not been defined for this species, however a precautionary approach has been taken and it is assumed that the project footprint could contain an important population within the meaning of the guideline. Key potential impacts include the removal of 130.5 ha of potential habitat. Given the mitigation measures proposed to control the impact of fragmentation on this species, and the areas of suitable habitat to be retained both within the project footprint and adjacent lands, the project is considered unlikely to disrupt breeding cycles for this species in the long-term.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

The project would result in the removal of 130.5 ha of potential habitat. Should the species occur, given the scale of habitat removal, it is possible that the reduction in habitat as a result of the project may lead to species decline.

Result in invasive species that are harmful to a vulnerable species becoming established in the vulnerable species' habitat

The Pilotbird is predated by introduced predators such as feral cats (*Felis catus*) and European Red Foxes (*Vulpes vulpes*), however this is currently considered a minor threat (DAWE, 2022b) and these species are already established throughout the project footprint and broader landscape. The project is unlikely to result in increased invasive species that will be harmful to the Pilotbird. Mitigation measures to control the spread of weeds and pest animals would be detailed in the Biodiversity Management Plan.

Introduce disease that may cause the species to decline, or

Whilst there is a risk that construction machinery and workers may disperse soil and plant pathogens that can affect forage species/habitat of the Pilotbird, this risk would be mitigated through hygiene protocols throughout the development and management of the project. The project is unlikely to result in the introduction of a disease that would cause the Pilotbird to decline.

Interfere with the recovery of the species

There is no recovery plan for this species. The conservation advice for this species identifies a number of conservation and recovery actions including to 'ensure remaining habitat is protected from disturbance and fragmentation'. Given that the project would remove suitable habitat for this species, there is potential for the project to interfere with this recovery action.

Conclusion

Due to the factors described above, it is considered that the project could potentially have a significant impact on the Pilotbird under the precautionary principle. A summary of the NSW assessment bilateral requirements for Pilotbird is presented in Table A18- 21.

Table A18- 21: NSW assessment bilateral requirements for Pilotbird

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of suitable breeding and foraging habitat for Pilotbird, habitat critical for survival and relevant Commonwealth documents are provided above. A map showing its modelled distribution is provided below, and a map showing the field verified locations of suitable foraging, nesting and breeding habitat within the project footprint are provided in Attachment 1.  Indicative distribution map of the known, likely to occur and may occur distributions of Pilotbird (DAWE, 2022b).
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	Field surveys were undertaken in accordance with the Survey guidelines for Australia's threatened birds, EPBC Act survey guidelines 6.2 (DEWHA 2010b). These included diurnal bird surveys across the project footprint in areas with an abundance of flowering eucalypts. Detailed methods, survey effort and survey timing, can be found in Section 3.6 of the BDAR.
Description of the relevant impacts and its regard to the full national extent of the species or community's range	The Pilotbird is likely to occur within the project footprint of the Bondo, Inland Slopes, and Snowy Mountains IBRA subregions. Direct impacts of the project on this species include the removal of approximately 130.5 ha of potential foraging and breeding habitat. The national distribution of the Pilotbird extends from south-eastern Victoria along the south-east coast of NSW (see distribution map above). The estimated area of occupancy for the Pilotbird is 2,660,000 ha (Loyn *et al.,* 2021). Therefore, the project is likely to reduce the species' area of occupancy by 0.001% on a national scale.
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Pilotbird: • Micro-siting during detailed design and pre-clearance surveys to: ▪ Avoid and mitigate the removal of known and potential species habitat. ▪ Avoid and mitigate vegetation clearing to minimise habitat fragmentation and increase connectivity.

NSW Assessment Bilateral requirements	
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	After the proposed activities are undertaken to avoid and mitigate these impacts, as detailed in the SIA above, a precautionary approach assumes that the project could potentially have a significant impact on the Pilotbird due to the scale of potential habitat to be impacted (130.5 ha).
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Potential residual impacts to the Pilotbird are considered to have the potential to be significant as detailed above. The Pilotbird is currently not listed under the BC Act and has no associated PCTs identified in BioNet (DPE, 2023). It is not identified as an ecosystem or species credit species. However, residual impacts to the species' habitat would be offset under the NSW BOS through calculation of offsets required due to impacts to vegetation types with which it is associated (ecosystem credits). Offsets would be established/satisfied as detailed below. Details of offset requirements and obligations for the Pilotbird as a result of residual impacts of the project are addressed in Chapter 15 of the BDAR.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.NSW BOS.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project/ • Through making a payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All significant adverse impacts to the species have been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required.

2.3.9 White-throated Needletail (*Hirundapus caudacutus*)

The White-throated Needletail is listed as Vulnerable under the EPBC Act and is not listed under the BC Act.

Description

White-throated Needletail is a large swift with approx. 50 cm wingspan and short, square tail. Predominantly dark, with white throat, forehead and undertail coverts. The name refers to the short spines that extend beyond the feathers of the tail (OEH, 2017c).

The White-throated Needletail is widespread in eastern and south-eastern Australia (DAWE, 2022b). In eastern Australia, it is recorded in all coastal regions of Queensland and NSW, extending inland to the western slopes of the Great Divide and occasionally onto the adjacent inland plains. It is widespread in Victoria, though more so on and south of the Great Divide, and there are few records in western Victoria outside the Grampians and the South-west. The species occurs in adjacent areas of south-eastern South Australia, where it extends west to the Yorke Peninsula and the Mount Lofty Ranges. It is widespread in

Tasmania. White-throated Needletails only occur as vagrants in the Northern Territory and in Western Australia (DAWE, 2022b).

There are no published estimates of the extent of occurrence of the White-throated Needletail in Australia. The estimated global extent of occurrence is 1,000,000–10,000,000 km² (Birdlife International 2007q). The area of occupancy of the White-throated Needletail in Australia has been estimated at 126,200 km². The species occurs at numerous and widespread sites in eastern Australia (DAWE, 2022b).

The White-throated Needletail is generally gregarious when in Australia, sometimes occurring in large flocks, comprising hundreds or thousands of birds, though they are occasionally seen singly, and occasionally occur in mixed flocks with other aerial insectivores, including Fork-tailed Swifts (*Apus pacificus*) and Fairy Martins (*Hirundo ariel*) (DAWE, 2022b).

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan:

A summary of the relevant Commonwealth guidelines and policy statements available for this species is as follows:

- Approved conservation advice for the White-throated Needletail (TSSC, 2019d), in effect under the EPBC Act from 4 July 2019.
- A Recovery Plan is not required for this species - the approved Conservation Advice is considered to provide sufficient guidance on the recovery of the species.
- No Threat Abatement Plan has been identified as being relevant for this species.
- There are no survey guidelines for this species.

Specific Impacts

The species is known to occupy the airspace above most vegetation formations, and habitats found within the project footprint (aerial forager). The project has the potential to remove approximately 85.09 ha of opportunistic/potential foraging habitat. However, the species is highly mobile, and is almost always aerial in Australia, at heights up to 'cloud level', above a wide variety of habitats and disturbed areas (DCCEW, 2019). They use updrafts, low pressure systems to glean aerial insects, and are less reliant on terrestrial vegetation communities as a habitat resource.

An action is likely to have a significant impact on a Vulnerable species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of an important population of a species

There is no adopted or made Recovery Plan for the White-throated Needletail and no important populations have been identified in Commonwealth conservation documents. It is considered unlikely that any population of White-throated Needletails in the project footprint would be considered part of an important population. This is because the project footprint is not at the limit of the species range. The currently available information is insufficient to assess whether the local population would be necessary for maintaining the genetic diversity of the species, however given the number and distribution of records within the species range, this is considered unlikely.

The White-throated Needletail was not recorded during the field surveys for the project. Potential foraging habitat is present in the project footprint in the form of associated PCTs. Approximately 722.67 ha of

potential habitat for this species would be cleared as a result of the project. Extensive areas of potential habitat for this species are also present within the locality and would be retained. Given the substantial area of similar habitat within the project footprint and locality, the project is considered unlikely to lead to long-term decrease in the size of an important population of this species.

Reduce the area of occupancy of an important population

White-throated Needletail is known to occur across eastern Australia. White-throated Needletail was not recorded during the field surveys for the project and the project footprint is not at the limit of the species range. As such, it is considered unlikely that any population of White-throated Needletail in the project footprint would be considered part of an important population. The clearing associated with the project may impact approximately 85.09 ha of potential habitat in the form of associated PCTs. The species is almost exclusively aerial in Australia, at heights up to 'cloud level', above a wide variety of habitats and disturbed areas (DCCEEW, 2022l). They use thermal updrafts, and low-pressure systems to glean aerial insects, and is less reliant on terrestrial vegetation as a habitat resource. Therefore, it is considered unlikely that the project would reduce the area of occupancy of an important population.

Fragment an existing important population into two or more populations

As mentioned previously, it is considered unlikely that any population of White-throated Needletail in the project footprint would be considered part of an important population. Clearing of approximately 85.09 ha potential habitat for the White-throated Needletail has potential to occur, although, the species is highly mobile and almost exclusively aerial in Australia (feeding on aerial insects) and is known to forage over a range of habitat types, and disturbed areas. Therefore, the project is unlikely to lead to fragmentation or isolation of an existing population into two or more populations due to the extensive areas of potential habitat to be retained, and the extensive range and mobility of the species.

Adversely affect habitat critical to the survival of a species

To date, no Critical Habitat as defined under section 207A of the EPBC Act has been identified or included in the Register of Critical Habitat for the species. The area of habitat to be impacted for the project would be approximately 85.09 ha of potential foraging habitat.

Given the substantial areas of similar habitat within the project footprint and locality to be retained, and the diversity of habitat types over which this species may forage, it is considered unlikely that the project would adversely affect habitat critical to the survival of the species.

Disrupt the breeding cycle of an important population

The species does not breed within Australia. Therefore, the project would not disrupt the breeding cycle of a population.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

The project may impact on potential habitat for the White-throated Needletail as described above, however considering the extensive range of the species, and variety and broad distribution of potential foraging habitat across its range, the removal of potential habitat associated with the project is considered unlikely to contribute to the decline of the species.

The installation of transmission lines have the potential to create a collision hazard resulting in strikes with the lines. The SPRAT profile for this species indicates that there is the constant threat of collision with overhead wires when in Australia, however this affects only a few individuals and is not a threat to the species overall (DCCEEW 2022l). Given the existing threat of collision with overhead wires, it is unlikely that the installation of transmission lines in the project footprint would increase this threat to the extent that there would be a substantial impact to the species overall.

Result in invasive species that are harmful to a vulnerable species becoming established in the vulnerable species' habitat

The project is not likely to result in the introduction of invasive species that may become established in habitat for this species.

Introduce disease that may cause the species to decline, or

Whilst there is some potential for construction plant and machinery to transport and disperse soil pathogens throughout the project footprint that could impact upon roosting habitat, this risk will be managed through the use of vehicle wash down procedures, to be detailed in the Biodiversity Management Plan.

Interfere substantially with the recovery of the species

There is no adopted or made Recovery Plan for this species. The Conservation Advice (TSSC, 2019d) for the species lists conservation actions that may assist the species. The project is considered unlikely to interfere with these conservation actions.

Conclusion

The project is considered unlikely to result in a significant impact to the White-throated Needletail.

NSW Bilateral assessment

The NSW Assessment of Bilateral requirements for White-throated Needletail are provided in Section 2.5.

2.3.10 Key's Matchstick Grasshopper (*Keyacris scurra*)

Key's Matchstick Grasshopper is listed as Endangered under the EPBC Act and BC Act.

Description

Key's Matchstick Grasshopper is a small (females approximately 25 mm, males approximately 18 mm), slender, wingless grasshopper characterised by its slanted face, splayed hind femora and ensiform antennae. This species occurs in several colour forms, with brown being the most common (TSSC, 2022).

Key's Matchstick grasshopper was originally distributed from Victoria (Vic.) to Orange (NSW) across the wheat/sheep belt (TSSC, 2022) although in recent times the range has contracted. This species is typically recorded in native grasslands, secondary native grasslands or areas that contain the native grass *Themeda* sp. with appropriate disturbance regimes. Degree of disturbance appears to be an important determinant of site occupancy and it appears to be absent from sites that are disturbed during inappropriate times of the year (and interrupt the short non-overlapping lifecycle) or have been subjected to erratic management (eg, periods of over and under grazing) (TSSC, 2022).

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species is as follows:

- Approved conservation advice for the *Keyacris scurra* Key's Matchstick Grasshopper, in effect under the EPBC Act from 5 October 2022 (TSSC, 2022)
- A Recovery Plan for this species is not required. This decision was based on the fact that the threats facing *Keyacris scurra*, and the recovery actions needed, are well-understood.
- There are no threat abatement plans are relevant to the Key's Matchstick Grasshopper.

Specific Impacts

Key's Matchstick Grasshopper occurrence is assumed in the Bungonia, Crookwell and Inland Slopes IBRA subregions due to the presence of suitable grassland habitats and multiple records within 5 kilometres of the project footprint and known within the Murrumbateman IBRA subregion portion of the project footprint (10 records in total across the project footprint). During field surveys, four individuals were identified within the Murrumbateman portion of the project footprint. The species is associated with PCTs 266, 277, 278, 283 and 1330.

Across the indicative disturbance area there is 192.30 ha of known habitat. According to the approved Conservation Advice there is approximately 14,200 ha of habitat for this species nationally (TSSC, 2022). The project would remove up to 1.6 % of known habitat for the species (habitat used for all life stages of the species).

The project would include the retention of ground-layer vegetation throughout the corridor wherever possible, potentially minimising impacts to the species and allowing for species persistence within areas of known and potential habitat in the project footprint.

Significant impact criteria

An action is likely to have a significant impact on an Endangered species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of a population of a species

Direct impacts may occur to 192.30 ha of modelled habitat for the species (habitat used for all life stages of the species and where the species is considered likely to occur). This extent of habitat loss has the potential to lead to the long-term decrease in the size of the species' population. The project would aim to avoid areas of known habitat during detailed design and habitat fragmentation would be minimised in known areas through the development of a connectivity strategy. The project would also include the retention of ground-layer vegetation throughout the transmission line easement wherever possible, potentially minimising impacts to the species and allowing for species persistence within areas of potential habitat in the project footprint. Despite this, the removal of habitat used by the species for all stages of its life cycle is likely to lead to a long-term decrease in the size of a Key's Matchstick Grasshopper population.

Reduce the area of occupancy of the species

Across the project footprint there is 192.30 ha of potential habitat within the indicative disturbance area. According to the approved Conservation Advice there is approximately 14,200 ha of remaining habitat for this species (TSSC, 2022). The project would remove up to 1.6 % of known habitat for the species (habitat used for all life stages of the species). The removal of habitat used by the species for all stages of its life cycle has the potential to reduce the area of occupancy of the species.

Fragment an existing population into two or more populations

Due to the limited dispersal capability of Key's Matchstick Grasshopper, this species does not disperse large distances, greater than 10 metres (DPE, 2022). Therefore, sites that are separated by 20 metres or more of unsuitable habitat are considered geographically isolated, individual subpopulations. The indicative disturbance area intersects the species likely distribution and would impact on 192.30 ha of known habitat. The project may reduce the overall extent of habitat, and reduce connectivity through the removal grassland habitats, particularly in proposed transmission line structure and access track locations. At its widest, the transmission line easement component of the project would not be more than 130 metres, whereas most of the easement would generally be 70 metres wide, and thus fragmentation of an existing population into two or more populations is considered unlikely. Therefore, it is considered unlikely that the project would fragment an existing population into two or more populations.

Adversely affect habitat critical to the survival of a species

To date, no Critical Habitat as defined under section 207A of the EPBC Act has been identified or included in the Register of Critical Habitat for the species. However, Conservation Advice identified Key's Matchstick Grasshopper habitat as native grasslands, secondary native grasslands or areas that contain the native grass understorey. The project would remove up to 1.6 % of known habitat for the species (habitat used for all life stages of the species). The removal of habitat used by the species for all stages of its life cycle has the potential to adversely affect habitat that may be critical to the survival of Key's Matchstick Grasshopper.

Disrupt the breeding cycle of a population

The project has the potential to disrupt the breeding cycle of Key's Matchstick Grasshopper via the removal of known habitat used for all stages of the species lifecycle. As stated above, the removal of critical habitat has the potential to disrupt the breeding cycle of this species. The project therefore has the potential to disrupt the breeding cycle of the Key's Matchstick Grasshopper.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

Known habitat for Key's Matchstick Grasshopper would be impacted by the project (192.30 ha in total). It is recommended that areas of known habitat are avoided, where feasible during detailed design, and a connectivity strategy is implemented. Despite this, there are likely to be residual impacts to the availability and quality of habitat. It is therefore considered likely that the project would decrease habitat availability to such an extent that the species may decline.

Result in invasive species that are harmful to an endangered or critically endangered species becoming established in the endangered or critically endangered species' habitat

Whilst there is a risk that the project would introduce invasive weed species into the habitat of the Key's Matchstick Grasshopper, which may be harmful to all stages of the species lifecycle, this risk would be

mitigated through hygiene protocols stipulated in the Biodiversity Management Plan to be prepared for the project.

Introduce disease that may cause the species to decline, or

No diseases are known to directly affect Key's Matchstick Grasshopper. However, the risk of soil pathogens would be mitigated via hygiene protocols stipulated in the Biodiversity Management Plan to be prepared for the project.

Interfere with the recovery of the species

There are no made or adopted recovery plans for this species. Key's Matchstick Grasshopper has been assigned a site-managed species by the Saving Our Species program, which suggests the following management practices at a site, regional and state scale:

- Retain and protect natural grassland remnants within the known distribution of the species
- Do not change management of sites where species exists unless changes are likely to be beneficial
- Do not destroy habitat and surrounding areas by ploughing and do not allow heavy, prolonged grazing on habitat
- Control invasions of weeds and pasture species (but be wary of the impact of herbicide use in habitat): where possible use methods that directly target weeds such as spot spraying and hand removal
- Where woody species threatens to out-compete grassy habitat in previously grazed or mown sites, consider re-introducing an appropriate biomass control method
- Ensure remnant populations remain connected or linked to each other; in cases where remnants have lost connective links, re-establish links by revegetating sites to act as steppingstones for dispersal.

As known habitat is likely to be removed as a result of the project, the project has the potential to interfere with the recovery of the species.

Conclusion

In line with the above findings, the project is considered likely to have a significant impact on Key's Matchstick Grasshopper. A summary of the NSW assessment bilateral requirements for Key's Matchstick Grasshopper is presented in Table A18- 22.

Table A18- 22: NSW assessment bilateral requirements for Key's Matchstick Grasshopper

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of suitable breeding and foraging habitat for Key's Matchstick Grasshopper, habitat critical for survival and relevant Commonwealth documents are provided above. A map showing its modelled distribution is provided below, and a map showing the field verified locations of suitable foraging, nesting and breeding habitat within the project footprint are provided in Attachment 1.  Indicative distribution map of the known, likely to occur and may occur distributions of Key's Matchstick Grasshopper (DCCEEW, 2022aj).
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	Detailed methods and timing of the surveys can be found in Section 3.6 of the BDAR.
Description of the relevant impacts and its regard to the full national extent of the species or community's range	Across the project footprint there is 635.21 ha of known habitat, and 1,647.18 ha of potential habitat (2,282.39 ha in total). According to the approved Conservation Advice there is approximately 14,200 ha of habitat for this species nationally (TSSC, 2022). The project is likely to remove 4.5% of known habitat for the species (habitat used for all life stages of the species), and removal of 11.6% of potential habitat.
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Key's Matchstick Grasshopper: • Micro-siting during detailed design and pre-clearance surveys to: ▪ Avoid impacts to known and potential Key's Matchstick Grasshopper habitat, including temperate grassland or open-box woodland. It is recommended that areas of known habitat are avoided, where feasible during detailed design ▪ Avoid and mitigate habitat fragmentation and ensure gaps between known subpopulation sites are less than 20 m via the development of a connectivity strategy.
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	After the above avoidance and mitigation measures are implemented, as detailed in the SIA, there is likely to be significant residual impacts on Key's Matchstick Grasshopper.
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Potential residual impacts to Key's Matchstick Grasshopper are considered likely to be significant as detailed above. Residual impacts to Key's Matchstick Grasshopper would be offset under the NSW BOS (species credits). Offsets will be established/satisfied as detailed below. Details of offset requirements and obligations for Key's Matchstick Grasshopper as a result of residual impacts of the project are addressed in Chapter 15 of the BDAR.

NSW Assessment Bilateral requirements	
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.NSW BOS
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project • Through making a payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All significant adverse impacts to the species have been addressed under the NSW BOS. There are no significant residual impacts to the species that have not been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required.

2.3.11 Golden Sun Moth (*Synemon plana*)

The Golden Sun Moth is listed as vulnerable under the EPBC Act and BC Act.

Description

The Golden Sun Moth is a medium-sized diurnal moth belonging to the family *Castniidae*. Both sexes have green eyes, clubbed antennae, and no functional mouthparts, however females have a long extensible ovipositor (DAWE, 2021f; DPE, 2022c). The wingspan of males is slightly larger than females with a wingspan of 34 mm and 31 mm, respectively, and females have a reduced hind wing which limits their ability to fly. The colouring of the upper side of the wing differs between the sexes. Males have a dark brown forewing with pale grey patterning and a dark bronze hindwing with dark brown patches. Whereas females have dark grey forewings with pale grey patterning and a bright orange hindwing with black patches around the edge (DAWE, 2021f).

The eggs of the Golden Sun Moth are just over 2 mm long and the larvae develop and pupate underground, feeding on the roots of Wallaby grass. The larvae are cream in colour and late instars have a red-brown head capsule. The red-brown pupal capsule protrudes from the ground after emergence, usually in proximity to a grass tussock. The pupal cases of females are larger than males (DAWE, 2021f).

The Golden Sun Moth is distributed throughout south-eastern Australia and is highly correlated with suitable food plants. However, while the extent of occurrence is large, the area of occupancy of this species is very small. In NSW, it is known to occur in small grassland remnants between Queanbeyan, Gunning, Young and Tumut (DAWE, 2021f; DPE, 2022c). Suitable habitat for the Golden Sun Moth includes native temperate grassland or open box-gum woodlands, with a ground cover layer dominated by native Wallaby grasses (*Rytidosperma* spp.) or exotic Chilean needlegrass (*Nassella neesiana*) on which the species feeds (DAWE, 2021f). The species is restricted within these discrete, suitable areas and breeding habitat is highly

specialised, being dependent on the presence of both food plants and heterogenous bare ground cover (DAWE, 2021f).

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species is as follows:

- Approved Conservation Advice for the Golden Sun Moth, in effect under the EPBC Act from 7 December 2021 (DAWE, 2021f)
- Recovery Plan required, included on the Commenced List (1 November 2009).
- The following threat abatement plans are relevant to the Golden Sun Moth:
  - Threat abatement plan for competition and land degradation by rabbits. In effect under the EPBC Act from 07 January 2017.

Specific Impacts

The Golden Sun Moth was not detected during field surveys, however it has been assumed present as it has a high likelihood of occurrence in the Murrumbateman and Inland Slopes IBRA subregions due to the presence of suitable grassland habitats and multiple records within five kilometres of the project footprint (59 in Murrumbateman and 11 in Inland Slopes). The project would result in the loss of approximately 38.63 ha of potential foraging and breeding habitat (including 2.75 ha of prescribed impacts on non-native vegetation) for the Golden Sun Moth.

PCTs present in the project footprint that are associated with this species include: PCT 266, 277, 352 and 1330. The project would include the retention of ground-layer vegetation throughout the transmission line easement wherever possible, potentially minimising impacts to the species and allowing for species persistence within areas of potential habitat in the project footprint.

Significant impact criteria

An action is likely to have a significant impact on a Vulnerable species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of an important population

Direct impacts may occur to 38.63 ha of potential foraging and breeding habitat (including prescribed impacts) of the Golden Sun Moth, which has the potential to lead to the long-term decrease in the size of the species' population. However, it is recommended that areas of known or potential habitat are avoided, where feasible during detailed design, and habitat fragmentation would be avoided in known areas through the implementation of a connectivity strategy be developed as part of the Biodiversity Management Plan. After these avoidance and mitigation measures are implemented, is it considered unlikely that the project would lead to a long-term decrease in the size of a Golden Sun Moth population.

Reduce the area of occupancy of an important population

The project has the potential to reduce the area of occupancy if any of the areas of potential habitat are occupied by the species. The project would implement avoidance measures as detailed above in areas of known habitat for the species. Once the removal of known habitat is avoided and a connectivity strategy

implemented, it is considered unlikely that the project would reduce the area of occupancy of a Golden Sun Moth population.

Fragment an existing population into two or more important populations

Golden Sun Moth persists in fragmented sites over a broad distribution. Due to the limited dispersal capability of the species, sites that are separated by 200 meters or more of unsuitable habitat are considered geographically isolated, individual subpopulations. Known habitat of populations within the project footprint would be avoided during detailed design where feasible, and a connectivity strategy implemented to minimise fragmentation impacts on the species. At its widest, the transmission line easement component of the project footprint would not be more than 130 metres wide (whereas most of the easement would generally be 70 metres wide), and thus fragmentation of an existing population into two or more populations is considered unlikely.

Adversely affect habitat critical to the survival of a species

To date, no Critical Habitat as defined under section 207A of the EPBC Act has been identified or included in the Register of Critical Habitat for the species. However, Conservation Advice for *Synemon plana* (Golden Sun Moth) (DAWE, 2021f) states that habitat critical to the survival of the species likely includes:

- All native grasslands occupied by the species across its range.
- All occupied habitat is important for the breeding activity of a subpopulation and the recovery of the species.
- Large subpopulations or small, well-connected subpopulations occurring in high quality habitat would classify as important for the long-term maintenance of the species.
- High quality habitat for the species is defined as medium to large sites containing native grassland with an abundant component of forage species including *Rytidosperma* spp. and/or *Austrostipa* spp., with low weed cover, tussock cover with heterogenous bare earth, and land management reflecting the ecological value of the site.
- Sites occurring at or near the limit of the species ranges or sites a long distance from other subpopulations.

There are large areas of potential habitat within the project footprint. However, known habitat within the project footprint would be avoided where possible and a connectivity strategy implemented. Therefore, it is considered unlikely that the project would adversely affect habitat critical to the survival of the Golden Sun Moth.

Disrupt the breeding cycle of an important population

The project has the potential to disrupt the breeding cycle of the Golden Sun Moth. Due to the limited dispersal capability of the species, sites that are separated by 200 meters or more of unsuitable habitat are considered geographically isolated, individual subpopulations. Reduced habitat connectivity impedes females from recolonising areas and further isolates subpopulations and, in turn, reduces genetic exchange between subpopulations and the long-term viability of a subpopulation (DAWE, 2021f). However, known habitat within the project footprint would be avoided where possible and a connectivity strategy implemented. Ground layer vegetation will also be retained throughout much of the project footprint allowing for the persistence of the species within areas of potential habitat should it occur. It is therefore considered unlikely that the project would disrupt the breeding cycle of a Golden Sun Moth population.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

Known habitat within the project footprint would be avoided where possible and a connectivity strategy implemented. Ground layer vegetation would also be retained throughout much of the project footprint allowing for the persistence of the species within areas of potential habitat should it occur. It is therefore considered unlikely that the project will decrease habitat availability to such an extent that the species would decline.

Result in invasive species that are harmful to a vulnerable species becoming established in the vulnerable species' habitat

The project is unlikely to result in invasive species that are harmful to Golden Sun Moth habitat.

Introduce disease that may cause the species to decline, or

No diseases are known to directly affect the Golden Sun Moth. However, various soil pathogens have the potential to affect the species larval food sources (ie *Rytidiosperma* spp., *Austrostipa* spp. and *Nassella trichotoma*). This risk would be mitigated via hygiene protocols stipulated in the Biodiversity Management Plan to be prepared for the project.

Interfere with the recovery of the species

Once avoidance and mitigation measures detailed above are implemented, it is considered unlikely that the project would interfere with the recovery of the species.

Conclusion

It is considered that the project may potentially significantly impact the Golden Sun Moth, due to impacts to 38.63 ha of potential foraging and breeding habitat (including prescribed impacts) where the species presence has been assumed. Despite planned avoidance of known habitat where possible, residuals impacts are still considered likely. A summary of the NSW assessment bilateral requirements for Golden Sun Moth is presented in Table A18- 23.

Table A18- 23: NSW assessment bilateral requirements for Golden Sun Moth

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of suitable breeding and foraging habitat for the Golden Sun Moth, habitat critical for survival and relevant Commonwealth documents are provided above. A map showing the species modelled distribution is provided below, and a map showing the field verified locations of suitable habitat within the project footprint is provided in Attachment 1.

NSW Assessment Bilateral requirements	
	 Indicative distribution map of the known, likely to occur and may occur distributions of the Golden Sun Moth *Synemon plana* (DAWE, 2021f).
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	Field surveys were in accordance with the Background Paper to EPBC Act Policy Statement 3.12 – Significant Impact Guidelines for the Critically Endangered Golden Sun Moth (*Synemon plana*) (DEWHA, 2009). Surveys were conducted in areas of suitable habitat for the species, including those dominated by exotic Chilean Needlegrass *Nassella neesiana*. These habitats included all areas which have, or once had, native grasslands (including derived grasslands) or grassy woodlands within the historical range of the species. The historical range of the species was determined through literature and database reviews, and this was used to inform survey locations within the project footprint. Detailed methods and timing of the surveys can be found in Section 3.6 of the BDAR.
Description of the relevant impacts and its regard to the full national extent of the species or community's range	The national distribution of the Golden Sun Moth extends from western and southern Victoria through the south and central eastern New South Wales (see Indicative distribution map above); however, its relative area of occupancy is very small (DAWE, 2021f). There are no robust estimates available in the literature to determine the current population of the species. Within the project footprint, the species is known to occur in the Murrumbateman and Inland Slopes IBRA subregions with multiple sightings in suitable grassland habitat. The project has the potential to result in the loss of approximately 38.63 ha of foraging and breeding habitat (including prescribed impacts) and may reduce habitat connectivity between subpopulations of this species.
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Golden Sun Moth: • Micro-siting during detailed design and pre-clearance surveys to: ▪ Avoid impacts to known or potential Golden Sun Moth habitat, including temperate grassland or open-box woodland with a ground layer dominated by Wallaby grass *Rytidosperma spp*. or Chilean Needlegrass *Nassella neesiana*. It is recommended that areas of known habitat are avoided, where feasible during detailed design. ▪ Avoid and mitigate habitat fragmentation (where feasible) and link gaps between known subpopulation sites that are less than 200 m via the development of a connectivity strategy.
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	After the above avoidance and mitigation measures are implemented, it is considered that the project is unlikely to have a significant impact on the Golden Sun Moth.

NSW Assessment Bilateral requirements	
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Residual impacts to Golden Sun Moth would be offset under the NSW BOS. 254 species credits will be required. Offsets will be established/satisfied as detailed below. Details of offset requirements and obligations for Golden Sun Moth as a result of residual impacts of the project are addressed in Chapter 15 of the BDAR.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.NSW BOS.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project/ • Through making a payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All significant adverse impacts to the species have been addressed under the NSW BOS. There are no significant residual impacts to the species that have not been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required.

2.3.12 Bogong Moth (*Agrotis infusa*)

Whilst not an EPBC Act listed threatened species, the Bogong Moth's assessment should follow the information requirements for EPBC listed species that is listed under paragraph 17 of the Supplementary SEARs.

Description

From the *Noctuidae* family, *Rutidosis leiolepis*, commonly referred to as Bogong Moth is a large species of moth at a range of 5 cm long. The Bogong Moth varies in colour from light brown to almost black with characteristic marks on each forewing: namely a dark arrow-marked streak, broken by one round pale spot and one comma-shaped spot. Caterpillars are cream coloured at first until they end up grey, brown with a paler ventral surface. They pupate in a cocoon in their burrow under the soil for four weeks until the adult emerges (Herbison-Evans and Crossley, 2021).

The distribution of the Bogong Moth varies as it is a highly mobile species that migrates through the seasons. The species mainly breeds in pastureland west of the Great Dividing Range. During summer when the temperature is unfavourable the Bogong Moth migrate south to the cooler high country of the Great Dividing Range (Herbison-Evans and Crossley, 2021). They particularly congregate around the area of Mount Bogong in the Alpine National Park. Indicative distribution mapping from the Australian Museum (2022) indicates the southern portion of the project footprint, near Tumut as known and predicted distribution. Overall, the species is considered likely to occur within the project footprint.

The habitat required by the Bogong Moth includes pasture lands, caves, forests, and woodlands. This variety of habitat is required for the species to make their migration possible (Australian Museum, 2022).

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan are not available for the Bogong Moth.

Specific Impacts

Key summer aestivation sites are generally found in the caves, boulder fields and tors of the Australian Alps (Green *et. al*., 2010). These sites are scattered across the south-eastern Australian alpine areas (limited to areas of the project footprint occurring the Snowy Mountains IBRA subregion) (Keaney, 2016).

Over the past decade, there has been a rapid decline in Bogong Moth numbers within the Australian Alps, and this likely due to several factors. In Green (*et al*. 2020) study, they reported a 99.5% decline in Bogong Moth numbers at alpine summer aestivation sites. It is possible, that severe drought and warmer temperatures during that period had impacted cave microclimates (maximum temperature for aestivation is 16°C) used by the species, restricting aestivation sites to higher altitudes. Further, caterpillars of Bogong Moth feeding in lowland sites are believed to ingest arsenate from agricultural sprays used against their weedy food plants amongst crops, and the developing migrant adults transport this to high altitudes. Analysis of soils washed out of aestivation sites revealed high levels of arsenic (Green *et al.,* 2021), possibly accumulated from larval food, and later released from the bodies of dead adult moths in the new environment. Other secondary threats include increased artificial light hampering migration efforts (Warrant and Dacke, 2016), and changes in agricultural practices, this includes the replacement of traditional agricultural land with cotton and rice monocultures that do not provide suitable larval host plants (Green *et al.,* 2021).

The Bogong Moth has a moderate likelihood of occurrence within portions of the project footprint during spring migration to summer aestivation sites in the Bogong Ranges. Adult moths during migration, are likely to forage on myrtaceous and proteaceous shrubs and trees, and agricultural crops (Warrant *et al.,* 2016) during this period. The project footprint also intersects 14.81 ha of potential karstic (cave-forming) geologies, which may provide suitable opportunistic, shelter (staging) sites for this species during spring migration to summer aestivation site. The project would result in the loss of approximately 1124.66 ha of potential foraging habitat for the species, and indirect impacts to 14.81 ha of potential sheltering habitats. There is also likely to be an increase in artificial lighting during construction of the project, however, the consequences of this would be relatively minor given construction would mostly be during daylight hours. A summary of the NSW assessment bilateral requirements for Bogong Moth is presented in Table A18- 24.

Table A18- 24: NSW assessment bilateral requirements for Bogong Moth

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	
NSW Assessment Bilateral requirements	
	Bogong Moth distribution (Atlas of Living Australia, 2022) The Bogong Moth occurs in pasture lands, caves, forests, and woodlands. This variety of habitat is required for the species to make their migration possible (Australian Museum, 2022). There is no current 'Important Populations' listed for the Bogong Moth. The species is known to congregate along the Great Dividing Range, particularly Mount Bogong in the Alpine National Park. There is no current defined 'Critical Habitat' for the Bogong Moth. The Bogong Moth does inhabit areas of the Great Dividing Range including Alpine National Park. These areas are not listed as 'Critical Habitat' for the species; however, their protection will serve as a direct benefit to the species.
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	There are currently no established survey guidelines, nor recovery plan for Bogong Moth. However, the species been listed on the International Union for Conservation of Nature and Natural Resources. Bogong Moth has now been declared endangered by the world's leading scientific assessment of species vulnerability.
Description of the relevant impacts and its regard to the full national extent of the species or community's range	The Bogong Moth has a moderate likelihood of occurrence within portions of the project footprint during spring migration to summer aestivation sites in the Bogong Ranges. Adult moths during migration, are likely to forage on myrtaceous and proteaceous shrubs and trees, and agricultural crops (Warrant *et al.,* 2016) during this period. The project footprint also intersects 14.81 ha of potential karstic (cave-forming) geologies, which may provide suitable opportunistic, shelter (staging) sites for this species during spring migration to summer aestivation site. The project would result in the loss of approximately 1124.66 ha of potential foraging habitat for the species, and indirect impacts to 14.81 ha of potential sheltering habitats. There is also likely to be an increase in artificial lighting during construction of the project, however, the consequences of this would be relatively minor given work would mostly be restricted to daylight hours. The area of occupancy for Bogong Moth cannot be defined given lack of knowledge on the species. Therefore, the extent of impact from the project on habitat is unknown on a national scale.
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR.
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	The residual impact to the Bogong Moth is estimated at 998.67 ha of potential habitat removal.
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Potential residual impacts to Bogong Moth are considered likely to be not significant. As such offsets are not proposed.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.

NSW Assessment Bilateral requirements	
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project/ • Payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All significant adverse impacts to the species have been addressed under the NSW BOS. There are no significant residual impacts to the species that have not been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required.

2.3.13 Large-eared Pied Bat (*Chalinolobus dwyeri*)

The Large-eared Pied Bat is listed as Vulnerable under the EPBC Act and BC Act.

Description

The Large-eared Pied Bat is a small to medium-sized insectivorous bat, measuring approximately 100 mm from head to tail and weighing 7-12 grams. Its fur is glossy and black with broad, white stripes running along the wing and tail membranes on the ventral side of the torso, which meet in a V shape at the pubic area. It has prominent, large ears and is a wattled bat, with small lobes of skin between the ears and the corners of the mouth (OEH, 2017b; DAWE, 2021g).

The Large-eared Pied Bat is found from Rockhampton, QLD to Bungonia in the Southern Highlands, NSW in areas with extensive cliffs and caves (OEH, 2017b). Within this distribution, subpopulations are considered severely fragmented and isolated. In NSW, much of the known distribution occurs, with main strongholds in the Sydney sandstone and Pilliga regions (DAWE, 2021g). Scattered records exist from the New England Tablelands and Northwest Slopes (OEH, 2017b).

The Large-eared Pied Bat has been recorded foraging in a range of vegetation types, including dry and wet sclerophyll forest, grassy woodland, *Callitris* dominated forest, tall open eucalypt forest with a rainforest sub-canopy, subtropical rainforest, and small clearings adjacent to rainforest, sub-alpine woodland, and sandstone outcrop country. Although the diet of the species has not been investigated, its wing shape indicates manoeuvrable flight suggesting it likely feeds on small flying insects below the forest canopy (DAWE, 2021g; OEH, 2017b). The modelled distribution of the species is in close association with sandstone escarpments used for roosts and fertile valleys used for foraging. Valleys that support box gum woodland are strongly associated (DAWE, 2021g).

The species is also dependent on the presence of roosts for shelter, which are used at night when the bats are not feeding and to raise their young. They are known to roost in caves, overhangs, disused mine shafts and the abandoned nests of the Fairy Martin *Petrochelidon ariel*. Known breeding sites are limited and the structure of maternity roosts appears to be very specific, with females returning to the same site in successive years. Maternity roosts often occur in arched caves with domed and indented roofs, with bats clustering in these indentations likely to capture heat and need to be high and deep enough to allow juveniles to learn how to fly inside. These physical characteristics are uncommon in the landscape and are thought to limit the distribution of the species (DAWE, 2021g).

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species are as follows:

- Large-eared Pied Bat is listed as threatened under the assessment, dated 30 October 2022.
- Approved conservation advice for *Chalinolobus dwyeri* Large-eared Pied Bat, in effect under the EPBC Act, from 23 November 2021.
- Listing advice for *Chalinolobus dwyeri* Large-eared Pied Bat. In effect under the EPBC Act from 29 June 2012.
- National Recovery Plan for the Large-eared Pied Bat *Chalinolobus dwyeri*. In effect under the EPBC Act from 10 February 2012.
- No Threat Abatement Plan has been identified as being relevant for this species.

Relevant survey guidelines for this species include:

- *Survey Guidelines for Australia's Threatened Bats.* EPBC Act survey guidelines 6.1 (Department of the Environment, Water, Heritage and the Arts (DEWHA), 2010c)

Specific Impacts

No individuals or roosting sites were recorded within the project footprint during targeted surveys. The Large-eared Pied Bat has a medium likelihood of occurrence in the Bungonia IBRA subregion portion of the project footprint. The species is considered likely to occur based on the presence of suitable cliffline roosting and foraging habitats (associated PCTs) within the project footprint and multiple species records in the broader subregion. The species is considered to have a low likelihood of occurrence in the Inland Slopes IBRA subregion portion of the project footprint, based on a low number of species records in the locality, and lack of suitable habitat components to support the species.

The project would result in the direct loss of approximately 7.70 ha of potential habitat within the Bungonia IBRA subregion portion of the indicative disturbance area. Indirect impacts resulting from the project include increased edge effects and reduced connectivity. It has been acknowledged that new forest edges may act as barriers because they interrupt existing linear flyways, or because some species avoid lit, or open areas (Threlfall et al., 2011; Altringham and Kerth, 2016; Haddock et al., 2019). The maximum gap between new forest edges within the project footprint is likely to be between 70 to 80 metres. Despite this, the transmission lines are highly permeable structures, and a Connectivity Strategy would be implemented to mitigate any impacts of habitat fragmentation on this species.

The area of occurrence for Large-eared Pied Bat is estimated at 912,000 ha (DCCEEW, 2022ak3). The project has the potential to reduce the area of occurrence by less than 0.001%.

Significant impact criteria

An action is likely to have a significant impact on a Vulnerable species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of an important population of a species

This is a data deficient species; however, important populations of the Large-eared Pied Bat are thought to occur in the sandstone escarpments of the Hunter Valley, Sydney Basin and Southern Tablelands of NSW

(DERM, 2011). Within the project footprint, direct impacts would occur to 7.70 ha of potential roosting and foraging habitat in the Bungonia IBRA subregion portion of the indicative disturbance area (primarily associated with PCTs 1330 and 1093).

The project would result in the development of highly permeable structures, with the majority of work proposed to be above ground. Earthworks would be limited to general subsurface work in the locality of the transmission line structures, ancillary infrastructure, and access tracks and roads. Therefore, suitable rocky habitat for Large-eared Pied Bat would be avoided.

Large-eared Pied Bats may also be negatively affected by increased habitat fragmentation which may affect bat species assemblages, and interactions with transmission lines. However, the transmission lines are highly permeable, and a connectivity strategy would be implemented to mitigate impacts of habitat fragmentation on this species. Additionally, no individuals or roosting sites were recorded within the project footprint during targeted surveys.

It is therefore considered unlikely that the project will lead to the long-term decrease in the size of an important population of the Large-eared Pied Bat.

Reduce the area of occupancy of an important population

Due to the factors detailed above, a reduction in the area of occupancy of an important population of the Large-eared Pied Bat as a result of the project is considered unlikely.

Fragment an existing important population into two or more populations

Impacts to potential roosting habitat suitable for the Large-eared Pied Bat would be avoided. The project would result in the construction of transmission lines and associated infrastructure that would be highly permeable. These developments would not lead to any significant barriers that would limit the species use of potential forage habitat within or outside of the project footprint. A connectivity strategy would also be implemented to mitigate any impacts of habitat fragmentation on this species. Therefore, the fragmentation of an existing important population into two or more populations as a result of the project is considered unlikely.

Adversely affect habitat critical to the survival of a species

To date, no Critical Habitat as defined under section 207A of the EPBC Act has been identified or included in the Register of Critical Habitat. This is a data deficient species and information on critical habitat is limited. However, the Recovery Plan of the Large-eared Pied Bat describes the following as critical habitat:

- Sandstone cliffs and fertile wooded valley habitat within proximity of each other
- Rainforests and moist eucalypt forest habitats on other geological substrates at high elevations
- Any maternity roosts.

Within the project footprint, impacts to sandstone escarpments will be avoided and no maternity roosts were found. Where possible, impacts to potential foraging habitat will be avoided and mitigated. Given the relatively small clearing of suitable forage habitat compared with that in the surrounding vegetation, the project is unlikely to adversely affect habitat critical to the survival of the species.

Disrupt the breeding cycle of an important population

Within the project footprint, there are no known roosting or breeding sites and impacts on potential roosting or breeding sites would be avoided. Due to this, it is considered unlikely that the project would disrupt the breeding cycle of an important population of the Large-eared Pied Bat.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

The project would result in a relatively small clearing of potential habitat (7.70 ha) compared to that remaining in the surrounding vegetation, and the construction of highly permeable transmission lines and associated infrastructure. These developments would not lead to any significant barriers that would limit the species use of potential foraging habitat within or outside of the project footprint. For areas where potential cliffline habitats have been mapped, but were inaccessible during the field surveys, pre-construction surveys have been recommended to determine species absence/presence. If Large-eared Pied Bat individuals area identified during these surveys, adaptive safeguards to mitigate impacts (eg, avoidance/delineation of habitat) to roosting individuals would be implemented, where necessary and feasible. A connectivity strategy would also be implemented to mitigate any impacts of habitat fragmentation on this species (Attachment 21).

Due to these factors, it is considered unlikely that the project will modify, destroy, remove, or isolate or decrease the availability or quality of habitat to the extent that the Large-eared Pied Bat is likely to decline.

Result in invasive species that are harmful to a vulnerable species becoming established in the vulnerable species' habitat

Threats to the Large-eared Pied Bat have not been thoroughly investigated. However, feral goats *Capra hircus*, and recreational cavers are known to disturb roosts, particularly in sandstone escarpment areas, which may cause roost abandonment. They are also likely predated by feral cats and European foxes (DERM, 2011). Vegetation clearing and increased habitat fragmentation may increase the predation and disturbance of the Large-eared Pied Bat by these species. Development of a pest species monitoring program may be required if there is a substantial occurrence of large intact remnants and threatened species habitat within or adjacent to the disturbance areas. Once mitigation measures are implemented, it is considered unlikely that the project would result in an invasive species becoming established in Large-eared Pied bat habitat.

Introduce disease that may cause the species to decline, or

Whilst there is a risk that construction machinery and workers may disperse soil and plant pathogens that can affect forage species, this risk will be mitigated through hygiene protocols throughout the development and management of the project. It is considered unlikely that the project would introduce disease that may cause the Large-eared Pied Bat to decline.

Interfere substantially with the recovery of the species.

The project does not interfere with any recovery plan actions for the Large-eared Pied Bat detailed in the National Recovery Plan for the species (DERM, 2011). The avoidance and mitigation measures described above will be implemented where practicable to reduce the potential impact of habitat fragmentation on the species as a result of the project. The project is considered unlikely to interfere with the recovery of the Large-eared Pied Bat.

Conclusion

In line with the above findings, the project is considered unlikely to have a significant impact on the Large-eared Pied Bat. A summary of the NSW assessment bilateral requirements for Large-eared Pied Bat is presented in Table A18- 25.

Table A18- 25: NSW assessment bilateral requirements for Large-eared Pied Bat

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations, and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	 **Figure 1.** Modelled distribution of the large-eared pied bat in Australia (source: Fly by Night Surveys Pty Ltd 2005). **Current distribution map for Large-eared Pied Bat (DERM, 2011)** The "*National recovery plan for the large-eared pied bat Chalinolobus dwyeri*" (DERM, 2011) is the key recovery plan for this species. This Plan notes that Large-eared Pied Bat is dependent on the presence of diurnal roosts for shelter. Roosts are utilised during the day and also at night when not feeding, as well as for the raising of young. This bat has been known to roost in disused mine shafts, caves, overhangs, and abandoned fairy martin *Hirundo ariel* nests (Schulz, 1998). The value of mine shafts and disused fairy martin nests as roost sites has not been evaluated to date. From the type locality mines may offer important roost sites, particularly in areas where natural roosts are uncommon or absent. The number of known breeding sites is limited. The type locality at Copeton was used for breeding until flooded by dam waters (Dwyer 1962). A maternity roost has been observed in a sandstone cave near Coonabarabran, NSW (Pennay 2008), and another nearby in the Pilliga sandstone (M. Pennay pers. Comm., 2010). Any known maternity roosts, or sandstone cliffs and fertile wooded valley habitat within proximity of each other should be considered habitat critical to the survival of the species.
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	Targeted surveys for Large-eared Pied Bat, were in accordance with *Survey guidelines for Australia's threatened bats* (DAWE, 2010) and *'Species credit' threatened bats and their habitats - NSW survey guide for the Biodiversity Assessment Method* (OEHDPE, 2018). The targeted surveys, habitat mapping and desktop karst and cliffline mapping methodologies were in accordance with the BAM (DPE, 2020a) with a detailed habitat mapping method provided in Section 4.6 (fauna) of the BDAR. Targeted surveys were undertaken in accordance with the guidelines outlined above, and in line with the requirements of the BAM (DPE, 2020a) within the Bungonia IBRA subregion portion of the project footprint, in November and January (within the recommended months of survey).

NSW Assessment Bilateral requirements	
	Acoustic microbat surveys Passive ultrasonic bat detectors (Anabat Swift/ Anabat Express – Titley Scientific, Brendal QLD; or SM4Bat - Wildlife Acoustics, Inc., Maynard, MA USA) were used to record and identify the echolocation calls of microchiropteran bats foraging at each survey site. Passive monitoring of survey sites was achieved by setting bat detectors to record throughout the night. Calls were analysed by Greg Ford using AnalookW (Version 4.7) software with reference to 'Bat Calls of NSW: Region Based Guide to the Echolocation Calls of Microchiropteran Bats' (Pennay et al., 2004). Targeted survey effort for threatened microbat species is outlined in Table 4-17 of the BDAR. Acoustic surveys within the Bungonia, and Inland Slopes IBRA subregions were undertaken within the months of November and January (within the recommended survey period for the species). **Harp trapping** Although many *microchiropteran* bat species are detectable through call detection methodologies, the vocal differences between species such as *Nyctophilus* sp. are sometimes too subtle to reliably differentiate between the various species occurring in each locality. In addition, harp trapping can provide additional information on sex, age, reproductive status, and other characteristics that can be assessed. Such information is required for surveys targeting breeding habitat for dual credit species. Site selection for the setting of harp traps included several considerations including suitable flyways and target species roosting and foraging habitat requirements. Harp traps were set at each location over a two-night period between spring and summer months (surveys best conducted between October and April for most species). Captured bats were identified to species level, sexed, measured, and weighed. Bats were released immediately after processing during dark conditions. Targeted survey effort for harp trapping is outlined in Table 4-17 of the BDAR. Species targeted included: Southern Myotis (*Myotis macropus*), Large-eared Pied Bat (*Chalinolobus dwyeri*), Little Bent-winged Bat (*Miniopterus australis*) and Large Bent-winged Bat (*Miniopterus orianae oceanensis*). Harp trapping within the Bungonia, and Inland Slopes IBRA subregions were undertaken within the months of November and January (within the recommended survey period for the species). **Supplementary cliffline mapping** For cliff line mapping within the project footprint, a Digital Elevation Model (DEM) was developed using 5 m contour mapping and orthotiles. Areas considered high potential for overhangs were those with a slope greater than 45 degrees. The polygons produced by the slope filter were reviewed individually using high-resolution aerial imagery, review of nearby bat records (BioNet 2022) and on-the-ground data collection (habitat mapping, survey results, vegetation mapping etc). Polygons were considered high potential to support cliff line habitat if there was: • Presence of nearby (within 10 km) cave-dependant bat records (BioNet 2022) • Presence of cliff line habitat, and nearby suitable foraging resources endorsed by field data, and photos • Aerial interpretation showing signs of cliffs, steep gullies etc. Cliff line modelling was developed to identify potential roost sites for Large-eared Pied Bat. The closest known maternity sites for the Large-eared Pied bat includes a granitic mine tunnel in northern New South Wales (Dwyer, 1966a) and another sandstone cave in central New South Wales with a low ceiling providing stable temperatures at approximately 15º C (Pennay, 2008). At both sites, clusters of bats were observed roosting in ceiling indentations or cracks.

NSW Assessment Bilateral requirements	
	No known maternity roosts, or species records for Large-eared Pied Bat occur within the project footprint, or within 10 km of the project footprint. However, as a precautionary approach for this species, cliffline habitat has been mapped (determined by API, field collected data, geological mapping and a DEM using 5-m interval contour mapping).
Description of the relevant impacts and its regard to the full national extent of the species or community's range	Within the project footprint, direct impacts would occur to 7.70 ha of potential roosting and foraging habitat in the Bungonia IBRA subregion portion of the project footprint (primarily associated with PCTs 1330 and 1093). The area of occupancy for Large-eared Pied Bat cannot be defined given lack of knowledge on the species. Therefore, the extent of impact from the project on potential Large-eared Pied Bat habitat is unknown on a national scale. The project would result in the development of highly permeable structures, with the majority of work proposed to be above ground. Earthworks would be limited to general subsurface work in the locality of the transmission line structures, telecommunication hut, substations, ancillary infrastructure, and access roads. Therefore, suitable rocky habitat for Large-eared Pied Bat would be avoided. Large-eared Pied Bats may also be negatively affected by increased habitat fragmentation which may affect bat species assemblages, and interactions with transmission lines. However, the transmission lines are a highly permeable structure, and a connectivity strategy would be implemented to mitigate any impacts of habitat fragmentation on this species. Additionally, no individuals or roosting sites were recorded within the project footprint during targeted surveys.
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Large-eared Pied Bat: <u>Cliff line habitats</u> • Pre-construction survey to confirm roosting habitat in the locality • If present, develop adaptive safeguards to mitigate indirect impacts to roosting individuals <u>Vegetated corridors in proximity to cliff line habitats</u> • Development of a connectivity strategy to maintain landscape connectivity.
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	The residual impact to Large-eared Pied Bat is 7.7 ha of habitat removal. There is the potential for indirect impacts (such as reduce habitat connectivity) within or adjacent to the project footprint, however, it is expected that these impacts would be largely mitigated and managed through implementation of measures noted above.
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Potential residual impacts to Large-eared Pied Bat are considered unlikely to be significant as detailed above. Residual impacts to Large-eared Pied Bat would be offset under the NSW BOS. 315 species credits would be required. Offsets would be established/satisfied as detailed below. Details of offset requirements and obligations for Large-eared Pied Bat as a result of residual impacts of the project are addressed in Chapter 15 of the BDAR.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.

NSW Assessment Bilateral requirements	
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project/ • Payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All significant adverse impacts to the species have been addressed under the NSW BOS. There are no significant residual impacts to the species that have not been addressed under the BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required.

2.3.14 Spotted-tailed Quoll (*Dasyurus maculatus*)

The Spotted-tailed Quoll is listed as Endangered under the EPBC Act and Vulnerable under the BC Act.

Description

The Spotted-tailed Quoll is a nocturnal, cat-sized, carnivorous marsupial with reddish-brown fur and distinctive white spots over its back and tail (TSSC, 2020a). Males are 380–759 mm in head and body length, and females are 350–450 mm (TSSC, 2020a). Tail length is 370–550 mm for males and 340–420 mm for females (TSSC, 2020a). Males weigh up to 7 kg and females up to 4 kg although the mean weight range for male adults is 2.8–4.6 kg and 1.5–2 kg for females (TSSC, 2020a).

The Spotted-tailed Quoll occurs in eastern Australia from south-eastern Queensland to western Victoria (TSSC, 2020a). Populations are now fragmented and isolated and estimates of the decline range from 50–90 per cent for the mainland and 25–50 per cent for the population in New South Wales since European settlement (TSSC, 2020a). It has been extirpated from many parts of its former range, most notably including south-eastern South Australia (TSSC, 2020a).

The Spotted-tailed Quoll is carnivorous, feeding on a wide variety of prey such as small-medium sized (less than 5 kg) mammals, birds, reptiles, fish, amphibians, and invertebrates (TSSC, 2020a). The Spotted-tailed Quoll is a mainly forest dependent species but occurs in a variety of habitats including closed forests, tall eucalypt forests, open woodlands, open forests, drier rain shadow woodlands and coastal heathlands (TSSC, 2020a). During the day Spotted-tailed Quolls shelter in fallen logs, boulder piles, burrows, tree hollows and occasionally under dwellings (TSSC, 2020a).

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species are as follows:

- Approved conservation advice for the Spotted-tailed Quoll (TSSC, 2020a), in effect under the EPBC Act from 1 September 2020.
- There is an adopted recovery plan for this species (DELWP, 2016), in effect under the EPBC Act from 6 May 2016.

The following threat abatement plants have been identified as relevant for this species:

- *Threat abatement plan for predation by feral cats*, in effect under the EPBC Act from 23 July 2015.

- Threat abatement plan for predation by the European red fox, in effect under the EPBC Act from 1 October 2008.

Relevant survey guidelines for this species include:

- Survey guidelines for Australia's threatened mammals. EPBC Act survey guidelines 6.5 (Department of Sustainability, Environment, Water, Population and Communities (DSEWPaC, 2011a).

Specific Impacts

The Spotted-tailed Quoll was not detected during field surveys, however it assumed present as it has a high likelihood of occurrence in the Bondo, Inland Slopes and Snowy Mountains IBRA subregions due to the presence of suitable habitat with moderate to high connectivity, and multiple records within 5 km of the project footprint (seven in Bondo, three in Inland Slopes and seven in Snowy Mountains). It also has a moderate likelihood of occurrence in Bungonia, Crookwell, and Murrumbateman IBRA subregions due to the presence of suitable habitat with moderate to high connectivity, and records within 20 km of the project footprint (three in Bungonia, one in Crookwell and one in Murrumbateman). The project would result in the loss of approximately 414.15 ha (17%) of potential habitat that may be impacted in the Bungonia, Bondo, Crookwell, Inland Slopes, Murrumbateman and Snowy Mountains IBRA subregions portion of the indicative disturbance area.

PCTs present in the project footprint that are associated with this species include PCT 5, 266, 268, 277, 278, 280, 283, 285, 287, 290, 295, 297, 299, 300, 306, 314, 316, 322, 343, 349, 351, 352, 638, 679, 731, 870, 939, 953, 1093, 1097, 1107, 1150, 1191, 1196, 1256 and 1330.

Significant impact criteria

An action is likely to have a significant impact on an Endangered species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of a population

The project would result in the loss of approximately 414.15 ha of potential habitat. The long, linear transmission line would result in a >70 m easement clearing within these habitats. This species has a low abundance in cleared areas and is unlikely to persist in smaller patches of bushland due to their large home range (TSSC, 2020a). A small number of patches of contiguous bushland would be intersected by the project footprint and therefore the project has the potential to result in fragmentation of Spotted-tailed Quoll habitat.

Many prey species of the Spotted-tailed Quoll require tree hollows, and therefore habitat used by Spotted-tailed Quolls is influenced by the density of hollows. The removal of known or suitable hollows, and the fragmentation of known or suitable habitat are therefore potential threats to the persistence of the species' population within the project footprint and surrounding vegetation.

The project includes the development of a connectivity strategy, including vegetation steppingstones, retention of potential den habitat wherever practicable, and reduced clearing requirements. Given the large home range of this species, the relatively narrow area to be impacted, and the mitigation measures to minimise fragmentation impacts, it is considered unlikely that the project would result in the long-term decrease of a Spotted-tailed Quoll population.

Reduce the area of occupancy of the species

The area of occupancy of this species is estimated at 251,200 ha and the species range extends from southern Queensland to northern Victoria. Given that the project footprint is entirely located within NSW and not near the outer limits of the species range, it is unlikely that the project would reduce the area of occupancy of this species.

Fragment an existing population into two or more populations

While the area of habitat mapped for this species extends from southern Queensland to Northern Victoria, populations of this species are fragmented and isolated. Much of the project footprint is predominantly cleared of intact bushland. This species has a low abundance in cleared areas and is unlikely to persist in smaller patches of bushland due to their large home range (TSSC 2020a). A small number of patches of contiguous bushland would be intersected by the project footprint and therefore it is considered possible that the project may fragment an existing population into two or more populations. However, the implementation a connectivity strategy may reduce fragmentation impacts.

Adversely affect habitat critical to the survival of a species

The recovery plan for the Spotted-tailed Quoll states that habitat critical to the survival of the species includes large patches of forest with adequate denning resources and relatively high densities of medium-sized mammalian prey (DELWP, 2016). However, the recovery plan expands on this to say that it is currently not possible to define (or map) habitat critical to the survival of the Spotted-tailed Quoll because the threshold densities of these critical components are unknown. The project footprint is predominantly cleared of intact bushland, however a small number of patches of contiguous bushland would be intersected by the project footprint which may adversely affect critical habitat through fragmentation. The implementation a connectivity strategy may reduce fragmentation impacts.

Disrupt the breeding cycle of a population

Spotted-tailed Quolls require suitable den sites for breeding such as rocky crevices, caves or hollow logs. Habitat features such as rocky outcrops, surface rock, logs, would be retained wherever practicable, and impacts to karsts would be minimised. The project has the potential to fragment an existing population and therefore may disrupt the breeding cycle of this species, however the project is required to implement the connectivity strategy which would reduce the impacts of fragmentation from the project. As such, there is potential that the project would disrupt the breeding cycle of a population of Spotted-tailed Quolls.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

The project footprint is predominantly cleared of intact bushland, however a small number of patches of contiguous bushland would be intersected by the project footprint which may result in fragmentation of areas of suitable habitat. The implementation a connectivity strategy may reduce fragmentation impacts. Given that this species is unlikely to persist in smaller patches of bushland, the project has the potential to reduce the area of occupancy for this species, however the extent of this is likely to minor and therefore it is considered unlikely to cause the species to decline.

Result in invasive species that are harmful to a critically endangered or endangered species becoming established in the endangered or critically endangered species' habitat

The Spotted-tailed Quoll are speculated to be threatened by feral cats, European red foxes, and wild and domestic dogs through competitive and/or predatory interactions (DELWP, 2016). Given the ubiquity of

feral cats and foxes in the Australian environment, they are likely already present within the IBRA subregions associated with the species. It is discussed in DELWP (2016) that impacts of introduced predators are likely magnified in conjunction with other threatening processes such as severe land disturbance, degradation and associated fragmentation of the Spotted-tailed Quoll populations.

Development of a pest species monitoring program may be required if there is a substantial occurrence of large intact remnants and threatened species habitat within or adjacent to the disturbance areas.

Where the project results in fragmentation of intact areas of bushland, the project may result in invasive species becoming established in areas of the Spotted-tailed Quoll habitat as a result of the project.

Introduce disease that may cause the species to decline, or

Whilst there is a risk that construction machinery and workers may disperse soil and plant pathogens that can affect forage species, this risk would be mitigated through hygiene protocols throughout the development and management of the project. It is considered unlikely that the project would introduce disease that may cause the Spotted-tailed Quoll to decline.

Interfere with the recovery of the species

Although impacts would be localised to a small number of areas where the project footprint intersects contiguous bushland, and various avoidance and mitigation measures would be implemented to reduce the impact on the Spotted-tailed Quoll, the project would result in the clearing and fragmentation of suitable habitat. Given that the Recovery Plan for the Spotted-tailed Quoll identifies a specific objective of 'Reduce the rate of habitat loss and fragmentation on private land', the project has the potential to interfere with the recovery of the species.

Conclusion

The project is considered to have the potential to have a significant impact on the Spotted-tailed Quoll due to removal of 414.15 ha of potentially suitable habitat where it has been assumed present. A summary of the NSW assessment bilateral requirements for Spotted-tailed Quoll is presented in Table A18- 26.

Table A18- 26: NSW assessment bilateral requirements for Spotted-tailed Quoll

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of habitat for this species, important populations, habitat critical for survival and relevant Commonwealth documents are provided above, with a map showing its modelled distribution provided below.

NSW Assessment Bilateral requirements	
	 Indicative distribution map of likely to occur and may occur distributions of the Spotted-tailed Quoll.
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	Field surveys were in accordance with the Survey guidelines for Australia's threatened mammals, EPBC Act survey guidelines 6.5 (DSEWPaC, 2011a). Methods included stagwatching, spotlighting and baited remote cameras in pockets of good quality habitat within all IBRA subregions. Detailed methods and timing of surveys can be found in Section 4.6 of the BDAR.
Description of the relevant impacts and its regard to the full national extent of the species or community's range	The direct impacts of the project on the species include the removal of approximately 414.15 ha of foraging and denning habitat. The area of occupancy of the Spotted-tailed Quoll is estimated at 251,200 ha and the national distribution of this species extends from Victoria, along the southeast coast of NSW, through to the south-east coast of Queensland (see distribution map above). The project would impact 0.16% of Spotted-tailed Quoll habitat on a national scale. However, it must be noted that this species has a low abundance in cleared areas and is unlikely to persist in smaller patches of bushland due to their large home range.
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Spotted-tailed Quoll: • Micro-siting during detailed design and pre-clearance surveys to: ▪ Avoid and mitigate the removal of habitat associated with the species, areas within large contiguous patches of bushland. ▪ Avoid and mitigate vegetation clearing to minimise habitat fragmentation and increase connectivity. If vegetation must be removed resulting in habitat fragmentation, vegetation stepping-stones are recommended to mitigate these impacts where feasible. • Development of a connectivity strategy.
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	The residual impact to Spotted-tailed Quoll is estimated at 414.15 ha of habitat removal. There is the potential for indirect impacts as a result of habitat removal and fragmentation to occur to any retained areas of Spotted-tailed Quoll habitat within or adjacent to the project footprint, however, it is expected that these impacts would be largely mitigated and managed through implementation of measures noted above. The residual impact to this species was considered to be potentially significant as per the SIA (see above).
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Potential residual impacts to Spotted-tailed Quoll are considered likely to be significant as detailed above. Residual impacts to Spotted-tailed Quoll would be offset under the NSW BOS. Offsets will be established/satisfied as detailed below. Details of offset requirements and obligations for Spotted-tailed Quoll as a result of residual impacts of the project are addressed in Chapter 15 of the BDAR.

NSW Assessment Bilateral requirements	
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project • Payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All significant adverse impacts to the species have been addressed under the NSW BOS. There are no significant residual impacts to the species that have not been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required

2.3.15 Broad-toothed Rat (*Mastacomys fuscus*)

The Broad-toothed Rat is listed as Vulnerable under the EPBC Act and the BC Act.

Description

The broad-toothed rat has a broad face, short tail and stocky body. It has fine, dense fur, which is brown tinged with rufous above, merging to a paler grey underneath. The fur may have a green tinge due to the presence of algae. The ears are small and round with tufts of hair inside. The feet are brown above and below. The tail is lightly haired, dark above and becoming slightly lighter underneath. It has characteristically large molars in a rounded head, with well-developed cheeks and large jaw muscles. It has a head and body length of 14-17 cm and a tail length of 10-13 cm.

Specific impacts

The Broad-toothed Rat was not detected during field surveys, however it assumed present as it has a high likelihood of occurrence in the Snowy Mountains IBRA subregion. This is due to the presence of suitable foraging and nesting habitat within the project footprint and 10 species records within 5 km of the project footprint. The proposed project footprint will result in the loss of approximately 2.20 ha of potential habitat in the Snowy Mountains IBRA subregion.

One PCT associated with this species is present in the project footprint within the Snowy Mountains IBRA subregion; PCT 679.

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species is as follows:

- Approved conservation advice for *Mastacomys fuscus* (Broad-toothed Rat) (TSSC, 2016c).
- There is no adopted or made Recovery Plan for this species.

Relevant adopted/made threat abatement plans include:

- Threat abatement plan for predation by feral cats. There is no adopted or made Recovery Plan for this species (DoE, 2015c).

Relevant survey guidelines for this species include:

- Survey guidelines for Australia's threatened mammals: Guidelines for detecting mammals listed under the *Environment Protection and Biodiversity Conservation Act 1999* (DSEWPaC, 2011a).

Significant impact criteria

An action is likely to have a significant impact on a Vulnerable species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of an important population of a species

Suitable foraging habitat for the Broad-toothed Rat was found within the project footprint in the Snowy Mountains IBRA subregion. The species predominantly occupies alpine and subalpine environments, which are present within the project footprint in the Snowy Mountains IBRA subregion. No species records occur within the project footprint, and no individuals were found during targeted surveys. The project would not impact any of the Snowy Mountain subpopulation outlined by the Conservation Advice (TSSC, 2016c), as the project footprint is approximately 70 kilometres north of the locality. Furthermore, the project would result in a relatively low clearing of suitable foraging habitat (2.20 ha) compared to that remaining in the surrounding vegetation.

Where possible, impacts to heathy midstories, rocky habitats, grass tree skirts, ground cover and soils (habitats utilised by this species) would be minimised under the linear transmission line infrastructure. Due to the lack of records and that no individuals were found within the project footprint, direct mortality as a result of the project is considered unlikely. It is therefore considered unlikely that the project would lead to a long-term decrease in the size of a Broad-toothed Rat population.

Reduce the area of occupancy of an important population

The area of occupancy of this species is estimated at 44,400 ha and the species distribution extends across the Great Dividing Range from near Warburton (Victoria) to the Brindabella Range (Australian Capital Territory) and around Barrington Tops (New South Wales). The project footprint is near the northern extent of the species range with the exception of an isolated population around Barrington Tops (New South Wales). Therefore, there is potential for the project to reduce the area of occupancy of this species.

Fragment an existing important population into two or more populations

The area of habitat that would be removed as a result of the project occurs near the northern extent of the species main range and therefore is unlikely to increase fragmentation. The Broad-toothed Rat exists within a subpopulation in the Snowy Mountains, which has exhibited decline due to climate change and associated early snow thaw. However due to the factors outlined above, and the ability of the species to traverse the linear project infrastructure via retained midstories and ground cover, it is considered unlikely that an existing population of the Broad-toothed Rat would be fragmented into two or more populations.

Adversely affect habitat critical to the survival of a species

There is no Critical Habitat in NSW defined under section 207A of the EPBC Act has been identified or included in the Register of Critical Habitat for the species.

The Conservation Advice (TSSC, 2016c) describes the Broad-toothed Rats preferred habitat as alpine and subalpine heathlands, grassland adjacent to boulder outcrops, swamps, sedgelands, coastal grassy or shrubby dunes, and sometimes forests with grassy understories. Suitable habitat has been identified in the project footprint. While no individuals were found or have been recorded within the project footprint there is potential for the project to impact the Snowy Mountain subpopulation. However, the project would result in a small area of clearing of suitable foraging habitat (2.20 ha) compared to that remaining in the surrounding vegetation. It is therefore considered unlikely that the project would adversely affect habitat critical to the survival of the Broad-toothed Rat.

Disrupt the breeding cycle of an important population

The key potential disruptions that could occur would be the potential for physical change in the habitat for the species associated with construction work that could remove native vegetation. The expected area to be impacted is 2.20 ha. The proposed vegetation removal is unlikely to disrupt the breeding cycle of the species in the long-term, as there will be other suitable habitats still in-tact in the project footprint and surrounding areas.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

The project would result in the removal of 2.20 ha of potential habitat. The project is considered unlikely to isolate or decrease habitat to an extent that leads to a decline in the species. Limited direct impacts to potential habitats for this species would occur and any indirect impacts would be localised. A number of mitigation measures have also been proposed to further mitigate the risk of indirect impacts. When this is considered in the context of existing landscape modification, the project is not likely to modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline.

Result in invasive species that are harmful to a vulnerable species becoming established in the vulnerable species' habitat

A major threat to the Broad-toothed Rat is predation by introduced carnivores, including feral cats (*Felis catus*) and European red foxes (*Vulpes vulpes)* (TSSC, 2016c). Vegetation clearing and increased habitat fragmentation may increase predation by these species. Development of a pest species monitoring program may be required if there is a substantial occurrence of large intact remnants and threatened species habitat within or adjacent to the disturbance areas. Once mitigation measures are implemented, it is considered unlikely that the project would result in an invasive species becoming established in the Broad-toothed Rat habitat as a result of the project.

Introduce disease that may cause the species to decline, or

Dieback of understory heathlands due to the Cinnamon Fungus (*Phytophthora cinnamomi*) is listed as a minor threat to the Broad-toothed Rat (TSSC, 2016c). Whilst there is a risk that construction machinery and workers may disperse *P. cinnamomi* as well as other soil and plant pathogens, this risk would be mitigated through hygiene protocols throughout the development and management of the project. It is therefore considered unlikely that the would introduce a disease that may cause the Broad-toothed Rat to decline.

Interfere with the recovery of the species

The Conservation Advice (TSSC, 2016c) for the species specifies the following regarding recovery for the species:

"*There are no species-specific management actions in place for the broad-toothed rat (mainland). However, much of its current range lies within conservation reserves, including Kosciuszko National Park, Barrington Tops National Park, Victoria's Alpine National Park, Wilsons Promontory National Park and Great Otway National Park (Menkorst et al., 2008). Management plans have been developed for these reserves, and some include intensive and extensive management of threats to the subspecies such as predator control programs (Menkorst et al., 2008). This subspecies has also been the subject of a series of intensive research studies and some monitoring*."

The project would not impede or interfere with any of the targeted recovery actions for this species.

Conclusion

In line with the above findings, the project is considered unlikely to have a significant impact on the Broad-toothed Rat due the relatively small area of habitat to be removed (2.20 ha) that would not impact critical habitat and in which areas of understorey and midstorey vegetation would be retained. In addition, the project footprint occurs near the northern extent of the species main range and therefore is unlikely to increase fragmentation.

A summary of the NSW assessment bilateral requirements for Broad-toothed Rat is presented in Table A18-27.

Table A18- 27: NSW assessment bilateral requirements for Broad-toothed Rat

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of habitat for this species, important populations, habitat critical for survival and relevant Commonwealth documents are provided above, with a map showing its modelled distribution provided below. Current distribution map for *Mastacomys fuscus mordicus* Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	The field surveys were in accordance with the Survey guidelines for Australia's threatened mammals, EPBC Act survey guidelines 6.5 (DSEWPaC, 2011a). These included baited hair tube arrays, spotlighting and baited remote camera placed in pockets of good quality habitat within the SNO IBRA subregions. Detailed methods can be found in Section 4.6 of the BDAR.

NSW Assessment Bilateral requirements	
Description of the relevant impacts and its regard to the full national extent of the species or community's range	Direct impacts of the project includes the removal of approximately 2.20 ha of habitat. The area of occupancy of this species is estimated at 44,400 ha. The project would impact <0.01% of the species area of occupancy.
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR.
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	After the proposed activities are undertaken to avoid and mitigate these impacts, there is unlikely to be significant residual adverse impacts on the Broad-toothed Rat.
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Potential residual impacts to the Broad-toothed Rat are considered likely to be not significant as detailed above. Residual impacts to Broad-toothed Rat would be offset under the NSW BOS. Offsets will be established/satisfied as detailed below. Details of offset requirements and obligations for Broad-toothed Rat as a result of residual impacts of the project are addressed in Chapter 15 of the BDAR.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project/ • Payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All significant adverse impacts to the species have been addressed under the NSW BOS. There are no significant residual impacts to the species that have not been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required

2.3.16 Greater Glider (*Petauroides volans*)

The Greater Glider is listed as Endangered under the EPBC Act and BC Act.

Description

The Greater Glider (southern and central) is the largest gliding possum in eastern Australia. It has a primarily florivorous diet, mostly comprising of eucalypt leaves supplemented by buds and flowers. It has a head and body length of 35−46 cm, tail length of 45−60 cm, and a weight range of 900−1,700 g, with females being larger than males. The Greater Glider (southern and central) has thick fur that increases its apparent size. Its fur colour is white or cream below and varies from dark grey, dusky brown through to light mottled grey and cream above. It has a long furry tail, large furry ears and a short snout. Its tail is not prehensile, and the gliding membrane extends from the forearm to the tibia.

The Greater Glider has a broad distribution along the east coast of Australia. It is primarily associated with eucalyptus forests along the Great Dividing Range from northern QLD through to southern VIC and occurs from sea level to 1,200 m above (DCCEEW, 2022c; McGregor 2020). Its distribution appears to be restricted in the ACT, where the species is only known from the Lower Cotter Catchment and Namadgi National Park. The species formerly occurred in Booderee National Park but appears to have been extirpated from that location in the mid-late 2000s (DCCEEW, 2022c).

The Greater Glider is typically found in highest abundance in habitats with tall, montane, moist forests on fertile soils, with a high diversity of eucalyptus species, relatively old trees and an abundance of hollows. However, it can also be found in drier habitats. Within these forest types, the species' occurrence is positively correlated with foliage nutrients and abundance, canopy productivity, tree age, overstorey basal area, tree hollow abundance, patch size and connectivity (DCCEEW, 2022c). The species feeds from a restricted range of eucalyptus species which varies regionally.

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species are as follows:

- Approved conservation advice for *Petauroides volans* Greater Glider. In effect under the EPBC Act from 05 Jul 2022
- The committee recommends that there should be a recovery plan (02 May 2016).

Relevant survey guidelines for this species include:

- Survey guidelines for Australia's threatened mammals. EPBC Act survey guidelines 6.5 (DSEWPaC, 2011a).

Specific Impacts

The Greater Glider was detected during field surveys within the project footprint in the Bondo (18 individuals), Bungonia (2 individuals) and Snowy Mountains (15 individuals) IBRA subregions in high condition, mature remnant vegetation. It also has a high likelihood of occurrence in the Inland Slopes IBRA subregion due to the presence of intact remnants with moderate to high connectivity and three records within 5 km of the project footprint. The project would result in the loss of approximately 109.25 ha of known habitat in the Bondo, Bungonia and Snowy Mountains IBRA subregions (including 0.05 ha of prescribed impacts) and 3.10 ha of potential habitat in the Inland Slopes IBRA subregion.

PCTs present in the project footprint that are associated with this species include PCT 5, 299, 300, 316, 351, 638, 727, 870, 952, 953, 1093, 1097, 1107, 1150, 1151, 1191, 1196 and 1330.

Significant impact criteria

An action is likely to have a significant impact on an Endangered species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of a population

Greater Gliders are known within the project footprint in the Bondo, Bungonia and Snowy Mountains IBRA subregions in high condition, mature remnants during targeted surveys. The species also has a high likelihood of occurrence in the Inland Slopes IBRA subregion in intact remnants. The probability of species occurrence is positively associated with the presence of hollow-bearing trees. The project would result in

the loss of approximately 118.03 ha of potential habitat. The final width of the linear transmission line easement is likely to be 70 metres wide, with some discrete areas, being up to 130 metres wide. Clearing widths greater than 80 metres would exceed potential glide distances for the species and would pose a partial barrier to movement (Taylor and Goldingay 2009). The species has little ability to safely traverse cleared landscapes without the ability to glide (DCCEEW, 2022c).

The Greater Glider requires tree hollows for denning, with a preference for hollows >10 cm in diameter in large, old, live hollow-bearing trees (DCCEEW, 2022c). It also exhibits relatively small home ranges, which are commonly 1–3 ha but may reach up to 11 ha in hollow-limited environments (Taylor and Goldingay 2009). The removal of known or suitable hollows and the fragmentation of known or suitable habitat are therefore key threats to the persistence of the species' population within the project footprint and surrounding vegetation.

The project would develop a connectivity strategy, potentially including glider poles, vegetation steppingstone habitats and reduced clearing requirements. However, the impact to known and potential habitat is relatively large even with consideration of the surrounding vegetation. Due to this, the project may lead to a long-term decline in local Greater Glider populations.

Reduce the area of occupancy of the species

The area of occupancy of this species is estimated at 1,531,600 ha and the species distribution extends from around Proserpine in Queensland, south through NSW and the Australian Capital Territory, to Wombat State Forest in central Victoria. Given that the project footprint is entirely located within NSW and not near the outer limits of the species range, it is unlikely that the project would reduce the area of occupancy of this species. The project is likely to reduce Greater Glider area of occupancy by 0.007%.

Fragment an existing population into two or more populations

Greater Glider populations are sensitive to fragmentation, and the final width of the linear transmission line easement is likely 70 metres wide, with some discrete areas up to 130 metres wide. As described above, the species has little ability to traverse between cleared fragments and population viability is low in small remnants (DCCEEW, 2022c). The implementation of a connectivity strategy may reduce fragmentation impacts, however, given the scale of the project and the area of habitats impacted, it is considered that the project may fragment an existing population into two or more populations.

Adversely affect habitat critical to the survival of a species

No Critical Habitat as defined under section 207A of the EPBC Act has been identified or included in the Register of Critical Habitat for the Greater Glider. However, habitat critical to the survival for the Greater Glider may be broadly defined as (DCCEEW, 2022d):

- Large, contiguous areas of eucalyptus forest containing mature hollow-bearing trees and a diverse range of the Greater Glider's preferred regional food species
- Smaller or fragmented habitat patches connected to larger patches of habitat that can facilitate the dispersal or recolonisation of the species
- Cool microclimate forest or woodland areas (eg, protected gullies, sheltered high elevation areas, coastal lowland areas, southern slopes
- Areas identified as refuges under future climate changes scenarios
- Short-term or long-term post-fire refuges (ie, unburnt habitat within or adjacent to recently burnt landscapes) that allow the species to persist, recover and recolonise burnt areas.

Irrespective of the abundance or density of the Greater Glider or perceived habitat quality, habitat meeting any of the above criteria is considered habitat critical to the survival of the species (DCCEEW, 2022d). Habitat meeting the above criteria occurs within the project footprint in the Bondo, Bungonia and Snowy Mountains IBRA subregions, which included high condition, mature remnants where the species was recorded. Therefore, it is considered likely that the project would impact habitat critical to the survival of the Greater Glider.

Disrupt the breeding cycle of a population

The project has the potential to disrupt the breeding cycle of the Greater Glider, due to the removal of known and potential habitat and the general 70 metres wide easement clearing for the installation of long, linear transmission lines which may fragment an existing population. However, the project is required to implement the connectivity strategy described in Chapter 14 of the BDAR. The connectivity strategy would reduce the impacts of fragmentation from the project, by improving connectivity between habitat fragments post construction and retain as many suitable hollows as practicable, allowing the species to connect and disperse across the landscape. However, the residual fragmentation and loss of habitat and hollows as a result of the project may lead to disruption of the breeding cycle of a Greater Glider population.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

Despite the implementation of the connectivity strategy described in Chapter 14 of the BDAR, considering the impact the project would have on the species habitat compared to that available in the surrounding environment, it is likely that the project would decrease habitat to the extent that the species is likely to decline.

Result in invasive species that are harmful to a critically endangered or endangered species becoming established in the endangered or critically endangered species' habitat

Greater Gliders are threatened by feral cats and European red foxes. Given the ubiquity of feral cats and foxes in the Australian environment, they are likely already present within the IBRA subregions associated with the species. However, vegetation clearing, and increased habitat fragmentation may increase predation of the Greater Glider by these species. Development of a pest species monitoring program may be required if there is a substantial occurrence of large intact remnants and threatened species habitat within or adjacent to the disturbance areas.

Greater Gliders are also threatened by over abundant native species that nest in tree hollows, such as Sulphur-crested Cockatoos (*Cacatua galerita*), which may take-over nest hollows in suitable habitat (DCCEEW, 2022c). Mitigation measures are required to reduce these impacts on the species, including retaining (where possible) hollow bearing trees and avoiding areas of high hollow-bearing tree density during detailed design. If hollows must be removed, nest boxes should be implemented, monitored and maintained.

Where the project results in fragmentation of intact areas of bushland, the project may result in invasive species becoming established in areas of the Greater Glider habitat as a result of the project.

Introduce disease that may cause the species to decline, or

No diseases are known to affect the Greater Glider.

Interfere with the recovery of the species

Although various avoidance and mitigation measures described above would be implemented to reduce the impact on the Greater Glider, the project would result in the clearing of known and suitable habitat. As outlined in the approved conservation advice for the Greater Glider (DCCEEW, 2022d), this habitat is considered critical to the survival of the species. It is therefore considered likely that the project would interfere with the recovery of the species.

Conclusion

Due to the factors described above, it is considered likely that the project would have a significant impact on the Greater Glider due to removal of approximately 109.25 ha of known habitat in the Bondo, Bungonia and Snowy Mountains IBRA subregions (including 0.05 of prescribed impacts on non-native habitats) where the species was recorded, and 3.10 ha of potential habitat in the Inland Slopes IBRA subregion where it has been assumed present and has a high likelihood of occurrence.

A summary of the NSW assessment bilateral requirements for Greater Glider is presented in Table A18- 28.

Table A18- 28: NSW assessment bilateral requirements for Greater Glider

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of habitat for this species, important populations, habitat critical for survival and relevant Commonwealth documents are provided above, with a map showing its modelled distribution provided below.  Indicative distribution map of the known, likely to occur and may occur distributions of the Greater Glider *Petauroides Volans* (Base map Geoscience Australia; species distribution data Species of National Environmental Significance database as cited in DCCEEW, 2022c)
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	Field surveys were in accordance with the Survey guidelines for Australia's threatened mammals, EPBC Act survey guidelines 6.5 (DSEWPaC, 2011a). Methods included stagwatching, spotlighting and baited remote cameras in pockets of good quality habitat within all IBRA subregions. Detailed methods and timing of surveys can be found in section 4.6 of the BDAR.
Description of the relevant impacts and its regard to the full national extent of the species or community's range	The Greater Glider has a broad distribution along the east coast of Australia which is primarily associated with eucalyptus forests along the Great Dividing Range (see distribution map above). Throughout this range, its distribution may be patchy even in continuous areas of habitat. There are no robust estimates of the species population size available. Various known subpopulations in Victoria and NSW were

NSW Assessment Bilateral requirements	
	in ≥30% decline before the 2019-20 bushfires, which are expected to have had a significant negative impact on the remaining population (DCCEEW, 2022c). The species is known to occur within the project footprint in the Bondo, Bungonia and Snowy Mountains IBRA subregions in high condition, mature remnants and has a high likelihood of occurrence in the Inland Slopes IBRA subregions in intact remnants. The impacts of the project on the species includes the loss of approximately 109.25 ha of known habitat (including 0.05 ha of prescribed impacts) and 3.10 ha of potential habitat. The project would impact <0.01% of the species area of occupancy. The final width of the linear transmission line easement is likely to be 70 metres wide, with some discrete areas, being up to 130 metres wide. Clearing widths greater than 80 metres would exceed potential glide distances for the species and would pose a partial barrier to movement (Taylor and Goldingay 2009). The species has little ability to safely traverse cleared landscapes without the ability to glide (DCCEEW, 2022c).
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Greater Gliders: • Micro-siting during detailed design and pre-clearance surveys to: ▪ Avoid and mitigate the removal of habitat associated with the species, particularly tall, relatively old eucalypts with hollows in relatively large fragments. If hollow bearing trees are removed, nest boxes must be installed and maintained. ▪ Avoid and mitigate vegetation clearing to minimise habitat fragmentation and increase connectivity. If vegetation must be removed resulting in habitat fragmentation, glider poles and vegetation steppingstones are required to mitigate these impacts. • Where practical, reduce clearing requirements in areas of known species occurrence (e.g., within cool microclimate forest or woodland areas) • Avoid and mitigate impacts on short-term or long-term post-fire refuges, (i.e., unburnt habitat within or adjacent to recently burnt landscapes that allow the species to persist and recolonise burnt areas • Mitigate the increased risk of predation by feral cats and European red foxes exacerbated by the project through the development of a pest species monitoring program where substantial large intact remnants and threatened species habitat occur within or adjacent to the disturbance areas..
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	The residual impact to the Greater Glider is estimated at 109.25 ha of known habitat removal and 3.10 ha of potential habitat removal. There is the potential for indirect impacts (such as edge effects) to occur to any retained areas of known or potential habitat within or adjacent to the project footprint, however, it is expected that these impacts would be largely mitigated and managed through implementation of measures noted above. The residual impact to this species was considered to be significant as per the SIA (see above).
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Potential residual impacts to 109.25 ha of known habitat and 3.10 ha of potential habitat are considered likely to be significant as detailed above. Residual impacts to 109.25 ha of known habitat and 3.10 ha of potential habitat would be offset under the NSW BOS. 359 species credits would be required, as detailed in Chapter 15 of the BDAR. Offsets would be established/satisfied as detailed below. Details of offset requirements and obligations for the Greater Glider as a result of residual impacts of the project are addressed in Chapter 15 of the BDAR.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements.

NSW Assessment Bilateral requirements	
	The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project/ • Payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All significant adverse impacts to the species have been addressed under the NSW BOS. There are no significant residual impacts to the species that have not been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required

2.3.17 Yellow-bellied Glider (*Petaurus australis*)

The Yellow-bellied Glider is listed as Vulnerable under the EPBC Act and BC Act.

Description

The Yellow-bellied Glider is a medium-sized arboreal marsupial, the largest Australian petaurid and the second largest Australian glider. The head and body length have a range of 240–310 mm, with a 380–470 mm long tail. The body is a greyish-brown colour with a black stripe running down the back and extending to the tail. The tail is mostly black with grey edging at the base. Males weigh 470–725 g and females weigh 435–660 g, though the head and body length of males is only marginally longer than that of females, and females have longer tailed. The belly is white to yellow, typically paler in young individuals and becoming more yellow with age. There are black markings on the feet, with a black stripe running down each thigh.

The Yellow-bellied Glider (south-eastern) is found at altitudes ranging from sea level to 1400 m above sea level and has a widespread but patchy distribution from south-eastern Queensland (Qld) to far south-eastern SA, near the SA-Vic border. In NSW, it predominantly occurs in forests along the eastern coast, from the NSW-Qld border to the NSW-Vic border. However, the distribution also extends inland to the western slopes of the Great Dividing Range in parts of NSW and Qld.

The Yellow-bellied Glider (south-eastern) occurs in eucalypt-dominated woodlands and forests, including both wet and dry sclerophyll forests. The subspecies shows a preference for large patches of mature old growth forest that provide suitable trees for foraging and shelter. There is also a clear preference for forests with a high proportion of winter-flowering and smooth-barked eucalypts. Smooth-barked eucalypts are important due to the range of foraging substrates (and therefore food resources) they provide, as loose bark hanging in strips from these trees provides shelter for insect prey. Yellow-bellied gliders (south-eastern) also require some level of floristic diversity to provide a year-round food supply, and they are unlikely to persist in forests dominated by only one or two tree species. Many tree species are found in the subspecies' habitat, with some used for sap feeding.

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species are as follows:

- Approved Conservation Advice for *Petaurus australis* Yellow-bellied Glider (DAWE, 2022c) in effect under the EPBC Act from 02 March 2022.
- The committee recommends that there should be a recovery plan (16 March 2022).
- No Threat Abatement Plans has been identified as being relevant with this species.

Relevant survey guidelines for this species include:

- Survey guidelines for Australia's threatened mammals. EPBC Act survey guidelines 6.5 (DSEWPaC, 2011a).

Specific Impacts

The Yellow-bellied Glider was detected during field surveys within the project footprint in the Bondo (10 individuals), Inland Slopes (1 individual) and Snowy Mountains (19 individuals) IBRA subregions in high condition, mature remnant vegetation. It also has a high likelihood of occurrence in the Bungonia IBRA subregion due to the presence of suitable intact remnants with moderate to high connectivity and nine records within 20 km of the project footprint including one within 5 km. The project would result in the loss of approximately 167.96 ha (22%) of known habitat in the Bondo, Inland Slopes and Snowy Mountains IBRA subregions and 50.63 ha (7%) of potential habitat in the Bungonia IBRA subregion portion of the indicative disturbance area.

PCTs present in the project footprint that are associated with this species include PCT 299, 300, 351, 638, 731, 870, 952, 953, 1093, 1097, 1107, 1150, 1191, 1196 and 1330.

Significant impact criteria

An action is likely to have a significant impact on an Endangered species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of an important population of a species

Yellow-bellied Gliders are known within the project footprint in the Bondo, Inland Slopes and Snowy Mountains IBRA subregions in high condition, mature remnants (recorded during targeted surveys). The species also has a high likelihood of occurrence in the Bungonia IBRA subregion in intact remnants. The project would result in the loss of approximately 167.96 ha of known habitat and 50.63 ha of potential habitat.

The Yellow-bellied Glider prefer denning in living hollow-bearing trees. Groups live in large, exclusive home ranges as foraging substrates are dispersed and variable through time and space. Large areas of forest are required to maintain population viability. The removal of known or suitable hollows and the fragmentation of known or suitable habitat are therefore key threats to the persistence of the species' population within the project footprint and surrounding vegetation (DAWE, 2022c).

The probability of this species' occurrence is positively associated with the presence of hollow-bearing trees. The final width of the linear transmission line easement is likely to be 70 metres wide, with some discrete areas, being up to 130 metres wide. Clearing widths greater than 80 metres would exceed

potential glide distances for the species and would pose a partial barrier to movement (Taylor and Goldingay 2009). The species has little ability to safely traverse cleared landscapes without the ability to glide (DCCEEW, 2022c).

The project includes the development of a connectivity strategy, including glider poles, vegetation steppingstone habitats and reduced clearing requirements. However, the impact to known and potential habitat is relatively large even with consideration of the surrounding vegetation. Due to this, there is potential for the project to result in the long-term decrease of a Yellow-bellied Glider population.

Reduce the area of occupancy of an important population

The area of occupancy of this species is estimated at 1,272,400 ha and the species distribution extends from south-eastern Queensland to far south-eastern South Australia. In NSW, it predominantly occurs along the eastern coast, however, the distribution also extends inland to the western slopes of the Great Dividing Range. As the Project will impact upon a total of 218.59 ha of known and potential habitat, itis likely to result in a 0.02% loss of Yellow-bellied Glider habitat on a national scale. The project footprint is located near the western extent of the species distribution in NSW, there is potential for the project to reduce the area of occupancy of this species, within the western extent of its known distribution.

Fragment an existing important population into two or more populations

Yellow-bellied Glider populations are sensitive to fragmentation, and the final width of the transmission line easement will be 70 metres wide, with some discrete areas, being greater than 80 metres wide.. As described above, the species has little ability to traverse between cleared fragments and population viability is low in small remnants (DAWE, 2022c). The implementation a connectivity strategy may reduce fragmentation impacts, however, given the scale of the project and the area of habitats impacted, it is considered that the project may fragment an existing population into two or more populations.

Adversely affect habitat critical to the survival of a species

No Critical Habitat as defined under section 207A of the EPBC Act has been identified or included in the Register of Critical Habitat for the Yellow-bellied Glider. However, habitat critical to the survival for the Yellow-bellied Glider may be broadly defined as (DAWE, 2022c):

- large contiguous areas of floristically diverse eucalypt forest, which are dominated by winter-flowering and smooth-barked eucalypts, including mature living hollow-bearing trees and sap trees (see Appendix A)
- areas identified as refuges under future climate change scenarios
- short or long-term post-fire refuges (ie, unburnt habitat within or adjacent to recently burnt landscapes) that allow the species to persist, recover and recolonise burnt areas
- habitat corridors required to facilitate dispersal of the subspecies between fragmented habitat patches and/or that enable recolonization or movement away from threats. Yellow-bellied gliders (south-eastern) have a glide ratio (horizontal distance/height dropped) of around 2.0, and corridors spanning gaps larger than the distance gliders are likely to be able to travel should be considered critical to the survival. There is not enough evidence to define the canopy and width characteristics of appropriate corridors. In the absence of such information, a precautionary approach should be taken to maximise dispersal by considering all habitat corridors in the species' range to be habitat critical to the survival; and
- areas in which some trees have evidence of use for sap extraction by yellow-bellied glider (south-eastern).

Irrespective of the abundance or density of the Yellow-bellied Glider or perceived habitat quality, habitat meeting any of the above criteria is considered habitat critical to the survival of the species (DAWE 2022c). Habitat meeting the above criteria occurs within the project footprint in the Bondo, Bungonia, Inland Slopes and Snowy Mountains IBRA subregions, which included high condition, mature remnants where the species was recorded. Therefore, it is considered likely that the project would impact habitat critical to the survival of the Yellow-bellied Glider.

Disrupt the breeding cycle of an important population

The project has the potential to disrupt the breeding cycle of the Yellow-bellied Glider, due to the removal of known and potential habitat and the general 70 metres wide easement clearing for the installation of long, linear transmission lines which may fragment an existing population. However, the project is required to implement the connectivity strategy described in Section 13 of the BDAR. The connectivity strategy would reduce the impacts of fragmentation from the project, by improving connectivity between habitat fragments post construction and retain as many suitable hollows as practicable, allowing the species to connect and disperse across the landscape. However, the residual fragmentation and loss of habitat and hollows as a result of the project may lead to disruption of the breeding cycle of a Yellow-bellied Glider population.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

Despite to the implementation of the connectivity strategy described in Chapter 14 of the BDAR, considering the impact the project would have on the species habitat compared to that available in the surrounding environment, it is likely that the project would decrease habitat to the extent that the yellow-bellied Glider is likely to decline.

Result in invasive species that are harmful to a vulnerable species becoming established in the vulnerable species' habitat

A major threat to this species is predation by introduced carnivores, including feral cats (*Felis catus*) and European red foxes (*Vulpes vulpes)* (DAWE, 2022c). Vegetation clearing and increased habitat fragmentation may increase predation by these species. Development of a pest species monitoring program may be required if there is a substantial occurrence of large intact remnants and threatened species habitat within or adjacent to the disturbance areas. . Once mitigation measures are implemented, it is considered unlikely that the project would result in an invasive species becoming established in the Yellow-bellied Glider habitat as a result of the project.

Introduce disease that may cause the species to decline, or

No diseases are known to affect the Yellow-bellied Glider. Whilst there is a risk that construction machinery and workers may disperse diseases as well as other soil and plant pathogens, this risk will be mitigated through hygiene protocols throughout the development and management of the project. It is therefore considered unlikely that the project would introduce a disease that may cause these species to decline.

Interfere substantially with the recovery of the species

The Conservation Advice (DAWE, 2022c) for the species specifies the following regarding recovery for the species:

- Habitat loss, disturbance and modifications (including fire)
  - Ensure suitable habitat is maintained and protected from known threats (such as high severity bushfires) around important subpopulations, as well as in areas where subpopulations have already declined through loss of habitat. When protecting an area, retain sufficient suitable habitat for subpopulation viability.
  - Avoid planned burns, clearing, timber harvesting or other disturbance in a 65-ha zone around habitat which has been burnt in the past 10 years.
  - Re-assess and revise current prescriptions used for prescribed burning to ensure that the frequency and severity of all fires are minimised, to mitigate the risk of further population decline.
  - Maintain current effective prescriptions in production forests where the yellow-bellied glider (south-eastern) is found to support subpopulations of the species, and, if necessary, establish new prescriptions. This includes but is not limited to appropriate levels of timber harvesting exclusion and timber harvesting rotation cycles, maintenance of wildlife corridors between logged patches, active protection of existing sap trees and hollow-bearing trees from known threats, adequate recruitment of hollow-bearing trees, and maintained use of variable retention systems and selective harvesting systems designed to protect hollow-bearing trees.
  - Construct artificial hollows in areas of low hollow availability, utilising appropriate nest boxes and/or chainsaw hollows, the latter of which have the potential to restore degraded habitat and may be used more by arboreal marsupials than nest boxes (Terry et al. 2021).
  - Restore connectivity in subpopulations fragmented by major roads, including the use of artificial structures such as rope bridges and glide poles.
  - If possible, avoid the use of barbed wire and modify existing barbed wire by replacing the top strand of barbed wire with plain or plastic-coated wire (Clancy & Land for Wildlife 2011).
- Climate change
  - Protect all habitat projected to be suitable as refuge sites under future climate change scenarios (as informed by research) and maintain and establish connectivity to facilitate movement where possible.
- Invasive species (including threats from grazing, trampling, predation)
  - If required, implement control measures for introduced predators, including the European red fox and feral cat, in areas burnt by bushfires. The control of introduced herbivores (eg, feral deer) may also aid habitat recovery.

The project would impede or interfere with targeted recovery actions for this species via interrupted connectivity.

Conclusion

In line with the above findings, the project is considered likely to have a significant impact on the Yellow-bellied Glider due to removal of approximately 167.96 ha of known habitat in the Bondo, Inland Slopes and Snowy Mountains IBRA subregions where the species was recorded, and 50.63 ha of potential habitat in the Bungonia IBRA subregion where it has been assumed present.

A summary of the NSW assessment bilateral requirements for Yellow-bellied Glider is presented in Table A18- 29.

Table A18- 29: NSW assessment bilateral requirements for Yellow-bellied Glider

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of habitat for this species, important populations, habitat critical for survival and relevant Commonwealth documents are provided above, with a map showing its modelled distribution provided below. Current distribution map for the Yellow-bellied Glider (Base map Geoscience Australia; species distribution data Species of National Environmental Significance database as cited in DCCEEW, 2022e)
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	Field surveys were in accordance with the Survey guidelines for Australia's threatened mammals, EPBC Act survey guidelines 6.5 (DSEWPaC, 2011a). Methods included stagwatching, spotlighting and baited remote cameras in pockets of good quality habitat within all IBRA subregions. Detailed methods and timing of surveys can be found in Section 4.6 of the BDAR.
Description of the relevant impacts and its regard to the full national extent of the species or community's range	The project would clear 167.96 ha of known habitat and 50.63 ha of potential habitat for this species. The area of occupancy of the Yellow-bellied Glider is estimated at 1,272,400 ha (see distribution map above). The project would impact 0.02% of known and potential habitat for this species on a national scale.
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Yellow-bellied Gliders: • Micro-siting during detailed design and pre-clearance surveys to: ▪ Avoid and mitigate the removal of habitat associated with the species, particularly tall, relatively old eucalypts with hollows in relatively large fragments. If hollow bearing trees are removed, nest boxes must be installed and maintained. ▪ Avoid and mitigate vegetation clearing to minimise habitat fragmentation and increase connectivity. If vegetation must be removed resulting in habitat fragmentation, glider poles and vegetation steppingstones are required to mitigate these impacts. • Where practical, reduce clearing requirements in areas of known species occurrence (e.g. within cool microclimate forest or woodland areas) • Avoid and mitigate impacts on short-term or long-term post-fire refuges, (i.e., unburnt habitat within or adjacent to recently burnt landscapes that allow the species to persist and recolonise burnt areas • Mitigate the increased risk of predation by feral cats and European red foxes exacerbated by the project through the development of a pest species monitoring program where substantial large intact remnants and threatened species habitat occur within or adjacent to the disturbance areas.
Identification of significant residual adverse impacts likely to occur after the	The residual impact to the Yellow-bellied Glider is estimated at 167.96 ha of known habitat removal and 50.63 ha of potential habitat removal. There is the potential for indirect impacts (such as edge effects) to occur to any retained areas

NSW Assessment Bilateral requirements	
proposed activities to avoid and mitigate all impacts are taken into account	known and potential habitat within or adjacent to the project footprint, however, it is expected that these impacts would be largely mitigated and managed through implementation of measures noted above. The residual impact to this species was considered to be significant as per the SIA (see above).
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Potential residual impacts to the Yellow-bellied Glider are considered likely to be significant as detailed above. Residual impacts to the Yellow-bellied Glider would be offset under the NSW BOS. Offsets will be established/satisfied as detailed below. Details of offset requirements and obligations for the Yellow-bellied Glider as a result of residual impacts of the project are addressed in Chapter 15 of the BDAR.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project/ • Payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All significant adverse impacts to the species have been addressed under the NSW BOS. There are no significant residual impacts to the species that have not been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required

2.3.18 Koala (*Phascolarctos cinereus*)

The Koala is listed as endangered under the EPBC Act and BC Act.

Description

The Koala is a medium-sized, arboreal marsupial with variable fur that can range from grey to brown above and is white below. Its body is stocky, with large rounded, furry ears, a prominent black nose, long sharp claws for climbing and spends most of its time in trees. Typically, males are larger than females; adult males weigh between 6-12 kg while females are between 5 – 8 kg (NSW OEH, 2022; DAWE, 2022d). The Koala's morphology gradually changes from the north to the south of its range. For example, the average weight of an adult male in Victoria is 12 kg, while in Queensland it is 6.5 kg. Southern populations are also characterised by long, thick brown-grey fur compared to northern populations, which have shorter, silver-grey fur (NSW OEH, 2022; DAWE, 2022d). Males have a distinct advertisement call during breeding, characterised by loud, low snarling coughs and bellows (NSW OEH, 2022).

The Koala typically occurs in eastern Australian forests and woodlands (DAWE, 2022d). Its distribution is not continuous across its range and it occurs in several subpopulations that are separated by cleared land or unsuitable habitat (DAWE, 2022d). The natural range of the Koala is determined by specialist food, habitat

and environmental requirements, which typically includes forests and woodlands dominated by Eucalyptus species (DAWE, 2022d). The Koala's home range is highly variable and dependant on life history stage, soil fertility, habitat quality and nutritional requirements, with home ranges in Queensland and New South Wales reported to vary between 3 and 500 ha (DAWE, 2022d).

The Koala's distribution and population size have declined significantly since European colonisation (DAWE, 2022d). Much of the Koala's national distribution now overlaps with human-modified landscapes (DAWE, 2022d). Vegetation clearance from activities including urbanisation, grazing, agriculture and mining have significantly reduced the Koala's distribution (DAWE, 2022d). Climate change drivers (eg, drought and rising temperatures) have also resulted in a reduction in climatically suitable habitat (DAWE, 2022d).

Koalas are tree-dwelling, obligate folivores (leaf eaters) with a highly specialised diet (DAWE, 2022d). The Koala's diet is defined by the availability and palatability of a limited variety of Eucalyptus, Corymbia and Angophora species (DAWE, 2022d). Koalas are nocturnal and spend significant periods of time moving across the ground between food and shelter trees, especially in the breeding season (typically September to February) (DAWE, 2022d). While Koalas are reported to utilise more than 400 different species of tree for their food and habitat, primary food species differ across habitats and may be as few as two at a particular location (DAWE, 2022d). Koala browsing preferences show regional differences which are influenced by the chemical profiles and water content of different target food leaves (DAWE, 2022d).

A population of Koalas requires a sufficient total amount of resources within their habitat of adequate quality to support a viable biological population (DAWE, 2022d). Crucial habitat elements include patches and corridors for gene flow (DAWE, 2022d). Over longer-time frames critical habitat includes climate refugia such as drainage lines, riparian zones and patches that are resilient to drying conditions due to favourable hydrological systems (DAWE, 2022d). Additionally, it includes areas that may be temporarily unoccupied and are available for future recolonisation (DAWE, 2022d).

Currently there is insufficient knowledge and data to effectively identify habitat critical to the survival of the Koala (DAWE, 2022d).

The conservation advice for Koalas (DAWE, 2022d) defines important populations as those that:

- have the potential to act as source populations to adjacent areas of suitable, or potentially suitable, habitat
- exist in areas of climatically suitable refugia during periods of environmental stress including droughts, heatwaves, and long-term climate change
- are genetically diverse
- are disease free and/or exhibit low rates of infection with important pathogens
- contain genes which may confer adaptation to current and future environmental stressors
- are geographical or environmental outliers within the species range.

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species is as follows:

- Approved conservation advice for the Koala (DAWE, 2022d), in effect under the EPBC Act from 12 February 2022.

- National recovery plan for the Koala (DAWE, 2022e), in effect under the EPBC Act from 8 April 2022.
- No Threat Abatement Plan has been identified as being relevant for the species.
- EPBC Act referral guidelines for the vulnerable koala (DoE, 2014c).

Specific Impacts

The Koala was not detected during field surveys, however it assumed present as it has a high likelihood of occurrence in the Bungonia IBRA subregion due to the presence of suitable habitat with moderate to high connectivity, 34 records within 20 km of the project footprint and proximity to a known source population (3.5 km). It also has a moderate likelihood of occurrence in the Bondo, Crookwell, Inland Slopes, Murrumbateman and Snowy Mountains IBRA subregions due to the presence of suitable habitat with moderate to high connectivity, and multiple records within the broader IBRA subregions (six in Bondo, 10 in Crookwell, 89 in Inland Slopes 15 in Murrumbateman and two in the Snowy Mountains) including records within 5 km of the project footprint in the Bondo (two), Crookwell (two), Inland Slopes (three) and Murrumbateman (one) IBRA subregions.

Vegetation clearing for the installation of transmission lines and associated infrastructure may reduce the availability of Eucalyptus dominated woodland and forests containing foraging and shelter resources potentially used by Koalas. Potential direct impacts include species injury or mortality during clearing and construction works. An area of approximately 418.40 ha of potential habitat, including 19.40 ha of high potential foraging and shelter habitat for this species in the Bungonia IBRA subregion, and 399.00 ha of moderate potential foraging and shelter habitat for this species in the Bondo, Crookwell, Inland Slopes, Murrumbateman and Snowy Mountains IBRA subregions would be impacted by the project.

PCTs present in the project footprint that are associated with this species include PCT 5, 266, 268, 277, 278, 280, 283, 285, 287, 290, 294, 295, 296, 297, 299, 300, 301, 306, 314, 316, 322, 335, 343, 349, 351, 352, 638, 679, 727, 731, 870, 939, 953, 1093, 1097, 1107, 1150, 1151, 1191, 1196 and 1330.

The Koala's distribution is not continuous across this range, and it occurs in a number of populations that are separated by cleared land or unsuitable habitat (DAWE, 2022d). Consequently, the Koala's total area of occupancy is lower than its extent of occurrence. The total area of occupancy is not known, but it would not be low enough to be considered very restricted, restricted or limited.

Significant impact criteria

An action is likely to have a significant impact on an Endangered species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of a population of a species

The species was not recorded during field surveys but are considered likely to occur based on the high number of local records and the occurrence of Koala feed tree species within the project footprint, including preferred species such as Grey Gum (*Eucalyptus punctata*), Blakely's Red Gum (*Eucalyptus blakelyi*), Brittle Gum (*Eucalyptus mannifera*), and Ribbon Gum (*Eucalyptus viminalis*).

Habitat to be removed within the clearance footprint is subject to varying degrees of disturbance and varied conditions. The project would require the removal of portions of Koala use trees where the clearance alignment intersects. About 418.40 ha of native vegetation (including Koala use trees) is estimated to occur within in the indicative disturbance area and would be directly impacted.

Areas of regional koala significance (ARKS) use the information on koala occurrence to identify key koala populations and management areas with potential long-term viability. No ARKS intersect the project footprint; the closest ARKS is located in Bungonia. The nearest point of the ARKS is approximately 3.5 km from the project footprint, however, the ARKS spans over 353,546 ha and only around 13% of it occurs within the Bungonia IBRA subregion. The majority of the Bungonia ARKS occurs within the Ettrema, Burragorang, Moss Vale, Cumberland, Sydney Cataract, and Illawarra IBRA subregions.

Portions of the project footprint connect to large intact continuous habitat (managed native forests), providing continuous habitat within the broader locality. The project is considered to potentially lead to a long-term decrease in the local population based on overall carrying capacity as determined by the availability of feed trees. However, the decline is likely to be minor considering the large surrounding area of vegetation that would not be impacted by the project.

Reduce the area of occupancy of the species

The area of occupancy of this species is estimated at 1,940,000 ha and the distribution of the listed population extends from the coastal and inland areas of Queensland, through New South Wales and the Australian Capital Territory. Other populations, which are not listed as threatened under the EPBC Act, occur to the south, in Victoria and South Australia. Given that the project footprint is not located near the outer limits of the species range, it is unlikely that the project would reduce the area of occupancy of this species.

Fragment an existing population into two or more populations

Koala populations are of low density, widespread and fragmented in many locations. The project would increase fragmentation of remnants, through the removal of native vegetation for the proposed transmission line and associated infrastructure. A small number of patches of contiguous bushland would be intersected by the project footprint. The species has a large home range. The area of clearing is relatively narrow when compared to adjacent similar habitat, and is situated in a landscape already subject to extensive historical clearing. The increase in fragmentation may influence Koala movement and habitat use throughout the regions however the extent of impact in this regard is likely to be limited given no hard barriers to Koala movement would be introduced from the project. The implementation a connectivity strategy may reduce fragmentation impacts, however, given the scale of the project and the area of habitats impacted, it is considered that the project may fragment an existing population into two or more populations.

Adversely affect habitat critical to the survival of a species

As defined in the conservation advice for Koala, habitat critical to the survival of the species is defined as the areas that the species relies on to avoid or halt decline and promote the recovery of the species (DAWE 2022d). Given that records of the species are found in all cardinal directions of the project footprint, all native vegetation within the project footprint is considered habitat critical to the survival of the species.

The project footprint does not occur within any Areas of Regional Koala Significance (ARKS). Bungonia is the only IBRA subregion that will be impacted by the project which contains an ARKS (also called Bungonia). The nearest point of the ARKS is approximately 3.5 km from the project footprint, however, the ARKS spans over 353,546 ha and only around 13% of it occurs within the Bungonia IBRA subregion. The majority of the Bungonia ARKS occurs within the Ettrema, Burragorang, Moss Vale, Cumberland, Sydney Cataract, and Illawarra IBRA subregions.

Native vegetation containing Koala use trees would be partially cleared to accommodate the development, and up to 418.40 ha of critical habitat would be modified. Therefore, the project is likely to adversely impact habitat critical to the survival of the species.

Disrupt the breeding cycle of a population

Large intact areas to the north-east of the project footprint, towards Bungonia State Conservation Area is likely to support an increased number of breeding individuals (high abundance of recent records). Whereas sections of the project footprint towards the south (Tumut) and west (Wagga Wagga), have fewer recent records.

Crucial habitat elements include patches and corridors for gene flow. Over longer-time frames habitat critical to survival includes climate refugia such as drainage lines, riparian zones and patches that are resilient to drying conditions due to favourable hydrological systems. For an individual koala, breeding resources include access to sufficient quality food and shelter trees to meet their daily energetic requirements and reproductive needs, and a place to avoid predators.

Habitat within the indicative disturbance footprint is not thought to be a key breeding area due to the low number of records. Therefore, removal of the habitat is unlikely to disrupt the breeding cycle of the population. The area constitutes a very small proportion of the overall habitat for the population, with active population areas, including the Bungonia State Conservation Area, being the prime candidate sites for breeding activity.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

The Koala has been recently observed (in the last 20 years) mostly near Bungonia State Conservation Area (highest number of records), Mundoonen Nature Reserve (near Jarrawa) and Kapooka (near Wagga Wagga). The project in these locations would result in the clearing of known and potential habitat, including koala use trees (used for sheltering, dispersal, foraging and potentially breeding). The species is known to use paddock trees and small remnants to move between patches, however, clearing of native vegetation has the potential to increase the risk of over-browsing (overuse of trees leading to defoliation), disease, predation, vehicle strike and altered movement corridors. The project would remove some, but not all crucial habitat elements for Koala, and is unlikely to substantially fragment movement/dispersal corridors. This project would not affect the entire species' distribution and impacts from the project are distributed throughout a large area. Therefore, while the project would modify, destroy and remove habitat, this is unlikely to cause the species to decline.

Result in invasive species that are harmful to an endangered or critically endangered species becoming established in the endangered or critically endangered species' habitat

The project is not likely to result in the introduction of invasive species that may become established in the species' habitat.

Introduce disease that may cause the species to decline, or

Diseases that currently impact koala populations include Koala retrovirus (KoRV) and Chlamydia (*Chlamydia pecorum*). Wild populations carry disease pathogens. Inadvertent spread of disease also occurred historically following koala translocations.

The prevalence of disease (chlamydiosis) has been found to increase following extreme stress from hot weather, drought, habitat loss and fragmentation (Davies *et al*. 2013). It is unlikely, the removal/modification of habitat as a result of the project, would increase the risk of chlamydiosis.

Phytophthora cinnamomi is known to affect the health of eucalypts. While this fungus does not directly affect the Koala, infestation of a forest may damage habitat important to the species. Management of this and other pathogens will be important in minimising impacts on the habitat for the Koala.

Whilst there is a risk that construction machinery and workers may disperse soil and plant pathogens that can affect forage species, this risk would be mitigated through hygiene protocols throughout the development and management of the project.

Interfere with the recovery of the species

There is a national recovery plan for the Koala (DAWE, 2022e), which identifies the following objectives and strategies to meet conservation objectives:

- Objectives:
  - The area of occupancy and estimated size of populations that are declining, suspected to be declining, or predicted to decline are instead stabilised then increased
  - The area of occupancy and estimated size of populations that are suspected and predicted to be stable are maintained or increased
  - Metapopulation processes are maintained or improved
  - Partners, communities and individuals have a greater role and capability in listed Koala monitoring, conservation and management
- Supporting strategies:
  - Build and share knowledge
  - Engage and partner with the community in listed Koala conservation
  - Increase the area of protected habitat for the listed Koala
  - Integrate listed Koala conservation into policy, statutory and land use plans
- On-ground strategies:
  - Strategically restore listed Koala habitat
  - Actively manage listed Koala metapopulations.

The project has the potential for clearing in native forests and to remove important habitat and increase fragmentation. These effects would be greatest at the local level and would not affect the species across its entire range. The project is therefore unlikely to interfere with the recovery strategies detailed above.

Conclusion

In line with the above findings, the project is considered likely to have a significant impact on the Koala under the precautionary principle due to removal of 418.40 ha of potentially suitable habitat where the species has been assumed present. A summary of the NSW assessment bilateral requirements for Koala is presented in Table A18- 30.

Table A18- 30: NSW assessment bilateral requirements for Koala

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of habitat for this species, important populations, habitat critical for survival and relevant Commonwealth documents are provided above, with a map showing its modelled distribution provided below.  The indicative distribution map of the known, likely to occur and may occur distributions of the Koala *Phascolarctos cinereus* (combined populations of Qld, NSW and the ACT) (DAWE, 2022d).
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	Koala surveys were carried out in accordance with the following survey guidelines: • Survey guidelines for Australia's threatened mammals (DSEWPaC, 2011a) • Koala (*Phascolarctos cinereus*) Biodiversity Assessment Method Survey Guide (DPE, 2022d). Opportunistic surveys of suitable habitats were undertaken in addition to targeted surveys. Habitat assessments were undertaken to assess the likelihood of threatened species of animal (those species known or predicted to occur within the locality from the literature and database review) occurring within the project footprint. Fauna habitat assessments were the primary assessment tool in assessing whether threatened species were likely to occur within the project footprint.
Description of the relevant impacts and its regard to the full national extent of the species or community's range	The direct impacts of the project on this species includes the removal of approximately 418.40 ha of potential habitat. The area of occupancy of the Koala is estimated at 1,940,000 ha the distribution of the listed population extends from the coastal and inland areas of Queensland, through New South Wales and the Australian Capital Territory (see distribution map above). The project will impact approximately 0.02% of potential Koala habitat on a national scale.
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	The proposed avoidance and mitigation measures pertaining to threatened fauna habitat for the project are outlined in Chapter 12 and 14 of the BDAR.
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	The residual impact to the Koala is estimated at 418.40 ha of habitat removal. There is the potential for indirect impacts (such as edge effects) to occur to any retained areas of Koala habitat within or adjacent to the project footprint, however, it is expected that these impacts would be largely mitigated and managed through implementation of measures detailed in Chapter 14 of the BDAR. The potential residual impact to this species was considered to be significant as per the SIA (see above).
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Potential residual impacts to Koalas are considered likely to be significant as detailed above. Residual impacts to Koalas would be offset under the NSW BOS. 465 species credits will be required. Offsets will be established/satisfied as detailed below. Details of

NSW Assessment Bilateral requirements	
	offset requirements and obligations for the Koala as a result of residual impacts of the project are addressed in Chapter 15 of the BDAR.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project/ • Payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All significant adverse impacts to the species have been addressed under the NSW BOS. There are no significant residual impacts to the species that have not been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required.

2.3.19 Smoky Mouse (*Pseudomys fumeus*)

The Smoky Mouse is listed as Endangered under the EPBC Act.

Description

The Smoky Mouse is a ground dwelling mammal, with an average length of the head and body of 90 mm, tail of 140 mm and body weight of 52 grams. Its fur is soft and fine, pale to blueish-grey on the back and head, grey to white on the belly, and there are rings of dark hairs around the eyes. It has a characteristic bi-colour tail, being blue-grey dorsally and pale pinkish to white ventrally, which is sparsely furred (OEH, 2021; TSSC, 2020b). However, in Victoria, a variability in size and colour has been noted between western and eastern forms. The western form is known only from the Grampians and is larger and darker than the eastern form, which is found east of Melbourne (TSSC 2020b), while populations in NSW are similar in appearance to the eastern form (TSSC, 2020b).

The Smoky Mouse is endemic to south-eastern Australia, from Victoria, to NSW and the ACT, where it occurs in four IBRA regions: South-east Highlands, South East Corner, Australian Alps and the Victorian Midlands (Menkhorst and Broome, 2006). For recovery planning purposes, five distinct biogeographic regions are used as basic units of management for the Smoky Mouse recovery, including: the Grampians, Otway Range, South-east Highlands and coastal East Gippsland-Eden Hinterland. However, it is unclear whether populations persist in all these regions.

The Smoky Mouse is known to inhabit a range of vegetation communities. These include heath and open forest on the Victorian coast, heath, and *Eucalyptus pauciflora* woodland in the subalpine regions up to 1800 metres, sclerophyll forest dominated by eucalypts such as *E. dives, E. mannifera, E. dalrympleana* or *E. delegatensis,* and fern gullies in the Grampians (OEH, 2021; TSSC, 2020b). It was thought to have a

preferred habitat of ridge-top sclerophyll forest with a diverse understory of heathy shrub. However, recent investigations captured more individuals on damp drainage systems than dry slopes, suggesting more information on the species' habitat requirements are necessary. Except for drainage lines, a characteristic of Smoky mouse habitat includes the presence of a floristically diverse understorey, with members of the plant families *Epacridaceae, Fabaceae* and *Mimosaceae* well represented. These characteristics appear to be related to the diversity of food resources available in these habitats, as well as adequate ground cover and soil conditions conducive to hypogeal fungi growth (TSSC, 2020b). The Smoky Mouse predominantly consumes fruits and seeds from leguminous shrubs in summer and autumn with some invertebrates such as Bogong Moths in the high country, and hypogeal fungi in winter and spring with some flowers, seeds and soil invertebrates (OEH, 2021). Boulder fields are thought to provide a refuge from predators (TSSC, 2020b), with nesting sites found in rocky localities between tree roots and under the skirts of *Xanthorrhoea* spp. in proximity to suitable forage resources (OEH, 2021).

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species are as follows:

- Approved conservation advice for *Pseudomys fumeus* Smoky Mouse, in effect under the EPBC Act from 01 Sep 2020.
- National Recovery Plan for the Smoky Mouse *Pseudomys fumeus*. In effect under the EPBC Act from 23 Oct 2008.

The following threat abatement plans are relevant to the Smoky Mouse:

- Threat abatement plan for predation by feral cats. In effect under the EPBC Act from 23 Jul 2015.
- Threat abatement plan for competition and land degradation by rabbits. In effect under the EPBC Act from 07 Jan 2017.
- Threat abatement plan for disease in natural ecosystems caused by *Phytophthora cinnamomi.* In effect under the EPBC Act from 22 Feb 2019.
- Threat abatement plan for predation by the European red fox. In effect under the EPBC Act from 01 October 2008.

Relevant survey guidelines for this species include:

- Survey guidelines for Australia's threatened mammals. EPBC Act survey guidelines 6.5 (DSEWPaC), 2011a).

Specific Impacts

The Smoky Mouse was not detected during field surveys, however it assumed present as it has a moderate likelihood of occurrence in the Bondo and Snowy Mountains IBRA subregions due to the presence of suitable habitats within the species known distribution and multiple records within 20 km of the project footprint (nine in Bondo and 28 in Snowy Mountains). The project would result in the loss of approximately 132.66 ha of potential habitat in the Bondo and Snowy Mountains IBRA subregion. PCTs present in the project footprint that are associated with this species include PCT 638, 953 and 1196.

The area of occupancy of the Smoky Mouse is estimated at 26,400 ha and the national distribution of this species extends from Victoria to southern New South Wales and the Australian Capital Territory, where it exists within small and fragmented populations. The project would impact 0.5% of Smoky Mouse habitat on a national scale.

Significant impact criteria

An action is likely to have a significant impact on an Endangered species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of a population

Suitable foraging habitat for the Smoky Mouse was found within the project footprint in the Bungonia, Bondo and Snowy IBRA subregions. However, the species predominantly occupies subalpine environments, which are not present within the project footprint in Bungonia. No species records occur within the project footprint, and no individuals were found during targeted surveys. The project will not impact any of the five Smoky Mouse biogeographic regions outlined by the National Recovery Plan (Menkhorst and Broom 2006) and would result in a relatively low clearing of suitable foraging habitat (132.66 ha, 0.5% of the national habitat extent) compared to that remaining in the surrounding habitats. Where possible, impacts to heathy midstories (eg, vegetation stepping-stones), rocky habitats, and ground refugia should be minimised under the linear transmission line infrastructure, where possible. Due to the lack of records and individuals found within the project footprint, direct mortality as a result of the project is also considered unlikely. It is therefore considered unlikely that the project would lead to a long-term decrease in the size of a Smoky Mouse population.

Reduce the area of occupancy of the species

The area of occupancy of this species is estimated at 26,400 ha and the species distribution extends from Victoria to southern New South Wales and the Australian Capital Territory. The project footprint is near the northern extent of the species range. Therefore, there is potential for the project to reduce the area of occupancy of this species by 0.5%.

Fragment an existing population into two or more populations

In its endemic distribution, the Smoky Mouse exists within small and fragmented ephemeral populations. A significant population was recently found in 2018-19 north of Cabramurra in Kosciuszko National Park (TSSC, 2020b), although most populations occur in Victoria (Menkhorst and Broome, 2006). However due to the factors outlined above, including the fact that the project footprint is located near the edge of the species range, and the ability of the species to traverse the linear project infrastructure via retained midstories and ground cover, it is considered unlikely that an existing population of the Smoky Mouse would be fragmented into two or more populations.

Adversely affect habitat critical to the survival of a species

The National Recovery Plan for the Smoky Mouse states that the knowledge of habitat requirements is inadequate to describe habitat critical to the survival of this species (Menkhorst and Broome, 2006). However, the Smoky Mouse is known to inhabit a range of vegetation communities with similar characteristics (described above) which were used to determine potentially suitable habitat within the project footprint. The project would not impact any of the five Smoky Mouse biogeographic regions outlined by the Recovery Plan and no individuals were found or have been recorded within the project footprint where targeted surveys were undertaken. In addition, the project would result in a relatively low clearing of suitable foraging habitat compared to that remaining in the surrounding vegetation. It is therefore considered unlikely that the project would adversely affect habitat critical to the survival of the Smoky Mouse.

Disrupt the breeding cycle of a population

Due to the factors described above, such as the avoidance of known Smoky Mouse populations, and the relatively low amount of clearing of suitable foraging habitat (0.5% reduction), it is considered unlikely that the project would disrupt the breeding cycle of a Smoky Mouse population.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

The Smoky Mouse was not detected during field surveys, however it assumed present as it has a moderate likelihood of occurrence in the Bondo and Snowy Mountains IBRA subregions due to the presence of suitable habitats within the species known distribution and multiple records within 20 km of the project footprint (nine in Bondo and 28 in Snowy Mountains). The project would result in the loss of approximately 132.66 ha of potential habitat in the Bondo and Snowy Mountains IBRA subregion. PCTs present in the project footprint that are associated with this species include PCT 638, 953 and 1196.

The area of occupancy of the Smoky Mouse is estimated at 26,400 ha and the national distribution of this species extends from Victoria to southern New South Wales and the Australian Capital Territory, where it exists within small and fragmented populations. The project would impact 0.5% of Smoky Mouse habitat on a national scale. Therefore, it is considered unlikely that the project would impact Smoky Mouse habitat to such an extent that the species is likely to decline.

Result in invasive species that are harmful to a critically endangered or endangered species becoming established in the endangered or critically endangered species' habitat

A major threat to the Smoky Mouse is predation by introduced carnivores, including feral cats (*Felis catus)* and European red foxes (*Vulpes vulpes)*. Vegetation clearing and increased habitat fragmentation may increase predation of the Smoky Mouse by these species. Development of a pest species monitoring program may be required if there is a substantial occurrence of large intact remnants and threatened species habitat within or adjacent to the disturbance areas.. Once mitigation measures are implemented, it is considered unlikely that the project would result in an invasive species becoming established in the Smoky Mouse habitat as a result of the project.

Introduce disease that may cause the species to decline, or

Dieback of understory heathlands due to the Cinnamon Fungus *Phytophthora cinnamomi* is listed as a major threat to the Smoky Mouse (Menkhorst and Broome, 2006; TSSC, 2020b). Whilst there is a risk that construction machinery and workers may disperse *P. cinnamomi* as well as other soil and plant pathogens, this risk would be mitigated through hygiene protocols throughout the development and management of the project. It is therefore considered unlikely that the project will introduce a disease that may cause the Smoky Mouse to decline.

Interfere with the recovery of the species

The avoidance and mitigation measures described above would be implemented where practicable to reduce the impact of the project on suitable habitat for the Smoky Mouse. The project does not impact any of the five Smoky Mouse biogeographic regions outlined by the Recovery Plan, and no individuals were found or have been recorded within the project footprint. The project would result in the relatively small clearing of suitable forage habitat compared to that available in the surrounding vegetation. Due to this, the project is considered unlikely to interfere with the recovery of the Smoky Mouse.

Conclusion

In line with the above findings, the project is considered unlikely to have a significant impact on the Smoky Mouse due the relatively small area of habitat to be removed (132.66 ha) that will not impact critical habitat and in which areas of understorey and midstorey vegetation would be retained. In addition, the project footprint occurs near the northern extent of the species range and therefore is unlikely to increase fragmentation.

A summary of the NSW assessment bilateral requirements for Smoky Mouse is presented in Table A18- 31.

Table A18- 31: NSW assessment bilateral requirements for Smoky Mouse

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	Distribution of the Smoky Mouse. The map shows all records from the Atlas of Victorian Wildlife and NSW Wildlife Atlas. A predicted distribution using the BIOCLIM climatic model is also shown (TSSC, 2020b). A description of the species habitat is provided above. Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	The field surveys undertaken were in accordance with the Survey guidelines for Australia's threatened mammals, EPBC Act survey guidelines 6.5 (DSEWPaC, 2011a). These included baited hair tube arrays, spotlighting and baited remote camera placed in pockets of good quality habitat within the Bungonia, Bondo and Snowy Mountains IBRA subregions. Detailed methods can be found in section 4.6 of the BDAR.
Description of the relevant impacts and its regard to the full national extent of the species or community's range	The impacts of the project on the species include the removal of approximately 132.66 ha of potential foraging habitat. The area of occupancy of the Smoky Mouse is estimated at 26,400 ha and the national distribution of this species extends from Victoria to southern New South Wales and the Australian Capital Territory (see distribution map above) where it exists within small and fragmented ephemeral populations. The project would impact 0.5% of Smoky Mouse habitat on a national scale. There is limited information available on the population size of the Smoky Mouse and there are no robust estimates available in the literature to approximate the national population. However, some studied populations show signs of decline (Menkhorst and Broome, 2006; TSSC, 2020b). Within the project footprint, no Smoky Mouse individuals have been recorded where targeted surveys have been undertaken. Further, the project footprint does not intersect any of the Smoky Mouse biogeographic regions outlined by the National Recovery Plan (Menkhorst and Broom, 2006).
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to the Smoky Mouse:

NSW Assessment Bilateral requirements	
	• Where feasible, reduce the clearing requirements for mid and understorey vegetation in areas of habitat within the indicative disturbance area. • Avoid and mitigate impacts to rocky outcrops, the skirts of *Xanthorrhoea* spp., ground cover and soils in proximity to the habitats described above (Figure 13-8). • Mitigate the increased risk of predation by feral cats and European red foxes exacerbated by the project through development of a pest species monitoring program where substantial large intact remnants and threatened species habitat occur within or adjacent to the disturbance areas..
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	After the proposed activities are undertaken to avoid and mitigate these impacts, there is unlikely to be significant residual adverse impacts on the Smoky Mouse.
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Potential residual impacts to Smoky Mouse are considered likely to be not significant as detailed above. As such offsets are not proposed.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project • Payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. Any significant residual impacts not addressed by the BAM will be addressed in accordance with the EPBC Act Environmental Offset Policy.

2.3.20 Grey-headed Flying-fox (*Pteropus poliocephalus*)

The Grey-headed Flying-fox is listed as Vulnerable under the EPBC Act and BC Act.

Description

The Grey-headed Flying-fox is the largest bat in Australia. Their head and body length ranges between 23-29 cm (OEH, 2020). Males are larger than females, usually weighing between 750 and 1000 g while females are between 650 and 800 g, and experience seasonal fluctuations in body weight (DAWE 2021h). Both sexes have forearms between 155 – 175 mm in length, and the wingspan can be up to one metre. Their body fur is typically medium to dark grey with light tipped hairs, while their head colour ranges between near black to silver (OEH, 2020; DAWE, 2021h). An orange to russet coloured fur collar encircles the neck

which is unique to the species. The wing membranes are black, and the leg fur extends to the ankle (DAWE, 2021h).

The Grey-headed Flying-fox is found in eastern Australia, from Ingham in Queensland through to Adelaide in South Australia, typically within 200 kilometres of the coast. However, they have recently become established in SA, ACT, Victoria and inland NSW. In NSW, they can be found along the coast as well as inland to the tablelands and western slopes in the north. Within its distribution their presence and abundance vary widely both seasonally and temporally. At a regional scale, regular annual cycles of migration are supported by plants with similar flowering and fruiting phenology (DAWE 2021h). However, during times of food shortages such as drought, they may be found in unusual locations (Yabsley *etal*. 2021).

The Grey-headed Flying Fox is known to forage in all habitat types and historically occupied forests and woodlands feeding on native vegetation. Most myrtaceous plants utilised by the Grey-headed Flying Fox flower within a defined season, however productive flowering events are not annually or geographically reliable, and only few locations within the range produce adequate forage continuously. This results in species migration in response to food quantity and location, often over large distances. They roost in large aggregations in the exposed branches of trees, known as camps. Camps are used as resting habitat, social interaction and breeding sites, and maternity and day refuges. They occur in a wide range of vegetation, ranging from continuous forests to 1 ha fragments. Many camps have predictable seasonal patterns of occupation and may be inhabited continuously or rarely, although annual variations can differ widely (DAWE 2021h). Important vegetation communities utilised by the Grey-headed Flying-fox in winter and spring contain *Eucalyptus tereticornis, E. albens, E. crebra, E. fibrosa, E. melliodora, E. paniculata, E. pilularis, E. robusta, E. seeana, E. sideroxylon, E. siderophloia, Banksia integrifolia, Castanospermum australe, Corymbia citriodora citriodora, C. eximia, C. maculata, Grevillea robusta, Melaleuca quinquenervia or Syncarpia glomulifera* (DAWE 2021h).

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species are as follows:

- No approved conservation advice exists for *Pteropus poliocephalus* Grey-headed Flying-fox.
- National Recovery Plan for the Grey-headed Flying-fox Pteropus poliocephalus. In effect under the EPBC Act from 23 November 2021.
- Listing advice for the Grey-headed Flying-fox (TSSC 2001): Commonwealth Listing Advice on *Pteropus poliocephalus* Grey-headed Flying-fox.
- No Threat Abatement Plan has been identified as being relevant for this species.

Relevant survey guidelines for this species include:

- Survey Guidelines for Australia's Threatened Bats. EPBC Act survey guidelines 6.1 (Department of the Environment, Water, Heritage, and the Arts (DEWHA), 2010c).

Specific Impacts

During field surveys, no breeding or roosting habitat (camps) were observed and no Nationally Important Flying Fox Camps occur within the project footprint (DECC, 2012). However, the Grey-headed Flying-fox has a medium likelihood of occurrence in Bungonia, Murrumbateman, Crookwell and Inland Slopes IBRA

subregion portion of the project footprint, which contains a variety of suitable forage habitats (comprising of native and non-native vegetation).

A review of known Grey-headed Flying-fox camps was undertaken to determine the proximity of these local populations to the project footprint (Table A18- 32). There are eight known Grey-headed Flying-fox camps within foraging range (less than 20 km) of the project footprint. Where field surveys have been undertaken, no Grey-headed Flying-fox camps have been identified.

Table A18- 32: Grey-headed Flying-fox camps known within the locality, as advised by the BCD

Camp name	Latitude	Longitude	LGA	Distance from project footprint (km)	Nationally Important Camps (DECC 2012)
Wagga Wagga	-35.117527	147.39032	Wagga Wagga	9 km	No
Tarcutta	-35.2792	147.7316	Wagga Wagga	5 km	No
Tumut River Island	-35.3008	148.2302	Snowy Valleys	6 km	No
Yass	-34.8404	148.9094	Yass Valley	6 km	No
Goulburn	-34.74869	149.73413	Goulburn-Mulwaree	22 km	No
Moss Vale	-34.5497	150.3695	Wingecarribee	30 km	No
Mittagong	-34.448	150.4598	Wingecarribee	37 km	No
Moss Vale, Whites Creek	-34.5497	150.3695	Wingecarribee	30 km	No

Based on the above assumptions that potential habitat within project footprint is for foraging purposes only, an area of approximately 226.68 ha (17%) of foraging habitat for the Grey-headed Flying-fox would be directly impacted by the project.

Indirect impacts resulting from the project include increased risk of entanglement and collision. In Mo *et al.* (2020), a broad range of factors were involved in flying-fox mortality or injury, the main ones being entanglements and electrocutions.

Upon review of BioNet records (2022), there have been numerous Grey-headed Flying-fox individuals that have experienced electrocution (resulting in injury or mortality from existing transmission lines), particularly within proximity to the Tumut River Island and Wagga Wagga flying-fox camps (more urbanised areas). However, based on knowledge of species behaviour and body size, it is likely that these electrocutions were associated with low voltage transmission lines which generally support line spacing of around 600 millimetres.

There is a risk of electrocution from short circuit associated with these lines where the species has potential to contact more than one line with their feet or wings. In contrast to this, the HumeLink project would involve high voltage lines spaced more than 6 m apart thus minimising any risk of electrocution.

Significant impact criteria

An action is likely to have a significant impact on a Vulnerable species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of an important population of a species

There are multiple records of the Grey-headed Flying-fox within the project footprint in the Bungonia, Crookwell, Inland Slopes and Murrumbateman IBRA subregions. No roosting and breeding sites or Nationally Important Flying-fox Camps are known to occur within accessible areas the project footprint, however, for inaccessible areas within the project footprint the occurrence of Grey-headed Flying-fox camps are unknown.

The loss of foraging resources is listed as a key threat to Grey-headed Flying-fox and the project would result in the removal of 226.68 ha of native foraging resources within the region. It is assumed that the reduction in foraging resources within 20 kilometres of known camps, would lead to long-term decrease in the size of an important population. Given that the species is nomadic and has a wide variety of native and non-native foraging resources that it relies on, it is difficult to quantify the scale of impact this loss of vegetation would incur on local populations.

The Bungonia, Crookwell, Inland Slopes and Murrumbateman IBRA subregions, consist of extensive areas that have been historically cleared for grazing and agricultural land practices. Native remnants primarily persist in the landscape as reserves and vegetation corridors, with varying degrees of fragmentation. Grey-headed Flying Fox in these regions are likely to rely on a combination of native flowering myrtaceous species, and non-native vegetation (eg, crops and planted gardens) within the locality.

Based on the known distribution of Grey-headed Flying Fox camps within the region, the increased risk of entanglement and collision from the project and the scale of vegetation loss within the region, it is considered likely that the project would lead to the long-term decrease in the size of an important population of Grey-headed Flying-fox.

Reduce the area of occupancy of an important population

An area of approximately 226.68 ha of potential foraging habitat for the Grey-headed Flying-fox would be impacted by the project. Given that the species is nomadic and has a wide variety of native and non-native foraging resources that it relies on, it is difficult to quantify the scale of impact this loss of vegetation would incur on local important populations. At this stage, little is known about landscape utilisation of flying-foxes in human-modified areas, and how this may differ in natural areas (Yabsley *et al.,* 2021). Further, eight known Grey-headed Flying-fox camps occur within less than 20 kilometres of the project footprint. The eight camps are not recognised as National Important Flying-fox camps on the Departments National Flying-fox monitoring viewer (DECC, 2012). However, it is noted that the national population of the Grey-headed Flying-fox is spatially structured into colonies (Parry-Jones and Wardle, 2004). There are no separate or distinct populations due to the constant genetic exchange and movement between camps throughout the species' entire geographic range. This indicates that there is one single interbreeding population (Webb and Tidemann, 1995).

Upon review of Grey-headed Flying Fox records in the region (20-kilometre buffer of the project footprint), there was over 400 records of injured individuals, and two dead individuals. A large proportion of those injuries were resulting from entanglement or electrocution. Therefore, the project would result in the depletion of habitat critical to the survival of the species and an elevated risk of entanglement, and electrocution in the locality.

Given the factors detailed above, a reduction in occupancy of an important population of the Grey-headed Flying Fox as a result of the project is considered likely.

Fragment an existing important population into two or more populations

An area of approximately 226.68 ha of potential foraging habitat for the Grey-headed Flying-fox would be impacted by the project. Given the species is highly mobile, the project is unlikely to impede aerial movement throughout the landscape. Despite this, a connectivity strategy would be prepared as part of the project, which would mitigate indirect impacts to connectivity resulting from the project.

Adversely affect habitat critical to the survival of a species

Within the project footprint, no native or exotic vegetation used for roosting at the site of a Nationally Important Camp was recorded, however, this can only be confirmed for areas where field surveys have been undertaken. There are eight known Grey-headed Flying-fox camps within foraging range (less than 20 kilometres) of the project footprint. PCTs within the project footprint, such as PCT 266, 268, 277, 278, 280, 1330 and 283 contain important foraging resources for Grey-headed Flying-fox (eg, *Eucalyptus melliodora, Eucalyptus albens and Eucalyptus sideroxylon).* The eight Grey-headed Flying-fox camps near the project footprint are not regarded as nationally important camps, however, the project footprint contains PCTs with native species that are known to be productive foraging resources during the final weeks of gestation, and during the weeks of birth, lactation, and conception (August to May), and therefore, the project footprint supports habitat critical to the survival of the species (DAWE, 2021h). Given that the species is nomadic and has a wide variety of native and non-native foraging resources that it relies on, it is difficult to quantify the scale of impact the loss of foraging resources as a result of the project (226.68 ha) would incur on local populations.

There is evidence that foraging resources (in southern NSW) in remaining habitat are inadequate to provide reliable resources during critical periods in the reproductive cycle of Grey-headed Flying-foxes. The species is subject to recurring food shortages during late gestation, birth and early lactation. These shortages are associated with rapid weight loss in adults, poor reproductive success, and death (Collins, 2000; Eby, 2000; Parry-Jones and Augee, 2001).

Given the proportion of foraging habitat to be removed (226.68 ha), the project is likely to adversely affect habitat critical to the survival of the species.

Disrupt the breeding cycle of an important population

A review of known Grey-headed Flying-fox camps was undertaken to determine the proximity of these local populations to the project footprint. There are eight known Grey-headed Flying-fox camps within foraging range (within 20 kilometres) of the project footprint. Where field surveys have been undertaken, no Grey-headed Flying-fox camps have been identified in the project footprint. Further, the project footprint is likely to contains PCTs with native flora species that are known important foraging resources during the final weeks of gestation, and during the weeks of birth, lactation, and conception (August to May).

Given the uncertainty on the presence, or absence of Grey-headed Flying-fox camps within inaccessible areas of the project footprint, the proximity of known camps to the project footprint, and the loss of important foraging resources used during gestation, the project is considered likely to disrupt the breeding cycle of an important population of the Grey-headed Flying-fox.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

An area of approximately 226.68 ha of potential foraging habitat for the Grey-headed Flying-fox would be impacted by the project. Given the species is highly mobile, the project is unlikely to impede aerial movement throughout the landscape. Despite this, a connectivity strategy would be prepared as part of the project, which will mitigate indirect impacts to connectivity resulting from the project (including collision and entanglement avoidance measures).

Grey-headed Flying-fox requires a continuous temporal sequence of productive foraging habitats and suitable roosting habitat. There are eight known Grey-headed Flying-fox camps within foraging range (within 20 kilometres) of the project footprint. It is assumed that all native vegetation within project footprint, is potential foraging habitat for the species, and therefore, habitat critical to the survival of the species (DAWE, 2021h).

Due to these factors, it is considered likely that the project would modify, destroy, remove, or isolate or decrease the availability or quality of foraging habitat (habitat critical to the species survival) to the extent that the Grey-headed Flying-fox is likely to decline.

Result in invasive species that are harmful to a vulnerable species becoming established in the vulnerable species' habitat;

There is anecdotal evidence that the Grey-headed Flying-fox is predated upon by a range of animals, but their impact is considered insignificant (DAWE, 2021h). It is considered therefore unlikely that an invasive species that is harmful to the Grey-headed Flying-fox will become established in its habitat as a result of the project.

Introduce disease that may cause the species to decline, or

Whilst there is a risk that construction machinery and workers may disperse soil and plant pathogens that can affect forage species, this risk would be mitigated through hygiene protocols implemented through the Biodiversity Management Plan to be prepared for the project. It is considered unlikely that the project will introduce disease that may cause the Grey-headed Flying-fox to decline.

Interfere substantially with the recovery of the species.

The project would partially interfere with Recovery Action 1 "*Identify, protect, and increase native foraging habitat that is critical to the survival of the Grey-headed Flying-fox*", with the removal of 226.68 ha of foraging habitat (within 20 kilometres of known camps), however, these camps are not recognised as Nationally Important, therefore, the project is considered unlikely to interfere with the recovery of the Grey-headed Flying-fox.

Conclusion

In line with the above findings, the project is considered likely to have a significant impact on the Grey-headed flying fox, based on the known distribution of Grey-headed Flying-fox camps within the region, the increased risk of entanglement and collision from the project and the scale of vegetation loss within the region. It is considered likely that the project will likely lead to the long-term decrease in the size of an important population of the Grey-headed Flying-fox.

A summary of the NSW assessment bilateral requirements for Grey-headed Flying-fox is presented in Table A18- 33.

Table A18- 33: NSW assessment bilateral requirements for Grey-headed Flying-fox

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations, and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	 Current distribution map for Grey-headed Flying-fox (DAWE, 2021h) The "*National Recovery Plan for the Grey-headed Flying-fox Pteropus poliocephalus*" (DAWE, 2021h) is the key recovery plan for this species. The Plan outlines habitat critical to the survival, and important foraging resources for the species, important winter and spring vegetation communities are those that contain *Eucalyptus tereticornis, E. albens, E. crebra, E. fibrosa, E. melliodora, E. paniculata, E. pilularis, E. robusta, E. seeana, E. sideroxylon, E. siderophloia, Banksia integrifolia, Castanospermum australe, Corymbia citriodora citriodora, C. eximia, C. maculata, Grevillea robusta, Melaleuca quinquenervia or Syncarpia glomulifera* (Eby and Law 2008; Eby 2016; Eby et al., 2019). Where the existence of these important winter and spring flowering vegetation communities is verified in the field, they are considered habitat critical to the survival of Grey-headed Flying-fox. Back yard fruit trees, orchards or non-native trees that may be used for foraging are not considered to be habitat critical to the survival of the Grey-headed Flying-fox.

NSW Assessment Bilateral requirements	
	PCTs within the project footprint, such as PCT 266, 268, 277, 278, 280, 1330 and 283, contain important foraging resources for Grey-headed Flying-fox (eg, *Eucalyptus melliodora, Eucalyptus albens* and *Eucalyptus sideroxylon*). Habitat critical to the survival of the Grey-headed Flying-fox may also be vegetation communities not containing the above tree species but which: • contain native species that are known to be productive as foraging habitat during the final weeks of gestation, and during the weeks of birth, lactation, and conception (August to May) • contain native species used for foraging and occur within 20 km of a nationally important camp as identified on the Department's interactive flying-fox web viewer, or • Contain native and or exotic species used for roosting at the site of a nationally important Grey-Headed Flying-fox camp as identified on the Department's interactive flying-fox web viewer (DAWE, 2021h). Habitat critical to the survival of the Grey-headed Flying-fox should be the focus for protection and any revegetation initiatives aimed to support the species. Habitat and associated seasonal resources critical to the survival of the Grey-headed Flying-fox have been mapped across large parts of the species range but have yet to be ground-truthed (Eby and Law, 2008). Actions under this recovery plan seek to build on this. Nationally important camps are those that have contained ≥ 10,000 Grey-headed Flying-foxes in more than one year in the last 10 years or have been occupied by more than 2,500 Grey-headed Flying-foxes permanently or seasonally every year for the last 10 years (OEH, 2020). The eight Grey-headed Flying-fox camps that are less than 20 km from the project footprint, are not regarded as nationally significant camps, however, the project footprint contains PCTs with native species that are known to be productive as foraging habitat during the final weeks of gestation, and during the weeks of birth, lactation, and conception (August to May), and therefore, the project footprint supports habitat critical to the survival of the species.
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	Survey guidelines for Grey-headed Flying-fox are provided in the Threatened Biodiversity Survey and Assessment: Guidelines for Developments and Activities (Working Draft) (DEC, 2004), and Survey guidelines for Australia's threatened mammals (DSEWPC, 2011a). The field survey techniques used to detect Grey-headed Flying-fox were habitat-based, and nocturnal survey work (eg, Spotlighting), with a detailed field validation method provided in Section 4.6 (fauna) of the BDAR.
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	**Habitat mapping** Fauna habitat assessments were undertaken for all accessible lands within the project footprint to assess habitat suitability for a range of threatened fauna species (those species known or predicted to occur within the locality from previous data collection, literature, and database review). Grey-headed Flying-fox habitat characteristics assessed included, but were not limited to: • the structure and floristics of the canopy, understorey, and groundcover vegetation, including the presence of flowering and fruiting trees providing potential foraging resources for a range of species • physical aspects such as geology, soils, slope, elevation, drainage, and aspect • presence and profiling of waterways (ephemeral or permanent) and water bodies. Opportunistic sightings of animals were recorded. Habitat mapping was undertaken diurnally throughout the duration of the field campaigns.

NSW Assessment Bilateral requirements	
	Spotlighting Spotlighting surveys were completed on foot by pairs of ecologists, targeting arboreal, flying, and large ground-dwelling mammals, as well as nocturnal birds, reptiles, and amphibians. At least one person hour of survey effort was completed per site. Spotlighting survey effort is outlined in the BDAR, in Table 417.
Description of the relevant impacts and its regard to the full national extent of the species or community's range	Within the project footprint, direct impacts would occur to 226.68 ha of potential foraging habitat across the project footprint (primarily associated with PCTs 5, 266, 268, 277, 278, 280, 1093, 1107, 1130, 1330, 283 and 731). The area of occupancy for Grey-headed Flying-fox cannot be defined given lack of knowledge on the species. Therefore, the extent of impact on habitat is unknown on a national scale. There are eight known Grey-headed Flying-fox camps less than 20 km of the project footprint. Some PCTs within the project footprint, and indicative disturbance area contain foraging resources considered important for the survival of the species at certain times of the year (eg, *Eucalyptus melliodora, Eucalyptus albens* and *Eucalyptus sideroxylon*). There is evidence that foraging resources (in southern NSW) in remaining habitat is inadequate to provide reliable resources during critical periods in the reproductive cycle of Grey-headed Flying-foxes (May – August). The species is subject to recurring food shortages during late gestation, birth, and early lactation. These shortages are associated with rapid weight loss in adults, poor reproductive success, and death (Collins, 2000; Eby, 2000; Parry-Jones and Augee, 2001). Approximately 226.68 ha of potential foraging habitat, that contains key foraging resources for the Grey-headed Flying-fox will be directly impacted by the project. Indirect impacts resulting from the project include increased risk of entanglement and collision. Further, a review of BioNet records (2023), highlighted numerous Grey-headed Flying-fox individuals that have experienced electrocution (resulting in injury or mortality), particularly within proximity to the Tumut River Island and Wagga Wagga flying-fox camps (more urbanised areas).
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Grey-headed Flying-fox: • Pre-construction survey in previously inaccessible areas of the project footprint, to confirm presence/absence of camps • Investigation into appropriate deterrent devices is recommended in areas of the project footprint considered high-risk of collision, electrocution, or entanglement • Micro-siting of transmission line infrastructure and associated construction work sites to avoid impacts to foraging resources, where possible. • Review species wildlife rehabilitation records in the locality to understand areas that are of higher risk to avifauna-strike • Where feasible, avoid the removal of feed trees; *Eucalyptus melliodora, Eucalyptus albens* and *Eucalyptus sideroxylon* via pre-clearance surveys of indicative disturbance area within 20 kilometres of a known camps, and support PCTs 266, 268, 277, 278, 280, 1330 and 283. These tree species are known to provide productive foraging habitat during conception, the final weeks of gestation, birth, and lactation (August – May). • Development of a connectivity strategy.
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	The residual impact to Grey-headed Flying-fox is 226.68 ha of habitat removal. There is the potential for indirect impacts (such as reduce habitat connectivity, and increased risk of entanglement and/or electrocution) within or adjacent to the project footprint.
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Potential residual impacts to Grey-headed Flying-fox are considered likely to be significant as detailed above. Ongoing consultation with BCD will be undertaken as the design is progressed to confirm offset requirements for these species' impacts.

NSW Assessment Bilateral requirements	
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations will be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project/ • Payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All significant adverse impacts to the species have been addressed under the NSW BOS. There are no significant residual impacts to the species that have not been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required.

2.3.21 Legless Lizards: Pink-tailed Legless Lizard (*Aprasia parapulchella*) and Striped Legless Lizard (*Delma impar*)

The Pink-tailed Legless Lizard and Striped Legless Lizard are listed as Vulnerable under the EPBC Act and the BC Act.

Description

Pink-tailed Legless Lizard:

The Pink-tailed Legless Lizard is a member of the family *Pygopodidae*. It is a small, legless, and very slender lizard that lives underground, growing to about 25 cm in length, nearly half of which is tail. The snout and the tail are rounded and blunt. The presence of small hind-limb flaps distinguishes it from a juvenile snake. Colouration is predominantly grey-brown to pale grey, with a slightly darker head and nape and a paler underside. The end part of the tail is pinkish to reddish-brown. Each dorsal scale has a short dark mark, forming indistinct, broken, longitudinal stripes that often come together on the tail. There are no external ear openings (TSSC, 2015b).

The Pink-tailed Legless Lizard is only known from the Central and Southern Tablelands, and the Southwestern Slopes. There is a concentration of populations in the Canberra/Queanbeyan Region. Inhabits sloping, open woodland areas with predominantly native grassy ground layers, particularly those dominated by Kangaroo Grass (*Themeda australis*). Sites are typically well-drained, with rocky outcrops or scattered, partially-buried rocks (TSSC, 2015b).

Striped Legless Lizard:

The Striped Legless Lizard lacks forelimbs and has very reduced vestigial hind limbs (TSSC, 2016d). The colour and pattern of this species varies; however, it generally has a pale grey-brown dorsal surface and

cream ventral surface, with a series of dark brown or blackish dorsal lateral and lateral stripes along the length of the body and tail (TSSC, 2016d).

The Striped Legless Lizard is patchily distributed throughout south-eastern New South Wales, the Australian Capital Territory, north-eastern, central, and south-western Victoria, and south-eastern South Australia (TSSC, 2016d). There are outlying records from Gilgandra and Muswellbrook in NSW. This species is a grassland specialist, found only in areas of native grassland and nearby grassy woodland and exotic pasture (TSSC, 2016d).

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for these species are as follows:

- Approved conservation advice for the Pink-tailed Legless Lizard (TSSC, 2015b), in effect under the EPBC Act from 1 October 2015, and for the Striped Legless Lizard (TSSC, 2016d), in effect under the EPBC Act from 16 December 2016.
- No specific listing advice is available for either species, listing assessment information may be available in the approved Conservation Advice
- The Minister for the Environment has determined that an official recovery plan for the Pink-tailed Legless Lizard and the Striped Legless Lizard is not required:
  - An approved Conservation Advice is an effective, efficient, and responsive document to guide the implementation of priority management actions, mitigate key threats, and support the recovery of these EPBC Act listed Vulnerable species.
  - The Pink-tailed Legless Lizard occurs across New South Wales, the ACT and Victoria. The threats facing the species, and the recovery actions needed, are largely being addressed and coordinated under existing state and territory plans and programs.
  - The threats facing the Striped Legless Lizard, and the recovery actions needed, are largely being addressed via existing mechanisms. The species' primary habitat is encompassed by four nationally threatened ecological communities. TECs with plans in place, each of which identify actions that benefit recovery of the Striped Legless Lizard.
- The Pink-tailed Legless Lizard and Striped Legless Lizard are referred to in the *Threat abatement plan for competition and land degradation by rabbits*, in effect under the EPBC Act from 7 January 2017
- In addition, the *Threat abatement plan for predation by feral cats*, in effect under the EPBC Act from 23 July 2015, and the *Threat abatement plan for predation by the European red fox*, in effect under the EPBC Act from 1 October 2008 are both relevant to the Striped Legless Lizard.
- Relevant survey guidelines for the Pink-tailed Legless Lizard and the Striped Legless Lizard include:
  - Survey guidelines for Australia's threatened reptiles, EPBC Act survey guidelines 6.6 (DSEWPaC, 2011b).
- Additional guidelines relevant to the Striped Legless Lizard include:
  - Referral guidelines for the Striped Legless Lizard, *Delma impar* (DSEWPaC, 2011c).

Specific Impacts

The Pink-tailed Legless Lizard was recorded in the project footprint during field surveys in the Murrumbateman (five individuals) and Snowy Mountains (one individual) IBRA subregions. It is also assumed present in the Bungonia and Crookwell IBRA subregions as it has a high likelihood of occurrence

due to the presence of suitable habitat and records within 5 kilometres of the project footprint (one in Bungonia and two in Crookwell).

The Striped Legless Lizard was not detected during field surveys, however it is assumed present due to the species high likelihood of occurrence in the Inland Slopes and Murrumbateman IBRA subregions. These areas contain suitable grassland and rocky habitats to support the species, and there are multiple records within 5 kilometres of the project footprint (three in Inland Slopes and 13 in Murrumbateman).

Vegetation clearing for the installation of transmission lines and associated infrastructure may reduce the availability of grassland habitat containing foraging resources potentially used by these species. Further, the project may disturb surface rock, and boulder fields potentially used as foraging and shelter sites by these species. Potential direct impacts include direct removal of grassland habitats, and potential injury or mortality during construction.

The total area of occupancy of the Striped Legless Lizard and Pink-tailed Legless Lizard is unknown (DCCEEW, 2022al). Potential Pink-tailed Legless Lizard habitat is associated with PCTs 266, 277, 278, 280, 283, 290, 294, 319, 322, 351, 731, 1191 and 1330, within the Bungonia, Crookwell, Inland Slopes and Murrumbateman IBRA subregions portion of the project footprint. Striped Legless Lizard habitat is associated with PCTs 277, 1330 and Non-native, within the Bungonia, Crookwell, Inland Slopes and Murrumbateman IBRA subregions.

The project footprint would directly impact on approximately 40.10 ha of known habitat (including 3.00 ha of prescribed impacts on non-native habitats) and 17.30 ha of potential habitat (57.40 ha in total) for the Pink-tailed Legless Lizard, and 124.90 ha of potential habitat for the Striped Legless Lizard. These areas of known and potential habitat are likely to be directly impacted by the project.

Significant impact criteria

An action is likely to have a significant impact on a Vulnerable species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of an important population of a species

There are no adopted or made Recovery Plans for Striped Legless Lizard and Pink-tailed Legless Lizard.

The Pink-tailed Legless Lizard was recorded in the project footprint during field surveys (six individual records). No important populations have been identified for the Pink-tailed Legless Lizard in in the approved Conservation Advice (TSSC, 2015b). Given the scattered distribution of the species' records, it is likely that any population could be regarded as important since they have limited dispersibility (restricted home range) and would be required to maintain genetic diversity on a local scale.

The Striped Legless Lizard was not recorded during the field surveys for the project and there are no previous records within the project footprint, and only a few records in the broader locality (within 5 kilometers of the project footprint). Like Pink-tailed Legless Lizard, all populations of the Striped Legless Lizard are likely to be regarded as important for the species recovery (TSSC, 2016d). The basis for this is the major loss and degradation of its grassland habitat, the ongoing pressures in remaining habitat and the highly fragmented nature of known habitat and populations (TSSC, 2016d).

The approved Conservation Advice for Striped Legless Lizard (TSSC, 2016d), lists 18 areas that contain known important populations, including the areas of Gilmore, Batlow and Tumut, and Yass and Young. The project is likely to traverse areas that contain important Striped Legless Lizard populations.

Both lizard species generally occupy areas dominated by native grasses, with the presence of surface rock or boulders being a key habitat feature. Potential foraging and shelter habitat is present in the project footprint in the form of rocky habitat in associated grassland PCTs. Approximately 40.10 ha of known habitat (including 3.00 of prescribed impacts) and 17.30 ha of potential (57.40 ha in total) for Pink-tailed Legless Lizard, and 124.90 ha of potential habitat for Striped Legless Lizard would be impacted as a result of the project.

The project may directly impact individuals and their habitats through the removal grassland habitats, and surface rock, particularly in proposed transmission line structures and access track locations. Therefore, the project is likely to lead to a long-term decrease in the size of an important legless lizard populations within the project footprint.

Reduce the area of occupancy of an important population

The national area of occupancy for the Pink-tailed Legless Lizard is unknown (TSSC, 2015b). The project footprint intersects the species likely distribution, both at the edges and entirely within the distribution. The Pink-tailed Legless Lizard was recorded in the project footprint during the field surveys, with additional areas within the footprint considered to be suitable habitat. Any population of the Pink-tailed Legless Lizard would be considered part of an important population. The clearing associated with the project may impact approximately 57.40 ha of potential habitat for the Pink-tailed Legless Lizard, which is considered to be a significant amount given that there is no data on the area of occurrence for this species, and populations are typically disjunct and small.

The national area of occupancy for the Striped Legless Lizard is unknown (TSSC, 2016d). The project footprint intersects the species likely distribution, both at the edges and entirely within the distribution. While the species was not recorded in the project footprint during surveys, these areas of the project footprint that intersect the important population areas are assumed, known or high likelihood of occurrence. Any population of the Striped Legless Lizard within the alignment would be considered part of an important population. The clearing associated with the project may impact approximately 124.90 ha of potential habitat for the Striped Legless Lizard in the form of rocky habitat in associated PCTs.

The project is likely to reduce the area of occupancy of important legless lizard populations.

Fragment an existing important population into two or more populations

Due to significant clearing within their natural distribution, habitat fragmentation is considered to be a key threat for both the Pink-tailed Legless Lizard and Striped Legless Lizard. Any population of these species present in the project footprint would be considered part of an important population.

Striped Legless Lizard are known to be poor dispersers, with evidence suggesting that they are genetically differentiated at distances less than 400 m (TSSC, 2016d). Movement and dispersal behaviour in the Pink-tailed Legless Lizard is unknown, but likely to be restricted based on the size and known ecology of the species. The project footprint intersects the species potential and known distribution. The project may reduce habitat connectivity through the removal grassland habitats, and surface rock, particularly in proposed transmission line structure and access track locations which may effectively isolate individuals

without appropriate consideration. Therefore, the project is likely to fragment an existing important population into two or more populations of these two lizard species. A connectivity strategy and BMP would be developed to mitigate connectivity impacts associated with the project.

Adversely affect habitat critical to the survival of a species

Habitat critical to the survival of the Striped Legless Lizard has been defined in the approved Conservation Advice (TSSC, 2016d):

- Breeding habitat with complex grass structures, and surface rocks or invertebrate burrows for oviposition.
- Foraging habitat diverse floristics, little to no disturbance and adequate connectivity.
- Areas of refuge from disturbance events with surface rocks, arthropod burrows, or suitable cracks in the soil in close proximity to known populations subject to disturbance.
- Areas with long term protection from development, including sites currently covenanted for conservation management, or sites that contain an Endangered Ecological Community protected under the EPBC Act.

No critical habitat has been identified for Pink-tailed Legless Lizard; however, the habitat requirements for both species are likely to be similar to some extent.

To date, no Critical Habitat as defined under section 207A of the EPBC Act has been identified or included in the Register of Critical Habitat for the Pink-tailed Legless Lizard or Striped Legless Lizard.

Given that both species have low dispersibility and occupy grassland and surface rock habitats for all stages of their lifecycle, it is likely the project would affect habitat critical to the survival of these species.

Disrupt the breeding cycle of an important population

Pink-tailed Legless Lizards lay eggs within ants' nests. Striped Legless Lizards lay eggs within soil cavities or under surface rocks. Both species rely on protection provided by rocks, cracks or arthropod burrows to nest and produce egg clutches. The project may result in the removal of some surface rocks, and ground disturbance in the indicative disturbance area. As such, it is considered likely to disrupt the breeding cycle of these species in the long-term, without appropriate consideration.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

The project may directly impact individuals and their habitats through the removal grassland habitats, and surface rock, and there may be localised impacts to habitat connectivity. Therefore, the project is likely to remove the availability of habitat to the extent that either, or both species are likely to decline.

Result in invasive species that are harmful to a vulnerable species becoming established in the vulnerable species' habitat

The project is not likely to result in the introduction of invasive species that may become established in habitat for these species.

Introduce disease that may cause the species to decline, or

Whilst there is a risk that construction plant, machinery and workers may disperse soil pathogens that can affect foraging habitat of both the Pink-tailed Legless Lizards and the Striped Legless Lizard, this risk would be mitigated through hygiene protocols throughout the development and management of the project.

Interfere substantially with the recovery of the species

There is no current national Recovery Plan for the Pink-tailed Legless Lizard, or the Striped Legless Lizard.

Conservation objectives are outlined in the previous recovery plan for the Pink-tailed Legless Lizard (Osborne and Jones 1995):

- Ensure that the species persists throughout its known range, including within each geographic isolate; and
- Prevent a decrease in population numbers at representative sites by active management of habitat.

In addition, the following objectives have been identified in the ACT Action Plan (ACT Government, 2017):

- Conserve all populations in defined landscape corridors that comprise important linking habitat and all medium to large habitat areas outside these corridors.
- Protect all other sites from unintended impacts (unintended impacts are those not already considered through an environmental assessment or other statutory process).
- Manage the species and its habitat to maintain the potential for evolutionary development in the wild.
- Enhance the long-term viability of populations through management of buffer zones that surround occupied habitat and through rehabilitation of habitat in corridor areas that will increase connectivity between populations.

Conservation objectives are outlined in the previous recovery plan for the Striped Legless Lizard (Smith and Robertson 1999):

- Establish and maintain national forums for the discussion and organization of the conservation of the Striped Legless Lizard across its natural distribution.
- Determine the distribution of potential Striped Legless Lizard habitat.
- Determine the current distribution and abundance of Striped Legless Lizards in Victoria, NSW, the ACT and SA.
- Establish a series of reserves and other managed areas such that viable populations are maintained across the known distribution of the species.
- Determine the habitat use and ecological requirements of Striped Legless Lizards.
- Identify the nature and extent of the threatening processes affecting Striped Legless Lizards.
- Undertake a program of research and monitoring to provide a basis for adaptive management of Striped Legless Lizards.
- Increase community awareness and involve the community in aspects of the recovery program.
- Assess the need for salvage and translocation, determine their feasibilities, develop protocols and undertake a trial translocation if appropriate.
- Ensure that captive population(s) are used to support education and research elements of the Recovery Plan.

The project may impede or interfere with any of targeted recovery actions for these species through the potential reduction in habitat and population numbers.

Conclusion

In line with the above findings, the project is considered likely to have a significant impact on the Pink-tailed Legless Lizard and Striped Legless Lizard, based on the known distribution of records and location of known important populations in proximity to the project footprint, the risk of reduced habitat connectivity, and the potential to directly impact individuals and their habitats through the removal of grassland habitats, and surface rock from the indicative disturbance area. It is considered likely that the project would lead to the long-term decrease in the size of an important population of Pink-tailed Legless Lizard and Striped Legless Lizard.

A summary of the NSW assessment bilateral requirements for Legless Lizards is presented in Table A18- 34.

Table A18- 34: NSW assessment bilateral requirements for Legless Lizards

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	**Pink-tailed Legless Lizard:** There is no listing advice or recovery plan identified for this species. Listing assessment and recovery actions are discussed in the approved conservation advice for this species (TSSC, 2015b). References to relevant guidelines and recovery plans are provided above. The conservation advice states that threats to the species include habitat loss and fragmentation, habitat degradation, removal of rocks, inappropriate fire regimes and predation. The Pink-tailed Legless Lizard is found in sloping, open woodland areas with predominantly native grassy ground layers and rocky outcrops or scattered partly buried rocks. These rocky habitats tend to be well-drained mid-slope or ridge-top sites with loosely embedded rocks on soil substrate with ant galleries present. Individuals are most found sheltering under these rocks, and rocks and spend a considerable amount of time in burrows below these rocks constructed, and sometimes still by inhabited by, small black ants or termites. Ant burrows are considered important foraging and shelter sites for this species. The Pink-tailed Legless Lizard is only known from the Central and Southern Tablelands, and the Southwestern Slopes. There is a concentration of populations in the Canberra/Queanbeyan Region. A map of the Pink-tailed Legless Lizard's indicative distribution is provided below:  **Striped Legless Lizard:** The Striped Legless Lizard is a grassland specialist, found only in areas of native grassland and nearby grassy woodland and exotic pasture. (TSSC, 2016d). Striped Legless Lizards are often recorded in grasslands with high structural complexity

NSW Assessment Bilateral requirements	
	(TSSC, 2016d). The lizard's primary habitat is encompassed by four nationally TECs (TSSC, 2016d): • Natural Temperate Grassland of the Victorian Volcanic Plain. • Grassy Eucalypt Woodland of the Victorian Volcanic Plain. • Natural Temperate Grassland of the South-eastern Highlands, and • White Box-Yellow Box-Blakely's Red Gum Grassy Woodland and Derived Native Grassland. All populations of the Striped Legless Lizard are likely to be important for the species recovery (TSSC, 2016d). The basis for this is the major loss and degradation of its grassland habitat, the ongoing pressures in remaining habitat and the highly fragmented nature of known habitat and populations (TSSC, 2016d). Genetic analysis shows that across the Striped Legless Lizard's geographical range the species forms four distinct genetic lineages: the South Australia & Victorian Wimmera; south-western Victoria (including Melbourne); eastern Victoria and a lineage covering the ACT and Monaro Plains in NSW (TSSC, 2016d). Genetic differentiation between populations suggests this species do not disperse long distances (TSSC, 2016d). Habitat critical to the survival of the Striped Legless Lizard is likely to include sites that possess more than one of the following characteristics (TSSC, 2016d): • Provides breeding habitat - as indicated by the presence of two or more adult individuals or juveniles, complex grass structures, and surface rocks or invertebrate burrows for oviposition. • Provides foraging habitat - as indicated by diverse floristics, little to no disturbance and is connected to other nearby grasslands or grassy woodlands. • Provides refuge from disturbance events - as indicated by the presence of surface rocks, arthropod burrows or suitable cracks in the soil where lizards can escape trampling by livestock or fire and is in close proximity to a known population which is subject to disturbance. • Provides for long term protection from development – including sites currently covenanted for conservation management, or sites that contain an Endangered Ecological Community protected under the EPBC Act. • Has connectivity value and contributes to the evolutionary potential of the species in the wild across its natural geographical range. A map of the Striped Legless Lizard's indicative distribution is provided below: Details of the scope, timing and methodology for studies or surveys used	**Pink-tailed Legless Lizard and Striped Legless Lizard:**

NSW Assessment Bilateral requirements	
and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	Threatened reptile surveys completed in suitable rocky habitat within the project footprint were carried out in accordance with the Survey guidelines for Australia's threatened reptiles Ver.6.6 (DSEWPaC, 2011b). Opportunistic surveys of suitable habitats were undertaken in addition to targeted surveys. Habitat assessments were undertaken to assess the likelihood of threatened species of animal (those species known or predicted to occur within the locality from the literature and database review) occurring within the project footprint. Fauna habitat assessments were the primary assessment tool in assessing whether threatened species were likely to occur within the project footprint. Reptile surveys, in the form of rock rolling, were undertaken within the project footprint by Eco Logical Australia and Niche as part of the BDAR. Detailed methods and timing of surveys can be found in section 3.6 of the BDAR.
Description of the relevant impacts and its regard to the full national extent of the species or community's range	**Pink-tailed Legless Lizard:** The species is widely but patchily distributed across New South Wales, Victoria and the Australian Capital Territory. In New South Wales it known only from isolated sites in the Central and Southern Tablelands and South-western slopes. The current known generalised distribution of this species is shown in the map above. The direct impact of the project on this species includes removal of approximately 57.40 ha of potential habitat. **Striped Legless Lizard:** The species is known to be patchily distributed throughout south-eastern New South Wales, the Australian Capital Territory, north-eastern, central and south-western Victoria, and south-eastern South Australia. The current known generalised distribution of this species is shown in the map above. The direct impact of the project on this species includes removal of approximately 124.90 ha of potential habitat. For both lizards, creation of new access tracks and transmission line structures are the actions likely to cause the most impact on the species. The project would minimise new tracks as far as possible and would retain surface rocks which are significant habitat for these lizards. As such, habitat allowing for species movement, breeding and foraging would be maintained across the project footprint, minimising effect on the national species extents.
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	**Pink-tailed Legless Lizard and Striped Legless Lizard:** The proposed avoidance and mitigation measures are outlined in Chapter 12 and 14 of the BDAR. Detailed avoidance description for impacts relating to biodiversity values (including threatened species) are outlined in Chapter 12. Mitigation measures to be implemented are outlined in Chapter 14. No specific measures for these species are identified other than retention of rocky areas.
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	**Pink-tailed Legless Lizard:** As detailed in the SIA above, it is considered that the removal of known and potential habitat for this species is likely to have a significant residual impact on the species. **Striped Legless Lizard:**

NSW Assessment Bilateral requirements	
	As detailed in the SIA above, it is considered that the removal of known and potential habitat for this species is likely to have a significant residual impact on the species.
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	**Pink-tailed Legless Lizard:** Details of offset requirements and obligations for this species as a result of residual impacts due the project are addressed in Chapter 15 of the BDAR. **Striped Legless Lizard:** Details of offset requirements and obligations for these species as a result of residual impacts due the project are addressed in Chapter 15 of the BDAR.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	**Pink-tailed Legless Lizard and Striped Legless Lizard:** Chapter 16 of the BDAR outlined the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • the purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register • establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project • payment into the Biodiversity Conservation Fund.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All significant adverse impacts to the species have been addressed under the NSW BOS. There are no significant residual impacts to the species that have not been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required.

2.4 Aquatic fauna

2.4.1 Flatheaded Galaxias (*Galaxias rostratus*)

Flatheaded Galaxias is listed as Critically Endangered under the EPBC Act and the FM Act.

Description

The Flatheaded Galaxias is a long, slender species of galaxias growing up to 12 centimetres in length. The species has a distinctly flattened head, and very small pectoral and pelvic fins with a large silver eye (Gomon & Bray, 2022).

In terms of distribution, the Flatheaded Galaxias is restricted to the southern Murray-Darling Basin (Lintermans, 2007). Although the species once occurred in the middle reaches of the Lachlan, Murrumbidgee and Murray River catchments in New South Wales (TSSC, 2016e), the last record in the Murrumbidgee River was in 1971 and the species may be locally extinct from Murrumbidgee and Lachlan rivers (Fisheries Scientific Committee 2008). Indicative distribution mapping for the species (DPI 2022a) includes Tarcutta Creek, the Tumut River, Umbango Creek, Kyeamba Creek and O'Briens Creek in the Murrumbidgee catchment within the project footprint.

In terms of habitat, the species occurs in still and gently flowing small streams, lakes, lagoons, billabongs and backwaters with coarse sand or muddy substrate and aquatic vegetation (NSW DPI, 2014).

Key threats to the species are considered to be river regulation, habitat degradation including agriculture and the removal of aquatic and riparian vegetation, water pollution and competition with and predation by alien fish species (TSSC, 2016e). All of these key threats are in operation within the project footprint at significant levels and as such potential habitats for the species would be marginal.

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species is as follows:

- Approved conservation advice for Flathead Galaxias (TSSC, 2016e). In effect under the EPBC Act from 05 May 2016.
- A Recovery Plan is not required, and no Threat Abatement Plan has been identified as being relevant for this species.

Relevant Commonwealth survey guidelines for this species include:

- The Survey guidelines for Australia's threatened fish (DSEWPaC, 2011d).

Specific Impacts

The construction process for the transmission line structures avoids direct impacts to streams and none of the waterways that have been mapped as within the species indicative distribution would be crossed by any waterway crossings for access tracks as indicated by the indicative access track mapping. As such, this assessment of significance focusses on the potential for disturbance and residual indirect impacts to potential habitats following the implementation of avoidance and mitigation measures, to the species (ie the removal of native riparian vegetation, erosion and sedimentation risk) during construction generally. Any indirect impacts that may occur are anticipated be localised and temporary in nature eg disturbance to

instream habitats during the construction of waterway crossings and access tracks or trimming of riparian trees to facilitate transmission line installation.

Significant impact criteria

An action is likely to have a significant impact on a Critically Endangered species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of a population of a species

The project is considered unlikely to lead to a long-term decrease in the species or a population of the species. This is in consideration that there would be no direct impacts to streams within the mapped indicative distribution of the species (DPI, 2022a) and any indirect impacts that may occur would be localised and temporary in nature. A number of avoidance and mitigation measures have already been incorporated into the project. Further detailed recommendations as to specific mitigation measures to prevent indirect impacts to potential habitats for the species have been included in Chapter 14.

Reduce the area of occupancy of the species;

The extent of occurrence for the species is calculated to be 23,065 square kilometers and the area of occupancy is calculated to be 84 square kilometers (TSSC, 2016e), however, the current distribution of the species outside of the Murray-Darling Basin in NSW is poorly understood.

The project would not directly impact streams within the mapped indicative distribution of the species (DPI, 2022a) and although the project has the potential to result in indirect impacts to aquatic habitats generally, these would be localised and temporary. It is considered unlikely that the scale of these indirect impacts would be significant given the history of landscape modification and existing deleterious processes operating in the streams generally within the project footprint, or that these potential indirect impacts would act to render any potential habitats no longer suitable. For these reasons the project is unlikely to reduce the area of occupancy of the species.

Fragment an existing population into two or more populations

The project would not directly impact mapped indicative distributions (DPI, 2022a) for the species and although the project has the potential to result in indirect impacts to potential habitats, these would be localised and temporary. It is considered unlikely that the scale of any potential indirect impacts would be so significant that they would render any potential habitats no longer suitable. No indicative access track crossings are located within waterways within the indicative distribution of the species and therefore the project would not result in any barriers to fish passage to the species. As such, the project is considered unlikely to fragment an existing population into two or more populations.

Adversely affect habitat critical to the survival of a species

To date, no Critical Habitat as defined under section 207A of the EPBC Act has been identified or included in the Register of Critical Habitat for the species or identified in the Conservation Advice for the species.

Streams mapped as within the indicative distribution (DPI, 2022a) for the species within the project footprint are considered highly unlikely to constitute critical habitat for the species given the lack of recent records within the Murrumbidgee catchment. Furthermore, the significant existing levels of key threats to the species within the project footprint that have led to the generally poor condition of aquatic habitats.

Disrupt the breeding cycle of a population

The breeding and spawning behaviour of this species is poorly understood beyond that the species spawns in August and September, when water temperatures rise above 10.5°C (Department of Primary Industries 2014) and that the species may move upstream in November and December (Lintermans, 2007).

The project would not result in any impacts to fish passage or water temperatures. Any indirect impacts to potential habitats would be anticipated to be localised and temporary. As such it is unlikely that the project would disrupt the breeding cycle of a population of the species.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

It is unclear whether the species is still extant in the Murrumbidgee catchment as it has been suggested the species may be locally extinct from the Murrumbidgee River (Department of Primary Industries 2014). Overall, aquatic habitats within the project footprint generally are in poor condition. The key threats to the species are in operation at significant levels at each of the waterways identified as part of the indicative distribution (DPI, 2022a) of the species.

Given the lack of records and the limited potential for habitat to be indirectly impacted and context of significant existing landscape modification, the project is not likely to contribute to decline of the species.

Result in invasive species that are harmful to an endangered or critically endangered species becoming established in the endangered or critically endangered species' habitat

The project is not likely to result in the introduction of invasive species that may become established in habitat for the species.

Introduce disease that may cause the species to decline, or

There is a low potential for any instream plant or machinery used in crossing construction to transport the Epizootic Haematopoietic Necrosis Virus (EHNV), which is known to occur within the Murrumbidgee catchment and is associated with the invasive Redfin Perch *Perca fluviatilis*, which is also known to occur. It has not been established whether the Flathead Galaxias is susceptible to EHNV, although a number of galaxiid species are (TSSC, 2016e).

It has been recommended that this risk be managed through the use of wash down procedures (Chapter 14).

Interfere with the recovery of the species

A Recovery Plan has not been prepared for the species, with the species profile (DCCEEW, 2022am) stating that "many of the threats to the flathead galaxias are threats to other EPBC Act-listed threatened fish species that occur within the Murray-Darling Basin. Actions and mechanisms that are being implemented through a variety of other existing programs (including in other species recovery plans, water management plans, actions being undertaken by relevant catchment management authorities) are likely to be of benefit to this species". The project would be unlikely to interfere with any of these actions or plans.

Conclusion

In line with the above findings, the project is unlikely to have a significant impact on the Flatheaded Galaxias. A summary of the NSW assessment bilateral requirements for Flatheaded Galaxias is presented in Table A18- 35.

Table A18- 35: NSW assessment bilateral requirements for Flatheaded Galaxias

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations, and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of the distribution and habitats for this species, and relevant conservation documents are provided in Section 10.2, summarised in the section above. A map of the species indicative distribution is provided below: Overall, the species is considered unlikely to occur within the project footprint. This is given the known current distribution of the species, limited suitable habitats present and generally degraded stream conditions within the project footprint. As a precautionary approach an Assessment of Significance under the EPBC Act has been completed given indicative distribution mapping (DPI, 2022a) occurs within the project footprint. Notwithstanding differences between this indicative distribution mapping and the inferred actual distribution, observed habitats and conditions, and the range of the species as detailed in conservation documents (Section 10.2).
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	No targeted survey has been completed for the species as the Flatheaded Galaxias is considered to be overall unlikely to occur within the project footprint and the potential for impacts to the species is considered low. The assessment is informed by a detailed desktop assessment augmented by opportunistic field observations and a review of the available literature relevant to the species. This assessment has been completed on a precautionary basis given the indicative distribution mapping by DPI (2022a) includes some streams within the project footprint.
Description of the relevant impacts and its regard to the full national extent of the species or community's range	Overall, the species is considered unlikely to occur within the project footprint. The construction process for the transmission line structures avoids direct impacts to major waterways and none of the waterways that have been mapped as within the species indicative distribution (DPI, 2022a) would be crossed by any indicative access track waterway crossings. As such, this assessment of significance focusses on the potential for residual indirect impacts to aquatic habitats generally (as the species cannot be ruled out) following the implementation of avoidance and mitigation measures (ie the trimming of native riparian vegetation, erosion and sedimentation risk) during construction.

NSW Assessment Bilateral requirements	
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	The proposed avoidance and mitigation measures are outlined in Chapter 12 and 14 including procedures and measures specific to the protection of aquatic environments. Avoidance measures most relevant to aquatic species include: • Avoiding wetlands protected by international agreements (Tier 1 constraint) • Avoiding where possible, and minimising impacts, in wetlands not listed as Tier 1 constraints, as well as ecological conservation areas, and water crossings greater than 800 metres • Paralleling existing transmission lines to avoid new areas of impact and utilise existing impacted areas • Targeting areas of existing disturbance, such as roads, tracks and property boundaries to reduce environmental and property impacts • Minimising direct impacts on waterways within the project footprint and higher risk erosion areas within the project footprint • New waterway crossings would be established in lower Strahler order waterways where possible. • No permanent transmission line structure infrastructure is anticipated to be located within waterbodies. The following factors will be considered during the detailed design and micro siting process for waterway crossings to minimise potential impacts to aquatic environments, wherever practicable: • Any existing crossings should be re-used or upgraded in preference to establishing new crossings. • Disturbance to waterways (bed, banks and associated riparian zones), should be avoided or minimised. • The crossing design and construction footprint should minimise disturbance to any native vegetation, including native instream, fringing, and riparian vegetation within the access track alignment. • Waterway crossings should be constructed perpendicular to the flow of the water and be positioned away from channel bends (where erosive forces are typically greatest). Preferably crossings should be located in straight stream sections with well-defined channel geometries and shallow stream gradients. • Micro-siting should avoid direct and indirect (erosion or sedimentation) impacts to riverine features such as riffles and rapids and sensitive habitat features (i.e. snags, coarse woody debris, instream macrophytes, boulders). • Where instream structures are required, considerations to potential flooding and erosive effects will be made in the design and construction of the crossing. • Crossing structures should be designed so that the existing nominal flow velocity, low flow conditions and fish passage are maintained wherever possible. This will include the following considerations: • Minimise the impact of essential instream structures by mimicking natural flows (DPI, 2005b). • Following Fairfull (2013), for waterway crossings incorporating culverts, a minimum of 300 mm of water should pool through the structure, with a centrally placed low-flow cell being preferable. • In line with Cotterell (1998), it is recommended that flow over or through instream crossing structures are designed such that they maintain water velocity of 0.3 m/s or less, which is likely to facilitate passage for native species of fish (velocities exceeding 1 m/s, are likely to prevent upstream migration of native fish).

NSW Assessment Bilateral requirements	
	The following procedures and considerations will be incorporated into construction methodologies and operational procedures for waterway crossings, as practicable and where appropriate: • Minimise disturbance to native vegetation, including instream, fringing and riparian vegetation within the construction footprint. This may include the demarcation of areas of native vegetation to be retained during work. • Any coarse woody debris or boulders located within instream works sites should be temporarily relocated during construction and then returned to the watercourse, at locations where scour risk can be avoided. • Waterway crossing work should be constructed during no or low flow conditions and under calm weather conditions. Work should also be timed to occur outside of any locally high seasonal flow periods. • Silt curtains or coffer dams will be deployed around instream work sites where required, to protect against any impacts to water quality or indirect impacts to retained vegetation. These measures will be situated so to avoid blocking fish passage wherever practical and removed as soon as they are no longer required. • Flow diversion measures will be installed on any bunded waterway crossings as appropriate or where construction during no or low flow conditions is not feasible. Flow diversion measures may include pumps to ensure that water can be moved from one side of blockages to the other, with screened inlets to prevent the entrapment of aquatic fauna and outlet structures that are designed to avoid scouring of the channel. Where waterways are bunded or flow obstructed, all obstructions to flow will need to be removed as soon as practical after watercourse crossing construction has been completed. • Appropriate erosion and sediment controls that take into account the potentially flood prone nature of the land will be employed to protect against any impacts to water quality or indirect impacts to retained vegetation. • Waterway bed and bank material excavated during construction will be stockpiled outside of the active channel and avoiding riparian vegetation. Any material excavated from the bed of waterways will be stockpiled separately from other materials and returned to the waterway bed following the completion of construction work. • If the stockpiling of sediment or soil is required, it will be located as far away from waterways as practicable and managed so that it is secure against flooding and runoff to prevent any sediment entering waterways. Adequate erosion and sediment control measures will be in place to protect stockpiled sediment against runoff during rainfall or flooding. • Only natural material will be used as fill during reclamation work, ie no contaminated material, building or demolition rubble will be used as fill in any stream crossings. • Any chemicals will be stored as far away from streams as practicable and appropriately protected against flooding or runoff. Spill kits will be made available, and a spill response plan developed. • Plant refuelling will occur as far away from streams as possible and appropriate spill prevention measures will be implemented when refuelling. • Regular monitoring/inspections of waterway crossing and access track conditions will be undertaken during operation. • Any sections of stream or waterway banks that are impacted or modified by the project will be reformed or remediated to resemble the pre-work condition and form wherever possible or alternatively to a stable design form, as appropriate following the completion of construction work. This may include revegetation to stabilise bank sediments. • Waterway banks impacted by the project will be reinstated such that bank stability at the crossing location is the same or better than prior to

NSW Assessment Bilateral requirements	
	construction. Stabilising materials such as rock armouring, hydro mulch, jute matting, or other suitable geotextile materials may be utilised where necessary. • Any temporary stream crossings will be removed and rehabilitated at the completion of their operational use.
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	No significant residual adverse impacts to the Flatheaded Galaxias are considered likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account.
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	The species is not listed under the BC Act. As no net loss of Key Fish Habitat, or significant impacts to threatened aquatic species are anticipated to occur as a result of the project, no offsets for aquatic species or Key Fish Habitat under the FM Act are proposed.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	Not applicable, species is not listed under the BC Act.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Not applicable, species is not listed under the BC Act.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	As no net loss of Key Fish Habitat, or significant impacts to threatened aquatic species are anticipated to occur as a result of the project, no offsets for aquatic species are proposed.

2.4.2 Southern Pygmy Perch (*Nannoperca australis*)

Southern Pygmy Perch is listed as Vulnerable under the EPBC Act and Endangered under the FM Act.

Description

The Southern Pygmy Perch is a small-bodied freshwater fish endemic to south-eastern Australia, with a deeply notched long-based dorsal fin and squarish to slightly rounded tail, with brilliant red fins in breeding males (Bray & Thompson, 2022).

In terms of distribution, the Southern Pygmy Perch was once widely distributed throughout the Lachlan, Murrumbidgee and Murray River system. Lintermans (2007) notes that the Southern Pygmy Perch has now disappeared from most locations in NSW, with remnant populations of the species are now restricted to sections of three waterways in New South Wales, which include a tributary of the Lachlan River (Blakney Creek near Yass) and two tributaries of the Murray River, aside from five additional conservation stocking sites (DPI, 2013, TSSC, 2021c). Importantly, all of these remnant populations are located outside the project footprint and sub-catchments intersected by the project. Information on the stocking locations for this species does not appear to be published. This notwithstanding, 14 waterways within the project footprint have been identified as being within the indicative distribution of the species (DPI 2022a).

The Southern Pygmy Perch prefers slow flowing or still waters in small streams, billabongs, vegetated lakes and irrigation channels with dense aquatic vegetation and habitat cover (Lintermans 2007). These habitats are generally absent within the project footprint, and where present in some form, they are typically limited and have been subject to impact or deleterious processes such as grazing and riparian clearing.

Key threats to the species are habitat degradation, including the loss of aquatic and riparian vegetation. Given the prevalence of these sources of degradation, potential habitats for the species within the project footprint would likely be considered marginal.

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species is as follows:

- Approved conservation advice for the Southern Pygmy Perch (TSSC, 2021c). In effect under the EPBC Act from 13 April 2021.
- A Recovery Plan is not required, and no Threat Abatement Plan has been identified as being relevant for this species.

Relevant Commonwealth survey guidelines for this species include:

- The Survey guidelines for Australia's threatened fish, (DSEWPaC, 2011d).

Is this part of an important population?

There is no adopted or made Recovery Plan for this species and the Conservation Advice does not identify any important populations (TSSC, 2021c).

No existing populations of the Southern Pygmy Perch are known to occur within the project footprint and these known remaining populations would not be impacted by the project. Should an unknown population of Southern Pygmy Perch occur within the project footprint, it would be at the limit of the species range and would therefore be considered an important population.

Specific Impacts

The construction process for the transmission line structures avoids direct impacts to streams. Fourteen waterways within the project footprint have been identified as being within the indicative distribution of the species (DPI, 2022a). Indicative waterway crossings are located at Yellow Creek (V9-13) and an unnamed stream (V9-12) have been included in indicative distribution mapping for the Southern Pygmy Perch (DPI, 2022a), identified in Section 10.3. However, these streams are not considered to be of significant importance to the species as they are outside the known range of remnant populations in NSW, combined with the levels of landscape modification at these locations, and presence of existing access tracks and crossings in these locations. This is particularly so for unnamed stream (V9-12) which is in reality a chain of farm dams rather than a waterway, with the indicative access track alignment avoiding these waterbodies. It is anticipated that any constructed crossings upgrades associated with the project would contribute to overall improvements to aquatic conditions as they would be more sensitive than existing informal crossings and would not result in any additional deleterious processes.

In light of the above, this assessment of significance focusses on the potential for disturbance and residual indirect impacts to potential habitats following the implementation of avoidance and mitigation measures, to the species (ie the removal of native riparian vegetation, erosion and sedimentation risk). Any impacts

that may occur are anticipated be localised and temporary in nature eg disturbance to instream habitats during the construction of waterway crossings for access tracks or trimming of riparian trees to facilitate transmission line installation.

Significant impact criteria

An action is likely to have a significant impact on a Vulnerable species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of an important population of a species

No existing populations of the Southern Pygmy Perch are known to occur within the project footprint and these populations would not be impacted by the project.

The project is considered unlikely to lead to a long-term decrease in the species or any population of the species. This is in consideration that as there will be no direct impacts to known habitats of the species. Any indirect impacts that may occur would be localised and temporary in nature. In addition, a number of avoidance and mitigation measures have already been incorporated into the project and detailed recommendations as to additional mitigation measures to prevent indirect impacts to potential habitats for the species have been included in this BDAR.

Reduce the area of occupancy of important population of the species;

The extent of occurrence for the species is estimated to be 168,398 square kilometers, and the area of occupancy is estimated to be 636 square kilometers (Pearce et al., 2019; TSSC, 2021c).

The project would not directly impact habitats within the known range of the species. While the project has the potential to result in impacts to potential habitats within the indicative distribution of the Southern Pygmy Perch (DPI, 2022a), these would be localised and temporary. It is considered unlikely that the scale of these indirect impacts would be significant given the history of landscape modification and existing deleterious processes operating in the streams identified as within the indicative distribution of the species (DPI, 2022a), or that these potential indirect impacts would act to render any potential habitats no longer suitable. For these reasons the project is unlikely to reduce the area of occupancy of the species.

Fragment an existing important population into two or more populations

The project is unlikely to directly impact any significant habitats for the species and although the project has the potential to result in indirect impacts to potential habitats, these would be localised and temporary. It is considered unlikely that the scale of any potential indirect impacts would be so significant that they would render any potential habitats no longer suitable.

Fourteen waterways within the project footprint have been identified as being within the indicative distribution of the species (DPI, 2022a). Indicative waterway crossings are located at Yellow Creek (V9-13) and an unnamed stream (V9-12) have been included in indicative distribution mapping for the Southern Pygmy Perch (DPI, 2022a), identified in Section 10.3. However, these streams are not considered to be of significant importance to the species as they are outside the known range of remnant populations in NSW, combined with the levels of landscape modification at these locations, and presence of existing access tracks and crossings. This is particularly so for unnamed stream (V9-12), which is a chain of farm dams rather than a waterway, with the access track alignment avoiding these waterbodies. It is anticipated that any constructed crossings upgrades associated with the project would contribute to overall improvements

to aquatic conditions and be more sensitive than existing informal crossings and would not result in any additional deleterious processes.

The project is therefore considered unlikely to fragment an existing population into two or more populations.

Adversely affect habitat critical to the survival of a species

To date, no Critical Habitat as defined under section 207A of the EPBC Act has been identified or included in the Register of Critical Habitat for the species or identified in the Conservation Advice for the species.

Potential habitats within the project footprint would not be considered critical to the survival of the species. This is given the highly restricted known distribution of the species, the general absence of key habitat features and prevalence of deleterious processes such as flow regulation, grazing and riparian clearing.

Disrupt the breeding cycle of an important population

Southern Pygmy Perch breeding occurs from late winter to early spring in response to rising water temperatures. The project will not result in any impacts to water temperatures. While waterway crossings for access tracks are proposed, mitigation measures to prevent as far as practical the creation of any barriers to fish passage have been recommended, with crossings designs aligning with relevant guidelines. Any indirect impacts to potential habitats would be anticipated to be localised and temporary. As such it is unlikely that the project would disrupt the breeding cycle of a population of the species.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

The project footprint does not intersect with the known distribution of any remaining populations of the species in NSW. Overall, aquatic habitats within the project footprint generally are in poor condition. The key threats to the species (habitat degradation including riparian and aquatic vegetation removal) are in operation at significant levels at each of the waterways identified as being within the indicative distribution of the species (DPI, 2022a).

Given the lack of records, the limited potential for habitat to be indirectly impacted and context of significant landscape modification, the project is not likely to contribute to a decline of the species.

Result in invasive species that are harmful to a vulnerable species becoming established in the vulnerable species' habitat

The project is not likely to result in the introduction of invasive species that may become established in habitat for the species.

Introduce disease that may cause the species to decline, or

There is a low potential for any instream plant or machinery used in crossing construction to transport the Epizootic Haematopoietic Necrosis Virus (EHNV), which is known to occur within the Murrumbidgee catchment and is associated with the invasive Redfin Perch, which is also known to occur. Although it has not been established whether the Southern Pygmy Perch is susceptible to EHNV.

It has been recommended that this risk be managed through the use of wash down procedures for in-stream plant between crossing locations.

Interfere substantially with the recovery of the species

A Recovery Plan has not been prepared for the species, with the species profile (DoE, 2022b) stating that "Many of the threats to the Southern Pygmy Perch-MDB are threats to other EPBC Act-listed threatened fish species that occur within the Murray-Darling Basin. Actions and mechanisms that are being implemented through a variety of other existing programs (including in other species recovery plans, a national native fish recovery strategy, water management plans, actions being undertaken by relevant catchment management authorities) are likely to be of benefit to this species". The project would be unlikely to interfere with any of these actions or plans.

Conclusion

In line with the above findings, the project is unlikely to have a significant impact on an important population of the Southern Pygmy Perch. A summary of the NSW assessment bilateral requirements for Southern Pygmy Perch is presented in Table A18- 36.

Table A18- 36: NSW assessment bilateral requirements for Southern Pygmy Perch

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations, and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of the distribution and habitats for this species, and relevant conservation documents are provided in Section 10.2, summarised in the section above. A map of the species indicative distribution is provided below:  Overall, the species is considered unlikely to occur within the project footprint. This is given the known current distribution of the species, limited suitable habitats present and generally degraded stream conditions within the project footprint. As a precautionary approach an Assessment of Significance under the EPBC Act has been completed given indicative distribution mapping (DPI, 2022a) occurs within the project footprint. Notwithstanding differences between this indicative distribution mapping and known or inferred actual distribution (Section 10.2), and the known range of the species in published conservation documents.
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or	No targeted survey has been completed for the species as the Southern Pygmy Perch is considered to be overall unlikely to occur within the project footprint and the potential for impacts to the species is considered low. The assessment is

NSW Assessment Bilateral requirements	
justification for divergence from) published Australian Government guidelines and policy statements	informed by a detailed desktop assessment augmented by opportunistic field observations and a review of the available literature relevant to the species. This assessment has been completed on a precautionary basis given the indicative distribution mapping by DPI (2022a) includes some streams within the project footprint.
Description of the relevant impacts and its regard to the full national extent of the species or community's range	Overall, the species is considered unlikely to occur within the project footprint. The construction process for the transmission line structures avoids direct impacts to major waterways and while two of the waterways that have been mapped as within the species indicative distribution (DPI 2022a) would be crossed by any proposed access tracks, it is unlikely to be important habitat for the species. As such, this assessment of significance focusses on the potential for residual indirect impacts to potential habitats following the implementation of avoidance and mitigation measures, to the species (ie the removal of native riparian vegetation, disturbance during waterway crossing construction and operation, erosion and sedimentation risk).
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	The proposed avoidance and mitigation measures are outlined in Chapter 12 and 14 including procedures and measures specific to the protection of aquatic environments. Avoidance measures most relevant to aquatic species include: • Avoiding wetlands protected by international agreements (Tier 1 constraint) • Avoiding where possible, and minimising impacts, in wetlands not listed as Tier 1 constraints, as well as ecological conservation areas, and water crossings greater than 800 metres • Paralleling existing transmission lines to avoid new areas of impact and utilise existing impacted areas • Targeting areas of existing disturbance, such as roads, tracks and property boundaries to reduce environmental and property impacts • Minimising direct impacts on waterways within the project footprint and higher risk erosion areas within the project footprint • New waterway crossings would be established in lower Strahler order waterways where possible. • No permanent transmission line structure infrastructure is anticipated to be located within waterbodies. The following factors will be considered during the detailed design and micro siting process for waterway crossings to minimise potential impacts to aquatic environments, wherever practicable: • Any existing crossings should be re-used or upgraded in preference to establishing new crossings. • Disturbance to waterways (bed, banks and associated riparian zones), should be avoided or minimised. • The crossing design and construction footprint should minimise disturbance to any native vegetation, including native instream, fringing, and riparian vegetation within the access track alignment. • Waterway crossings should be constructed perpendicular to the flow of the water and be positioned away from channel bends (where erosive forces are typically greatest). Preferably crossings should be located in straight stream sections with well-defined channel geometries and shallow stream gradients. • Micro-siting should avoid direct and indirect (erosion or sedimentation) impacts to riverine features such as riffles and rapids and sensitive habitat features (i.e. snags, coarse woody debris, instream macrophytes, boulders).

NSW Assessment Bilateral requirements	
	• Where instream structures are required, considerations to potential flooding and erosive effects will be made in the design and construction of the crossing. • Crossing structures should be designed so that the existing nominal flow velocity, low flow conditions and fish passage are maintained wherever possible. This will include the following considerations: • Minimise the impact of essential instream structures by mimicking natural flows (DPI, 2005b). • Following Fairfull (2013), for waterway crossings incorporating culverts, a minimum of 300 mm of water should pool through the structure, with a centrally placed low-flow cell being preferable. • In line with Cotterell (1998), it is recommended that flow over or through instream crossing structures are designed such that they maintain water velocity of 0.3 m/s or less, which is likely to facilitate passage for native species of fish (velocities exceeding 1 m/s, are likely to prevent upstream migration of native fish). The following procedures and considerations will be incorporated into construction methodologies and operational procedures for waterway crossings, as practicable and where appropriate: • Minimise disturbance to native vegetation, including instream, fringing and riparian vegetation within the construction footprint. This may include the demarcation of areas of native vegetation to be retained during work. • Any coarse woody debris or boulders located within instream works sites should be temporarily relocated during construction and then returned to the watercourse, at locations where scour risk can be avoided. • Waterway crossing work should be constructed during no or low flow conditions and under calm weather conditions. Work should also be timed to occur outside of any locally high seasonal flow periods. • Silt curtains or coffer dams will be deployed around instream work sites where required, to protect against any impacts to water quality or indirect impacts to retained vegetation. These measures will be situated so to avoid blocking fish passage wherever practical and removed as soon as they are no longer required. • Flow diversion measures will be installed on any bunded waterway crossings as appropriate or where construction during no or low flow conditions is not feasible. Flow diversion measures may include pumps to ensure that water can be moved from one side of blockages to the other, with screened inlets to prevent the entrapment of aquatic fauna and outlet structures that are designed to avoid scouring of the channel. Where waterways are bunded or flow obstructed, all obstructions to flow will need to be removed as soon as practical after watercourse crossing construction has been completed. • Appropriate erosion and sediment controls that take into account the potentially flood prone nature of the land will be employed to protect against any impacts to water quality or indirect impacts to retained vegetation. • Waterway bed and bank material excavated during construction will be stockpiled outside of the active channel and avoiding riparian vegetation. Any material excavated from the bed of waterways will be stockpiled separately from other materials and returned to the waterway bed following the completion of construction work. • If the stockpiling of sediment or soil is required, it will be located as far away from waterways as practicable and managed so that it is secure against flooding and runoff to prevent any sediment entering waterways. Adequate erosion and sediment control measures will be

NSW Assessment Bilateral requirements	
	in place to protect stockpiled sediment against runoff during rainfall or flooding. • Only natural material will be used as fill during reclamation work, ie no contaminated material, building or demolition rubble will be used as fill in any stream crossings. • Any chemicals will be stored as far away from streams as practicable and appropriately protected against flooding or runoff. Spill kits will be made available, and a spill response plan developed. • Plant refuelling will occur as far away from streams as possible and appropriate spill prevention measures will be implemented when refuelling. • Regular monitoring/inspections of waterway crossing and access track conditions will be undertaken during operation. • Any sections of stream or waterway banks that are impacted or modified by the project will be reformed or remediated to resemble the pre-work condition and form wherever possible or alternatively to a stable design form, as appropriate following the completion of construction work. This may include revegetation to stabilise bank sediments. • Waterway banks impacted by the project will be reinstated such that bank stability at the crossing location is the same or better than prior to construction. Stabilising materials such as rock armouring, hydro mulch, jute matting, or other suitable geotextile materials may be utilised where necessary. • Any temporary stream crossings will be removed and rehabilitated at the completion of their operational use.
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	No significant residual adverse impacts to the Southern Pygmy Perch are considered likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account.
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	The species is not listed under the BC Act. As no net loss of Key Fish Habitat, or significant impacts to threatened aquatic species are anticipated to occur as a result of the project, no offsets for aquatic species or Key Fish Habitat under the FM Act are proposed.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	Not applicable, species is not listed under the BC Act.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Not applicable, species is not listed under the BC Act.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	As no net loss of Key Fish Habitat, or significant impacts to threatened aquatic species are anticipated to occur as a result of the project, no offsets for aquatic species are proposed.

2.4.3 Trout Cod (*Maccullochella macquariensis*)

The Trout Cod is listed as Endangered under the EPBC Act and the FM Act.

Description

The Tout Cod is a large sized fish with a with a deep body, a straight head profile and a protruding upper jaw (Bray & Thompson, 2019). The Trout Cod is bluish-grey to brown in colour with irregular spots or dashes, and pale underbody.

In terms of distribution, the only known naturally reproducing (non-translocated) population of Trout Cod occurs in the Murray River below Yarrawonga Weir (DPI, 2006), although stocking has occurred at various locations within the Murrumbidgee River with some success, and Tumut River, although this seems to be unsuccessful or at least the level of success undetermined (Lintermans, 2007; Trout Cod Recovery Team 2008). Indicative distribution mapping for the species (DPI, 2022a) includes the Murrumbidgee River within the project footprint.

In terms of habitat, the species occurs in a variety of flowing habitats, typically in the mid to upper reaches of rivers and streams with cover in the form of woody debris or boulders (Trout Cod Recovery Team 2008). Habitats for the species require substantial amounts of large in-stream woody debris, which provides complex habitat supporting each life-cycle stage of the species (DPI, 2017). While such habitats are limited within the project footprint, the species cannot be ruled out as occurring and an Assessment of Significance under the EPBC Act has been completed.

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species is as follows:

- No approved conservation advice for the Trout Cod.
- Recovery Plan (Trout Cod Recovery Team 2008), in effect under the EPBC Act from 27 March 2008.

Relevant Commonwealth survey guidelines for this species include:

- The Survey guidelines for Australia's threatened fish (DSEWPaC, 2011d).

Specific Impacts

The construction process for the transmission line structures avoids direct impacts to streams and none of the waterways that have been mapped as within the species indicative distribution would be crossed by any indicative access track waterway crossings. As such, this assessment of significance focusses on the potential for disturbance and residual indirect impacts to potential habitats following the implementation of avoidance and mitigation measures, to the species (ie the removal of native riparian vegetation, erosion and sedimentation risk) during access track construction. Any indirect impacts that may occur are anticipated be localised and temporary in nature eg disturbance to instream habitats during the construction of waterway crossings for access tracks or trimming of riparian trees to facilitate transmission line installation.

Significant impact criteria

An action is likely to have a significant impact on an Endangered species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of a population of a species

The project is considered unlikely to lead to a long-term decrease in the species or a population of the species. This is in consideration that there will be no direct impacts to mapped indicative distributions (DPI, 2022a) of the species and any indirect impacts that may occur would be localised and temporary in nature. A number of avoidance and mitigation measures have already been incorporated into the project. Further detailed recommendations as to specific mitigation measures to prevent indirect impacts to potential habitats for the species have been included in this report.

Reduce the area of occupancy of the species

The project would not directly impact potential habitats for the species and although the project has the potential to result in indirect impacts to potential habitats, these would be localised and temporary. It is considered unlikely that the scale of these indirect impacts would be significant given the history of landscape modification and existing deleterious processes operating in the streams identified as within the indicative distribution of the species, or that these potential indirect impacts would act to render any potential habitats no longer suitable. For these reasons the project is unlikely to reduce the area of occupancy of the species.

Fragment an existing population into two or more populations

The project would not directly impact potential habitats for the species and although the project has the potential to result in indirect impacts to potential habitats, these would be localised and temporary. It is considered unlikely that the scale of any potential indirect impacts would be so significant that they would render any potential habitats no longer suitable. No indicative access track crossings intersect with waterways identified as within the indicative distribution of the species (DPI, 2022a) and therefore the project will not result in any barriers to fish passage to the species. The project is considered unlikely to fragment an existing population into two or more populations.

Adversely affect habitat critical to the survival of a species

To date, no Critical Habitat as defined under section 207A of the EPBC Act has been identified or included in the Register of Critical Habitat for the species.

The National Recovery Plan for Trout Cod does not identify habitat critical to the survival of the species, but does note that an assessment of habitat critical to survival of the Trout Cod population in the Murray River found that the species inhabited river positions where large woody debris was present in high quantity, close to deeper areas of water with high surface velocity, further from the bank (Trout Cod Recovery Team, 2008).

No direct impacts to aquatic habitats within the mapped indicative distribution of the species will occur. While there is the potential for indirect impacts to occur, any indirect impacts that may occur would be temporary and localised. The potential for indirect impacts would also be mitigated by the management measures proposed in this report (Chapter 14).

Disrupt the breeding cycle of a population

Any possible indirect impacts to potential habitats for the species would be anticipated to be localised and temporary and these would be considered unlikely to occur based upon the distance of construction from the Murrumbidgee River (approximately 40 metres from the bank), as well as the mitigation measures

proposed (Chapter 14). As such it is unlikely that the project would disrupt the breeding cycle of a population of the species.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

Any possible indirect impacts to potential habitats would be anticipated to be localised and temporary and these would be considered unlikely to occur based upon the distance of construction from the Murrumbidgee River (approximately 40 metres from the bank), as well as the mitigation measures proposed (Chapter 14). In light of this, the project is not likely to contribute to decline of the species.

Result in invasive species that are harmful to an endangered or critically endangered species becoming established in the endangered or critically endangered species' habitat

The project is not likely to result in the introduction of invasive species that may become established in habitat for the species.

Introduce disease that may cause the species to decline, or

There is a low potential for any instream plant or machinery used in crossing construction to transport EHNV. EHNV is known to occur within the Murrumbidgee catchment and is associated with the invasive Redfin Perch, which is also known to occur in this catchment. It has not been established whether Trout Cod are susceptible to EHNV.

It has been recommended that this risk be managed through the use of wash down procedures (Chapter 14).

Interfere with the recovery of the species

The National Recovery Plan for the species (Trout Cod Recovery Team 2008) identifies the following strategies to achieve the recovery plan objectives:

- Investigate key aspects of biology and ecology;
- Determine the growth rates and viability of populations;
- Identify and map habitat critical to survival;
- Investigate and control threatening processes;
- Manage Murray River population to ensure its continued sustainability natural and reintroduced populations to achieve self-sustainability;
- Manage Seven Creeks (Vic) population to ensure its continued sustainability;
- Manage Ovens River population to ensure its continued sustainability;
- Manage the Murrumbidgee River and Cotter River populations (ACT) to ensure their continued sustainability;
- Breed Trout Cod for reintroduction;
- Undertake reintroductions to establish new populations;
- Encourage community awareness and support;
- Trial a stocked recreational fishery for Trout Cod in Victoria;
- Manage Recovery Plan implementation.

The project would be unlikely to interfere with any of these objectives.

Conclusion

In line with the above findings, the project is unlikely to have a significant impact on the Trout Cod. A summary of the NSW assessment bilateral requirements for Trout Cod is presented in Table A18- 37.

Table A18- 37: NSW assessment bilateral requirements for Trout Cod

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations, and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of habitat for this species, and relevant conservation documents are provided in Section 10.2. Stocking has occurred at various locations within the Murrumbidgee River with some success (Lintermans, 2007; Trout Cod Recovery Team, 2008) and indicative distribution mapping for the species (DPI, 2022a) includes the Murrumbidgee River within the project footprint. While complex flowing habitats with substantial amounts of large in-stream woody debris upon which the species is reliant (DPI, 2017) are limited within the project footprint, the species cannot be ruled out as occurring. No waterway crossings of the Murrumbidgee River are proposed under the indicative access track mapping and as such no direct impacts to habitats for the species would occur, however the species could be subject to indirect impacts arising from the project. A map of the species indicative distribution (DEE, 2018) is provided below: Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	No targeted survey has been completed for the species due to the limited potential for serious impacts to the species. The assessment is informed by a detailed desktop assessment augmented by opportunistic field observations and a review of the available literature relevant to the species.
Description of the relevant impacts and its regard to the full national extent of the species or community's range	The construction process for the transmission line structures avoids direct impacts to major waterways and none of the waterways that have been mapped as within the species indicative distribution (DPI, 2022a) intersect with indicative access track mapping. Avoidance measures most relevant to aquatic species include:

NSW Assessment Bilateral requirements	
	• Avoiding wetlands protected by international agreements (Tier 1 constraint) • Avoiding where possible, and minimising impacts, in wetlands not listed as Tier 1 constraints, as well as ecological conservation areas, and water crossings greater than 800 metres • Paralleling existing transmission lines to avoid new areas of impact and utilise existing impacted areas • Targeting areas of existing disturbance, such as roads, tracks and property boundaries to reduce environmental and property impacts • Minimising direct impacts on waterways within the project footprint and higher risk erosion areas within the project footprint • New waterway crossings would be established in lower Strahler order waterways where possible. • No permanent transmission line structure infrastructure is anticipated to be located within waterbodies. The following factors will be considered during the detailed design and micro siting process for waterway crossings to minimise potential impacts to aquatic environments, wherever practicable: • Any existing crossings should be re-used or upgraded in preference to establishing new crossings. • Disturbance to waterways (bed, banks and associated riparian zones), should be avoided or minimised. • The crossing design and construction footprint should minimise disturbance to any native vegetation, including native instream, fringing, and riparian vegetation within the access track alignment. • Waterway crossings should be constructed perpendicular to the flow of the water and be positioned away from channel bends (where erosive forces are typically greatest). Preferably crossings should be located in straight stream sections with well-defined channel geometries and shallow stream gradients. • Micro-siting should avoid direct and indirect (erosion or sedimentation) impacts to riverine features such as riffles and rapids and sensitive habitat features (i.e. snags, coarse woody debris, instream macrophytes, boulders). • Where instream structures are required, considerations to potential flooding and erosive effects will be made in the design and construction of the crossing. • Crossing structures should be designed so that the existing nominal flow velocity, low flow conditions and fish passage are maintained wherever possible. This will include the following considerations: • Minimise the impact of essential instream structures by mimicking natural flows (DPI, 2005b). • Following Fairfull (2013), for waterway crossings incorporating culverts, a minimum of 300 mm of water should pool through the structure, with a centrally placed low-flow cell being preferable. • In line with Cotterell (1998), it is recommended that flow over or through instream crossing structures are designed such that they maintain water velocity of 0.3 m/s or less, which is likely to facilitate passage for native species of fish (velocities exceeding 1 m/s, are likely to prevent upstream migration of native fish). The following procedures and considerations will be incorporated into construction methodologies and operational procedures for waterway crossings, as practicable and where appropriate: • Minimise disturbance to native vegetation, including instream, fringing and riparian vegetation within the construction footprint. This may

NSW Assessment Bilateral requirements	
	include the demarcation of areas of native vegetation to be retained during work. • Any coarse woody debris or boulders located within instream works sites should be temporarily relocated during construction and then returned to the watercourse, at locations where scour risk can be avoided. • Waterway crossing work should be constructed during no or low flow conditions and under calm weather conditions. Work should also be timed to occur outside of any locally high seasonal flow periods. • Silt curtains or coffer dams will be deployed around instream work sites where required, to protect against any impacts to water quality or indirect impacts to retained vegetation. These measures will be situated so to avoid blocking fish passage wherever practical and removed as soon as they are no longer required. • Flow diversion measures will be installed on any bunded waterway crossings as appropriate or where construction during no or low flow conditions is not feasible. Flow diversion measures may include pumps to ensure that water can be moved from one side of blockages to the other, with screened inlets to prevent the entrapment of aquatic fauna and outlet structures that are designed to avoid scouring of the channel. Where waterways are bunded or flow obstructed, all obstructions to flow will need to be removed as soon as practical after watercourse crossing construction has been completed. • Appropriate erosion and sediment controls that take into account the potentially flood prone nature of the land will be employed to protect against any impacts to water quality or indirect impacts to retained vegetation. • Waterway bed and bank material excavated during construction will be stockpiled outside of the active channel and avoiding riparian vegetation. Any material excavated from the bed of waterways will be stockpiled separately from other materials and returned to the waterway bed following the completion of construction work. • If the stockpiling of sediment or soil is required, it will be located as far away from waterways as practicable and managed so that it is secure against flooding and runoff to prevent any sediment entering waterways. Adequate erosion and sediment control measures will be in place to protect stockpiled sediment against runoff during rainfall or flooding. • Only natural material will be used as fill during reclamation work, ie no contaminated material, building or demolition rubble will be used as fill in any stream crossings. • Any chemicals will be stored as far away from streams as practicable and appropriately protected against flooding or runoff. Spill kits will be made available, and a spill response plan developed. • Plant refuelling will occur as far away from streams as possible and appropriate spill prevention measures will be implemented when refuelling. • Regular monitoring/inspections of waterway crossing and access track conditions will be undertaken during operation. • Any sections of stream or waterway banks that are impacted or modified by the project will be reformed or remediated to resemble the pre-work condition and form wherever possible or alternatively to a stable design form, as appropriate following the completion of construction work. This may include revegetation to stabilise bank sediments. • Waterway banks impacted by the project will be reinstated such that bank stability at the crossing location is the same or better than prior to construction. Stabilising materials such as rock armouring, hydro mulch, jute matting, or other suitable geotextile materials may be utilised where necessary. • Any temporary stream crossings will be removed and rehabilitated at the completion of their operational use.

NSW Assessment Bilateral requirements	
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	No significant residual adverse impacts to the Trout Cod are considered likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account.
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	The species is not listed under the BC Act. As no net loss of Key Fish Habitat, or significant impacts to threatened aquatic species are anticipated to occur as a result of the project, no offsets for aquatic species or Key Fish Habitat under the FM Act are proposed.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	Not applicable, species is not listed under the BC Act.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Not applicable, species is not listed under the BC Act.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	As no net loss of Key Fish Habitat, or significant impacts to threatened aquatic species are anticipated to occur as a result of the project, no offsets for aquatic species are proposed.

2.4.4 Macquarie Perch (*Macquaria australasica*)

The Macquarie Perch is listed as Endangered under the EPBC Act and the FM Act.

Description

The Macquarie Perch is a medium sized fish with a deep, laterally compressed body growing up to 465 millimetres in length (Lintermans, 2007). Individuals are generally black-grey or bluish grey, with a rounded tail and large white eye.

In terms of distribution, Macquarie Perch from the Murray-Darling Basin strain of the species may occur in the upstream reaches of the Lachlan, Murrumbidgee and Murray rivers. Indicative distribution mapping by DPI for the species includes the Lachlan River and Adjungbilly Creek within the project footprint (DPI, 2022a), although a number of streams may be within the historic distribution of the species (DPI, 2015; DPI, 2016a). Overall, the species is considered unlikely to occur within the Murrumbidgee River in the project footprint, with the known population of the species in this river occurring in upstream reaches south of Canberra (DEE, 2018).

In terms of habitat, the Macquarie Perch may occur in stream or lake habitats, with a preference for upper river reaches or tributaries, and lake dwelling individuals of the species will migrate into these habitats to spawn (DPI, 2016a). Typical habitat for the species is described as being a large and moderately deep pool immediately upstream of fast-flowing broken water with aquatic vegetation and additional cover in the form of large boulders, debris and overhanging banks, with stream shading provided by steep rock faces, riparian trees or over hanging bank vegetation (DEE, 2018). Indicative distribution mapping (DPI, 2022a) for the species includes the Lachlan River and Adjungbilly Creek within the project footprint.

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species is as follows:

- Approved conservation advice for the Macquarie Perch, in effect under the EPBC Act from 17 December 2013.
- A Recovery Plan (DEE, 2018), in effect under the EPBC Act from 09 February 2019.

Relevant Commonwealth survey guidelines for this species include:

- The Survey guidelines for Australia's threatened fish (DSEWPaC, 2011d).

Specific Impacts

The construction process for the transmission line structures avoids direct impacts to streams and none of the waterways that have been mapped as within the species indicative distribution would be crossed by indicative access tracks waterway crossing mapping. As such, this assessment of significance focusses on the potential for disturbance and residual indirect impacts to potential habitats following the implementation of avoidance and mitigation measures, to the species (ie the removal of native riparian vegetation, erosion and sedimentation risk) during access track construction. Any indirect impacts that may occur are anticipated be localised and temporary in nature eg disturbance to instream habitats during the construction of waterway crossings for access tracks or trimming of riparian trees to facilitate transmission line installation.

Significant impact criteria

An action is likely to have a significant impact on an Endangered species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of a population of a species

The project is considered unlikely to lead to a long-term decrease in the species or a population of the species. This is in consideration that there would be no direct impacts to mapped indicative distributions (DPI, 2022a) of the species and any indirect impacts that may occur would be localised and temporary in nature. A number of avoidance and mitigation measures have already been incorporated into the project. Further detailed recommendations as to specific mitigation measures to prevent indirect impacts to potential habitats for the species have been included in this report (Chapter 14).

Reduce the area of occupancy of the species;

The project would not directly impact potential habitats for the species and although the project has the potential to result in indirect impacts to habitats, these would be localised and temporary. It is considered unlikely that the scale of these indirect impacts would be significant given the history of landscape modification and existing deleterious processes operating in the streams identified as within the indicative distribution of the species, or that these potential indirect impacts would act to render any potential habitats no longer suitable. For these reasons the project is unlikely to reduce the area of occupancy of the species.

Fragment an existing population into two or more populations

The project would not directly impact potential habitats for the species and although the project has the potential to result in indirect impacts to potential habitats, these would be localised and temporary. It is considered unlikely that the scale of any potential indirect impacts would be so significant that they would render any potential habitats no longer suitable. No indicative access track crossings intersect with waterways identified as within the indicative distribution (DPI, 2022a) and therefore the project is unlikely to result in any barriers to fish passage to the species. The project is considered unlikely to fragment an existing population into two or more populations.

Adversely affect habitat critical to the survival of a species

To date, no Critical Habitat as defined under section 207A of the EPBC Act has been identified or included in the Register of Critical Habitat for the species.

- The National Recovery Plan for the Macquarie Perch (DEE, 2018) identifies critical habitat as:
  - All areas within the species' range which are characterised by flowing runs or riffles and small complex rock piles;
  - The current area of occupancy of the species (including historically translocated populations in Cataract Reservoir and the Mongarlowe River in New South Wales and the Yarra River in Victoria);
  - Any newly discovered locations within the species' natural range which hold populations that extend the area of occupancy for the species;
  - Unoccupied habitat within the species' natural range into which the species could disperse, be stocked or be translocated.

Whilst referenced in the National Recovery Plan for the species (DEE, 2018), the document does not define the area of occupancy of the species. The project footprint does extend into the natural range of the species as described in DEE (2018), as it includes Adjungbilly Creek. Sections of riffle may be present along reaches of Adjungbilly Creek and the Lachlan River within or adjacent to the project footprint, as such these habitats may be considered critical habitat.

No direct impacts to critical habitat would occur as a result of the project. Any indirect impacts that may occur would be temporary and localised. The key potential indirect impact that could occur would be the potential for sedimentation associated with construction work that could infill the interstitial spaces between rocks and pebbles used by the species for spawning. This is considered unlikely to occur given mitigation measures proposed to control this risk (Chapter 14) and the distance at which construction would be taking place from these reaches that may be considered critical habitat (approximately 40 metres from the bank).

Disrupt the breeding cycle of a population

The key potential disruption that could occur would be the potential for sedimentation associated with construction work that could infill the interstitial spaces between rocks and pebbles used by the species for spawning. This is considered unlikely to occur given mitigation measures proposed to control this risk (Chapter 14) and the distance at which construction would be taking place from the reaches of the Lachlan River and Adjungbilly Creek (approximately 40 metres from the bank). Establishing barriers to fish passage may also disrupt breeding movements of the species into more upstream habitats for spawning. However, the proposed waterway crossings are not identified as being within indicative distribution of the species

(DPI, 2022a) and would be designed and constructed in line with the relevant guidelines to avoid disrupting fish passage as far as practicable.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

Overall, aquatic habitats within the project footprint generally are in poor condition. No direct impacts to potential habitats for this species would occur and any indirect impacts would be localised and temporary. A number of mitigation measures have also been proposed to further mitigate the risk of indirect impacts. When this is considered in the context of existing landscape modification, the project is not likely to modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline.

Result in invasive species that are harmful to an endangered or critically endangered species becoming established in the endangered or critically endangered species' habitat

The project is not likely to result in the introduction of invasive species that may become established in habitat for the species.

Introduce disease that may cause the species to decline, or

There is a low potential for any instream plant or machinery used in crossing construction to transport the Epizootic Haematopoietic Necrosis Virus (EHNV), to which Macquarie Perch are susceptible. EHNV is known to occur within the Murrumbidgee catchment and is associated with the invasive Redfin Perch, which is also known to occur in this catchment.

It has been recommended that this risk be managed through the use of wash down procedures (Chapter 14).

Interfere with the recovery of the species

The National Recovery Plan for the species (DEE, 2018) identifies the following strategies to achieve the recovery plan objectives:

- Conserve existing Macquarie perch (including historically translocated populations in Cataract Reservoir and the Mongarlowe and Yarra rivers);
- Protect and restore Macquarie perch habitat;
- Understand and address threats to Macquarie perch populations and habitats;
- Establish additional Macquarie perch populations within the species' natural range;
- Improve understanding of the biology and ecology of the Macquarie perch and its distribution and abundance; and
- Increase participation by community groups in Macquarie perch conservation.

The project would not directly interfere with these strategies or associated actions.

Conclusion

In line with the above findings, the project is unlikely to have a significant impact on the Macquarie Perch. A summary of the NSW assessment bilateral requirements for Macquarie Perch is presented in Table A18-38.

Table A18- 38: NSW assessment bilateral requirements for Macquarie Perch

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations, and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of habitat for this species, and relevant conservation documents are provided in Section 10.2. Indicative distribution mapping (DPI 2022a) for the species includes the Lachlan River and Adjungbilly Creek within the project footprint, although a number of streams may be within the historic distribution of the species (DPI, 2015; DPI, 2016a). Overall, the species is considered unlikely to occur within the Murrumbidgee River in the project footprint, with the known population of the species in this river occurring in upstream reaches south of Canberra (DEE, 2018). A map of the species indicative distribution (DEE, 2018) is provided below: Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	No targeted survey has been completed for the species due to the limited potential for impacts to the species. The assessment is informed by a detailed desktop assessment augmented by opportunistic field observations and a review of the available literature relevant to the species.
Description of the relevant impacts and its regard to the full national extent of the species or community's range	The construction process for the transmission line structures avoids direct impacts to major waterways and none of the waterways that have been mapped as within the species indicative distribution (DPI, 2022a) would be crossed by any proposed access tracks by waterway crossings. As such, this assessment of significance focusses on the potential for residual indirect impacts to potential habitats following the implementation of avoidance and mitigation measures, to the species (ie the removal of native riparian vegetation, erosion and sedimentation risk) during construction.

NSW Assessment Bilateral requirements	
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	The proposed avoidance and mitigation measures are outlined in Chapter 12 and 14 including procedures and measures specific to the protection of aquatic environments. Avoidance measures most relevant to aquatic species include: • Avoiding wetlands protected by international agreements (Tier 1 constraint) • Avoiding where possible, and minimising impacts, in wetlands not listed as Tier 1 constraints, as well as ecological conservation areas, and water crossings greater than 800 metres • Paralleling existing transmission lines to avoid new areas of impact and utilise existing impacted areas • Targeting areas of existing disturbance, such as roads, tracks and property boundaries to reduce environmental and property impacts • Minimising direct impacts on waterways within the project footprint and higher risk erosion areas within the project footprint • New waterway crossings would be established in lower Strahler order waterways where possible. • No permanent transmission line structure infrastructure is anticipated to be located within waterbodies. The following factors will be considered during the detailed design and micro siting process for waterway crossings to minimise potential impacts to aquatic environments, wherever practicable: • Any existing crossings should be re-used or upgraded in preference to establishing new crossings. • Disturbance to waterways (bed, banks and associated riparian zones), should be avoided or minimised. • The crossing design and construction footprint should minimise disturbance to any native vegetation, including native instream, fringing, and riparian vegetation within the access track alignment. • Waterway crossings should be constructed perpendicular to the flow of the water and be positioned away from channel bends (where erosive forces are typically greatest). Preferably crossings should be located in straight stream sections with well-defined channel geometries and shallow stream gradients. • Micro-siting should avoid direct and indirect (erosion or sedimentation) impacts to riverine features such as riffles and rapids and sensitive habitat features (i.e. snags, coarse woody debris, instream macrophytes, boulders). • Where instream structures are required, considerations to potential flooding and erosive effects will be made in the design and construction of the crossing. • Crossing structures should be designed so that the existing nominal flow velocity, low flow conditions and fish passage are maintained wherever possible. This will include the following considerations: • Minimise the impact of essential instream structures by mimicking natural flows (DPI, 2005b). • Following Fairfull (2013), for waterway crossings incorporating culverts, a minimum of 300 mm of water should pool through the structure, with a centrally placed low-flow cell being preferable. • In line with Cotterell (1998), it is recommended that flow over or through instream crossing structures are designed such that they maintain water velocity of 0.3 m/s or less, which is likely to facilitate passage for native species of fish (velocities exceeding 1 m/s, are likely to prevent upstream migration of native fish).

NSW Assessment Bilateral requirements	
	The following procedures and considerations will be incorporated into construction methodologies and operational procedures for waterway crossings, as practicable and where appropriate: • Minimise disturbance to native vegetation, including instream, fringing and riparian vegetation within the construction footprint. This may include the demarcation of areas of native vegetation to be retained during work. • Any coarse woody debris or boulders located within instream works sites should be temporarily relocated during construction and then returned to the watercourse, at locations where scour risk can be avoided. • Waterway crossing work should be constructed during no or low flow conditions and under calm weather conditions. Work should also be timed to occur outside of any locally high seasonal flow periods. • Silt curtains or coffer dams will be deployed around instream work sites where required, to protect against any impacts to water quality or indirect impacts to retained vegetation. These measures will be situated so to avoid blocking fish passage wherever practical and removed as soon as they are no longer required. • Flow diversion measures will be installed on any bunded waterway crossings as appropriate or where construction during no or low flow conditions is not feasible. Flow diversion measures may include pumps to ensure that water can be moved from one side of blockages to the other, with screened inlets to prevent the entrapment of aquatic fauna and outlet structures that are designed to avoid scouring of the channel. Where waterways are bunded or flow obstructed, all obstructions to flow will need to be removed as soon as practical after watercourse crossing construction has been completed. • Appropriate erosion and sediment controls that take into account the potentially flood prone nature of the land will be employed to protect against any impacts to water quality or indirect impacts to retained vegetation. • Waterway bed and bank material excavated during construction will be stockpiled outside of the active channel and avoiding riparian vegetation. Any material excavated from the bed of waterways will be stockpiled separately from other materials and returned to the waterway bed following the completion of construction work. • If the stockpiling of sediment or soil is required, it will be located as far away from waterways as practicable and managed so that it is secure against flooding and runoff to prevent any sediment entering waterways. Adequate erosion and sediment control measures will be in place to protect stockpiled sediment against runoff during rainfall or flooding. • Only natural material will be used as fill during reclamation work, ie no contaminated material, building or demolition rubble will be used as fill in any stream crossings. • Any chemicals will be stored as far away from streams as practicable and appropriately protected against flooding or runoff. Spill kits will be made available, and a spill response plan developed. • Plant refuelling will occur as far away from streams as possible and appropriate spill prevention measures will be implemented when refuelling. • Regular monitoring/inspections of waterway crossing and access track conditions will be undertaken during operation. • Any sections of stream or waterway banks that are impacted or modified by the project will be reformed or remediated to resemble the pre-work condition and form wherever possible or alternatively to a stable design form, as appropriate following the completion of construction work. This may include revegetation to stabilise bank sediments. • Waterway banks impacted by the project will be reinstated such that bank stability at the crossing location is the same or better than prior to

NSW Assessment Bilateral requirements	
	construction. Stabilising materials such as rock armouring, hydro mulch, jute matting, or other suitable geotextile materials may be utilised where necessary. • Any temporary stream crossings will be removed and rehabilitated at the completion of their operational use.
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	No significant residual adverse impacts to the Macquarie Perch are considered likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account.
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	The species is not listed under the BC Act. As no net loss of Key Fish Habitat, or significant impacts to threatened aquatic species are anticipated to occur as a result of the project, no offsets for aquatic species or Key Fish Habitat under the FM Act are proposed.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	Not applicable, species is not listed under the BC Act.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Not applicable, species is not listed under the BC Act.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	As no net loss of Key Fish Habitat, or significant impacts to threatened aquatic species are anticipated to occur as a result of the project, no offsets for aquatic species are proposed.

2.4.5 Silver Perch (*Bidyanus bidyanus*)

The Silver Perch is listed as Critically Endangered under the EPBC Act and Vulnerable under the FM Act.

Description

The Silver Perch is a large-bodied fish species with a dark grey to silvery greyish-brown colour with dark silvery scale margins in a reticulated pattern, and a whitish belly (Bray & Thompson, 2021).

In terms of distribution, Silver Perch are endemic to the Murray-Darling system (including all states and sub-basins) and previously occurred in a range of habitats. Silver Perch are generally found in lowland areas outside of cooler upstream waters, although the species may undertake large scale migrations into upstream reaches. Indicative distribution mapping for the species within the project footprint includes the Murrumbidgee River (DPI, 2022a; DPI, 2016b; DPI, 2022a), although currently there is only one known strong viable natural population in the middle Murray region (TSSC, 2013).

In terms of habitat, Silver Perch are generally found in faster flowing streams, including rapid habitats, in more open water habitats. Although the species has also been stocked into impoundments.

River regulation, habitat degradation (in particular loss of submerged aquatic macrophytes and siltation), disease and invasive fish species are all identified as key threats to the species (TSSC, 2013).

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for this species is as follows:

- Approved conservation advice (TSSC, 2013) in effect under the EPBC Act from 21 December 2013.
- A Recovery Plan for the species is not required.

Relevant Commonwealth survey guidelines for this species include:

- The Survey guidelines for Australia's threatened fish, (DSEWPaC, 2011d).

Specific Impacts

The construction process for the transmission line structures avoids direct impacts to streams and none of the waterways that have been mapped as within the species indicative distribution intersect with the indicative access tracks and waterway crossings. As such, this assessment of significance focusses on the potential for disturbance and residual indirect impacts to potential habitats following the implementation of avoidance and mitigation measures, to the species (ie the removal of native riparian vegetation, erosion and sedimentation risk) during access track construction. Any indirect impacts that may occur are anticipated be localised and temporary in nature eg disturbance to instream habitats during the construction of waterway crossings for access tracks or trimming of riparian trees to facilitate transmission line installation.

Significant impact criteria

An action is likely to have a significant impact on an Endangered species if there is a real chance or possibility that it will:

Lead to a long-term decrease in the size of a population of a species

The project is considered unlikely to lead to a long-term decrease in the species or a population of the species. This is in consideration that there will be no direct impacts to mapped indicative distributions (DPI, 2022a) of the species and any indirect impacts that may occur would be localised and temporary in nature. A number of avoidance and mitigation measures have already been incorporated into the project. Further detailed recommendations as to specific mitigation measures to prevent indirect impacts to potential habitats for the species have been included in this report.

Reduce the area of occupancy of the species

The project would not directly impact potential habitats for the species and although the project has the potential to result in indirect impacts to potential habitats, these would be localised and temporary. It is considered unlikely that the scale of these indirect impacts would be significant given the history of landscape modification and existing deleterious processes operating in the streams identified as within the indicative distribution of the species, or that these potential indirect impacts would act to render any potential habitats no longer suitable. For these reasons the project is unlikely to reduce the area of occupancy of the species.

Fragment an existing population into two or more populations

The project would not directly impact potential habitats for the species and although the project has the potential to result in indirect impacts to potential habitats, these would be localised and temporary. It is considered unlikely that the scale of any potential indirect impacts would be so significant that they would render any potential habitats no longer suitable. No indicative access track waterway crossings intersect with waterways within the mapped indicative distributions for the species (DPI, 2022a) and therefore the project would not result in any barriers to fish passage to the species. The project is considered unlikely to fragment an existing population into two or more populations.

Adversely affect habitat critical to the survival of a species

To date, no Critical Habitat as defined under section 207A of the EPBC Act has been identified or included in the Register of Critical Habitat for the species, or any National Recovery Plan prepared.

No direct impacts to aquatic habitats within the mapped indicative distributions for the species will occur. While there is the potential for indirect impacts to occur, these would be mitigated by the management measures proposed in this report.

Disrupt the breeding cycle of a population

The project would not result in any direct impacts to fish habitat. Any possible indirect impacts to potential habitats would be anticipated to be localised and temporary and these would be considered unlikely to occur based upon the distance of construction from the Murrumbidgee River (approximately 40 metres from the bank), as well as the mitigation measures proposed (Chapter 14). As such it is unlikely that the project would disrupt the breeding cycle of a population of the species.

Modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline

Any possible indirect impacts to potential habitats would be anticipated to be localised and temporary and these would be considered unlikely to occur based upon the distance of construction from the Murrumbidgee River (approximately 40 metres from the bank), as well as the mitigation measures proposed (Chapter 14). In light of this, the project is not likely to contribute to decline of the species.

Result in invasive species that are harmful to an endangered or critically endangered species becoming established in the endangered or critically endangered species' habitat

The project is not likely to result in the introduction of invasive species that may become established in habitat for the species.

Introduce disease that may cause the species to decline, or

There is a low potential for any instream plant or machinery used in crossing construction to transport EHNV. EHNV is known to occur within the Murrumbidgee catchment and is associated with the invasive Redfin Perch, which is also known to occur in this catchment. Silver Perch is known to be susceptible to EHNV.

It has been recommended that this risk be managed through the use of wash down procedures (Chapter 14).

Interfere with the recovery of the species

A National Recovery Plan has not been prepared for the species.

The Conservation Advice (TSSC, 2013) for the species identifies a number of Priority Conservation Actions, including:

- Support and enhance existing native fish monitoring programs. Start a basin-wide monitoring program specifically for Silver Perch
- Further research into the recruitment ecology of Silver Perch, and the potential for managed flow events (both flood and within-channel) to facilitate Silver Perch spawning and recruitment
- Further research into how to avoid or minimise blackwater events during both natural and artificial flooding events
- Further research into alien pathogens, some possibly unidentified, that may be involved in past Silver Perch decline, including collection and examination of specimens from Silver Perch kills
- Investigate options to reduce the impacts of thermal pollution (ie un-naturally cold water released from the base of dams).
- Modify structures currently blocking migration of Silver Perch wherever possible (eg fishways on weirs)
- Avoid installing new structures that impede migration of all life stages of Silver Perch
- Avoid installing undershot weirs that kill drifting native fish larvae, and consider modifying current undershot weirs to an 'overshot' design
- Install screens at irrigation offtake/diversion points to reduce entrainment of Silver Perch eggs, larvae, juveniles and adults
- Manage any changes to hydrology that may result increased salinity, algal blooms, sedimentation or pollution.
- Return small daily variations to river flows, eg 0.15 m rises and falls, in standard river management instead of highly regulated flows to encourage spawning events.
- Initiate spring river rises for spawning.
- Explore the use of larger environmental flow events, particularly the use of environmental water to "top-up" natural flood events, to improve Silver Perch spawning (eg King et al., 2008).
- Avoid river management and environmental watering practices that may create or exacerbate blackwater events, including in terms of seasonality (ie late spring or summer flood events are more likely to create blackwater).
- Develop and implement a stock management plan for important Silver Perch habitats to limit degradation by cattle trampling.
- Develop and implement a management plan for alien fish species that affect Silver Perch, particularly carp (*Cyprinus carpio*) and gambusia (*Gambusia holbrooki*)
- Carefully consider potential impacts of fish stockings, including disease introduction, in any sites known to support wild Silver Perch.
- Develop and implement suitable hygiene protocols to protect known sites from further outbreaks of EHN virus, Epizootic Ulcerative Syndrome (aka 'red spot disease') and parasitic protozoans such as Chilodonella, including from contaminated fish stockings
- Investigate control measures for Lernaea (aka 'anchor worm') and Asian fish tapeworm.
- Raise awareness of Silver Perch within the community
- Engage with private landholders and land managers responsible for the land on which populations occur and encourage these key stakeholders to contribute to the implementation of conservation management actions.

- Attempt to re-establish lost, formerly significant populations (eg ACT reaches of Murrumbidgee River) through conservation stocking and translocation using broodfish sourced from the middle Murray region population, which may now have greater resistance to alien pathogens likely involved in the loss of original populations.

The project would be unlikely to interfere with any of these actions.

Conclusion

In line with the above findings, the project is unlikely to have a significant impact on the Silver Perch.

Table A18- 39: NSW assessment bilateral requirements for Silver Perch

NSW Assessment Bilateral requirements	
Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations, and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	A description of habitat for this species, and relevant conservation documents are provided in Section 10.2. Silver Perch are generally found in lowland areas outside of cooler upstream waters, although the species may undertake large scale migrations into upstream reaches. Indicative distribution mapping for the species within the project footprint includes the Murrumbidgee River (DPI, 2016b; DPI, 2022a), although currently there is only one known strong viable natural population in the middle Murray region (TSSC, 2013). No waterway crossings of the Murrumbidgee are proposed and as such no direct impacts to habitats for the species would occur, however the species could be subject to indirect impacts arising from the project. A map of the species indicative distribution is provided below:
Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	No targeted survey has been completed for the species due to the limited potential for impacts to the species. The assessment is informed by a detailed desktop assessment augmented by opportunistic field observations and a review of the available literature relevant to the species.
Description of the relevant impacts and its regard to the full national extent of the species or community's range	The construction process for the transmission line structures avoids direct impacts to major waterways and none of the waterways that have been mapped as within the species indicative distribution (DPI, 2022a) would be crossed by any indicative access tracks and waterway crossings. As such, this assessment of significance focusses on the potential for residual indirect impacts to potential habitats following the implementation of avoidance and mitigation measures (Chapter 14), to the species (ie the removal of native riparian vegetation, erosion and sedimentation risk) during construction.

NSW Assessment Bilateral requirements	
Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	The proposed avoidance and mitigation measures are outlined in Chapter 12 and 14 including procedures and measures specific to the protection of aquatic environments. Avoidance measures most relevant to aquatic species include: • Avoiding wetlands protected by international agreements (Tier 1 constraint) • Avoiding where possible, and minimising impacts, in wetlands not listed as Tier 1 constraints, as well as ecological conservation areas, and water crossings greater than 800 metres • Paralleling existing transmission lines to avoid new areas of impact and utilise existing impacted areas • Targeting areas of existing disturbance, such as roads, tracks and property boundaries to reduce environmental and property impacts • Minimising direct impacts on waterways within the project footprint and higher risk erosion areas within the project footprint • New waterway crossings would be established in lower Strahler order waterways where possible. • No permanent transmission line structure infrastructure is anticipated to be located within waterbodies. The following factors will be considered during the detailed design and micro siting process for waterway crossings to minimise potential impacts to aquatic environments, wherever practicable: • Any existing crossings should be re-used or upgraded in preference to establishing new crossings. • Disturbance to waterways (bed, banks and associated riparian zones), should be avoided or minimised. • The crossing design and construction footprint should minimise disturbance to any native vegetation, including native instream, fringing, and riparian vegetation within the access track alignment. • Waterway crossings should be constructed perpendicular to the flow of the water and be positioned away from channel bends (where erosive forces are typically greatest). Preferably crossings should be located in straight stream sections with well-defined channel geometries and shallow stream gradients. • Micro-siting should avoid direct and indirect (erosion or sedimentation) impacts to riverine features such as riffles and rapids and sensitive habitat features (i.e. snags, coarse woody debris, instream macrophytes, boulders). • Where instream structures are required, considerations to potential flooding and erosive effects will be made in the design and construction of the crossing. • Crossing structures should be designed so that the existing nominal flow velocity, low flow conditions and fish passage are maintained wherever possible. This will include the following considerations: • Minimise the impact of essential instream structures by mimicking natural flows (DPI, 2005b). • Following Fairfull (2013), for waterway crossings incorporating culverts, a minimum of 300 mm of water should pool through the structure, with a centrally placed low-flow cell being preferable. • In line with Cotterell (1998), it is recommended that flow over or through instream crossing structures are designed such that they maintain water velocity of 0.3 m/s or less, which is likely to facilitate passage for native species of fish (velocities exceeding 1 m/s, are likely to prevent upstream migration of native fish).

NSW Assessment Bilateral requirements	
	The following procedures and considerations will be incorporated into construction methodologies and operational procedures for waterway crossings, as practicable and where appropriate: • Minimise disturbance to native vegetation, including instream, fringing and riparian vegetation within the construction footprint. This may include the demarcation of areas of native vegetation to be retained during work. • Any coarse woody debris or boulders located within instream works sites should be temporarily relocated during construction and then returned to the watercourse, at locations where scour risk can be avoided. • Waterway crossing work should be constructed during no or low flow conditions and under calm weather conditions. Work should also be timed to occur outside of any locally high seasonal flow periods. • Silt curtains or coffer dams will be deployed around instream work sites where required, to protect against any impacts to water quality or indirect impacts to retained vegetation. These measures will be situated so to avoid blocking fish passage wherever practical and removed as soon as they are no longer required. • Flow diversion measures will be installed on any bunded waterway crossings as appropriate or where construction during no or low flow conditions is not feasible. Flow diversion measures may include pumps to ensure that water can be moved from one side of blockages to the other, with screened inlets to prevent the entrapment of aquatic fauna and outlet structures that are designed to avoid scouring of the channel. Where waterways are bunded or flow obstructed, all obstructions to flow will need to be removed as soon as practical after watercourse crossing construction has been completed. • Appropriate erosion and sediment controls that take into account the potentially flood prone nature of the land will be employed to protect against any impacts to water quality or indirect impacts to retained vegetation. • Waterway bed and bank material excavated during construction will be stockpiled outside of the active channel and avoiding riparian vegetation. Any material excavated from the bed of waterways will be stockpiled separately from other materials and returned to the waterway bed following the completion of construction work. • If the stockpiling of sediment or soil is required, it will be located as far away from waterways as practicable and managed so that it is secure against flooding and runoff to prevent any sediment entering waterways. Adequate erosion and sediment control measures will be in place to protect stockpiled sediment against runoff during rainfall or flooding. • Only natural material will be used as fill during reclamation work, ie no contaminated material, building or demolition rubble will be used as fill in any stream crossings. • Any chemicals will be stored as far away from streams as practicable and appropriately protected against flooding or runoff. Spill kits will be made available, and a spill response plan developed. • Plant refuelling will occur as far away from streams as possible and appropriate spill prevention measures will be implemented when refuelling. • Regular monitoring/inspections of waterway crossing and access track conditions will be undertaken during operation. • Any sections of stream or waterway banks that are impacted or modified by the project will be reformed or remediated to resemble the pre-work condition and form wherever possible or alternatively to a stable design form, as appropriate following the completion of construction work. This may include revegetation to stabilise bank sediments.

NSW Assessment Bilateral requirements	
	• Waterway banks impacted by the project will be reinstated such that bank stability at the crossing location is the same or better than prior to construction. Stabilising materials such as rock armouring, hydro mulch, jute matting, or other suitable geotextile materials may be utilised where necessary. • Any temporary stream crossings will be removed and rehabilitated at the completion of their operational use.
Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	No significant residual adverse impacts to the Silver Perch are considered likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account.
A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	The species is not listed under the BC Act. As no net loss of key fish habitat, or significant impacts to threatened aquatic species are anticipated to occur as a result of the project, no offsets for aquatic species or key fish habitats under the FM Act are proposed.
Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	Not applicable, species is not listed under the BC Act.
Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Not applicable, species is not listed under the BC Act.
Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	As no net loss of Key Fish Habitat, or significant impacts to threatened aquatic species are anticipated to occur as a result of the project, no offsets for aquatic species are proposed.

2.5 Migratory species

Migratory species listed under EPBC Act, with a moderate or higher likelihood of occurrence within the project footprint, include, Fork-tailed Swift (*Apus pacificus*), Sharp-tailed Sandpiper (*Calidris acuminata*), Red-necked Stint (*Calidris ruficollis*), Latham's Snipe (*Gallinago hardwickii*), White-throated Needletail (*Hirundapus caudacutus*), Black-faced Monarch (*Monarcha melanopsis*), Satin Flycatcher (*Myiagra cyanoleuca),* Rufous Fantail (*Rhipidura rufifrons*), Common Greenshank (*Tringa nebularia*), and Marsh Sandpiper (*Tringa stagnatilis*).

Species descriptions and habitat requirements, relevant project impacts, MNES assessments for each migratory species and assessment under the NSW Bilateral assessment requirements are provided below. A summary of species habitat requirements and likely impacts from the project are summarised below in Table A18- 40.

Table A18- 40: Migratory bird species descriptions and project impacts

Species	Migratory listings	Description	Summary of specific Impacts
Black-faced Monarch (*Monarcha melanopsis*)	Migratory under the EPBC Act, and Bonn Migratory Agreement	The Black-faced Monarch is widespread in eastern Australia (DoE, 2022c). In New South Wales and the Australian Capital Territory, the species occurs around the eastern slopes and tablelands of the Great Divide, inland to Coutts Crossing, Armidale, Widden Valley, Wollemi National Park, Wombeyan Caves and Canberra (DoE, 2022c). The Black-faced Monarch exhibits migratory behaviour, spending spring, summer, and autumn in eastern Australia where they breed, and wintering in southern and eastern Papua New Guinea from March to August (DoE, 2022c). The Black-faced Monarch mainly occurs in rainforest ecosystems, including selectively logged and 20—30 years old regrowth rainforest (DoE, 2022c). The species also occurs in open eucalypt forests (mainly wet sclerophyll forests), especially in gullies with a dense, shrubby understorey, and dry sclerophyll forests and woodlands, often with a patchy understorey (DoE, 2022c). The species especially occurs in 'marginal' habitats during winter or during passage (migration) (DoE, 2022c). Other areas in which the Black-faced Monarch may be found include gullies in mountain areas or coastal foothills, softwood scrub dominated by Brigalow (*Acacia harpophylla*), coastal scrub dominated by Coast Banksia (*Banksia integrifolia*) and Southern Mahogany (*Eucalyptus botryiodes*), occasionally among mangroves and sometimes in suburban parks and gardens (DoE, 2022c).	The project has the potential to remove approximately 131.13 ha of potential habitat. There are no records of the species in proximity to the project footprint, however, the species is known to primarily occupy wet sclerophyll vegetation formations. Based on the transient nature of the species, no nearby records, and the implementation of appropriate mitigation measures a significant impact is unlikely.
Common Greenshank (*Tringa nebularia*)	Migratory under the following EPBC Act migratory agreements: Bonn, CAMBA, JAMBA and ROKAMBA	The Common Greenshank is a heavily built, elegant wader, 30–35 cm in length, with a wingspan of 55–65 cm and weight up to 190 g for both males and females (DCCEEW, 2022j). The bill is long and slightly upturned, and the legs are long and yellowish green (DCCEEW, 2022j). In flight, all plumages show uniformly dark upper wing and contrasting white rump extending in a white wedge up the back, whitish tail and tips of toes projecting slightly beyond the tip of the tail (DCCEEW, 2022j). The Common Greenshank does not breed in Australia; however, the species occurs in all types of wetlands and has the widest distribution of any shorebird in Australia (DCCEEW, 2022j). In NSW the species has been recorded in most coastal regions (DCCEEW, 2022j). It is widespread west of the Great Dividing Range, especially between the Lachlan and Murray	Based on the ecology (highly transient) of Common Greenshank, the species is at higher risk of collision in areas where wetlands and major waterbodies intersect or are within 1 km of the project footprint (Attachment 21, Figure 13-15). Based on the indicative disturbance area, the project has the potential to also impact 54.98 ha of riparian habitat indirectly within the Bondo and Inland Slopes portion of the project footprint.

Species	Migratory listings	Description	Summary of specific Impacts
		Rivers and the Darling River drainage basin, including the Macquarie Marshes, and north-west regions (DCCEEW, 2022j). The Common Greenshank is found in a wide variety of inland wetlands and sheltered coastal habitats of varying salinity (DCCEEW, 2022j). Habitats include embayment, harbours, river estuaries, deltas and lagoons and are recorded less often in round tidal pools, rock-flats and rock platforms (DCCEEW, 2022j). The species uses both permanent and ephemeral terrestrial wetlands, including swamps, lakes, dams, rivers, creeks, billabongs, waterholes and inundated floodplains, claypans and salt flats (DCCEEW, 2022j). It will also use artificial wetlands, including sewage farms and saltworks dams, inundated rice crops and bores (DCCEEW, 2022j). The species is known to forage at edges of wetlands, in soft mud on mudflats, in channels, or in shallows around the edges of water (DCCEEW, 2022j). It will occasionally feed on exposed seagrass beds (DCCEEW, 2022j). The Common Greenshank roosts and loafs around wetlands, in shallow pools and puddles, or slightly elevated on rocks, sandbanks or small muddy islets (DCCEEW, 2022j). The species is known to have roosted on an inland claypan near Roebuck Bay, Western Australia (DCCEEW, 2022j).	Considering the above factors, the project has the potential to significantly impact the species.
Fork-tailed Swift (*Apus pacificus*)	Migratory under the following EPBC Act migratory agreements: CAMBA, JAMBA and ROKAMBA	The Fork-tailed Swift is a medium to large member of the Apodidae Family (DCCEEW, 2022f). It has a length of 18–21 cm, a wingspan of 40–42 cm and weighs around 30–40 g (DCCEEW, 2022f). It is a medium-sized Swift, with a slim body with long scythe-shaped wings that taper to finely pointed tips (DCCEEW, 2022f). It is characterized by a long and deeply forked tail. The Fork-tailed Swift is mainly blackish with a white band across the rump (DCCEEW, 2022f). There is also a white patch on the chin and throat (DCCEEW, 2022f). The body, tail and upper wings are black-brown and they have a faint pale scaling to the saddle and white scalloping to the underbody (DCCEEW, 2022f). The Fork-tailed Swift is a non-breeding visitor to all states and territories of Australia (DCCEEW, 2022f). In NSW, the Fork-tailed Swift is recorded in all regions (DCCEEW, 2022f). Many records occur east of the Great Divide; however, a few populations have been found west of the Great Divide (DCCEEW, 2022f). These are widespread but scattered further west of the line joining Bourke and Dareton (DCCEEW 2022f). Sightings have been recorded at Milparinka, the Bulloo River and Thurloo Downs (DCCEEW, 2022f).	The species is known to occupy the airspace above most vegetation formations, and riparian habitats found within the project footprint (records within Bondo and Inland Slopes portion of the project footprint). The project has the potential to remove approximately 727.40 ha of non-breeding habitat. Given the aerial nature of the species, the proposed transmission lines may pose a potential collision risk within riparian habitats association with wetlands and major waterbodies that intersect or are within 1 km of the project footprint (Attachment 21). However, given the species size and known manoeuvrability, it is likely that any potential collision risk would generally be low.

Species	Migratory listings	Description	Summary of specific Impacts
		The Fork-tailed Swift is almost exclusively aerial, flying from less than 1 m to at least 300 m above ground and probably much higher (DCCEEW, 2022f). In Australia, they mostly occur over inland plains but sometimes above foothills or in coastal areas (DCCEEW, 2022f). They often occur over cliffs and beaches and also over islands and sometimes well out to sea (DCCEEW 2022f). They also occur over settled areas, including towns, urban areas and cities (DCCEEW, 2022f). They mostly occur over dry or open habitats, including riparian woodland and tea-tree swamps, low scrub, heathland or saltmarsh (DCCEEW, 2022f). They are also found at treeless grassland and sandplains covered with spinifex, open farmland and inland and coastal sand-dunes (DCCEEW, 2022f). The sometimes occur above rainforests, wet sclerophyll forest or open forest or plantations of pines (DCCEEW, 2022f). They forage aerially, up to hundreds of metres above ground, but also less than 1 m above open areas or over water (DCCEEW, 2022f). They sometimes feed aerially among tree-tops in open forest. They probably roost aerially but are occasionally observed to land (DCCEEW, 2022f). They were once recorded roosting in trees, using a bare exposed branch emergent above the foliage (DCCEEW, 2022f).	Considering the above factors, a precautionary significant impact has been identified for the species as a result of the project.
Latham's Snipe (*Gallinago hardwickii*)	Migratory under the following EPBC Act migratory agreements: Bonn, JAMBA and ROKAMBA	Latham's Snipe is a medium sized wader, and the largest snipe in Australia, with a length of 29-33 cm, a wingspan of 50-54 cm and a mass of 150-230 g (DCCEEW, 2022i). It has a long straight bill, rather short broad pointed wings, a long tail and short legs (DCCEEW, 2022i). The cryptic plumage is intricately marked with barring and chevrons of buff, black and various shades of brown, with blackish-brown stripes across the crown and cream streaks down the back (DCCEEW, 2022i). The belly and parts of the head are white, and the tail is rufous with a white tip (DCCEEW, 2022i). The colour of the bill varies from pale-brown to olive, becoming blackish at the distal third and olive-yellow at the base, and the legs and feet are olive-grey to olive in colour (DCCEEW, 2022i). Latham's Snipe is a non-breeding visitor to south-eastern Australia (DCCEEW, 2022i). The species has been recorded along the east coast of Australia from Cape York Peninsula through to south-eastern South Australia (DCCEEW, 2022i). The range extends inland over the eastern tablelands in south-eastern Queensland, and to west of the Great Dividing Range in New South Wales (DCCEEW, 2022i). In Australia, Latham's Snipe occurs in permanent and ephemeral wetlands up to 2000 m above sea-level (DCCEEW, 2022i). They usually inhabit open, freshwater wetlands with low,	There are a couple of Latham's Snipe records along the Murrumbidgee River (intersecting the project footprint) (Figure 13-15). Records were also present around Lake Albert, and along the Murrumbidgee River in Wagga Wagga, NSW. Based on review of literature and species records, Latham's Snipe are at higher risk of collision in areas where wetlands and major waterbodies intersect or are within 1 km of the project footprint (Attachment 21, Figure 13-15). Based on the indicative disturbance area, the project has the potential to also impact 54.98 ha of riparian habitat indirectly within the Bondo and Inland Slopes portion of the project footprint.

Species	Migratory listings	Description	Summary of specific Impacts
		dense vegetation (DCCEEW, 2022i). However, they can also occur in habitats with saline or brackish water, in modified or artificial habitats, and in habitats located close to humans or human activity (DCCEEW, 2022i). The foraging habitats of Latham's Snipe are characterized by areas of mud and some form of cover such as low, dense vegetation (DCCEEW, 2022i). The snipe roost on the ground within or near their foraging areas, usually in sites that provide some degree of shelter, eg, vegetation, in drainage ditches, boulders, or in shallow water if cover is unavailable (DCCEEW, 2022i).	Considering the above factors, the project has the potential to significantly impact the species.
Marsh Sandpiper (***Tringa stagnatilis***)	Migratory under the following EPBC Act migratory agreements: Bonn, CAMBA, JAMBA and ROKAMBA	The Marsh Sandpiper is a medium sized member of the Tringinae family. It has a length of 22–26 cm, a wingspan of 40–45 cm and a weight of 70 g (DCCEEW, 2022k). In all plumages the species shows a contrasting outer wing, a very pale whitish tail and a bold white wedge up the back (DCCEEW, 2022k). The Marsh Sandpiper is found on coastal and inland wetlands throughout Australia (DCCEEW, 2022k). The species is recorded in all regions of NSW but especially the central and south coasts and inland on the western slopes of Great Divide and western plains (DCCEEW, 2022k). The Marsh Sandpiper lives in permanent or ephemeral wetlands of varying salinity, including swamps, lagoons, billabongs, saltpans, saltmarshes, estuaries, pools on inundated floodplains, and intertidal mudflats and also regularly at sewage farms and saltworks (DCCEEW, 2022k). They are recorded less often at reservoirs, waterholes, soaks, bore-drain swamps and flooded inland lakes (DCCEEW, 2022k). The Marsh Sandpiper usually forages in shallow water at the edge of wetlands (DCCEEW, 2022k). They probe wet mud of mudflats or feed among marshy vegetation (DCCEEW, 2022k). The Marsh Sandpiper has been recorded roosting or loafing on tidal mudflats, near low saltmarsh, and around inland swamps (DCCEEW, 2022k).	There are records of this species within the Inland Slopes portion of the project footprint. the species is at higher risk of collision in areas where wetlands and major waterbodies intersect or are within 1 km of the project footprint (Attachment 21, Figure 13-15). Based on the indicative disturbance area, the project has the potential to also impact 54.98 ha of riparian habitat indirectly within the Inland Slopes and Bondo portion of the project footprint. Considering the above factors, the project has the potential to significantly impact the species.
Red-necked Stint (***Calidris ruficollis***)	Migratory under the following EPBC Act migratory agreements: Bonn, CAMBA,	The Red-necked Stint is a small Calidridinae approximately 13–16 cm in length and is the smallest shorebird in Australia (DCCEEW, 2022h). It weighs 25 g and has a wingspan between 29 and 33 cm. The species is characterised by a small head, steep rounded forehead, and long thickset body with an attenuated rear end (DCCEEW, 2022h). Other distinguishing features include short legs and a short, straight, or slightly decurved bill with a slight bulbous or finely pointed tip (DCCEEW, 2022h).	Similar to the Sharp-tailed Sandpiper, Red-necked Stint has multiple records along the Murrumbidgee River, and Tumut River (intersect the project footprint) (Figure 13-15). Upon review of the species records, multiple records

Species	Migratory listings	Description	Summary of specific Impacts
	JAMBA and ROKAMBA	It is distributed along most of the Australian coastline with large densities on the Victorian and Tasmanian coasts (DCCEEW, 2022h). The Red-necked Stint has been recorded in all coastal regions and found inland in all states when conditions are suitable (DCCEEW, 2022h). The Red-necked Stint probably travels in flocks and has been observed to feed in dense flocks. The Australian population was estimated at 353 000 (DCCEEW, 2022h). The Red-necked Stint is mostly found in coastal areas, including in sheltered inlets, bays, lagoons and estuaries with intertidal mudflats, often near spits, islets and banks and, sometimes, on protected sandy or coralline shores (DCCEEW, 2022h). They also occur in saltworks and sewage farms; saltmarsh; ephemeral or permanent shallow wetlands near the coast or inland, including lagoons, lakes, swamps, riverbanks, waterholes, bore drains, dams, soaks and pools in saltflats (DCCEEW, 2022h). The Red-necked Stint mostly forages on bare wet mud on intertidal mudflats or sandflats, or in very shallow water; mostly in areas with a film of surface water and mostly close to edge of water (DCCEEW, 2022h). During high tides they sometimes forage in non-tidal wetlands (DCCEEW, 2022h). They have been recorded foraging in flooded paddocks and in a freshly cropped lucerne paddock near lagoons (DCCEEW, 2022h). The Red-necked Stint roosts on sheltered beaches, spits, banks or islets, of sand, mud, coral or shingle, sometimes in saltmarsh or other vegetation (DCCEEW, 2022h). Large numbers (an estimated 7967 birds) were recorded roosting at an inland claypan near Roebuck Bay in north-west Western Australia (DCCEEW, 2022h).	are found at Lake Albert, and along the Murrumbidgee River in Wagga Wagga, NSW. Based on review of literature and species records, the Red-necked Stint is at higher risk of collision in areas where wetlands and major waterbodies intersect or are within 1 km of the project footprint (Attachment 21, Figure 13-15). The project has the potential to indirectly impact 54.98 ha of riparian habitat within the Inland Slopes portion of the project footprint and increase the potential for collision or entanglement. Considering the above factors, the project has the potential to significantly impact the species.
Rufous Fantail **(*Rhipidura rufifrons*)**	Migratory under the EPBC Act, and Bonn Migratory Agreement	Rufous Fantail adults are medium sized birds, generally ranging from 14.5–18.5 cm in length with a wingspan between 18–22.5 cm and a weight of approximately 10 g. (DoE, 2022e). The male and female of the species look identical; however, females are generally smaller than the males (DoE, 2022e). The Rufous Fantail has a rich reddish-brown black forehead, a white arc under the eyes, black ear-coverts, a white throat, and black bar across the upper breast (DoE, 2022e). The top of the head, back of the neck and the upper back, transition from an olive to reddish-brown colour, which then blends into a blackish brown, long, fan-shaped tail. which is tipped with a paler colour, often white (DoE, 2022e). The lower breast is off-white with black scale-like spots which transitions into an off-white colour towards the centre of	The species is known to occupy a range of habitats found within the project footprint. Therefore, the project has the potential to remove approximately 85.09 ha of opportunistic non-breeding habitat. Based on the transient nature of the species, no nearby records, and the implementation of appropriate mitigation measures a significant impact is unlikely.

Species	Migratory listings	Description	Summary of specific Impacts
		the abdomen (DoE, 2022e). The eyes, bill and feet of the bird are all a brown colour (DoE, 2022e). The Rufous Fantail occurs in coastal and near coastal districts of northern and eastern Australia (DoE, 2022e). Breeding populations occur from about the South Australia-Victoria border, through south and central Victoria, on and east of the Great Divide in New South Wales (NSW), and north to about the Cairns-Atherton region, Queensland (DoE, 2022e). This species winters farther north from Cape York Peninsula in Queensland to Torres Strait and southern Papua New Guinea (DoE, 2022e). Some populations of the Rufous Fantail in east Australia are migratory (DoE, 2022e). They breed in south-east Australia between September and February; however, their movement patterns are not fully understood (DoE, 2022e). In east and south-east Australia, the Rufous Fantail mainly inhabits wet sclerophyll forests, often in gullies dominated by eucalypts, usually with a dense shrubby understorey often including ferns (DoE, 2022e). They also occur in subtropical and temperate rainforests, and occasionally occur in secondary regrowth, following logging or disturbance in forests or rainforests (DoE, 2022e). When on passage, they are sometimes recorded in drier sclerophyll forests and woodlands, parks, and gardens (DoE, 2022e).	
Satin Flycatcher **(*Myiagra cyanoleuca*)**	Migratory under the EPBC Act, Bonn Migratory Agreement	The Satin Flycatcher are around 17.5 cm long, with a wingspan of 23 cm and a weight of 17 g (DoE, 2022d). The species is characterised by an upright posture, short erectile crest, and a distinctive habit of quivering the tail when perched (DoE, 2022d). Males are glossy blue-black above, with a blue-black chest and white below, while females are duskier blue-black above, with an orange-red chin, throat and breast, and white underparts and pale-edged wing and tail feathers (DoE, 2022d). The Satin Flycatcher is widespread in eastern Australia and vagrant to New Zealand (DoE, 2022d). In NSW, they are widespread on and east of the Great Divide and sparsely scattered on the western slopes, with very occasional records on the western plains (DoE, 2022d). Satin Flycatchers are migratory, moving north in autumn to spend winter in northern Australia and New Guinea (DoE, 2022d). They return south in spring to breed and spend summer in south-eastern Australia (DoE, 2022d).	The species has not been recorded within proximity of the project footprint (within 20 km). Satin Flycatcher is known to occur in heavily vegetated gullies in eucalypt-dominated forests and taller woodlands. Therefore, the project has the potential to remove approximately 595.03 ha of potential foraging habitat for this species. Based on the transient nature of the species, no nearby records, and the implementation of appropriate mitigation measures a significant impact is unlikely.

Species	Migratory listings	Description	Summary of specific Impacts
		Satin Flycatchers inhabit heavily vegetated gullies in eucalypt-dominated forests and taller woodlands, and on migration, occur in coastal forests, woodlands, mangroves and drier woodlands and open forests (DoE, 2022d). Satin Flycatchers mainly inhabit eucalypt forests, often near wetlands or watercourses (DoE, 2022d). They generally occur in moister, taller forests than the Leaden Flycatcher (*Myiagra rebecula*), often occurring in gullies (DoE, 2022d). They also occur in eucalypt woodlands with open understorey and grass ground cover and are generally absent from rainforest (DoE, 2022d). In south-eastern Australia, they occur at elevations of up to 1,400 m above sea level (DoE, 2022d).	
Sharp-tailed Sandpiper (*Calidris acuminata*)	Migratory under the following EPBC Act migratory agreements: Bonn, CAMBA, JAMBA and ROKAMBA	The Sharp-tailed Sandpiper is a small-medium wader. The bird has a length of 17–22 cm, a wingspan of 36–43 cm and a weight of 65 g (DCCEEW, 2022g). It is a portly sandpiper with a flat back, pot belly and somewhat drawn-out rear end (DCCEEW, 2022g). It has a small flat head on a short neck with a short and slightly decurved bill (DCCEEW, 2022g). The species has medium length legs (DCCEEW, 2022g). At rest, the primaries are level with or slightly short of the tip of the tail (DCCEEW ,2022g). The primary projection is short in adults and moderately long in juveniles (DCCEEW, 2022g). The sexes are similar and there is marked seasonal variation (DCCEEW, 2022g). The Sharp-tailed Sandpiper spends the non-breeding season in Australia with small numbers occurring regularly in New Zealand (DCCEEW, 2022g). Most of the population migrates to Australia, mostly to the south-east and are widespread in both inland and coastal locations and in both freshwater and saline habitats (DCCEEW, 2022g). Many inland records are of birds on passage (DCCEEW, 2022g). They are widespread in most regions of New South Wales, especially in coastal areas, but they are sparse in the south-central Western Plain and east Lower Western Regions (DCCEEW, 2022g). The Sharp-tailed Sandpiper prefers muddy edges of shallow fresh or brackish wetlands, with inundated or emergent sedges, grass, saltmarsh or other low vegetation (DCCEEW, 2022g). This includes lagoons, swamps, lakes and pools near the coast, and dams, waterholes, soaks, bore drains and bore swamps, saltpans and hypersaline salt lakes inland (DCCEEW, 2022g). They forage at the edge of the water of wetlands or intertidal mudflats, either on bare wet mud or sand, or in shallow water, as well as among inundated vegetation of saltmarsh, grass or sedges, and in sewage ponds, and hypersaline environments (DCCEEW, 2022g). After rain,	There are multiple Sharp-tailed Sandpiper records along the Murrumbidgee River, and Tumut River (intersecting the project footprint) (Figure 13-15). Although the sites are not formally part of the *East Asian-Australasian Flyway* (the Flyway), the waterbodies are known as inland corridors for many migratory waterbirds. Upon review of the distribution of species records (BioNet, 2023), multiple records were found at Lake Albert, and along the Murrumbidgee River in Wagga Wagga, NSW. It is well documented that transmission lines, especially close to wetlands, forests or over floodplains, are a significant cause of mortality for many waterbird species (Baker et al., 1998; Clancy, 2010; Loss et al., 2014). Generally, it is those groups of birds which are likely to fly at heights where transmission lines are located, and are not familiar with local habitat attributes, which have the most potential to encounter transmission line infrastructure. Based on review of literature and species records, Sharp-tailed Sandpiper is at

Species	Migratory listings	Description	Summary of specific Impacts
		they may forage in paddocks of short grass, well away from water (DCCEEW, 2022g). Roosting occurs at the edges of wetlands, on wet open mud or sand, in shallow water, or in short sparse vegetation, such as grass or saltmarsh (DCCEEW, 2022g). Occasionally, they roost on sandy beaches, stony shores or on rocks in water (DCCEEW, 2022g). They have also been recorded roosting in mangroves (DCCEEW, 2022g).	higher risk of collision in areas where wetlands and major waterbodies intersect or are within 1 km of the project footprint (Attachment 21, Figure 13-15). The project has the potential to indirectly impact 54.98 ha of riparian habitat within the Inland Slopes portion of the project footprint and increase the potential for collision or entanglement. Therefore, the project has the potential to significantly impact the species.
White-throated Needletail (*Hirundapus caudacutus*)	Vulnerable under the EPBC Act, Migratory under the following EPBC Act migratory agreements: CAMBA, JAMBA and ROKAMBA	The White-throated Needletail is a large swift with a thickset, cigar-shaped body, stubby tail and long pointed wings (TSSC, 2019d). They have a dark-olive head and neck, with an iridescent gloss on the crown, a narrow, white band across the forehead and lores and a white patch on the chin and throat (TSSC, 2019d). The upper wings are blackish, sometimes with a greenish gloss, and the upper tail is black with a greenish gloss (TSSC, 2019d). The underparts are generally dark-olive except for a U-shaped band across the rear flanks, the vent and the undertail coverts (TSSC, 2019d). The bill is black, the eyes black-brown and the legs and feet are dark grey, sometimes with a pinkish tinge (TSSC, 2019d). The White-throated Needletail is widespread in eastern and south-eastern Australia (TSSC, 2019d). In eastern Australia, the species is recorded in all coastal regions of Queensland and NSW, extending inland to the western slopes of the Great Dividing Range and occasionally onto the adjacent inland plains (TSSC, 2019d). Further south on the mainland, it is widespread in Victoria, though more so on and south of the Great Dividing Range, and there are few records in western Victoria (TSSC, 2019d). The species occurs in adjacent areas of south-eastern South Australia, where it extends west to the Yorke Peninsula and the Mount Lofty Ranges. It is widespread in Tasmania (TSSC, 2019d). The breeding distribution of the White-throated Needletail is restricted to Asia (TSSC, 2019d). In Australia, the White-throated Needletail is mostly aerial, from heights of less than 1 m up to more than 1,000 m above the ground (TSSC, 2019d). Although they occur over most types of habitats, they are recorded most often above wooded areas, including open forest and	The species is known to occupy the airspace above most vegetation formations, and habitats found within the project footprint (aerial forager). The project has the potential to remove approximately 85.09 ha (5%) of opportunistic/potential foraging habitat. However, the species is highly mobile, and is almost always aerial in Australia, at heights up to 'cloud level', above a wide variety of habitats and disturbed areas (DCCEEW, 2022an). They use updrafts, low pressure systems to glean aerial insects, and are less reliant on terrestrial vegetation communities as a habitat resource. Therefore, a significant impact is unlikely.

Species	Migratory listings	Description	Summary of specific Impacts
		rainforest. They may also fly below the canopy between trees, in clearings, over sandy beaches or mudflats, and often around coastal cliffs and other areas with prominent updraughts, such as ridges and sand-dunes (TSSC, 2019d).	

Relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan

A summary of the relevant Commonwealth guidelines and policy statements available for these species is as follows:

Recovery plans or conservation advice:

- There is no approved conservation advice or adopted Recovery Plan for nine of the 10 species including the Fork-tailed Swift, Sharp-tailed Sandpiper, Red-necked Stint, Latham's Snipe, Black-faced Monarch, Satin Flycatcher, Rufous Fantail, Common Greenshank, or Marsh Sandpiper.
- There is no adopted Recovery Plan for White-throated Needletail, however, the approved conservation advice for the White-throated Needletail (TSSC, 2019d), provides sufficient direction to implement priority actions, mitigate against key threats and enable recovery. The primary actions include: Work with governments in East Asia to minimise destruction of key breeding habitats.
- Important habitats in Australia are identified and protected.

Threat abatement plans:

- No Threat Abatement Plans apply to the Sharp-tailed Sandpiper, Red-necked Stint, White-throated Needletail, Satin Flycatcher, Rufous Fantail, Common Greenshank or Marsh Sandpiper.
- The *Threat abatement plan for predation by feral cats* (DAWE 2015), has been identified as being relevant for the Fork-tailed Swift and the Black-faced Monarch.
- The *Threat abatement plan for predation by the European red fox* (DAWE 2008), has been identified as being relevant for the Latham's Snipe.

Guidelines:

- The following guidelines are relevant to these species
  - Draft referral guideline for 14 birds listed as migratory species under the EPBC Act (DoE 2015).
  - National Light Pollution Guidelines for Wildlife Including Marine Turtles, Seabirds and Migratory Shorebirds (DEE 2020).

Specific impacts

Migratory birds may potentially be impacted by the installation of new transmission lines in their flightpath (Section 12.5.4 of the BDAR, and Attachment 21). Potential direct impacts include vegetation clearing for the installation of transmission lines and associated infrastructure within riparian and mesic habitats, which may reduce the availability of nesting and foraging resources for these species, as well as suitable hollow bearing trees used as roosting habitat by the White-throated Needletail. Specific impacts for each species are described above in Table A18- 40.

Potential indirect impacts include species injury or mortality, resulting from collision, entanglement, or electrocution from new transmission lines. Migratory waterbird species are likely to be more susceptible to this type of impact as they may be less familiar with the landscape than resident fauna species, who will likely habituate to the structures over time. The risk of collision, entanglement, or electrocution is likely to be higher where the project footprint is within 1 kilometre of a major waterbody or wetland (eg, Murrumbidgee River, Tumut River, Tarlo River, and Wollondilly River).

Significant impact criteria

All 10 species discussed in this section are assessed against the significant impact criteria for Migratory species. In addition, the White-throated Needletail is assessed against the significant impact criteria for Vulnerable species.

Significant impact criteria for Migratory species:
An action is likely to have a significant impact on a migratory species if there is a real chance or possibility that it will:

Substantially modify (including by fragmenting, altering fire regimes, altering nutrient cycles or altering hydrological cycles), destroy or isolate an area of important habitat for a migratory species

Fork-tailed Swift, Satin Flycatcher and Rufous Fantail were detected during field surveys of the project footprint (known habitat). Known habitat for the Satin Flycatcher and Rufous Fantail is present in the project footprint, however no nests were observed during surveys. Given the transient nature of these species, and the availability of habitat in the broader surrounds, the habitat present within the project footprint is not considered to be important habitat for any of these species. Therefore, the project has the potential to direct impact approximately 727.40 ha of non-breeding habitat.

Migratory waterbirds (eg, Common Greenshank, Sharp-tailed Sandpiper, Red-necked Stint, Latham's Snipe, Marsh Sandpiper), are at higher risk of indirect impacts (e.g., collision) in areas where wetlands and major waterbodies intersect or are within 1 kilometres of the project footprint (Figure 13-15). Based on the indicative disturbance area, the project has the potential to also impact 54.98 ha of riparian habitat indirectly within the Bondo and Inland Slopes portion of the project footprint. The impact assessment has focused on the Inland Slopes and Bondo IBRA subregions exclusively, based on the distribution of migratory species records (primarily occurring along the Ginini Flats Wetland Complex Ramsar Site and the Murrumbidgee River, near Wagga Wagga and Lake Albert), and the outcome of the connectivity and collision risk assessment, which identified moderate and high-risk areas within the project footprint (Attachment 22). The Sharp-tailed Sandpiper, Red-necked Stint, Latham's Snipe, Black-faced Monarch, Common Greenshank and Marsh Sandpiper were not recorded within the project footprint during surveys however, they have been recorded in the broader area, along the Murrumbidgee River, Lake Albert, Ginini Flats Wetland Complex Ramsar Site, and towards Wagga Wagga (Inland Slopes and Bondo IBRA subregions). They may occasionally utilise the riparian habitats within the project footprint for foraging, or as passage to inland wetland habitats (non-breeding habitats). The potential habitat present within the project footprint is not considered to be important habitat for any of these species.

The Fork-tailed Swift and White-throated Needletail are aerial foragers and may be at risk of collision with transmission line s while foraging. However, there is insufficient data available to determine the risk of transmission line collisions for Fork-tailed Swift. The SPRAT profile for the White-throated Needletail indicates that the species experiences a constant threat of collision with overhead wires when in Australia, however this affects only a few individuals and is not a threat to the species overall (DCCEEW 2022l). Given the existing threat of collision with overhead wires, it is unlikely that the installation of transmission line s in the project footprint would increase this threat to the extent that there would be a substantial impact to the species overall.

Extensive areas of similar habitat for these species are also present within the locality and would not be impacted by the project. The habitat within the project footprint to be impacted is therefore not considered important habitat for these species. As such, the removal of approximately 85.09 ha of native

vegetation as a result of the project is unlikely to substantially modify, destroy or isolate an area of important habitat for a migratory species.

Result in an invasive species that is harmful to the migratory species becoming established in an area of important habitat for the migratory species, or

The project is not likely to result in the introduction of invasive species to an area of important habitat for these migratory species.

Seriously disrupt the lifecycle (breeding, feeding, migration or resting behaviour) of an ecologically significant proportion of the population of a migratory species.

The Fork-tailed Swift, Sharp-tailed Sandpiper, Red-necked Stint, Latham's Snipe, White-throated Needletail, Common Greenshank and Marsh Sandpiper do not breed in Australia and therefore no breeding habitat for these species is present in the project footprint. While these species may occasionally utilise the project footprint for foraging, this is not considered to form important non-breeding habitats for these species within the project footprint (not formally part of East Asian-Australasian Flyway). However, the proposed transmission line infrastructure has the potential to increase collision and entanglement risks to migratory species travelling to inland feeding grounds (eg, Lake Albert, and Fivebough and Tuckerbil Swamps Ramsar Site). These species are more susceptible to this type of impact as they may be less familiar with the landscape than resident fauna species, who will likely habituate to the structures over time. The risk of collision, or entanglement is likely to have flow-on effects to the lifecycle and breeding success of these species. Therefore, indirect impacts to this habitat as a result of the project have the potential to seriously disrupt the lifecycle of an ecologically significant proportion of any population of these species.

The Black-faced Monarch breeds in rainforest habitat and nests near the top of trees and small saplings or in lower shrubs. There is no confirmed breeding habitat within the project footprint (no signs of nests). However, there are portions of the project footprint that haven’t been surveyed due to limited site access. While there is potential habitat for the species within the project footprint, given the extent of habitat in the broader surrounds, and transient nature of the species, the habitat to be impacted by the project is not considered to be important to the lifecycle of the Black-faced Monarch.

While there was potential breeding habitat suitable for the Satin Flycatcher and Rufous Fantail present in the project footprint, no nests observed during surveys. Potential habitat for the species within the project footprint is not considered to be important to the lifecycle of the species. In addition, similar areas of potential breeding and foraging habitat for these species would be retained in the project footprint (through the implementation of various mitigation measures as outlined in Chapter 14 of the BDAR), and the wider locality. Therefore, the removal of the potential habitat as a result of the project is unlikely to disrupt the lifecycle of an ecologically significant proportion of these species.

Conclusion

In light of the above, the proposed project is unlikely to result in a significant impact to the White-throated Needletail, Black-faced Monarch Satin Flycatcher or Rufous Fantail.

For species, such as Fork-tailed Swift, Sharped-tailed Sandpiper, Red-necked Stint, Latham’s Snipe, Marsh Sandpiper, and Common Greenshank, there is inadequate data to determine the risk of transmission line collision. Transmission lines are known to cause mortalities of migrating birds as they are flying through unfamiliar habitat, sometimes in conditions of poor visibility or at night (DoE 2015). Further, there are

multiple records of these species, distributed around wetland habitats and waterways, that intersect or are adjacent to the project footprint. The proposed transmission line would intersect the typical flightpath of these species, and thus, increases collision and entanglement risks to migratory species travelling to inland feeding grounds (eg, Lake Albert, and Fivebough and Tuckerbil Swamps Ramsar Site). Therefore, the project may significantly impact Fork-tailed Swift, Sharped-tailed Sandpiper, Red-necked Stint, Latham's Snipe, Marsh Sandpiper, and Common Greenshank, without appropriate consideration of migratory patterns and mitigation options.

A summary of the NSW assessment bilateral requirements for migratory bird species is presented in Table A18- 41.

Table A18- 41: NSW assessment bilateral requirements for migratory birds

Common Name	NSW Assessment Bilateral requirements	Response
Fork-tailed Swift	Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations, and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	 Current distribution map for Fork-tailed Swift (DECCW, 2015) There is no adopted recovery plan, nor conservation advice for this species. However, the *Threat abatement plan for predation by feral cats* (DAWE 2015), has been identified as being relevant for the Fork-tailed Swift. Description of habitat is detailed in Table 1.
	Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	The field surveys undertaken were in accordance with the Survey guidelines for Australia's threatened birds, EPBC Act survey guidelines (DSEWPaC 2010). These included diurnal bird surveys in pockets of good quality habitat within the project footprint. Detailed methods can be found in Section 4.6 of the BDAR.
	Description of the relevant impacts and its regard to the full national extent of the species or community's range	The species is known to occupy the airspace above most vegetation formations, and habitats found within the project footprint (records within Bondo and Inland Slopes portion of the project footprint). Fork-tailed Swift is a non-breeding visitor to all states and territories of Australia (DCCEEW 2022f). In NSW, the Fork-tailed Swift is recorded in all regions (DCCEEW 2022f). Many records occur east of the Great Divide; however, a few populations have been found west of the Great Divide (DCCEEW 2022f). The project would remove 727.40 ha of potential (non-breeding) habitat. The area of occupancy for

Common Name	NSW Assessment Bilateral requirements	Response
		Fork-tailed Swift cannot be defined given lack of knowledge on the species. Therefore, the extent of impact on habitat is unknown on a national scale.
	Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Fork-tailed Swift: • Investigation into appropriate deterrent devices is recommended in areas of the project footprint considered high-risk of collision, electrocution, or entanglement • Micro-siting of transmission line infrastructure and associated construction working areas to avoid impacts to foraging resources, where possible. • Review species wildlife rehabilitation records, and BioNet records in the locality to understand flightpaths, and areas that are of higher risk to avifauna-strike • Development of a connectivity strategy.
	Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	The residual impact to Fork-tailed Swift is 727.40 ha of habitat removal. There is the potential for indirect impacts (such as reduced habitat connectivity, and increased risk of collision with transmission lines) within or adjacent to the project footprint.
	A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Potential residual impacts to the Fork-tailed Swift are considered to have the potential to be significant as detailed above. The Fork-tailed Swift is currently not listed under the BC Act and has no associated PCTs identified in BioNet. It is not identified as an ecosystem or species credit species. However, residual impacts to the species habitat would be offset under the NSW BOS through calculation of offsets required due to impacts to vegetation types with which it is associated (ecosystem credits). Offsets will be established/satisfied as detailed below. Details of offset requirements and obligations for the Fork-tailed Swift as a result of residual impacts of the project are addressed in Chapter 15 of the BDAR.
	Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.

Common Name	NSW Assessment Bilateral requirements	Response
	Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations will be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project/ • Payment into the Biodiversity Conservation Fund.
	Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All significant adverse impacts to the species have been addressed under the NSW BOS. In line with the SIA, there is likely to be significant residual impacts to the species that have not been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is required.
Black-faced Monarch	Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations, and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	 Current distribution map for Black-faced Monarch (DoE, 2023) There is no adopted recovery plan, nor conservation advice for this species. However, the *Threat abatement plan for predation by feral cats* (DAWE 2015), has been identified as being relevant for the Black-faced Monarch.

Common Name	NSW Assessment Bilateral requirements	Response
		Wet forest specialist, found mainly in rainforest and wet sclerophyll forest, especially in sheltered gullies and slopes with a dense understorey of ferns and/or shrubs.
	Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	The field surveys undertaken were in accordance with the Survey guidelines for Australia's threatened birds, EPBC Act survey guidelines (DSEWPaC 2010). These included diurnal bird surveys in pockets of good quality habitat within the project footprint. Detailed methods can be found in section 4.6 of the BDAR.
	Description of the relevant impacts and its regard to the full national extent of the species or community's range	The project has the potential to remove approximately 131.13 ha of potential habitat. There are no records of the species in proximity to the project footprint, however, the species is known to primarily occupy wet sclerophyll vegetation formations. The area of occupancy of the Black-faced Monarch is estimated at 260,000 ha and the national distribution of this species extends from Victoria, along the south-east coast of NSW, through to the southeast coast of Queensland (see distribution map above). The project will impact 0.05% of Black-faced Monarch habitat on a national scale.
	Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Black-faced Monarch: • Micro-siting of transmission line infrastructure and associated construction work to avoid and minimise the clearing of associated vegetation communities, where practicable • Development of a connectivity strategy.
	Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	The residual impact to Black-faced Monarch is 131.13 ha of habitat removal. There is the potential for indirect impacts (such as reduced habitat connectivity) within or adjacent to the project footprint. As detailed in the SIA above, residual impacts to the species were considered unlikely to be significant.
	A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Potential residual impacts to Black-faced Monarch are considered unlikely to be significant as detailed in the SIA. As such offsets are not proposed.
	Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements.

Common Name	NSW Assessment Bilateral requirements	Response
		The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.
	Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project/ Payment into the Biodiversity Conservation Fund.
	Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All adverse impacts to the species habitat have been addressed under the NSW BOS. There are no significant residual impacts to the species that have not been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required.
Satin Flycatcher	Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations, and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	 Current distribution map for Satin Flycatcher (DoE, 2020) There is no adopted recovery plan, nor conservation advice for this species.

Common Name	NSW Assessment Bilateral requirements	Response
	Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	The field surveys undertaken were in accordance with the Survey guidelines for Australia's threatened birds, EPBC Act survey guidelines (DSEWPaC 2010). These included diurnal bird surveys in pockets of good quality habitat within the project footprint. Detailed methods can be found in Section 4.6 of the BDAR.
	Description of the relevant impacts and its regard to the full national extent of the species or community's range	The species has not been recorded within proximity of the project footprint (within 20 km). Satin Flycatcher is known to occur in heavily vegetated gullies in eucalypt-dominated forests and taller woodlands. The project has the potential to remove approximately 595.03 ha of potential foraging habitat for this species. The area of occupancy of the Satin Flycatcher is estimated at 440,000 ha and the national distribution of this species extends from Victoria, along the southeast coast of NSW, through to the south-east coast of Queensland (see distribution map above). The project will impact 0.1% of Satin Flycatcher habitat on a national scale.
	Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Satin Flycatcher: • Investigation into appropriate deterrent devices is recommended in areas of the project footprint considered high-risk of collision, electrocution, or entanglement • Micro-siting of transmission line infrastructure and associated construction work sites to avoid impacts to foraging resources, where possible. • Review species wildlife rehabilitation records, and BioNet records in the locality to understand flightpaths, and areas that are of higher risk to avifauna-strike • Development of a connectivity strategy.
	Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	The residual impact to Satin Flycatcher is 595.03 ha of habitat removal. There is the potential for indirect impacts (such as reduced habitat connectivity) within or adjacent to the project footprint. As detailed in the SIA above, residual impacts to the species were considered unlikely to be significant.
	A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Potential residual impacts to Satin Flycatcher are considered unlikely to be significant as detailed above. As such offsets are not proposed.
	Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements.

Common Name	NSW Assessment Bilateral requirements	Response

	Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All adverse impacts to the species habitat have been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required.
Rufous Fantail	Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations, and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	 Current distribution map for Rufous Fantail (DoE, 2023)

Common Name	NSW Assessment Bilateral requirements	Response
		There is no adopted recovery plan, nor conservation advice for this species. However, *Draft referral guideline for 14 birds listed as migratory species under the EPBC Act* (DoE 2015), provides guidance on the conservation of the species.
	Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	The field surveys undertaken were in accordance with the Survey guidelines for Australia's threatened birds, EPBC Act survey guidelines (DSEWPaC 2010). These included diurnal bird surveys in pockets of good quality habitat within the project footprint. Detailed methods can be found in Section 4.6 of the BDAR.
	Description of the relevant impacts and its regard to the full national extent of the species or community's range	The species is known to occupy a range of habitats found within the project footprint. Therefore, the project has the potential to remove approximately 722.67 ha of opportunistic non-breeding habitat. The area of occupancy of the Rufous Fantail is estimated at 750,000 ha and the national distribution of this species extends from Victoria, along the south-east coast of NSW, through to the southeast coast of Queensland (see distribution map above). The project would impact 0.9% of Rufous Fantail habitat on a national scale.
	Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Rufous Fantail: • Investigation into appropriate deterrent devices is recommended in areas of the project footprint considered high-risk of collision, electrocution, or entanglement • Micro-siting of transmission line infrastructure and associated construction working areas to avoid impacts to foraging resources, where possible • Review species wildlife rehabilitation records, and BioNet records in the locality to understand flightpaths, and areas that are of higher risk to avifauna-strike • Development of a connectivity strategy.
	Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	The residual impact to Rufous Fantail is 722.67 ha of habitat removal. There is the potential for indirect impacts (such as reduced habitat connectivity) within or adjacent to the project footprint. As detailed in the SIA above, residual impacts to the species were considered unlikely to be significant.
	A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Potential residual impacts to Rufous Fantail are considered unlikely to be significant as detailed above. As such offsets are not proposed.

Common Name	NSW Assessment Bilateral requirements	Response
	Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance with the objects of the EPBC Act to offset significant residual adverse impacts	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements. The BDAR specifically addresses Section 11 of the BAM and provides information on the application of the no net loss standard and the project biodiversity offset obligations. Credit calculations were quantified using the BAM-C Version 57.
	Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project • Payment into the Biodiversity Conservation Fund.
	Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All adverse impacts to the species habitat have been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required.
White-throated Needletail	Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations, and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	
Common Name	NSW Assessment Bilateral requirements	Response
		Current distribution map for White-throated Needletail (DoE, 2023) There is no adopted recovery plan, however the approved conservation advice (DoE 2019) for this species provides guidance on its conservation, and recovery.
	Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	The field surveys undertaken were in accordance with the Survey guidelines for Australia's threatened birds, EPBC Act survey guidelines (DSEWPaC 2010). These included diurnal bird surveys in pockets of good quality habitat within the project footprint. Detailed methods can be found in Section 4.6 of the BDAR.
	Description of the relevant impacts and its regard to the full national extent of the species or community's range	The species is known to occupy the airspace above most vegetation formations, and habitats found within the project footprint (aerial forager). The project has the potential to remove approximately 85.09 ha of opportunistic/potential foraging habitat. The area of occupancy for White-throated Needletail cannot be defined given lack of knowledge on the species. Therefore, the extent of impact on habitat is unknown on a national scale.
	Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to White-throated Needletail: • Investigation into appropriate deterrent devices is recommended in areas of the project footprint considered high-risk of collision, electrocution, or entanglement • Micro-siting of transmission line infrastructure and associated construction working areas to avoid impacts to foraging resources, where possible • Review species wildlife rehabilitation records, and BioNet records in the locality to understand flightpaths, and areas that are of higher risk to avifauna-strike • Development of a connectivity strategy.
	Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	The residual impact to White-throated Needletail is 85.09 ha of habitat removal. There is the potential for indirect impacts (such as reduce habitat connectivity) within or adjacent to the project footprint. As detailed in the SIA above, residual impacts to the species were considered unlikely to be significant.
	A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Potential residual impacts to White-throated Needletail are considered unlikely to be significant as detailed above. As such offsets are not proposed.
	Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act

Common Name	NSW Assessment Bilateral requirements	Response
	with the objects of the EPBC Act to offset significant residual adverse impacts	Environmental Offset Policy through like for like offset trading requirements and the provisions for the establishment and securing into perpetuity of Biodiversity Stewardship Agreements.
	Details of the offset package to compensate for significant residual impacts including details of the credit profiles required to offset the action in accordance with the bam and/or mapping and descriptions of the extent and condition of the relevant habitat and/or threatened communities occurring on proposed offset sites	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. The offset obligations would be met through implementing a combination of the following offset delivery options: • The purchase and retirement of existing biodiversity credits currently available on the biodiversity credit register. • Establishing a biodiversity stewardship site(s) on lands with like for like biodiversity values to those impacted by the project • Payment into the Biodiversity Conservation Fund.
	Any significant residual impacts not addressed by the BAM may need to be addressed in accordance with the EPBC Act Environmental Offset Policy.	Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. All adverse impacts to the species habitat have been addressed under the NSW BOS. Therefore, application of the EPBC Act Environmental Offsets Policy is not required.
Sharp-tailed Sandpiper	Description of the habitat (including identification and mapping of suitable breeding habitat, suitable foraging habitat, important populations, and habitat critical for survival), with consideration of, and reference to, any relevant Commonwealth guidelines and policy statements including listing advice, conservation advice and recovery plan	 Current distribution map for Sharp-tailed Sandpiper (DoE, 2023) There is no adopted recovery plan, nor approved conservation advice for this species.

Common Name	NSW Assessment Bilateral requirements	Response
	Details of the scope, timing and methodology for studies or surveys used and how they are consistent with (or justification for divergence from) published Australian Government guidelines and policy statements	The field surveys undertaken were in accordance with the Survey guidelines for Australia's threatened birds, EPBC Act survey guidelines (DSEWPaC 2010). These included diurnal bird surveys in pockets of good quality habitat within the project footprint. Detailed methods can be found in Section 4.6 of the BDAR.
	Description of the relevant impacts and its regard to the full national extent of the species or community's range	The project has the potential to indirectly impact 54.98 ha of riparian habitat within the Inland Slopes portion of the project footprint and increase the potential for collision or entanglement. The area of occupancy for Sharp-tailed Sandpiper in Australia, primarily occurs in wetland habitats during annual migration. Given the migratory movements of this species, it is difficult to determine the extent of impact on habitat on a national scale.
	Description of the specific proposed avoidance and mitigation measures to deal with relevant impacts of the action	Proposed avoidance and mitigation measures for the project are outlined in Chapter 12 and 14 of the BDAR. The following measures are included to mitigate any residual impacts to Sharp-tailed Sandpiper: • Investigation into appropriate deterrent devices is recommended in areas of the project footprint considered high-risk of collision, electrocution, or entanglement • Micro-siting of transmission line infrastructure and associated construction working areas to avoid impacts to foraging resources, where possible • Review species wildlife rehabilitation records, and BioNet records in the locality to understand flightpaths, and areas that are of higher risk to avifauna-strike • Development of a connectivity strategy.
	Identification of significant residual adverse impacts likely to occur after the proposed activities to avoid and mitigate all impacts are taken into account	The residual impact to Sharp-tailed Sandpiper is 54.98 ha of potential habitat removal. There is the potential for indirect impacts (such as reduce habitat connectivity, and increased risk of collision) within or adjacent to the project footprint.
	A description of any offsets proposed to address residual adverse significant impacts and how these offsets will be established	Potential residual impacts to the Sharp-tailed Sandpiper are considered to have the potential to be significant as detailed above. The Sharp-tailed Sandpiper is currently not listed under the BC Act and has no associated PCTs identified in BioNet. It is not identified as an ecosystem or species credit species. However, residual impacts to the specie's habitat would be offset under the NSW BOS through calculation of offsets required due to impacts to vegetation types with which it is associated (ecosystem credits). Offsets would be established/satisfied as detailed below. Details of offset requirements and obligations for the Sharp-tailed Sandpiper as a result of residual impacts of the project are addressed in Chapter 15 of the BDAR.
	Details of how the current published NSW Biodiversity Assessment Method (BAM) has been applied in accordance	All significant residual impacts would be addressed through the provision of biodiversity offsets under the NSW BOS. Offsets delivered under the NSW BOS address the requirements of the EPBC Act

Chapter 16 of the BDAR outlines the biodiversity offset strategy for the project. Any significant residual impacts not addressed by the BAM will be addressed in accordance with the EPBC Act Environmental Offset Policy.

Attachment 19. Aquatic assessment of significance

Six FM Act listed threatened aquatic species and one FM Act listed Endangered Ecological Community (EEC) have been identified as having the potential to occur within the project footprint based upon an assessment of habitats available and review of desktop information sources (Section 10.2.1). Assessments of Significance under the FM Act have been completed for the following threatened biota listed under the FM Act:

- Lowland Murray River EEC (*Aquatic Ecological Community In The Natural Drainage System Of The Lower Murray River Catchment)*
- Murray Crayfish *(Euastacus armatus)*
- Small-bodied Fish
    - Southern Pygmy Perch *(Nannoperca australis)*
    - Flatheaded Galaxias *(Galaxias rostratus)*
- Large-bodied Fish
    - Trout Cod (*Maccullochella macquariensis*)
    - Silver Perch (*Bidyanus bidyanus*)
    - Macquarie Perch *(Macquaria australasica).*

The proposed construction methodology for the transmission line structures themselves avoids direct impacts to streams and waterways, as discussed in Chapter 13.7. Importantly, this includes the major waterways and majority of streams included in Key Fish Habitat (KFH) mapping within the project footprint. The maximum aquatic impact likely to occur at any of waterways relevant to the proposed transmission line would be the removal or trimming of tree canopy on waterway banks to facilitate the construction and operation of the transmission lines spanning riparian areas, as necessary. Tree trunk bases and understory species would be retained in-situ adjoining the waterway banks. All potential erosion and sedimentation impacts would be managed and monitored to ensure that these do not impact the riparian areas (described in Chapter 14). At most, any unintended impact to water quality would be temporary and negligible. The result being that riparian areas would retain their current function.

Construction of waterway crossings to support access for the project has been identified as the primary pathway of potential impact to aquatic habitats as this would result in the direct disturbance to aquatic ecosystems. A total of 280 streams were identified as occurring within the project footprint and intersecting with indicative access track locations that cross waterways. Of these, 194 are first order and 60 are second order streams, combining to total 91 per cent of streams intersecting indicative access track locations, reflecting the dominance of smaller streams within the project footprint. The majority of these streams appear to be in poor condition as a result of land clearing, online dam construction, clearing, grazing and cropping and cropping, as well as existing informal access track and waterway crossing construction. The existing impacts have resulted in deleterious processes such as bank erosion and channel incision and contribute to an overall picture of degraded aquatic habitats within the project footprint. Detailed consideration of access track locations that intersect with mapped KFH or indicative distribution mapping for threatened aquatic species (DPI 2022a), have been made in Chapter 10.

Avoiding and minimizing impacts on aquatic habitats would be a priority of the detailed design

(Chapter 12). Detailed mitigation measures to guide the design, construction and operational phase of these crossing locations have been made in Chapter 14 to control and reduce the potential for any residual indirect impacts to aquatic ecosystems.

Nevertheless, significance assessments for these six threatened aquatic species and one EEC have been completed following the threatened species assessment guidelines (DPI 2008) and are presented in the following sections.

Small-bodied fish

Flatheaded Galaxias (*Galaxias rostratus*): Critically Endangered species	Southern Pygmy Perch (*Nannoperca australis*): Endangered species
Distribution: The Flatheaded Galaxias is restricted to the southern Murray-Darling Basin (Lintermans 2007). Although the species once occurred in the middle reaches of the Lachlan, Murrumbidgee and Murray River catchments in New South Wales (Threatened Species Scientific Committee 2016), the last record in the Murrumbidgee River was in 1971 and the species may be locally extinct from Murrumbidgee and Lachlan rivers (Fisheries Scientific Committee 2008). Indicative distribution mapping for the species by NSW DPI includes Tarcutta Creek, the Tumut River, Umbango Creek and Kyeamba Creek in the Murrumbidgee catchment within the project footprint. **Habitats:** The species occurs in still and gently flowing small streams, lakes, lagoons, billabongs and backwaters with coarse sand or muddy substrate and aquatic vegetation (NSW DPI 2014). Key threats to the species are considered to be river regulation, habitat degradation including agriculture and the removal of aquatic and riparian vegetation, water pollution and competition with and predation by alien fish species (Threatened Species Scientific Committee 2016). All of these key threats are in operation within the project footprint at significant levels and as such potential habitats for the species would in general terms be considered marginal.	**Distribution:** The Southern Pygmy Perch was once widely distributed throughout the Lachlan, Murrumbidgee and Murray River system. In NSW, the species is now restricted to sections of three waterways In New South Wales, which include a tributary of the Lachlan River (Blakney Creek near Yass) and two tributaries of the Murray River, aside from five additional conservation stocking sites (NSW DPI 2013, Threatened Species Scientific Committee 2021). All of which are outside the project footprint and subcatchments. Lintermans (2007) notes that the Southern Pygmy Perch has now disappeared from most locations in NSW. Fourteen waterways within the project footprint have been identified as being within the indicative distribution of the species (NSW DPI 2022). Indicative waterway crossings are located at Yellow Creek (V8-13) and an unnamed stream (V8-12) have been included in indicative distribution mapping for the Southern Pygmy Perch (DPI 2022a), identified in Table 9 2 and Figure 9 1. Habitats within the relevant sections of Yellow Creek (V8-13) and unnamed stream (V8-12) are not considered to be important to the species based upon the levels of landscape modification. This is particularly so for unnamed stream (V8-12) which is a chain of farm dams rather than a waterway, with the indicative access track alignment avoiding these waterbodies. There are numerous existing crossings in proximity to both indicative crossing locations. It is anticipated that any constructed crossings upgrades associated with the project would contribute to overall improvements to aquatic conditions and be more sensitive than existing informal crossings and would not result in any additional deleterious processes. **Habitats:** The Southern Pygmy Perch prefers slow flowing or still waters in small streams, billabongs, vegetated lakes and irrigation channels with dense aquatic vegetation and habitat cover (Lintermans 2007). These habitats are generally absent within the

Flatheaded Galaxias (*Galaxias rostratus*): Critically Endangered species	Southern Pygmy Perch (*Nannoperca australis*): Endangered species
	project footprint, and where present in some form, they are typically limited and have been subject to impact or deleterious processes such as grazing and riparian clearing. Key threats to the species are habitat degradation, including the loss of aquatic and riparian vegetation. As such, potential habitats for the within the project footprint for the species would be marginal.

Potential impacts:

Overall, these species are considered unlikely to occur within the project footprint. This is given the known current distribution of the species, limited suitable habitats and generally degraded stream conditions within the project footprint. As a precautionary approach an Assessment of Significance has been completed.

The construction process for the transmission line structures avoids direct impacts to streams. As such, this assessment primarily considers the potential residual indirect impacts following the implementation of avoidance and mitigation measures, to the species (ie the removal of native riparian vegetation, erosion and sedimentation risk during track construction), as described in Section 13.7.

An action is likely to have a significant impact on a critically endangered species if there is a real chance or possibility that it will:

Criteria	Address of Criteria
a) in the case of a threatened species, whether the proposed development or activity is likely to have an adverse effect on the life cycle of the species such that a viable local population of the species is likely to be placed at risk of extinction	The project is considered unlikely to adversely affect the life cycle of these species such that a viable local population is likely to be placed at risk of extinction as: • There would be no direct impacts to habitats in the known range of the species. • Any indirect impacts that may occur would be localised and temporary in nature. • A number of avoidance and mitigation measures have been incorporated into the project. • Detailed recommendations as to additional mitigation measures to prevent or reduce indirect impacts to potential habitats for the species have been included in this report.
b) in the case of an endangered population, whether the action proposed is likely to have an adverse effect on the life cycle of the species that constitutes the endangered population such that a viable local population of the species is likely to be placed at risk of extinction	Not applicable.
c) in the case of an endangered ecological community or critically endangered ecological community, whether the proposed development or activity:	Not applicable.

Flatheaded Galaxias (*Galaxias rostratus*): Critically Endangered species	Southern Pygmy Perch (*Nannoperca australis*): Endangered species
i. is likely to have an adverse effect on the extent of the ecological community such that its local occurrence is likely to be placed at risk of extinction, or ii. Is likely to substantially and adversely modify the composition of the ecological community such that its local occurrence is likely to be placed at risk of extinction,	
d) in relation to the habitat of a threatened species or ecological community: i. the extent to which habitat is likely to be removed or modified as a result of the proposed development or activity, and ii. whether an area of habitat is likely to become fragmented or isolated from other areas of habitat as a result of the proposed development or activity, and iii. the importance of the habitat to be removed, modified, fragmented or isolated to the long-term survival of the species or ecological community in the locality,	In general, potential habitats for these species within the project footprint would be considered marginal, given the extent of landscape modifications and existing operation of key threats to the species. The nature and scale of possible indirect impacts to potential habitats for these species are not considered significant, especially in the context of existing conditions. It is considered unlikely that the potential indirect impacts would be so significant that they would render any potential habitats no longer suitable, or thereby fragment populations. No indicative access track crossings occur within waterways identified as being within the indicative distribution of the Flatheaded Galaxias and therefore the project would not result in any barriers to fish passage within this indicative distribution. The indicative access track crossing at Yellow Creek (V8-13) and unnamed stream (V8-12) are unlikely to result in any additional barriers to fish passage for the Southern Pygmy Perch, given the streams are outside the known distribution of the species described by Lintermans (2007) and Threatened Species Scientific Committee 2021. Also, in consideration of the number of existing informal access tracks, apparent level of flow at V8-13 and online dams present at V8-12, these potential habitats are considered marginal given the levels of landscape modification, evidence of riparian clearing, grazing bank and erosion described. Considering these factors, the project is considered unlikely to fragment an existing population into two or more populations.
e) whether the proposed development or activity is likely to have an adverse effect on critical habitat (either directly or indirectly),	No critical habitat has been declared for the Flatheaded Galaxias or Southern Pygmy Perch.

Flatheaded Galaxias (*Galaxias rostratus*): Critically Endangered species	Southern Pygmy Perch (*Nannoperca australis*): Endangered species
f) whether the action proposed is consistent with the objectives or actions of a recovery plan or threat abatement plan.	No recovery plans or threat abatement plans have been prepared for these species.
g) whether the proposed development or activity is or is part of a key threatening process or is likely to increase the impact of a key threatening process.	The project has the potential to contribute to the operation of three Key Threatening Processes (KTP's). These are: • Degradation of native riparian vegetation along New South Wales water courses • Installation and operation of instream structures and other mechanisms that alter natural flow regimes of rivers and streams. • Removal of large woody debris from New South Wales rivers and streams. Avoidance and mitigation measures have been incorporated into the project to minimise the potential for the operation of these KTP's. Additional recommended mitigation measures have been detailed in the following sections to further mitigate the potential for impacts to aquatic environments, including the operation of these KTP's. The project is unlikely to significantly increase the operation of these KTP's, given the landscape context of the project footprint which has been subject to significant existing levels of operation for each of these KTP's.
Conclusion: Considering the following: • Potential habitats for the species within the project footprint would be considered marginal. • No direct impacts to habitats in the known ranges for these species would occur. • Any potential indirect impacts that may occur would be localised and temporary. • The potential for residual indirect impacts would be managed through mitigation measures. It is unlikely that any population of Flathead Galaxias or Southern Pygmy Perch would be significantly impacted by the project.	

Large-bodied fish

Macquarie Perch (*Macquaria australasica*): Endangered species	Trout Cod (*Maccullochella macquariensis*): Endangered species	Silver Perch (*Bidyanus bidyanus*): Critically Endangered species
Distribution: Macquarie Perch from the Murray-Darling Basin strain of the species may occur in the upstream reaches of the Lachlan, Murrumbidgee and Murray rivers. Indicative distribution mapping by NSW DPI for the species	**Distribution:** The only known naturally reproducing (non-translocated) population of Trout Cod occurs in the Murray River below Yarrawonga Weir (NSW DPI 2006), although stocking has occurred at various locations	**Distribution:** Silver perch are endemic to the Murray-Darling system (including all states and sub-basins) and previously occurred in a range of habitats. Silver Perch are generally found in lowland areas outside of cooler

Macquarie Perch (*Macquaria australasica*): Endangered species	Trout Cod (*Maccullochella macquariensis*): Endangered species	Silver Perch (*Bidyanus bidyanus*): Critically Endangered species
includes the Lachlan River and Adjungbilly Creek within the project footprint, although a number of streams may be within the historic distribution of the species (NSW DPI 2015c, NSW DPI 2016a). Overall, the species is considered unlikely to occur within the Murrumbidgee River in the project footprint, with the known population of the species in this river occurring in upstream reaches south of Canberra (DEE 2018). **Habitats:** The Macquarie Perch may occur in stream or lake habitats, with a preference for upper river reaches or tributaries, and lake dwelling individuals of the species will migrate into these habitats to spawn (NSW DPI 2016a). Typical habitat for the species is described as being a large and moderately deep pool immediately upstream of fast-flowing broken water with aquatic vegetation and additional cover in the form of large boulders, debris and overhanging banks, with stream shading provided by steep rock faces, riparian trees or over hanging bank vegetation (DEE 2018).	within the Murrumbidgee River with some success, and Tumut River, although this seems unsuccessful or at least undetermined (Lintermans 2007, Trout Cod Recovery Team 2008). Indicative distribution mapping for the species by NSW DPI includes the Murrumbidgee River within the project footprint. **Habitats:** The species occurs in a variety of flowing habitats, typically in the mid to upper reaches of rivers and streams with cover in the form of woody debris or boulders (Trout Cod Recovery Team 2008). Habitats for the species require substantial amounts of large in-stream woody debris, which provides complex habitat supporting each life-cycle stage of the species (NSW DPI 2017). While such habitats are limited within the project footprint, the species cannot be ruled out as occurring.	upstream waters, although the species may undertake large scale migrations into upstream reaches. Indicative distribution mapping for the species within the project footprint includes the Murrumbidgee River (NSW DPI 2016b, 2022), although currently there is only one known strong viable natural population in the middle Murray region (Threatened Species Scientific Committee 2013). **Habitats:** Silver Perch are generally found in faster flowing streams, including rapid habitats, in more open water habitats. Although the species has also been stocked into impoundments. River regulation, habitat degradation (in particular loss of submerged aquatic macrophytes and siltation), disease and invasive fish species are all identified as key threats to the species (Threatened Species Scientific Committee 2013).
Potential impacts: No streams within the indicative distribution mapping (NSW DPI 2022) for these species are identified as locations for indicative access tracks. The construction process for the transmission line structures avoids direct impacts to streams and none of the waterways that have been mapped as within the species indicative distribution would be crossed by any indicative waterway crossings. As such, this assessment of significance assesses the potential residual indirect impacts following the implementation of avoidance and mitigation measures to the species (ie the removal of native riparian vegetation, erosion and sedimentation risk during track construction), as described in Chapter 12 and 14.		
An action is likely to have a significant impact on a critically endangered species if there is a real chance or possibility that it will:		
Criteria	**Address of Criteria**	
a) in the case of a threatened species, whether the proposed development or activity is likely to have an adverse	The project is considered unlikely to adversely affect the life cycle of the species such that a viable local population of the species is likely to be placed at risk of extinction as: • There would be no direct impacts to potential habitats within the indicative distributions of the species.	

Macquarie Perch (*Macquaria australasica*): Endangered species	Trout Cod (*Maccullochella macquariensis*): Endangered species	Silver Perch (*Bidyanus bidyanus*): Critically Endangered species
effect on the life cycle of the species such that a viable local population of the species is likely to be placed at risk of extinction	• Any indirect impacts that may occur would be localised and temporary in nature. • A number of avoidance and mitigation measures have been incorporated into the project. • Detailed recommendations as to additional mitigation measures to prevent or reduce indirect impacts to potential habitats for the species have been included in this report.	
b) in the case of an endangered population, whether the action proposed is likely to have an adverse effect on the life cycle of the species that constitutes the endangered population such that a viable local population of the species is likely to be placed at risk of extinction	Not applicable.	
c) in the case of an endangered ecological community or critically endangered ecological community, whether the proposed development or activity: i. is likely to have an adverse effect on the extent of the ecological community such that its local occurrence is likely to be placed at risk of extinction, or ii. Is likely to substantially and adversely modify the composition of the ecological community such that its local occurrence is likely to be placed at risk of extinction,	Not applicable.	
d) in relation to the habitat of a threatened species or ecological community:	Potential habitats for the species within the project footprint are subject to existing levels of impacts through landscape modification, flow regulation and the degradation of riparian zones.	

Macquarie Perch (*Macquaria australasica*): Endangered species	Trout Cod (*Maccullochella macquariensis*): Endangered species	Silver Perch (*Bidyanus bidyanus*): Critically Endangered species
i. the extent to which habitat is likely to be removed or modified as a result of the proposed development or activity, and ii. whether an area of habitat is likely to become fragmented or isolated from other areas of habitat as a result of the proposed development or activity, and iii. the importance of the habitat to be removed, modified, fragmented or isolated to the long-term survival of the species or ecological community in the locality,	The nature and scale of possible indirect impacts to potential habitats for the species are not considered significant, especially in the context of existing conditions. It is considered unlikely that the potential indirect impacts would be so significant that they would render any potential habitats no longer suitable, or thereby fragment populations. No indicative access track crossings occur within waterways identified as being within the indicative distribution of the species or known populations and therefore the project would not result in any barriers to fish passage within these reaches. As such, the project is considered unlikely to fragment an existing population into two or more populations.	
e) whether the proposed development or activity is likely to have an adverse effect on critical habitat (either directly or indirectly),	To date, no critical habitat for these species has been included in the Register of Critical Habitat. The National Recovery Plan for the Macquarie Perch (DEE 2018) identifies critical habitat as: • All areas within the species' range which are characterised by flowing runs or riffles and small complex rock piles; • The current area of occupancy of the species (including historically translocated populations in Cataract Reservoir and the Mongarlowe River in New South Wales and the Yarra River in Victoria); • Any newly discovered locations within the species' natural range which hold populations that extend the area of occupancy for the species; • Unoccupied habitat within the species' natural range into which the species could disperse, be stocked or be translocated. Whilst the current area of occupancy is referenced in the National Recovery Plan for the Macquarie Perch, the document does not define this current area of occupancy of the species. The project footprint does extend into the natural range of the species as described in the National Recovery Plan, as it includes Adjungbilly Creek. Sections of riffle may be present along reaches of Adjungbilly Creek and the Lachlan River within or adjacent to the project footprint, as such these habitats may be considered critical habitat. Neither the National Recovery Plan (Trout Cod Recovery Team 2008) or NSW Recovery Plan (NSW DPI 2006a) for Trout Cod does not identify habitat critical to the survival of the species. The National Recovery Plan does note that an assessment of habitat critical to	

Macquarie Perch (*Macquaria australasica*): Endangered species	Trout Cod (*Maccullochella macquariensis*): Endangered species	Silver Perch (*Bidyanus bidyanus*): Critically Endangered species
	survival of the Trout Cod population in the Murray River found that the species inhabited river positions where large woody debris was present in high quantity, close to deeper water and high surface velocity, further from the bank (Trout Cod Recovery Team 2008). No direct impacts to critical habitat would occur as a result of the project. Any indirect impacts that may occur would be temporary and localised. The key potential indirect impact that could occur would be the potential for sedimentation associated with construction work that could infill the interstitial spaces between rocks and pebbles used by Macquarie Perch for spawning. This is considered unlikely to occur given mitigation measures adopted and recommended to control this risk and the distance at which construction would be taking place from these reaches that would be considered critical habitat (approximately 50 metres from the bank). Recommendations to avoid and mitigate impacts to coarse woody debris, key habitat for the Trout Cod have been included in this report.	
f) whether the action proposed is consistent with the objectives or actions of a recovery plan or threat abatement plan.	The National Recovery Plan for the Macquarie Perch (DEE 2018) identifies the following strategies to achieve the recovery plan objectives: • Conserve existing Macquarie perch (including historically translocated populations in Cataract Reservoir and the Mongarlowe and Yarra rivers) • Protect and restore Macquarie perch habitat • Understand and address threats to Macquarie perch populations and habitats • Establish additional Macquarie perch populations within the species' natural range • Improve understanding of the biology and ecology of the Macquarie perch and its distribution and abundance; and • Increase participation by community groups in Macquarie perch conservation. The NSW Trout Cod Recovery Plan (DPI 2006a) identifies recovery actions to occur in a number of areas, including: • Habitat protection and restoration • Reduce the impact of Illegal fishing and incidental capture • Minimising risks from inter-specific competition and introduced species • Establishing new populations through stocking • Research and monitoring • Community awareness, involvement and support. The NSW Silver Perch Recovery Plan (DPI 2006b) identifies recovery actions to occur in a number of areas, including: • Increase awareness of the current status of silver perch throughout its range.	

Macquarie Perch (*Macquaria australasica*): Endangered species	Trout Cod (*Maccullochella macquariensis*): Endangered species	Silver Perch (*Bidyanus bidyanus*): Critically Endangered species
	• Increase scientific knowledge of the current distribution, ecological and habitat requirements and population genetics of silver perch. • Protect and enhance remaining natural populations of silver perch. • Ameliorate the impacts of known major threats to silver perch. • Minimise any fishing impacts on natural populations through enhanced compliance with fishing regulations and involvement of recreational fishers. • Improve management of aquaculture and stocking programs. • Encourage and support the involvement of indigenous communities in the implementation of recovery actions. • Establish a program to monitor the status of silver perch and evaluate the effectiveness of recovery actions. The project would not directly interfere with these strategies or associated actions.	
g) whether the proposed development or activity is or is part of a key threatening process or is likely to increase the impact of a key threatening process.	The project has the potential to contribute to the operation of three KTP's. These are: • Degradation of native riparian vegetation along New South Wales water courses • Installation and operation of instream structures and other mechanisms that alter natural flow regimes of rivers and streams. • Removal of large woody debris from New South Wales rivers and streams. Avoidance and mitigation measures have been incorporated into the project to minimise the potential for the operation of these KTP's. Additional recommended mitigation measures have been detailed in the following sections to further mitigate the potential for impacts to aquatic environments, including the operation of these KTP's. The project is unlikely to significantly increase the operation of these KTP's, especially given the landscape context of the project footprint that that has been subject to significant existing levels of operation for each of these KTP's.	
Conclusion: Considering the following: • No direct impacts to potential habitats for the species will occur. • Any potential indirect impacts that may occur would be localised and temporary. • The potential for residual indirect impacts would be managed through mitigation measures. it is unlikely that any local population of Macquarie Perch, Trout Cod or Silver Perch would be significantly impacted by the project.		

Murray Crayfish (*Euastacus armatus*)

Murray Crayfish (*Euastacus armatus*)	**Vulnerable species**
Distribution and Habitats: The Murray Crayfish may occur in the streams within the Murrumbidgee catchment with indicative distribution mapping including 13 streams within the project footprint identified in Table 9-1 (NSW DPI 2018, 2022). The species may occupy a range of habitats from pasturelands to sclerophyll forest with cool, well oxygenated flowing water (NSW DPI 2019). **Potential impacts:** No streams within the indicative distribution mapping (NSW DPI 2022) for the species are identified as locations for indicative access tracks. The construction process for the transmission line structures avoids direct impacts to streams and none of the waterways that have been mapped as within the species indicative distribution would be crossed by any indicative waterway crossings. As such, this assessment of significance assesses the potential residual indirect impacts following the implementation of avoidance and mitigation measures to the species (ie the removal of native riparian vegetation, erosion and sedimentation risk during track construction), as described in Chapter 13.7.	
An action is likely to have a significant impact on a critically endangered species if there is a real chance or possibility that it will:	
Criteria	**Address of Criteria**
a) in the case of a threatened species, whether the proposed development or activity is likely to have an adverse effect on the life cycle of the species such that a viable local population of the species is likely to be placed at risk of extinction	The project is considered unlikely to adversely affect the life cycle of the species such that a viable local population of the species is likely to be placed at risk of extinction as: • There would be no direct impacts to potential habitats within the indicative distribution of the species. • Any indirect impacts that may occur would be localised and temporary in nature. • A number of avoidance and mitigation measures have been incorporated into the project. • Detailed recommendations as to additional mitigation measures to prevent or reduce indirect impacts to potential habitats for the species have been included in this report.
b) in the case of an endangered population, whether the action proposed is likely to have an adverse effect on the life cycle of the species that constitutes the endangered population such that a viable local population of the species is likely to be placed at risk of extinction	Not applicable.
c) in the case of an endangered ecological community or critically endangered ecological community, whether the proposed development or activity:	Not applicable.

Murray Crayfish (*Euastacus armatus*)	Vulnerable species
i. is likely to have an adverse effect on the extent of the ecological community such that its local occurrence is likely to be placed at risk of extinction, or ii. Is likely to substantially and adversely modify the composition of the ecological community such that its local occurrence is likely to be placed at risk of extinction,	
d) in relation to the habitat of a threatened species or ecological community: i. the extent to which habitat is likely to be removed or modified as a result of the proposed development or activity, and ii. whether an area of habitat is likely to become fragmented or isolated from other areas of habitat as a result of the proposed development or activity, and iii. the importance of the habitat to be removed, modified, fragmented or isolated to the long-term survival of the species or ecological community in the locality,	Potential habitats for the species within the project footprint are subject to existing levels of impacts through landscape modification and the degradation of riparian zones. The nature and scale of possible indirect impacts to potential habitats for the species are not considered significant, especially in the context of existing conditions. It is considered unlikely that the potential indirect impacts would be so significant that they would render any potential habitats no longer suitable, or thereby fragment populations. No indicative access track crossings occur within waterways identified as being within the indicative distribution of the species or known populations and therefore the project will not result in any barriers to fish passage within these reaches. As such, the project is considered unlikely to fragment an existing population into two or more populations.
e) whether the proposed development or activity is likely to have an adverse effect on critical habitat (either directly or indirectly),	To date, no critical habitat for the species has been included in the Register of Critical Habitat. No direct impacts to critical habitat would occur as a result of the project. Any indirect impacts that may occur would be temporary and localised.
f) whether the action proposed is consistent with the objectives or actions of a recovery plan or threat abatement plan.	No recovery plan or threat abatement plan has been prepared for this species.
g) whether the proposed development or activity is or is part of a key threatening process or is likely to increase the impact of a key threatening process.	The project has the potential to contribute to the operation of three Key Threatening Processes (KTP's). These are: • Degradation of native riparian vegetation along New South Wales water courses • Installation and operation of instream structures and other mechanisms that alter natural flow regimes of rivers and streams. • Removal of large woody debris from New South Wales rivers and streams.

Murray Crayfish (*Euastacus armatus*)	Vulnerable species
	Avoidance and mitigation measures have been incorporated into the project to minimise the potential for the operation of these KTP's. Additional recommended mitigation measures have been detailed in the following sections to further mitigate the potential for impacts to aquatic environments, including the operation of these KTP's. The project is unlikely to significantly increase the operation of these KTP's, especially given the landscape context of the project footprint that that has been subject to significant existing levels of operation for each of these KTP's.
Conclusion: Considering the following: • No direct impacts to potential habitats for the species will occur. • Any potential indirect impacts that may occur would be localised and temporary. • The potential for residual indirect impacts would be managed through mitigation measures. it is unlikely that any local population of Murray Crayfish would be significantly impacted by the project.	

Aquatic Ecological Community In The Natural Drainage System Of The Lower Murray River Catchment

Lowland Murray River EEC	Endangered Ecological Community
Distribution: Of relevance to the project, the lower Murray River aquatic ecological community includes the Murrumbidgee River below Burrinjuck Dam and the Tumut River below Blowering Dam, while the Lachlan River and its tributaries are excluded from the aquatic ecological community. The lower Murray aquatic ecological community includes all native fish and aquatic invertebrates within all natural creeks, rivers and associated lagoons, billabongs and lakes of the regulated portions of the Murray, Murrumbidgee and Tumut rivers, as well as all their tributaries and branches (NSW DPI 2007). **Potential impacts:** The construction process for the transmission line structures avoids direct impacts to streams. A number of access track crossings would be required to support the project, which present the primary pathway of potential direct impact to aquatic environments. A total of 28 indicative access track crossings intersect with 23 streams that are mapped as KFH or indicative distribution mapping for threatened aquatic species (DPI 2022a), which are most likely to present higher ecological values, higher stream orders and more permanent water (as described in Section 4.8.3). These 23 streams are typically small and subject to degrees of existing degradation, appearing to be in an overall poor condition. Only three of these streams have received freshwater fish community grades, with each of these described as "Very Poor". There is also the potential for residual	

Lowland Murray River EEC	Endangered Ecological Community
indirect impacts following the implementation of avoidance measures (ie the removal of native riparian vegetation, erosion and sedimentation risk during track construction). A comprehensive suite of mitigation measures have been adopted and recommended to further reduce the likelihood of potential impacts to natural biota within the lower Murray aquatic ecological community, as described in Section 14.2.	
An action is likely to have a significant impact on a endangered ecological community if there is a real chance or possibility that it will:	
Criteria	**Address of Criteria**
a) in the case of a threatened species, whether the proposed development or activity is likely to have an adverse effect on the life cycle of the species such that a viable local population of the species is likely to be placed at risk of extinction	Not applicable.
b) in the case of an endangered population, whether the action proposed is likely to have an adverse effect on the life cycle of the species that constitutes the endangered population such that a viable local population of the species is likely to be placed at risk of extinction	Not applicable.
c) in the case of an endangered ecological community or critically endangered ecological community, whether the proposed development or activity: i. is likely to have an adverse effect on the extent of the ecological community such that its local occurrence is likely to be placed at risk of extinction, or ii. Is likely to substantially and adversely modify the composition of the ecological community such that its local occurrence is likely to be placed at risk of extinction,	The project is considered unlikely to adversely affect the extent, or modify the composition, of the community such that the local occurrence is likely to be placed at risk of extinction as: • There is the potential for the project to result in small scale and localised impacts to aquatic habitats and biota at the indicative access track crossings. However, the scale of these potential impacts are not considered significant in the context of existing conditions • These potential impacts are not at the level at which it would result in any declines in the extent of the community, or result in changes to, or a loss of any overall community composition. • Any indirect impacts that may occur would be localised and temporary in nature. • A number of avoidance and mitigation measures have been incorporated into the project. • Detailed recommendations as to additional mitigation measures to prevent or reduce indirect impacts to potential habitats for the species have been included in this report.
d) in relation to the habitat of a threatened species or ecological community: i. the extent to which habitat is likely to be removed or modified as a result of the proposed development or activity, and	The nature and scale of possible indirect impacts to potential habitats for the species are not considered significant, especially in the context of existing conditions. It is considered unlikely that the potential indirect impacts would be so significant that they would render any potential habitats no longer suitable for native aquatic biota.

Lowland Murray River EEC	Endangered Ecological Community
ii. whether an area of habitat is likely to become fragmented or isolated from other areas of habitat as a result of the proposed development or activity, and iii. the importance of the habitat to be removed, modified, fragmented or isolated to the long-term survival of the species or ecological community in the locality,	The construction of access track crossings has the potential to result in localised impediments to fish passage. However, these indicative access tracks are located across predominantly small streams (stream orders of 1 or 2) and no impediments to the potential movement of any threatened species are anticipated. These localised crossings are not considered to represent significant impacts in the context of existing degraded conditions, or likely to result in any further significant decline in stream conditions. Furthermore, the design of the access tracks will be in accordance with relevant guidelines including: • Policy and guidelines for fish habitat conservation and management (Fairfull 2013) • Policy and Guidelines for Fish Friendly Waterway Crossings (DPI N.D.) • Why do fish need to cross the road? Fish Passage Requirements for Waterway Crossings (DPI 2003) • Water Guidelines for Controlled Activities on Waterfront Land (DPI Office of Water 2012). Based on the desktop assessment of aquatic points of interest and the KFH at indicative crossing locations, the aquatic habitat to be impacted is not considered important to the long-term survival of the ecological community.
e) whether the proposed development or activity is likely to have an adverse effect on critical habitat (either directly or indirectly),	To date, no critical habitat for the community has been included in the Register of Critical Habitat.
f) whether the action proposed is consistent with the objectives or actions of a recovery plan or threat abatement plan.	No recovery plan or threat abatement plan has been prepared for this community.
g) whether the proposed development or activity is or is part of a key threatening process or is likely to increase the impact of a key threatening process.	The project has the potential to contribute to the operation of three Key Threatening Processes (KTP's). These are: • Degradation of native riparian vegetation along New South Wales water courses • Installation and operation of instream structures and other mechanisms that alter natural flow regimes of rivers and streams. • Removal of large woody debris from New South Wales rivers and streams. Avoidance and mitigation measures have been incorporated into the project to minimise the potential for the operation of these KTP's. Additional recommended mitigation measures have been detailed in the following sections to further mitigate the potential for impacts to aquatic environments, including the operation of these KTP's.

Lowland Murray River EEC	Endangered Ecological Community
	The project is unlikely to significantly increase the operation of these KTP's, especially given the landscape context of the project footprint that that has been subject to significant existing levels of operation for each of these KTP's.

Conclusion: Considering the following:

- Potential impacts would be small scale and localised.
- The scale of these potential impacts are not considered significant in the context of existing conditions, or at the level at which they would result in any declines in the extent of the community, or change the overall community composition.
- Any indirect impacts that may occur would be localised and temporary in nature.
- A number of avoidance and mitigation measures have been incorporated into the project.

it is unlikely that any local population of Lowland Murray River EEC would be significantly impacted by the project.

Attachment 20. Ecosystem and species credits required (BAM-C credit report)

BAM Biodiversity Credit Report (Variations)

Proposal Details

Assessment Id
00029440/BAAS17040/21/00029447

Proposal Name
6699 Humelink Assessment - Bondo

BAM data last updated *
22/06/2023

Assessor Name
Simon Tweed

Assessor Number
BAAS17040

BAM Data version *
61

Proponent Name(s)
Jack McGovern

Report Created
18/08/2023

BAM Case Status
Finalised

Assessment Revision
6

Assessment Type
Major Projects

Date Finalised
18/08/2023

Potential Serious and Irreversible Impacts

Name of threatened ecological community	Listing status	Name of Plant Community Type/ID
Nil		

Species
Pseudomys fumeus / Smoky Mouse

Additional Information for Approval

PCT Outside Ibra Added

None added

PCTs With Customized Benchmarks

PCT
No Changes

Predicted Threatened Species Not On Site

Name
No Changes

Ecosystem Credit Summary (Number and class of biodiversity credits to be retired)

Name of Plant Community Type/ID	Name of threatened ecological community	Area of impact	HBT Cr	No HBT Cr	Total credits to be retired
285-Broad-leaved Sally grass - sedge woodland on valley flats and swamps in the NSW South Western Slopes Bioregion and adjoining South Eastern Highlands Bioregion	Not a TEC	0.7	9	0	9.00
295-Robertsons Peppermint - Broad-leaved Peppermint - Nortons Box - stringybark shrub-fern open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion	Not a TEC	1.8	27	2	29.00
296-Brittle Gum - peppermint open forest of the Woomargama to Tumut region, NSW South Western Slopes Bioregion	Not a TEC	0.0	0	1	1.00
299-Riparian Ribbon Gum - Robertsons Peppermint - Apple Box riverine very tall open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion	Not a TEC	2.6	27	0	27.00

953-Mountain Gum - Snow Gum - Broad-leaved Peppermint shrubby open forest of montane ranges, South Eastern Highlands Bioregion and Australian Alps Bioregion	Not a TEC	33.7	554	25	579.00

285-Broad-leaved Sally grass - sedge woodland on valley flats and swamps in the NSW South Western Slopes Bioregion and adjoining South Eastern Highlands Bioregion

Like-for-like options

Ammobium craspedioides/ Yass Daisy	Spp		IBRA region
	Ammobium craspedioides/Yass Daisy		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora	Vulnerable	Bondo, Bondo, Inland Slopes, Murrumbateman and Snowy Mountains. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Callocephalon fimbriatum/ Gang-gang Cockatoo	Spp		IBRA region
	Callocephalon fimbriatum/Gang-gang Cockatoo		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Bondo, Bondo, Inland Slopes, Murrumbateman and Snowy Mountains. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

Cercartetus nanus/ Eastern Pygmy-possum	Spp		IBRA region
	Cercartetus nanus/Eastern Pygmy-possum		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Bondo, Bondo, Inland Slopes, Murrumbateman and Snowy Mountains. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Haliaeetus leucogaster/ White-bellied Sea-Eagle	Spp		IBRA region
	Haliaeetus leucogaster/White-bellied Sea-Eagle		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Bondo, Bondo, Inland Slopes, Murrumbateman and Snowy Mountains. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

Hieraaetus morphnoides/ Little Eagle	Spp		IBRA region
	Hieraaetus morphnoides/Little Eagle		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Bondo, Bondo, Inland Slopes, Murrumbateman and Snowy Mountains. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Leucochrysum albicans var. tricolor/ Hoary Sunray	Spp		IBRA region
	Leucochrysum albicans var. tricolor/Hoary Sunray		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora		Bondo, Bondo, Inland Slopes, Murrumbateman and Snowy Mountains. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

Litoria booroolongensis/ Booroolong Frog	Spp		IBRA region
	Litoria booroolongensis/Booroolong Frog		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Endangered	Bondo, Bondo, Inland Slopes, Murrumbateman and Snowy Mountains. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Lophoictinia isura/ Square-tailed Kite	Spp		IBRA region
	Lophoictinia isura/Square-tailed Kite		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Bondo, Bondo, Inland Slopes, Murrumbateman and Snowy Mountains. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

Myotis macropus/ Southern Myotis	Spp		IBRA region
	Myotis macropus/Southern Myotis		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Bondo, Bondo, Inland Slopes, Murrumbateman and Snowy Mountains. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Ninox connivens/ Barking Owl	Spp		IBRA region
	Ninox connivens/Barking Owl		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Bondo, Bondo, Inland Slopes, Murrumbateman and Snowy Mountains. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

Ninox strenua/ Powerful Owl	Spp		IBRA region
	Ninox strenua/Powerful Owl		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Bondo, Bondo, Inland Slopes, Murrumbateman and Snowy Mountains. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Petauroides volans/ Southern Greater Glider	Spp		IBRA region
	Petauroides volans/Southern Greater Glider		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Endangered	Bondo, Bondo, Inland Slopes, Murrumbateman and Snowy Mountains. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

Petaurus norfolcensis/ Squirrel Glider	Spp		IBRA region
	Petaurus norfolcensis/Squirrel Glider		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Bondo, Bondo, Inland Slopes, Murrumbateman and Snowy Mountains. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Petroica rodinogaster/ Pink Robin	Spp		IBRA region
	Petroica rodinogaster/Pink Robin		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Bondo, Bondo, Inland Slopes, Murrumbateman and Snowy Mountains. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

Phascogale tapoatafa/ Brush-tailed Phascogale	Spp		IBRA region
	Phascogale tapoatafa/Brush-tailed Phascogale		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Bondo, Bondo, Inland Slopes, Murrumbateman and Snowy Mountains. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Phascolarctos cinereus/ Koala	Spp		IBRA region
	Phascolarctos cinereus/Koala		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Endangered	Bondo, Bondo, Inland Slopes, Murrumbateman and Snowy Mountains. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

Pseudomys fumeus/ Smoky Mouse	Spp		IBRA region
	Pseudomys fumeus/Smoky Mouse *Note: Variation rules do not apply for Critically Endangered species and impacts on Commonwealth listed entities that are a controlled action.*		Any in NSW
Tyto novaehollandiae/ Masked Owl	Spp		IBRA region
	Tyto novaehollandiae/Masked Owl		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Bondo, Bondo, Inland Slopes, Murrumbateman and Snowy Mountains. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

Assessor Name	Report Created	BAM Data version *
Simon Tweed	18/08/2023	61
Assessor Number	Assessment Type	BAM Case Status
BAAS17040	Major Projects	Finalised
Assessment Revision		Date Finalised
6		18/08/2023

* Disclaimer: BAM data last updated may indicate either complete or partial update of the BAM calculator database. BAM calculator database may not be completely aligned with Bionet.

Threatened species reliably predicted to utilise the site. No surveys are required for these species. Ecosystem credits apply to these species.

Common Name	Scientific Name	Vegetation Types(s)
Barking Owl	Ninox connivens	295-Robertsons Peppermint - Broad-leaved Peppermint - Nortons Box - stringybark shrub-fern open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		953-Mountain Gum - Snow Gum - Broad-leaved Peppermint shrubby open forest of montane ranges, South Eastern Highlands Bioregion and Australian Alps Bioregion
Brown Treecreeper (eastern subspecies)	Climacteris picumnus victoriae	296-Brittle Gum - peppermint open forest of the Woomargama to Tumut region, NSW South Western Slopes Bioregion
Diamond Firetail	Stagonopleura guttata	285-Broad-leaved Sally grass - sedge woodland on valley flats and swamps in the NSW South Western Slopes Bioregion and adjoining South Eastern Highlands Bioregion
		295-Robertsons Peppermint - Broad-leaved Peppermint - Nortons Box - stringybark shrub-fern open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		296-Brittle Gum - peppermint open forest of the Woomargama to Tumut region, NSW South Western Slopes Bioregion

Dusky Woodswallow	Artamus cyanopterus cyanopterus	285-Broad-leaved Sally grass - sedge woodland on valley flats and swamps in the NSW South Western Slopes Bioregion and adjoining South Eastern Highlands Bioregion
		295-Robertsons Peppermint - Broad-leaved Peppermint - Nortons Box - stringybark shrub-fern open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		296-Brittle Gum - peppermint open forest of the Woomargama to Tumut region, NSW South Western Slopes Bioregion
		299-Riparian Ribbon Gum - Robertsons Peppermint - Apple Box riverine very tall open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		953-Mountain Gum - Snow Gum - Broad-leaved Peppermint shrubby open forest of montane ranges, South Eastern Highlands Bioregion and Australian Alps Bioregion
Eastern False Pipistrelle	Falsistrellus tasmaniensis	285-Broad-leaved Sally grass - sedge woodland on valley flats and swamps in the NSW South Western Slopes Bioregion and adjoining South Eastern Highlands Bioregion
		295-Robertsons Peppermint - Broad-leaved Peppermint - Nortons Box - stringybark shrub-fern open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		296-Brittle Gum - peppermint open forest of the Woomargama to Tumut region, NSW South Western Slopes Bioregion
		299-Riparian Ribbon Gum - Robertsons Peppermint - Apple Box riverine very tall open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		953-Mountain Gum - Snow Gum - Broad-leaved Peppermint shrubby open forest of montane ranges, South Eastern Highlands Bioregion and Australian Alps Bioregion
Flame Robin	Petroica phoenicea	285-Broad-leaved Sally grass - sedge woodland on valley flats and swamps in the NSW South Western Slopes Bioregion and adjoining South Eastern Highlands Bioregion
		295-Robertsons Peppermint - Broad-leaved Peppermint - Nortons Box - stringybark shrub-fern open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		296-Brittle Gum - peppermint open forest of the Woomargama to Tumut region, NSW South Western Slopes Bioregion

Flame Robin	Petroica phoenicea	299-Riparian Ribbon Gum - Robertsons Peppermint - Apple Box riverine very tall open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		953-Mountain Gum - Snow Gum - Broad-leaved Peppermint shrubby open forest of montane ranges, South Eastern Highlands Bioregion and Australian Alps Bioregion
Gang-gang Cockatoo	Callocephalon fimbriatum	285-Broad-leaved Sally grass - sedge woodland on valley flats and swamps in the NSW South Western Slopes Bioregion and adjoining South Eastern Highlands Bioregion
		295-Robertsons Peppermint - Broad-leaved Peppermint - Nortons Box - stringybark shrub-fern open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		296-Brittle Gum - peppermint open forest of the Woomargama to Tumut region, NSW South Western Slopes Bioregion
		299-Riparian Ribbon Gum - Robertsons Peppermint - Apple Box riverine very tall open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		953-Mountain Gum - Snow Gum - Broad-leaved Peppermint shrubby open forest of montane ranges, South Eastern Highlands Bioregion and Australian Alps Bioregion
Hooded Robin (south-eastern form)	Melanodryas cucullata cucullata	296-Brittle Gum - peppermint open forest of the Woomargama to Tumut region, NSW South Western Slopes Bioregion
Large Bent-winged Bat	Miniopterus orianae oceanensis	285-Broad-leaved Sally grass - sedge woodland on valley flats and swamps in the NSW South Western Slopes Bioregion and adjoining South Eastern Highlands Bioregion
		295-Robertsons Peppermint - Broad-leaved Peppermint - Nortons Box - stringybark shrub-fern open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		299-Riparian Ribbon Gum - Robertsons Peppermint - Apple Box riverine very tall open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		953-Mountain Gum - Snow Gum - Broad-leaved Peppermint shrubby open forest of montane ranges, South Eastern Highlands Bioregion and Australian Alps Bioregion
Little Eagle	Hieraaetus morphnoides	285-Broad-leaved Sally grass - sedge woodland on valley flats and swamps in the NSW South Western Slopes Bioregion and adjoining South Eastern Highlands Bioregion

Little Eagle	Hieraaetus morphnoides	295-Robertsons Peppermint - Broad-leaved Peppermint - Nortons Box - stringybark shrub-fern open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		296-Brittle Gum - peppermint open forest of the Woomargama to Tumut region, NSW South Western Slopes Bioregion
		299-Riparian Ribbon Gum - Robertsons Peppermint - Apple Box riverine very tall open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		953-Mountain Gum - Snow Gum - Broad-leaved Peppermint shrubby open forest of montane ranges, South Eastern Highlands Bioregion and Australian Alps Bioregion
Masked Owl	Tyto novaehollandiae	953-Mountain Gum - Snow Gum - Broad-leaved Peppermint shrubby open forest of montane ranges, South Eastern Highlands Bioregion and Australian Alps Bioregion
Powerful Owl	Ninox strenua	295-Robertsons Peppermint - Broad-leaved Peppermint - Nortons Box - stringybark shrub-fern open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		296-Brittle Gum - peppermint open forest of the Woomargama to Tumut region, NSW South Western Slopes Bioregion
		953-Mountain Gum - Snow Gum - Broad-leaved Peppermint shrubby open forest of montane ranges, South Eastern Highlands Bioregion and Australian Alps Bioregion
Rosenberg's Goanna	Varanus rosenbergi	285-Broad-leaved Sally grass - sedge woodland on valley flats and swamps in the NSW South Western Slopes Bioregion and adjoining South Eastern Highlands Bioregion
		295-Robertsons Peppermint - Broad-leaved Peppermint - Nortons Box - stringybark shrub-fern open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		296-Brittle Gum - peppermint open forest of the Woomargama to Tumut region, NSW South Western Slopes Bioregion
		299-Riparian Ribbon Gum - Robertsons Peppermint - Apple Box riverine very tall open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
Scarlet Robin	Petroica boodang	285-Broad-leaved Sally grass - sedge woodland on valley flats and swamps in the NSW South Western Slopes Bioregion and adjoining South Eastern Highlands Bioregion

Scarlet Robin	Petroica boodang	295-Robertsons Peppermint - Broad-leaved Peppermint - Nortons Box - stringybark shrub-fern open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		296-Brittle Gum - peppermint open forest of the Woomargama to Tumut region, NSW South Western Slopes Bioregion
		299-Riparian Ribbon Gum - Robertsons Peppermint - Apple Box riverine very tall open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		953-Mountain Gum - Snow Gum - Broad-leaved Peppermint shrubby open forest of montane ranges, South Eastern Highlands Bioregion and Australian Alps Bioregion
Spotted-tailed Quoll	Dasyurus maculatus	285-Broad-leaved Sally grass - sedge woodland on valley flats and swamps in the NSW South Western Slopes Bioregion and adjoining South Eastern Highlands Bioregion
		295-Robertsons Peppermint - Broad-leaved Peppermint - Nortons Box - stringybark shrub-fern open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		296-Brittle Gum - peppermint open forest of the Woomargama to Tumut region, NSW South Western Slopes Bioregion
		299-Riparian Ribbon Gum - Robertsons Peppermint - Apple Box riverine very tall open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		953-Mountain Gum - Snow Gum - Broad-leaved Peppermint shrubby open forest of montane ranges, South Eastern Highlands Bioregion and Australian Alps Bioregion
Square-tailed Kite	Lophoictinia isura	953-Mountain Gum - Snow Gum - Broad-leaved Peppermint shrubby open forest of montane ranges, South Eastern Highlands Bioregion and Australian Alps Bioregion
Varied Sittella	Daphoenositta chrysoptera	285-Broad-leaved Sally grass - sedge woodland on valley flats and swamps in the NSW South Western Slopes Bioregion and adjoining South Eastern Highlands Bioregion
		295-Robertsons Peppermint - Broad-leaved Peppermint - Nortons Box - stringybark shrub-fern open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		296-Brittle Gum - peppermint open forest of the Woomargama to Tumut region, NSW South Western Slopes Bioregion

Varied Sittella	Daphoenositta chrysoptera	299-Riparian Ribbon Gum - Robertsons Peppermint - Apple Box riverine very tall open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		953-Mountain Gum - Snow Gum - Broad-leaved Peppermint shrubby open forest of montane ranges, South Eastern Highlands Bioregion and Australian Alps Bioregion
White-bellied Sea-Eagle	Haliaeetus leucogaster	285-Broad-leaved Sally grass - sedge woodland on valley flats and swamps in the NSW South Western Slopes Bioregion and adjoining South Eastern Highlands Bioregion
		295-Robertsons Peppermint - Broad-leaved Peppermint - Nortons Box - stringybark shrub-fern open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		296-Brittle Gum - peppermint open forest of the Woomargama to Tumut region, NSW South Western Slopes Bioregion
		299-Riparian Ribbon Gum - Robertsons Peppermint - Apple Box riverine very tall open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		953-Mountain Gum - Snow Gum - Broad-leaved Peppermint shrubby open forest of montane ranges, South Eastern Highlands Bioregion and Australian Alps Bioregion
White-throated Needletail	Hirundapus caudacutus	285-Broad-leaved Sally grass - sedge woodland on valley flats and swamps in the NSW South Western Slopes Bioregion and adjoining South Eastern Highlands Bioregion
		295-Robertsons Peppermint - Broad-leaved Peppermint - Nortons Box - stringybark shrub-fern open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		296-Brittle Gum - peppermint open forest of the Woomargama to Tumut region, NSW South Western Slopes Bioregion
		299-Riparian Ribbon Gum - Robertsons Peppermint - Apple Box riverine very tall open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion
		953-Mountain Gum - Snow Gum - Broad-leaved Peppermint shrubby open forest of montane ranges, South Eastern Highlands Bioregion and Australian Alps Bioregion
Yellow-bellied Glider	Petaurus australis	299-Riparian Ribbon Gum - Robertsons Peppermint - Apple Box riverine very tall open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion

Yellow-bellied Glider	Petaurus australis	953-Mountain Gum - Snow Gum - Broad-leaved Peppermint shrubby open forest of montane ranges, South Eastern Highlands Bioregion and Australian Alps Bioregion

Potential Serious and Irreversible Impacts

Name of threatened ecological community	Listing status	Name of Plant Community Type/ID
White Box - Yellow Box - Blakely's Red Gum Grassy Woodland and Derived Native Grassland in the NSW North Coast, New England Tableland, Nandewar, Brigalow Belt South, Sydney Basin, South Eastern Highla	Critically Endangered Ecological Community	1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion

White Box - Yellow Box - Blakely's Red Gum Grassy Woodland and Derived Native Grassland in the NSW North Coast, New England Tableland, Nandewar, Brigalow Belt South, Sydney Basin, South Eastern Highla	Critically Endangered Ecological Community	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
Tableland Basalt Forest in the Sydney Basin and South Eastern Highlands Bioregions	Endangered Ecological Community	1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
Tableland Basalt Forest in the Sydney Basin and South Eastern Highlands Bioregions	Endangered Ecological Community	1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion

Species
Caladenia tessellata / Thick Lip Spider Orchid
Chalinolobus dwyeri / Large-eared Pied Bat
Solanum armourense / Solanum armourense
Pomaderris delicata / Delicate Pomaderris
Genoplesium superbum / Superb Midge Orchid
Mixophyes balbus / Stuttering Frog
Petrogale penicillata / Brush-tailed Rock-wallaby

Species Credit Summary

Species	Vegetation Zone/s	Area / Count	Credits
Acacia bynoeana / Bynoe's Wattle	**1093_Veryhigh_TCZ_100, 1093_High_TCZ_100, 1093_High_ECZ_100, 1093_High_HTZ_100, 1093_Moderate_TCZ_100**	1.2	40.00

Acacia flocktoniae / Flockton Wattle	**870_Veryhigh_TCZ_100, 870_Veryhigh_ECZ_100, 870_Veryhigh_HTZ_100, 1150_High_TCZ_100, 1150_High_ECZ_100, 1150_High_HTZ_100, 1150_Moderate_TCZ_100, 1150_Moderate_ECZ_100, 1150_Moderate_HTZ_100, 1330_Veryhigh_TCZ_100, 1330_Veryhigh_ECZ_100**	14.3	309.00
Aprasia parapulchella / Pink-tailed Legless Lizard	**1330_Veryhigh_TCZ_100, 1330_Veryhigh_ECZ_100, 1330_Veryhigh_HTZ_100, 1330_Low_TCZ_100, 1330_Low_ECZ_100, 1330_Low_HTZ_100, 1330_Verylow_ECZ_5, 283_Moderate_TCZ_100, 283_Moderate_ECZ_100, 283_Low_TCZ_100**	6.0	130.00
Baloskion longipes / Dense Cord-rush	**1093_Veryhigh_TCZ_100, 1093_High_TCZ_100, 1093_High_ECZ_100, 1093_High_HTZ_100, 1093_Moderate_TCZ_100**	1.2	40.00

Bossiaea oligosperma / Few-seeded Bossiaea	**1093_Veryhigh_TCZ_100, 1093_High_TCZ_100, 1093_High_ECZ_100, 1093_High_HTZ_100, 1093_Moderate_TCZ_100, 1093_Low_TCZ_100**	1.2	41.00
Caladenia tessellata / Thick Lip Spider Orchid	**870_Veryhigh_TCZ_100, 870_Veryhigh_ECZ_100, 870_Veryhigh_HTZ_100, 1093_Veryhigh_TCZ_100, 1093_Veryhigh_ECZ_100, 1093_Veryhigh_HTZ_100, 1093_High_TCZ_100, 1093_High_ECZ_100, 1093_High_HTZ_100, 1093_Moderate_TCZ_100, 1093_Moderate_ECZ_100, 1150_High_TCZ_100, 1150_High_ECZ_100, 1150_High_HTZ_100, 1150_Moderate_TCZ_100, 1150_Moderate_ECZ_100, 1150_Moderate_HTZ_100, 1330_Veryhigh_TCZ_100, 1330_Veryhigh_ECZ_100**	16.0	550.00

Callocephalon fimbriatum / Gang-gang Cockatoo	**870_Veryhigh_TCZ_100, 870_Veryhigh_ECZ_100, 870_Veryhigh_HTZ_100, 1093_Veryhigh_TCZ_100, 1093_Veryhigh_ECZ_100, 1093_Veryhigh_HTZ_100, 1093_High_TCZ_100, 1093_High_ECZ_100, 1093_High_HTZ_100, 1093_Moderate_TCZ_100, 1093_Moderate_ECZ_100, 1093_Low_TCZ_100, 1093_Low_ECZ_100, 1150_High_TCZ_100, 1150_High_ECZ_100, 1150_High_HTZ_100, 1150_Moderate_TCZ_100, 1150_Moderate_ECZ_100, 1150_Moderate_HTZ_100, 1150_Low_TCZ_100, 1150_Low_ECZ_100, 1330_Veryhigh_TCZ_100, 1330_Veryhigh_ECZ_100, 1330_Veryhigh_HTZ_100, 1330_Low_TCZ_100, 1330_Low_ECZ_100, 283_Moderate_TCZ_100, 283_Moderate_ECZ_100, 1097_Moderate_TCZ_100, 1107_High_TCZ_100, 1107_High_HTZ_100**	14.8	370.00

Calyptorhynchus lathami / Glossy Black-Cockatoo	**870_Veryhigh_TCZ_100, 870_Veryhigh_ECZ_100, 870_Veryhigh_HTZ_100, 1093_Veryhigh_TCZ_100, 1093_Veryhigh_ECZ_100, 1093_Veryhigh_HTZ_100, 1093_High_TCZ_100, 1093_High_ECZ_100, 1093_High_HTZ_100, 1093_Moderate_TCZ_100, 1093_Moderate_ECZ_100, 1093_Low_TCZ_100, 1093_Low_ECZ_100, 1150_High_TCZ_100, 1150_High_ECZ_100, 1150_High_HTZ_100, 1150_Moderate_TCZ_100, 1150_Moderate_ECZ_100, 1150_Moderate_HTZ_100, 1150_Low_TCZ_100, 1150_Low_ECZ_100, 1330_Veryhigh_TCZ_100, 1330_Veryhigh_ECZ_100, 1330_Veryhigh_HTZ_100, 1330_Low_TCZ_100, 1330_Low_ECZ_100, 1097_Moderate_TCZ_100, 1107_High_TCZ_100, 1107_High_HTZ_100**	12.2	301.00

Cercartetus nanus / Eastern Pygmy-possum	**1093_Veryhigh_TCZ_100, 1093_Veryhigh_ECZ_100, 1093_Veryhigh_HTZ_100, 1093_High_TCZ_100, 1093_High_ECZ_100, 1093_High_HTZ_100, 1093_Moderate_TCZ_100, 1093_Moderate_ECZ_100, 1093_Low_TCZ_100, 1093_Low_ECZ_100, 1150_High_TCZ_100, 1150_High_ECZ_100, 1150_High_HTZ_100, 1150_Moderate_TCZ_100, 1150_Moderate_ECZ_100, 1150_Moderate_HTZ_100, 1330_Veryhigh_TCZ_100, 1330_Veryhigh_ECZ_100, 1330_Veryhigh_HTZ_100, 283_Moderate_TCZ_100, 283_Moderate_ECZ_100, 1107_High_TCZ_100**	5.2	147.00

Chalinolobus dwyeri / Large-eared Pied Bat	**1093_Veryhigh_TCZ_100, 1093_Veryhigh_ECZ_100, 1093_Veryhigh_HTZ_100, 1093_High_TCZ_100, 1093_High_ECZ_100, 1093_High_HTZ_100, 1093_Moderate_TCZ_100, 1093_Moderate_ECZ_100, 1093_Low_TCZ_100, 1093_Low_ECZ_100, 1150_High_TCZ_100, 1150_High_ECZ_100, 1150_High_HTZ_100, 1330_Veryhigh_TCZ_100, 1330_Veryhigh_ECZ_100, 1330_Veryhigh_HTZ_100, 1330_Low_TCZ_100, 1330_Low_ECZ_100, 283_Moderate_TCZ_100, 283_Moderate_ECZ_100, 1097_Moderate_TCZ_100**	7.7	316.00
Delma impar / Striped Legless Lizard	**1330_Veryhigh_TCZ_100, 1330_Veryhigh_ECZ_100, 1330_Veryhigh_HTZ_100, 1330_Low_TCZ_100, 1330_Low_ECZ_100, 1330_Low_HTZ_100, 1330_Verylow_ECZ_5**	16.0	226.00

Dillwynia glaucula / Michelago Parrot-pea	**1093_Veryhigh_TCZ_100, 1093_Veryhigh_ECZ_100, 1093_Veryhigh_HTZ_100, 1093_High_TCZ_100, 1093_High_ECZ_100, 1093_High_HTZ_100, 1093_Moderate_TCZ_100, 1093_Moderate_ECZ_100, 1093_Low_TCZ_100**	1.7	61.00
Diuris aequalis / Buttercup Doubletail	**1093_Veryhigh_TCZ_100, 1093_Veryhigh_ECZ_100, 1093_Veryhigh_HTZ_100, 1093_High_TCZ_100, 1093_High_ECZ_100, 1093_High_HTZ_100, 1093_Moderate_TCZ_100, 1093_Moderate_ECZ_100, 1093_Low_TCZ_100, 1093_Low_ECZ_100, 1097_Moderate_TCZ_100, 1097_Verylow_TCZ_100, 1097_Verylow_ECZ_100, 1097_Verylow_ECZ_5**	3.6	120.00
Eucalyptus macarthurii / Paddys River Box, Camden Woollybutt	**1330_Veryhigh_TCZ_100, 1330_Low_TCZ_100, 1097_Verylow_TCZ_100**	18.0	36.00

Genoplesium superbum / Superb Midge Orchid	**1150_High_TCZ_100, 1150_High_ECZ_100, 1150_High_HTZ_100, 1150_Moderate_TCZ_100, 1150_Moderate_ECZ_100, 1150_Moderate_HTZ_100, 1150_Low_TCZ_100, 1150_Low_ECZ_100, 1150_Verylow_TCZ_100, 1150_Verylow_ECZ_100**	8.8	237.00

Hieraaetus morphnoides / Little Eagle	**870_Veryhigh_TCZ_100, 870_Veryhigh_ECZ_100, 870_Veryhigh_HTZ_100, 1093_Veryhigh_TCZ_100, 1093_Veryhigh_ECZ_100, 1093_Veryhigh_HTZ_100, 1093_High_TCZ_100, 1093_High_ECZ_100, 1093_High_HTZ_100, 1093_Moderate_TCZ_100, 1093_Moderate_ECZ_100, 1093_Low_TCZ_100, 1093_Low_ECZ_100, 1150_High_TCZ_100, 1150_High_ECZ_100, 1150_High_HTZ_100, 1150_Moderate_TCZ_100, 1150_Moderate_ECZ_100, 1150_Moderate_HTZ_100, 1150_Low_TCZ_100, 1150_Low_ECZ_100, 1330_Veryhigh_TCZ_100, 1330_Veryhigh_ECZ_100, 1330_Veryhigh_HTZ_100, 1330_Low_TCZ_100, 1330_Low_ECZ_100, 283_Moderate_TCZ_100, 283_Moderate_ECZ_100, 1097_Moderate_TCZ_100, 1107_High_TCZ_100, 1107_High_HTZ_100**	19.2	349.00

Keyacris scurra / Key's Matchstick Grasshopper	**1330_Veryhigh_TCZ_100, 1330_Veryhigh_ECZ_100, 1330_Veryhigh_HTZ_100, 1330_Low_TCZ_100, 1330_Low_ECZ_100, 1330_Low_HTZ_100, 1330_Verylow_ECZ_5, 283_Moderate_TCZ_100, 283_Moderate_ECZ_100, 283_Low_TCZ_100**	16.4	308.00
Kunzea cambagei / Cambage Kunzea	**1150_High_TCZ_100, 1150_High_ECZ_100, 1150_High_HTZ_100, 1150_Moderate_TCZ_100, 1150_Moderate_ECZ_100, 1150_Moderate_HTZ_100, 1150_Low_TCZ_100, 1150_Low_ECZ_100, 1150_Verylow_TCZ_100, 1150_Verylow_ECZ_100**	12.2	220.00

Leucochrysum albicans subsp. tricolor / Hoary Sunray	**1093_Veryhigh_TCZ_100, 1093_High_TCZ_100, 1093_High_ECZ_100, 1093_High_HTZ_100, 1093_Moderate_TCZ_100, 1093_Low_TCZ_100, 1330_Veryhigh_TCZ_100, 1330_Low_TCZ_100, 1330_Low_ECZ_100, 1330_Low_HTZ_100, 1330_Verylow_ECZ_5, 1097_Moderate_TCZ_100, 1097_Verylow_TCZ_100, 1097_Verylow_ECZ_100, 1097_Verylow_ECZ_5**	1065.0	2130.00
Mixophyes balbus / Stuttering Frog	**870_Veryhigh_TCZ_100, 870_Veryhigh_ECZ_100, 870_Veryhigh_HTZ_100, 1150_High_TCZ_100, 1150_High_ECZ_100, 1150_High_HTZ_100, 1150_Moderate_TCZ_100, 1150_Moderate_ECZ_100, 1150_Moderate_HTZ_100, 1150_Low_TCZ_100, 1150_Low_ECZ_100, 1097_Moderate_TCZ_100, 1107_High_TCZ_100, 1107_High_HTZ_100**	13.8	421.00

Myotis macropus / Southern Myotis	**870_Veryhigh_TCZ_100, 870_Veryhigh_ECZ_100, 1330_Veryhigh_TCZ_100, 1330_Veryhigh_ECZ_100, 1330_Veryhigh_HTZ_100, 1330_Low_TCZ_100, 1330_Low_ECZ_100, 1107_High_TCZ_100, 1107_High_HTZ_100**	2.1	68.00

Ninox connivens / Barking Owl	**870_Veryhigh_TCZ_100, 870_Veryhigh_ECZ_100, 870_Veryhigh_HTZ_100, 1093_Veryhigh_TCZ_100, 1093_Veryhigh_ECZ_100, 1093_Veryhigh_HTZ_100, 1093_High_TCZ_100, 1093_High_ECZ_100, 1093_High_HTZ_100, 1093_Moderate_TCZ_100, 1093_Moderate_ECZ_100, 1093_Low_TCZ_100, 1093_Low_ECZ_100, 1150_High_TCZ_100, 1150_High_ECZ_100, 1150_High_HTZ_100, 1150_Moderate_TCZ_100, 1150_Moderate_ECZ_100, 1150_Moderate_HTZ_100, 1150_Low_TCZ_100, 1150_Low_ECZ_100, 1330_Veryhigh_TCZ_100, 1330_Veryhigh_ECZ_100, 1330_Veryhigh_HTZ_100, 1330_Low_TCZ_100, 1330_Low_ECZ_100, 283_Moderate_TCZ_100, 283_Moderate_ECZ_100, 1097_Moderate_TCZ_100, 1107_High_TCZ_100, 1107_High_HTZ_100**	14.8	372.00

Ninox strenua / Powerful Owl	**870_Veryhigh_TCZ_100, 870_Veryhigh_ECZ_100, 870_Veryhigh_HTZ_100, 1093_Veryhigh_TCZ_100, 1093_Veryhigh_ECZ_100, 1093_Veryhigh_HTZ_100, 1093_High_TCZ_100, 1093_High_ECZ_100, 1093_High_HTZ_100, 1093_Moderate_TCZ_100, 1093_Moderate_ECZ_100, 1093_Low_TCZ_100, 1093_Low_ECZ_100, 1150_High_TCZ_100, 1150_High_ECZ_100, 1150_High_HTZ_100, 1150_Moderate_TCZ_100, 1150_Moderate_ECZ_100, 1150_Moderate_HTZ_100, 1150_Low_TCZ_100, 1150_Low_ECZ_100, 1330_Veryhigh_TCZ_100, 1330_Veryhigh_ECZ_100, 1330_Veryhigh_HTZ_100, 1330_Low_TCZ_100, 1330_Low_ECZ_100, 283_Moderate_TCZ_100, 283_Moderate_ECZ_100, 1097_Moderate_TCZ_100, 1107_High_TCZ_100, 1107_High_HTZ_100**	14.8	372.00

Persoonia mollis subsp. revoluta / Persoonia mollis subsp. revoluta	**1150_High_TCZ_100, 1150_High_ECZ_100, 1150_High_HTZ_100, 1150_Moderate_TCZ_100, 1150_Moderate_ECZ_100, 1150_Moderate_HTZ_100**	8.0	151.00

Acacia bynoeana/ Bynoe's Wattle	Spp		IBRA region
	Acacia bynoeana/Bynoe's Wattle		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora	Endangered	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Acacia flocktoniae/ Flockton Wattle	Spp		IBRA region
	Acacia flocktoniae/Flockton Wattle		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region

	Flora	Vulnerable	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Aprasia parapulchella/ Pink-tailed Legless Lizard	Spp	IBRA region	
	Aprasia parapulchella/Pink-tailed Legless Lizard	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Baloskion longipes/ Dense Cord-rush	Spp	IBRA region	
	Baloskion longipes/Dense Cord-rush	Any in NSW	
	Variation options		

	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora	Vulnerable	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Bossiaea oligosperma/ Few-seeded Bossiaea	Spp		IBRA region
	Bossiaea oligosperma/Few-seeded Bossiaea		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora	Vulnerable	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

Caladenia tessellata/ Thick Lip Spider Orchid	Spp		IBRA region
	Caladenia tessellata/Thick Lip Spider Orchid		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora	Endangered	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Callocephalon fimbriatum/ Gang-gang Cockatoo	Spp		IBRA region
	Callocephalon fimbriatum/Gang-gang Cockatoo		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region

	Fauna	Vulnerable	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Calyptorhynchus lathami/ Glossy Black-Cockatoo	Spp	IBRA region	
	Calyptorhynchus lathami/Glossy Black-Cockatoo	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Cercartetus nanus/ Eastern Pygmy-possum	Spp	IBRA region	
	Cercartetus nanus/Eastern Pygmy-possum	Any in NSW	
	Variation options		

	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Chalinolobus dwyeri/ Large-eared Pied Bat	Spp	IBRA region	
	Chalinolobus dwyeri/Large-eared Pied Bat	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

Delma impar/ Striped Legless Lizard	Spp		IBRA region
	Delma impar/Striped Legless Lizard		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Dillwynia glaucula/ Michelago Parrot-pea	Spp		IBRA region
	Dillwynia glaucula/Michelago Parrot-pea		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region

	Flora	Endangered	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Diuris aequalis/ Buttercup Doubletail	Spp	IBRA region	
	Diuris aequalis/Buttercup Doubletail	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora	Endangered	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Eucalyptus macarthurii/ Paddys River Box, Camden Woollybutt	Spp	IBRA region	
	Eucalyptus macarthurii/Paddys River Box, Camden Woollybutt	Any in NSW	

Eucalyptus macarthurii/ Paddys River Box, Camden Woollybutt	**Variation options**		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora	Endangered	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Genoplesium superbum/ Superb Midge Orchid	Spp		IBRA region
	Genoplesium superbum/Superb Midge Orchid		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region

	Flora	Endangered	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Hieraaetus morphnoides/ Little Eagle	Spp	IBRA region	
	Hieraaetus morphnoides/Little Eagle	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Keyacris scurra/ Key's Matchstick Grasshopper	Spp	IBRA region	
	Keyacris scurra/Key's Matchstick Grasshopper	Any in NSW	
	Variation options		

	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Endangered	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Kunzea cambagei/ Cambage Kunzea	Spp	IBRA region	
	Kunzea cambagei/Cambage Kunzea	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora	Vulnerable	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

Leucochrysum albicans subsp. tricolor/ Hoary Sunray	Spp		IBRA region
	Leucochrysum albicans subsp. tricolor/Hoary Sunray		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora	Endangered	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Mixophyes balbus/ Stuttering Frog	Spp		IBRA region
	Mixophyes balbus/Stuttering Frog		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region

	Fauna	Endangered	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Myotis macropus/ Southern Myotis	Spp	IBRA region	
	Myotis macropus/Southern Myotis	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Ninox connivens/ Barking Owl	Spp	IBRA region	
	Ninox connivens/Barking Owl	Any in NSW	
	Variation options		

	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Ninox strenua/ Powerful Owl	Spp	IBRA region	
	Ninox strenua/Powerful Owl	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

Persoonia mollis subsp. revoluta/ Persoonia mollis subsp. revoluta	Spp		IBRA region
	Persoonia mollis subsp. revoluta/Persoonia mollis subsp. revoluta		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora	Vulnerable	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Petauroides volans/ Southern Greater Glider	Spp		IBRA region
	Petauroides volans/Southern Greater Glider		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region

	Fauna	Endangered	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Petaurus norfolcensis/ Squirrel Glider	Spp	IBRA region	
	Petaurus norfolcensis/Squirrel Glider	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Petrogale penicillata/ Brush-tailed Rock-wallaby	Spp	IBRA region	
	Petrogale penicillata/Brush-tailed Rock-wallaby	Any in NSW	
	Variation options		

	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Endangered	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Petroica rodinogaster/ Pink Robin	Spp	IBRA region	
	Petroica rodinogaster/Pink Robin	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

Phascolarctos cinereus/ Koala	Spp		IBRA region
	Phascolarctos cinereus/Koala		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Endangered	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Phyllota humifusa/ Dwarf Phyllota	Spp		IBRA region
	Phyllota humifusa/Dwarf Phyllota		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region

	Flora	Vulnerable	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Pomaderris cotoneaster/ Cotoneaster Pomaderris	Spp	IBRA region	
	Pomaderris cotoneaster/Cotoneaster Pomaderris	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora	Endangered	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Pomaderris delicata/ Delicate Pomaderris	Spp	IBRA region	

	Pomaderris delicata/Delicate Pomaderris *Note: Variation rules do not apply for Critically Endangered species and impacts on Commonwealth listed entities that are a controlled action.*		Any in NSW
Solanum armourense/ Solanum armourense	Spp		IBRA region
	Solanum armourense/Solanum armourense		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora	Endangered	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Swainsona sericea/ Silky Swainson-pea	Spp		IBRA region
	Swainsona sericea/Silky Swainson-pea		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act	IBRA region

		shown below	
	Flora	Vulnerable	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Thesium australe/ Austral Toadflax	Spp	IBRA region	
	Thesium australe/Austral Toadflax	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora	Vulnerable	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Tyto novaehollandiae/ Masked Owl	Spp	IBRA region	
	Tyto novaehollandiae/Masked Owl	Any in NSW	

Tyto novaehollandiae/ Masked Owl	**Variation options**		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Bungonia, Bateman, Burragorang, Crookwell, Ettrema, Kanangra, Kybeyan-Gourock, Monaro and South East Coastal Ranges. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

List of Species Requiring Survey

Name	Presence	Survey Months
Acacia bynoeana Bynoe's Wattle	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Acacia clunies-rossiae Kanangra Wattle	No (surveyed)	☑ Jan ☑ Feb ☐ Mar ☐ Apr ☑ May ☐ Jun ☐ Jul ☐ Aug ☑ Sep ☑ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Acacia flocktoniae Flockton Wattle	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?

Aprasia parapulchella Pink-tailed Legless Lizard	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Baloskion longipes Dense Cord-rush	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Bossiaea oligosperma Few-seeded Bossiaea	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Caladenia tessellata Thick Lip Spider Orchid	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Callocephalon fimbriatum Gang-gang Cockatoo	Yes (surveyed)	☑ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☑ Oct ☐ Nov ☑ Dec ☐ Survey month outside the specified months?
Calyptorhynchus lathami Glossy Black-Cockatoo	Yes (surveyed)	☑ Jan ☑ Feb ☑ Mar ☐ Apr ☑ May ☐ Jun ☐ Jul ☐ Aug ☑ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?

Cercartetus nanus Eastern Pygmy-possum	Yes (surveyed)	☑ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☑ Oct ☐ Nov ☑ Dec ☐ Survey month outside the specified months?
Chalinolobus dwyeri Large-eared Pied Bat	Yes (surveyed)	☑ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☑ Nov ☐ Dec ☐ Survey month outside the specified months?
Delma impar Striped Legless Lizard	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Dillwynia glaucula Michelago Parrot-pea	Yes (surveyed)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☑ Sep ☑ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Diuris aequalis Buttercup Doubletail	Yes (surveyed)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☑ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Eucalyptus macarthurii Paddys River Box, Camden Woollybutt	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?

Genoplesium superbum Superb Midge Orchid	Yes (surveyed)	☐ Jan ☑ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Hakea dohertyi Kowmung Hakea	No (surveyed)	☑ Jan ☑ Feb ☐ Mar ☐ Apr ☑ May ☐ Jun ☐ Jul ☐ Aug ☑ Sep ☑ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Hieraaetus morphnoides Little Eagle	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Keyacris scurra Key's Matchstick Grasshopper	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Kunzea cambagei Cambage Kunzea	Yes (surveyed)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☑ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Leucochrysum albicans subsp. tricolor Hoary Sunray	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?

Mixophyes balbus Stuttering Frog	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Myotis macropus Southern Myotis	Yes (surveyed) *Survey months are outside of the months specified in Bionet.	☑ Jan ☑ Feb ☑ Mar ☑ Apr ☑ May ☑ Jun ☑ Jul ☑ Aug ☑ Sep ☑ Oct ☑ Nov ☑ Dec ☑ Survey month outside the specified months?
Ninox connivens Barking Owl	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Ninox strenua Powerful Owl	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Persoonia mollis subsp. revoluta Persoonia mollis subsp. revoluta	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Petauroides volans Southern Greater Glider	Yes (surveyed)	☑ Jan ☑ Feb ☑ Mar ☑ Apr ☑ May ☑ Jun ☑ Jul ☑ Aug ☑ Sep ☑ Oct ☑ Nov ☑ Dec ☐ Survey month outside the specified months?

Petaurus norfolcensis Squirrel Glider	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Petrogale penicillata Brush-tailed Rock-wallaby	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Petroica rodinogaster Pink Robin	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Phascolarctos cinereus Koala	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Phyllota humifusa Dwarf Phyllota	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Pomaderris cotoneaster Cotoneaster Pomaderris	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?

Pomaderris delicata Delicate Pomaderris	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Solanum armourense Solanum armourense	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Swainsona sericea Silky Swainson-pea	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Thesium australe Austral Toadflax	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Tyto novaehollandiae Masked Owl	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?

Threatened species Manually Added

None added

Threatened species assessed as not on site

Refer to BAR for detailed justification

Common name	Scientific name	Justification in the BAM-C
Booroolong Frog	Litoria booroolongensis	Species is vagrant
Broad-headed Snake	Hoplocephalus bungaroides	Species is vagrant
Giant Burrowing Frog	Heleioporus australiacus	Refer to BAR
Grey-headed Flying-fox	Pteropus poliocephalus	Habitat constraints
Large Bent-winged Bat	Miniopterus orianae oceanensis	Refer to BAR
Little Bent-winged Bat	Miniopterus australis	Habitat constraints
Long-nosed Potoroo	Potorous tridactylus	Species is vagrant
Matted Bush-pea	Pultenaea pedunculata	Refer to BAR
Nerriga Grevillea	Grevillea renwickiana	Refer to BAR
Red-crowned Toadlet	Pseudophryne australis	Species is vagrant
Regent Honeyeater	Anthochaera phrygia	Habitat constraints
Sooty Owl	Tyto tenebricosa	Refer to BAR
Southern Brown Bandicoot (eastern)	Isoodon obesulus obesulus	Species is vagrant
Swift Parrot	Lathamus discolor	Habitat constraints
White-bellied Sea-Eagle	Haliaeetus leucogaster	Habitat constraints
White-footed Dunnart	Sminthopsis leucopus	Species is vagrant

* Disclaimer: BAM data last updated may indicate either complete or partial update of the BAM calculator database. BAM calculator database may not be completely aligned with Bionet.

Threatened species reliably predicted to utilise the site. No surveys are required for these species. Ecosystem credits apply to these species.

Common Name	Scientific Name	Vegetation Types(s)
Barking Owl	Ninox connivens	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion
		1150-Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Black Falcon	Falco subniger	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion

Black Falcon	Falco subniger	1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Black-chinned Honeyeater (eastern subspecies)	Melithreptus gularis gularis	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Broad-headed Snake	Hoplocephalus bungaroides	870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion
		1150-Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion
Brown Treecreeper (eastern subspecies)	Climacteris picumnus victoriae	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Diamond Firetail	Stagonopleura guttata	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion

Dusky Woodswallow	Artamus cyanopterus cyanopterus	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion
		1150-Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Eastern Coastal Free-tailed Bat	Micronomus norfolkensis	870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion
		1150-Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion
Eastern False Pipistrelle	Falsistrellus tasmaniensis	870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion
		1150-Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion

Flame Robin	Petroica phoenicea	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion
		1150-Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Gang-gang Cockatoo	Callocephalon fimbriatum	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion
		1150-Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Glossy Black-Cockatoo	Calyptorhynchus lathami	870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion

Glossy Black-Cockatoo	Calyptorhynchus lathami	1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion
		1150-Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Greater Broad-nosed Bat	Scoteanax rueppellii	870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion
		1150-Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Grey-headed Flying-fox	Pteropus poliocephalus	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion
		1150-Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion

Grey-headed Flying-fox	Pteropus poliocephalus	1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Hooded Robin (south-eastern form)	Melanodryas cucullata cucullata	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Large Bent-winged Bat	Miniopterus orianae oceanensis	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion
		1150-Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Little Bent-winged Bat	Miniopterus australis	870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion
		1150-Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion
Little Eagle	Hieraaetus morphnoides	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion

Little Eagle	Hieraaetus morphnoides	870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion
		1150-Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Little Lorikeet	Glossopsitta pusilla	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion
		1150-Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Little Whip Snake	Suta flagellum	1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Masked Owl	Tyto novaehollandiae	870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion

Masked Owl	Tyto novaehollandiae	1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion
		1150-Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Olive Whistler	Pachycephala olivacea	1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
Painted Honeyeater	Grantiella picta	1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Powerful Owl	Ninox strenua	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion
		1150-Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion

Regent Honeyeater	Anthochaera phrygia	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Rosenberg's Goanna	Varanus rosenbergi	870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1150-Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Scarlet Robin	Petroica boodang	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion
		1150-Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion

Scarlet Robin	Petroica boodang	1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Sooty Owl	Tyto tenebricosa	870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion
Speckled Warbler	Chthonicola sagittata	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Spotted-tailed Quoll	Dasyurus maculatus	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion
		1150-Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion

Swift Parrot	Lathamus discolor	870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Turquoise Parrot	Neophema pulchella	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion
		1150-Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Varied Sittella	Daphoenositta chrysoptera	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion

Varied Sittella	Daphoenositta chrysoptera	1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion
		1150-Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
White-bellied Sea-Eagle	Haliaeetus leucogaster	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
White-throated Needletail	Hirundapus caudacutus	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1150-Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Yellow-bellied Glider	Petaurus australis	870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion
		1150-Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion

Yellow-bellied Glider	Petaurus australis	1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Yellow-bellied Sheathtail-bat	Saccolaimus flaviventris	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		870-Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1097-Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1107-River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion
		1150-Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion

Potential Serious and Irreversible Impacts

Name of threatened ecological community	Listing status	Name of Plant Community Type/ID
White Box - Yellow Box - Blakely's Red Gum Grassy Woodland and Derived Native Grassland in the NSW North Coast, New England Tableland, Nandewar, Brigalow Belt South, Sydney Basin, South Eastern Highla	Critically Endangered Ecological Community	280-Red Stringybark - Blakely's Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South Western Slopes Bioregion
White Box - Yellow Box - Blakely's Red Gum Grassy Woodland and Derived Native Grassland in the NSW North Coast, New England Tableland, Nandewar, Brigalow Belt South, Sydney Basin, South Eastern Highla	Critically Endangered Ecological Community	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion

Tableland Basalt Forest in the Sydney Basin and South Eastern Highlands Bioregions	Endangered Ecological Community	952-Mountain Gum - Narrow-leaved Peppermint - Snow Gum dry shrubby open forest on undulating tablelands, southern South Eastern Highlands Bioregion
White Box - Yellow Box - Blakely's Red Gum Grassy Woodland and Derived Native Grassland in the NSW North Coast, New England Tableland, Nandewar, Brigalow Belt South, Sydney Basin, South Eastern Highla	Critically Endangered Ecological Community	1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Monaro Tableland Cool Temperate Grassy Woodland in the South Eastern Highlands Bioregion	Critically Endangered Ecological Community	679-Black Sallee - Snow Gum low woodland of montane valleys, South Eastern Highlands Bioregion and Australian Alps Bioregion
Monaro Tableland Cool Temperate Grassy Woodland in the South Eastern Highlands Bioregion	Critically Endangered Ecological Community	1191-Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion

Species
Litoria castanea / Yellow-spotted Tree Frog
Eucalyptus robertsonii subsp. hemisphaerica / Robertson's Peppermint

Like-for-like options

Acacia bynoeana/ Bynoe's Wattle

Spp	IBRA region
Acacia bynoeana/Bynoe's Wattle	Any in NSW

Variation options

Kingdom	Any species with same or higher category of listing	IBRA region

		under Part 4 of the BC Act shown below	
	Flora	Endangered	Crookwell, Bungonia, Inland Slopes, Kanangra, Monaro, Murrumbateman, Oberon and Orange. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Ammobium craspedioides/ Yass Daisy	Spp	IBRA region	
	Ammobium craspedioides/Yass Daisy	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora	Vulnerable	Crookwell, Bungonia, Inland Slopes, Kanangra, Monaro, Murrumbateman, Oberon and Orange. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Aprasia parapulchella/ Pink-tailed Legless Lizard	Spp	IBRA region	
	Aprasia parapulchella/Pink-tailed Legless Lizard	Any in NSW	
	Variation options		

	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Crookwell, Bungonia, Inland Slopes, Kanangra, Monaro, Murrumbateman, Oberon and Orange. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Callocephalon fimbriatum/ Gang-gang Cockatoo	Spp	IBRA region	
	Callocephalon fimbriatum/Gang-gang Cockatoo	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Crookwell, Bungonia, Inland Slopes, Kanangra, Monaro, Murrumbateman, Oberon and Orange. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Calyptorhynchus lathami/ Glossy Black-Cockatoo	Spp	IBRA region	

	Calyptorhynchus lathami/Glossy Black-Cockatoo	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Crookwell, Bungonia, Inland Slopes, Kanangra, Monaro, Murrumbateman, Oberon and Orange. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Cercartetus nanus/ Eastern Pygmy-possum	Spp	IBRA region	
	Cercartetus nanus/Eastern Pygmy-possum	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region

	Fauna	Vulnerable	Crookwell, Bungonia, Inland Slopes, Kanangra, Monaro, Murrumbateman, Oberon and Orange. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Commersonia prostrata/ Dwarf Kerrawang	Spp	IBRA region	
	Commersonia prostrata/Dwarf Kerrawang	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora	Endangered	Crookwell, Bungonia, Inland Slopes, Kanangra, Monaro, Murrumbateman, Oberon and Orange. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Delma impar/ Striped Legless Lizard	Spp	IBRA region	
	Delma impar/Striped Legless Lizard	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing	IBRA region

		under Part 4 of the BC Act shown below	
	Fauna	Vulnerable	Crookwell, Bungonia, Inland Slopes, Kanangra, Monaro, Murrumbateman, Oberon and Orange. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Diuris aequalis/ Buttercup Doubletail	Spp	IBRA region	
	Diuris aequalis/Buttercup Doubletail	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora	Endangered	Crookwell, Bungonia, Inland Slopes, Kanangra, Monaro, Murrumbateman, Oberon and Orange. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Eucalyptus aggregata/ Black Gum	Spp	IBRA region	
	Eucalyptus aggregata/Black Gum	Any in NSW	
	Variation options		

	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora	Vulnerable	Crookwell, Bungonia, Inland Slopes, Kanangra, Monaro, Murrumbateman, Oberon and Orange. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Eucalyptus robertsonii subsp. hemisphaerica/ Robertson's Peppermint	Spp	IBRA region	
	Eucalyptus robertsonii subsp. hemisphaerica/Robertson's Peppermint	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora	Vulnerable	Crookwell, Bungonia, Inland Slopes, Kanangra, Monaro, Murrumbateman, Oberon and Orange. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Haliaeetus leucogaster/ White-bellied Sea-Eagle	Spp	IBRA region	

	Haliaeetus leucogaster/White-bellied Sea-Eagle	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Crookwell, Bungonia, Inland Slopes, Kanangra, Monaro, Murrumbateman, Oberon and Orange. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Hieraaetus morphnoides/ Little Eagle	Spp	IBRA region	
	Hieraaetus morphnoides/Little Eagle	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region

	Fauna	Vulnerable	Crookwell, Bungonia, Inland Slopes, Kanangra, Monaro, Murrumbateman, Oberon and Orange. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Keyacris scurra/ Key's Matchstick Grasshopper	Spp	IBRA region	
	Keyacris scurra/Key's Matchstick Grasshopper	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Endangered	Crookwell, Bungonia, Inland Slopes, Kanangra, Monaro, Murrumbateman, Oberon and Orange. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Lepidium hyssopifolium/ Aromatic Peppercress	Spp	IBRA region	
	Lepidium hyssopifolium/Aromatic Peppercress	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing	IBRA region

		under Part 4 of the BC Act shown below	
	Flora	Endangered	Crookwell, Bungonia, Inland Slopes, Kanangra, Monaro, Murrumbateman, Oberon and Orange. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Leucochrysum albicans subsp. tricolor/ Hoary Sunray	Spp	IBRA region	
	Leucochrysum albicans subsp. tricolor/Hoary Sunray	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora	Endangered	Crookwell, Bungonia, Inland Slopes, Kanangra, Monaro, Murrumbateman, Oberon and Orange. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Litoria castanea/ Yellow-spotted Tree Frog	Spp	IBRA region	

	Litoria castanea/Yellow-spotted Tree Frog *Note: Variation rules do not apply for Critically Endangered species and impacts on Commonwealth listed entities that are a controlled action.*		Any in NSW
Ninox strenua/ Powerful Owl	Spp		IBRA region
	Ninox strenua/Powerful Owl		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Crookwell, Bungonia, Inland Slopes, Kanangra, Monaro, Murrumbateman, Oberon and Orange. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Petauroides volans/ Southern Greater Glider	Spp		IBRA region
	Petauroides volans/Southern Greater Glider		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region

	Fauna	Endangered	Crookwell, Bungonia, Inland Slopes, Kanangra, Monaro, Murrumbateman, Oberon and Orange. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Petaurus norfolcensis/ Squirrel Glider	Spp	IBRA region	
	Petaurus norfolcensis/Squirrel Glider	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Crookwell, Bungonia, Inland Slopes, Kanangra, Monaro, Murrumbateman, Oberon and Orange. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Phascolarctos cinereus/ Koala	Spp	IBRA region	
	Phascolarctos cinereus/Koala	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing	IBRA region

		under Part 4 of the BC Act shown below	
	Fauna	Endangered	Crookwell, Bungonia, Inland Slopes, Kanangra, Monaro, Murrumbateman, Oberon and Orange. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Polytelis swainsonii/ Superb Parrot	Spp	IBRA region	
	Polytelis swainsonii/Superb Parrot	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Crookwell, Bungonia, Inland Slopes, Kanangra, Monaro, Murrumbateman, Oberon and Orange. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Thesium australe/ Austral Toadflax	Spp	IBRA region	
	Thesium australe/Austral Toadflax	Any in NSW	
	Variation options		

	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora	Vulnerable	Crookwell, Bungonia, Inland Slopes, Kanangra, Monaro, Murrumbateman, Oberon and Orange. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

List of Species Requiring Survey

Name	Presence	Survey Months
Acacia bynoeana Bynoe's Wattle	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Ammobium craspedioides Yass Daisy	Yes (surveyed)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☑ Nov ☐ Dec ☐ Survey month outside the specified months?
Aprasia parapulchella Pink-tailed Legless Lizard	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?

Callocephalon fimbriatum Gang-gang Cockatoo	Yes (surveyed) *Survey months are outside of the months specified in Bionet.	☑ Jan ☑ Feb ☑ Mar ☑ Apr ☑ May ☐ Jun ☑ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☑ Survey month outside the specified months?
Calyptorhynchus lathami Glossy Black-Cockatoo	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Cercartetus nanus Eastern Pygmy-possum	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Commersonia prostrata Dwarf Kerrawang	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Delma impar Striped Legless Lizard	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Diuris aequalis Buttercup Doubletail	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?

Eucalyptus aggregata Black Gum	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Eucalyptus robertsonii subsp. hemisphaerica Robertson's Peppermint	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Haliaeetus leucogaster White-bellied Sea-Eagle	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Hieraaetus morphnoides Little Eagle	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Keyacris scurra Key's Matchstick Grasshopper	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Lepidium hyssopifolium Aromatic Peppercress	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?

Leucochrysum albicans subsp. tricolor Hoary Sunray	Yes (surveyed)	☑ Jan ☑ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☑ Nov ☑ Dec ☐ Survey month outside the specified months?
Litoria castanea Yellow-spotted Tree Frog	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Ninox strenua Powerful Owl	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Petauroides volans Southern Greater Glider	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Petaurus norfolcensis Squirrel Glider	Yes (surveyed)	☐ Jan ☑ Feb ☑ Mar ☑ Apr ☑ May ☐ Jun ☑ Jul ☐ Aug ☐ Sep ☑ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Phascolarctos cinereus Koala	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?

Polytelis swainsonii Superb Parrot	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Thesium australe Austral Toadflax	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?

Threatened species Manually Added

None added

Threatened species assessed as not on site

Refer to BAR for detailed justification

Common name	Scientific name	Justification in the BAM-C
Booroolong Frog	Litoria booroolongensis	Refer to BAR
Giant Burrowing Frog	Heleioporus australiacus	Refer to BAR
Green and Golden Bell Frog	Litoria aurea	Refer to BAR
Grey-headed Flying-fox	Pteropus poliocephalus	Refer to BAR
Large Bent-winged Bat	Miniopterus orianae oceanensis	Refer to BAR
Regent Honeyeater	Anthochaera phrygia	Refer to BAR

BAM Predicted Species Report

Proposal Details

Assessment Id	Proposal Name	BAM data last updated *
00029440/BAAS17040/21/00029442	6699 Humelink Assessment - Crookwell	22/06/2023
Assessor Name	Report Created	BAM Data version *
Simon Tweed	18/08/2023	61
Assessor Number	Assessment Type	BAM Case Status
BAAS17040	Major Projects	Finalised
Assessment Revision		Date Finalised
4		18/08/2023

* Disclaimer: BAM data last updated may indicate either complete or partial update of the BAM calculator database. BAM calculator database may not be completely aligned with Bionet.

Threatened species reliably predicted to utilise the site. No surveys are required for these species. Ecosystem credits apply to these species.

Common Name	Scientific Name	Vegetation Types(s)
Australasian Bittern	Botaurus poiciloptilus	1256-Tableland swamp meadow on impeded drainage sites of the western Sydney Basin Bioregion and South Eastern Highlands Bioregion
Australian Painted Snipe	Rostratula australis	1256-Tableland swamp meadow on impeded drainage sites of the western Sydney Basin Bioregion and South Eastern Highlands Bioregion
Black Falcon	Falco subniger	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		335-Tussock grass - sedgeland fen - rushland - reedland wetland in impeded creeks in valleys in the upper slopes sub-region of the NSW South Western Slopes Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Black-chinned Honeyeater (eastern subspecies)	Melithreptus gularis gularis	280-Red Stringybark - Blakely's Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South Western Slopes Bioregion
		283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		731-Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion

Black-chinned Honeyeater (eastern subspecies)	Melithreptus gularis gularis	1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Brown Treecreeper (eastern subspecies)	Climacteris picumnus victoriae	280-Red Stringybark - Blakely's Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South Western Slopes Bioregion
		283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		727-Broad-leaved Peppermint - Brittle Gum - Red Stringybark dry open forest on the South Eastern Highlands Bioregion
		731-Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1191-Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Diamond Firetail	Stagonopleura guttata	280-Red Stringybark - Blakely's Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South Western Slopes Bioregion
		283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		727-Broad-leaved Peppermint - Brittle Gum - Red Stringybark dry open forest on the South Eastern Highlands Bioregion
		731-Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1191-Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion

Dusky Woodswallow	Artamus cyanopterus cyanopterus	280-Red Stringybark - Blakely's Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South Western Slopes Bioregion
		283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		335-Tussock grass - sedgeland fen - rushland - reedland wetland in impeded creeks in valleys in the upper slopes sub-region of the NSW South Western Slopes Bioregion
		679-Black Sallee - Snow Gum low woodland of montane valleys, South Eastern Highlands Bioregion and Australian Alps Bioregion
		727-Broad-leaved Peppermint - Brittle Gum - Red Stringybark dry open forest on the South Eastern Highlands Bioregion
		731-Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion
		952-Mountain Gum - Narrow-leaved Peppermint - Snow Gum dry shrubby open forest on undulating tablelands, southern South Eastern Highlands Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1151-Silvertop Ash - Broad-leaved Peppermint dry shrub forest of the South Eastern Highlands Bioregion
		1191-Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion
		1256-Tableland swamp meadow on impeded drainage sites of the western Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Eastern False Pipistrelle	Falsistrellus tasmaniensis	280-Red Stringybark - Blakely's Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South Western Slopes Bioregion
		679-Black Sallee - Snow Gum low woodland of montane valleys, South Eastern Highlands Bioregion and Australian Alps Bioregion
		731-Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion

Eastern False Pipistrelle	Falsistrellus tasmaniensis	952-Mountain Gum - Narrow-leaved Peppermint - Snow Gum dry shrubby open forest on undulating tablelands, southern South Eastern Highlands Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1191-Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion
		1256-Tableland swamp meadow on impeded drainage sites of the western Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Flame Robin	Petroica phoenicea	280-Red Stringybark - Blakely's Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South Western Slopes Bioregion
		283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		679-Black Sallee - Snow Gum low woodland of montane valleys, South Eastern Highlands Bioregion and Australian Alps Bioregion
		727-Broad-leaved Peppermint - Brittle Gum - Red Stringybark dry open forest on the South Eastern Highlands Bioregion
		731-Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion
		952-Mountain Gum - Narrow-leaved Peppermint - Snow Gum dry shrubby open forest on undulating tablelands, southern South Eastern Highlands Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1151-Silvertop Ash - Broad-leaved Peppermint dry shrub forest of the South Eastern Highlands Bioregion
		1191-Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion
		1256-Tableland swamp meadow on impeded drainage sites of the western Sydney Basin Bioregion and South Eastern Highlands Bioregion

Flame Robin	Petroica phoenicea	1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Gang-gang Cockatoo	Callocephalon fimbriatum	280-Red Stringybark - Blakely's Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South Western Slopes Bioregion
		283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		679-Black Sallee - Snow Gum low woodland of montane valleys, South Eastern Highlands Bioregion and Australian Alps Bioregion
		727-Broad-leaved Peppermint - Brittle Gum - Red Stringybark dry open forest on the South Eastern Highlands Bioregion
		731-Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion
		952-Mountain Gum - Narrow-leaved Peppermint - Snow Gum dry shrubby open forest on undulating tablelands, southern South Eastern Highlands Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1151-Silvertop Ash - Broad-leaved Peppermint dry shrub forest of the South Eastern Highlands Bioregion
		1191-Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Glossy Black-Cockatoo	Calyptorhynchus lathami	731-Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1151-Silvertop Ash - Broad-leaved Peppermint dry shrub forest of the South Eastern Highlands Bioregion
		1191-Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion

Greater Broad-nosed Bat	Scoteanax rueppellii	731-Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1151-Silvertop Ash - Broad-leaved Peppermint dry shrub forest of the South Eastern Highlands Bioregion
		1191-Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion
		1256-Tableland swamp meadow on impeded drainage sites of the western Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Grey-headed Flying-fox	Pteropus poliocephalus	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		731-Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Hooded Robin (south-eastern form)	Melanodryas cucullata cucullata	280-Red Stringybark - Blakely's Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South Western Slopes Bioregion
		283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		731-Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1191-Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion

Large Bent-winged Bat	Miniopterus orianae oceanensis	280-Red Stringybark - Blakely's Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South Western Slopes Bioregion
		283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		679-Black Sallee - Snow Gum low woodland of montane valleys, South Eastern Highlands Bioregion and Australian Alps Bioregion
		727-Broad-leaved Peppermint - Brittle Gum - Red Stringybark dry open forest on the South Eastern Highlands Bioregion
		731-Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion
		952-Mountain Gum - Narrow-leaved Peppermint - Snow Gum dry shrubby open forest on undulating tablelands, southern South Eastern Highlands Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1151-Silvertop Ash - Broad-leaved Peppermint dry shrub forest of the South Eastern Highlands Bioregion
		1191-Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion
		1256-Tableland swamp meadow on impeded drainage sites of the western Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Little Eagle	Hieraaetus morphnoides	280-Red Stringybark - Blakely's Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South Western Slopes Bioregion
		283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		335-Tussock grass - sedgeland fen - rushland - reedland wetland in impeded creeks in valleys in the upper slopes sub-region of the NSW South Western Slopes Bioregion
		679-Black Sallee - Snow Gum low woodland of montane valleys, South Eastern Highlands Bioregion and Australian Alps Bioregion

Little Eagle	Hieraaetus morphnoides	727-Broad-leaved Peppermint - Brittle Gum - Red Stringybark dry open forest on the South Eastern Highlands Bioregion
		731-Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion
		952-Mountain Gum - Narrow-leaved Peppermint - Snow Gum dry shrubby open forest on undulating tablelands, southern South Eastern Highlands Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1191-Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion
		1256-Tableland swamp meadow on impeded drainage sites of the western Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Little Lorikeet	Glossopsitta pusilla	280-Red Stringybark - Blakely's Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South Western Slopes Bioregion
		283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		731-Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1191-Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Little Whip Snake	Suta flagellum	1191-Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion

Painted Honeyeater	Grantiella picta	280-Red Stringybark - Blakely's Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South Western Slopes Bioregion
		727-Broad-leaved Peppermint - Brittle Gum - Red Stringybark dry open forest on the South Eastern Highlands Bioregion
		731-Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Powerful Owl	Ninox strenua	283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		727-Broad-leaved Peppermint - Brittle Gum - Red Stringybark dry open forest on the South Eastern Highlands Bioregion
		731-Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1151-Silvertop Ash - Broad-leaved Peppermint dry shrub forest of the South Eastern Highlands Bioregion
		1191-Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Regent Honeyeater	Anthochaera phrygia	280-Red Stringybark - Blakely's Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South Western Slopes Bioregion
		283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		731-Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion

Regent Honeyeater	Anthochaera phrygia	1191-Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Rosenberg's Goanna	Varanus rosenbergi	280-Red Stringybark - Blakely's Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South Western Slopes Bioregion
		727-Broad-leaved Peppermint - Brittle Gum - Red Stringybark dry open forest on the South Eastern Highlands Bioregion
		731-Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion
		952-Mountain Gum - Narrow-leaved Peppermint - Snow Gum dry shrubby open forest on undulating tablelands, southern South Eastern Highlands Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1191-Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion
		1256-Tableland swamp meadow on impeded drainage sites of the western Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Scarlet Robin	Petroica boodang	280-Red Stringybark - Blakely's Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South Western Slopes Bioregion
		283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		679-Black Sallee - Snow Gum low woodland of montane valleys, South Eastern Highlands Bioregion and Australian Alps Bioregion
		727-Broad-leaved Peppermint - Brittle Gum - Red Stringybark dry open forest on the South Eastern Highlands Bioregion
		731-Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion

Scarlet Robin	Petroica boodang	952-Mountain Gum - Narrow-leaved Peppermint - Snow Gum dry shrubby open forest on undulating tablelands, southern South Eastern Highlands Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1151-Silvertop Ash - Broad-leaved Peppermint dry shrub forest of the South Eastern Highlands Bioregion
		1191-Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion
		1256-Tableland swamp meadow on impeded drainage sites of the western Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Speckled Warbler	Chthonicola sagittata	280-Red Stringybark - Blakely's Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South Western Slopes Bioregion
		283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		727-Broad-leaved Peppermint - Brittle Gum - Red Stringybark dry open forest on the South Eastern Highlands Bioregion
		731-Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion
		952-Mountain Gum - Narrow-leaved Peppermint - Snow Gum dry shrubby open forest on undulating tablelands, southern South Eastern Highlands Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1191-Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Spotted Harrier	Circus assimilis	335-Tussock grass - sedgeland fen - rushland - reedland wetland in impeded creeks in valleys in the upper slopes sub-region of the NSW South Western Slopes Bioregion

Spotted Harrier	Circus assimilis	1191-Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion
		1256-Tableland swamp meadow on impeded drainage sites of the western Sydney Basin Bioregion and South Eastern Highlands Bioregion
Spotted-tailed Quoll	Dasyurus maculatus	280-Red Stringybark - Blakely's Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South Western Slopes Bioregion
		283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		679-Black Sallee - Snow Gum low woodland of montane valleys, South Eastern Highlands Bioregion and Australian Alps Bioregion
		727-Broad-leaved Peppermint - Brittle Gum - Red Stringybark dry open forest on the South Eastern Highlands Bioregion
		731-Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion
		952-Mountain Gum - Narrow-leaved Peppermint - Snow Gum dry shrubby open forest on undulating tablelands, southern South Eastern Highlands Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1191-Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion
		1256-Tableland swamp meadow on impeded drainage sites of the western Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
Superb Parrot	Polytelis swainsonii	280-Red Stringybark - Blakely's Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South Western Slopes Bioregion
		283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion

Varied Sittella	Daphoenositta chrysoptera	280-Red Stringybark - Blakely's Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South Western Slopes Bioregion
		283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		679-Black Sallee - Snow Gum low woodland of montane valleys, South Eastern Highlands Bioregion and Australian Alps Bioregion
		727-Broad-leaved Peppermint - Brittle Gum - Red Stringybark dry open forest on the South Eastern Highlands Bioregion
		731-Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion
		952-Mountain Gum - Narrow-leaved Peppermint - Snow Gum dry shrubby open forest on undulating tablelands, southern South Eastern Highlands Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1151-Silvertop Ash - Broad-leaved Peppermint dry shrub forest of the South Eastern Highlands Bioregion
		1191-Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
White-bellied Sea-Eagle	Haliaeetus leucogaster	280-Red Stringybark - Blakely's Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South Western Slopes Bioregion
		283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		335-Tussock grass - sedgeland fen - rushland - reedland wetland in impeded creeks in valleys in the upper slopes sub-region of the NSW South Western Slopes Bioregion
		679-Black Sallee - Snow Gum low woodland of montane valleys, South Eastern Highlands Bioregion and Australian Alps Bioregion
		1191-Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion

White-bellied Sea-Eagle	Haliaeetus leucogaster	1256-Tableland swamp meadow on impeded drainage sites of the western Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion
White-fronted Chat	Epthianura albifrons	1256-Tableland swamp meadow on impeded drainage sites of the western Sydney Basin Bioregion and South Eastern Highlands Bioregion
White-throated Needletail	Hirundapus caudacutus	280-Red Stringybark - Blakely's Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South Western Slopes Bioregion
		283-Apple Box - Blakely's Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
		335-Tussock grass - sedgeland fen - rushland - reedland wetland in impeded creeks in valleys in the upper slopes sub-region of the NSW South Western Slopes Bioregion
		679-Black Sallee - Snow Gum low woodland of montane valleys, South Eastern Highlands Bioregion and Australian Alps Bioregion
		727-Broad-leaved Peppermint - Brittle Gum - Red Stringybark dry open forest on the South Eastern Highlands Bioregion
		731-Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion
		952-Mountain Gum - Narrow-leaved Peppermint - Snow Gum dry shrubby open forest on undulating tablelands, southern South Eastern Highlands Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1151-Silvertop Ash - Broad-leaved Peppermint dry shrub forest of the South Eastern Highlands Bioregion
		1191-Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion
		1256-Tableland swamp meadow on impeded drainage sites of the western Sydney Basin Bioregion and South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion

Yellow-bellied Glider	Petaurus australis	731-Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion
		952-Mountain Gum - Narrow-leaved Peppermint - Snow Gum dry shrubby open forest on undulating tablelands, southern South Eastern Highlands Bioregion
		1093-Red Stringybark - Brittle Gum - Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion
		1191-Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion
		1330-Yellow Box - Blakely's Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion

Threatened species Manually Added

None added

Threatened species assessed as not within the vegetation zone(s) for the PCT(s)

Refer to BAR for detailed justification

BAM Biodiversity Credit Report (Variations)

Proposal Details

Assessment Id
00029440/BAAS17040/21/00029446

Proposal Name
6699 Humelink Assessment - Inland Slopes

BAM data last updated *
22/06/2023

Assessor Name
Simon Tweed

Assessor Number
BAAS17040

BAM Data version *
61

Proponent Name(s)
Jack McGovern

Report Created
18/08/2023

BAM Case Status
Finalised

Assessment Revision
5

Assessment Type
Major Projects

Date Finalised
18/08/2023

* Disclaimer: BAM data last updated may indicate either complete or partial update of the BAM calculator database. BAM calculator database may not be completely aligned with Bionet.

Potential Serious and Irreversible Impacts

Name of threatened ecological community	Listing status	Name of Plant Community Type/ID
White Box - Yellow Box - Blakely's Red Gum Grassy Woodland and Derived Native Grassland in the NSW North Coast, New England Tableland, Nandewar, Brigalow Belt South, Sydney Basin, South Eastern Highla	Critically Endangered Ecological Community	266-White Box grassy woodland in the upper slopes sub-region of the NSW South Western Slopes Bioregion
White Box - Yellow Box - Blakely's Red Gum Grassy Woodland and Derived Native Grassland in the NSW North Coast, New England Tableland, Nandewar, Brigalow Belt South, Sydney Basin, South Eastern Highla	Critically Endangered Ecological Community	268-White Box - Blakely's Red Gum - Long-leaved Box - Nortons Box - Red Stringybark grass-shrub woodland on shallow soils on hills in the NSW South Western Slopes Bioregion

White Box - Yellow Box - Blakely's Red Gum Grassy Woodland and Derived Native Grassland in the NSW North Coast, New England Tableland, Nandewar, Brigalow Belt South, Sydney Basin, South Eastern Highla	Critically Endangered Ecological Community	277-Blakely's Red Gum - Yellow Box grassy tall woodland of the NSW South Western Slopes Bioregion

Species
Caladenia concolor / Crimson Spider Orchid
Grevillea wilkinsonii / Tumut Grevillea
Zieria obcordata / Granite Zieria
Bossiaea fragrans / Bossiaea fragrans
Euphrasia arguta / Euphrasia arguta
Prasophyllum sp. Wybong / Prasophyllum sp. Wybong

Additional Information for Approval

PCT Outside Ibra Added

PCT
5-River Red Gum herbaceous-grassy very tall open forest wetland on inner floodplains in the lower slopes sub-region of the NSW South Western Slopes Bioregion and the eastern Riverina Bioregion.
266-White Box grassy woodland in the upper slopes sub-region of the NSW South Western Slopes Bioregion

PCTs With Customized Benchmarks

PCT
No Changes

Predicted Threatened Species Not On Site

Name
No Changes

BAM Biodiversity Credit Report (Variations)

Ecosystem Credit Summary (Number and class of biodiversity credits to be retired)

Name of Plant Community Type/ID	Name of threatened ecological community	Area of impact	HBT Cr	No HBT Cr	Total credits to be retired
5-River Red Gum herbaceous-grassy very tall open forest wetland on inner floodplains in the lower slopes sub-region of the NSW South Western Slopes Bioregion and the eastern Riverina Bioregion.	Not a TEC	2.6	20	7	27.00

	Flora	Vulnerable	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

Aprasia parapulchella/ Pink-tailed Legless Lizard	Spp		IBRA region
	Aprasia parapulchella/Pink-tailed Legless Lizard		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Bossiaea fragrans/ Bossiaea fragrans	Spp		IBRA region
	Bossiaea fragrans/Bossiaea fragrans *Note: Variation rules do not apply for Critically Endangered species and impacts on Commonwealth listed entities that are a controlled action.*		Any in NSW
Burhinus grallarius/ Bush Stone-curlew	Spp		IBRA region
	Burhinus grallarius/Bush Stone-curlew		Any in NSW
	Variation options		

	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Endangered	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Caladenia concolor/ Crimson Spider Orchid	Spp	IBRA region	
	Caladenia concolor/Crimson Spider Orchid	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region

	Flora	Endangered	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Callocephalon fimbriatum/ Gang-gang Cockatoo	Spp	IBRA region	
	Callocephalon fimbriatum/Gang-gang Cockatoo	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

Calyptorhynchus lathami/ Glossy Black-Cockatoo	Spp		IBRA region
	Calyptorhynchus lathami/Glossy Black-Cockatoo		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Cercartetus nanus/ Eastern Pygmy-possum	Spp		IBRA region
	Cercartetus nanus/Eastern Pygmy-possum		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region

	Fauna	Vulnerable	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Crinia sloanei/ Sloane's Froglet	Spp	IBRA region	
	Crinia sloanei/Sloane's Froglet	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

Cullen parvum/ Small Scurf-pea	Spp		IBRA region
	Cullen parvum/Small Scurf-pea		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora	Endangered	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Delma impar/ Striped Legless Lizard	Spp		IBRA region
	Delma impar/Striped Legless Lizard		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region

	Fauna	Vulnerable	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

Euphrasia arguta/ Euphrasia arguta	Spp	IBRA region
	Euphrasia arguta/Euphrasia arguta *Note: Variation rules do not apply for Critically Endangered species and impacts on Commonwealth listed entities that are a controlled action.*	Any in NSW
Grevillea wilkinsonii/ Tumut Grevillea	Spp	IBRA region
	Grevillea wilkinsonii/Tumut Grevillea *Note: Variation rules do not apply for Critically Endangered species and impacts on Commonwealth listed entities that are a controlled action.*	Any in NSW
Haliaeetus leucogaster/ White-bellied Sea-Eagle	Spp	IBRA region
	Haliaeetus leucogaster/White-bellied Sea-Eagle	Any in NSW
	Variation options	

Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act	IBRA region

		shown below	
	Fauna	Vulnerable	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Hieraaetus morphnoides/ Little Eagle	Spp	IBRA region	
	Hieraaetus morphnoides/Little Eagle	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

Keyacris scurra/ Key's Matchstick Grasshopper	Spp		IBRA region
	Keyacris scurra/Key's Matchstick Grasshopper		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Endangered	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Leucochrysum albicans subsp. tricolor/ Hoary Sunray	Spp		IBRA region
	Leucochrysum albicans subsp. tricolor/Hoary Sunray		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region

	Flora	Endangered	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Lophoictinia isura/ Square-tailed Kite	Spp	IBRA region	
	Lophoictinia isura/Square-tailed Kite	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

Myotis macropus/ Southern Myotis	Spp		IBRA region
	Myotis macropus/Southern Myotis		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Ninox connivens/ Barking Owl	Spp		IBRA region
	Ninox connivens/Barking Owl		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region

	Fauna	Vulnerable	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Ninox strenua/ Powerful Owl	Spp	IBRA region	
	Ninox strenua/Powerful Owl	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

Petaurus norfolcensis/ Squirrel Glider	Spp		IBRA region
	Petaurus norfolcensis/Squirrel Glider		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Petaurus norfolcensis - endangered population/ Squirrel Glider in the Wagga Wagga Local Government Area	Spp		IBRA region
	Petaurus norfolcensis - endangered population/Squirrel Glider in the Wagga Wagga Local Government Area		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region

	Fauna	Endangered Population	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Phascolarctos cinereus/ Koala	Spp	IBRA region	
	Phascolarctos cinereus/Koala	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Endangered	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

Polytelis swainsonii/ Superb Parrot	Spp		IBRA region
	Polytelis swainsonii/Superb Parrot		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Prasophyllum petilum/ Tarengo Leek Orchid	Spp		IBRA region
	Prasophyllum petilum/Tarengo Leek Orchid		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region

	Flora	Endangered	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Prasophyllum sp. Wybong/ Prasophyllum sp. Wybong	Spp	IBRA region	
	Prasophyllum sp. Wybong/Prasophyllum sp. Wybong	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora	Not Listed	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

Pultenaea humilis/ Dwarf Bush-pea	Spp		IBRA region
	Pultenaea humilis/Dwarf Bush-pea		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora	Vulnerable	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Swainsona recta/ Small Purple-pea	Spp		IBRA region
	Swainsona recta/Small Purple-pea		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region

	Flora	Endangered	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Swainsona sericea/ Silky Swainson-pea	Spp	IBRA region	
	Swainsona sericea/Silky Swainson-pea	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora	Vulnerable	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

Synemon plana/ Golden Sun Moth	Spp		IBRA region
	Synemon plana/Golden Sun Moth		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Fauna	Vulnerable	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Tyto novaehollandiae/ Masked Owl	Spp		IBRA region
	Tyto novaehollandiae/Masked Owl		Any in NSW
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region

	Fauna	Vulnerable	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.
Zieria obcordata/ Granite Zieria	Spp	IBRA region	
	Zieria obcordata/Granite Zieria	Any in NSW	
	Variation options		
	Kingdom	Any species with same or higher category of listing under Part 4 of the BC Act shown below	IBRA region
	Flora	Endangered	Inland Slopes, Bogan-Macquarie, Bondo, Capertee Uplands, Capertee Valley, Crookwell, Hill End, Kerrabee, Lower Slopes, Murray Fans, Murrumbateman, Orange, Pilliga, Talbragar Valley and Wollemi. or Any IBRA subregion that is within 100 kilometers of the outer edge of the impacted site.

BAM Candidate Species Report

Proposal Details

Assessment Id 00029440/BAAS17040/21/00029446	Proposal Name 6699 Humelink Assessment - Inland Slopes	BAM data last updated * 22/06/2023
Assessor Name Simon Tweed	Report Created 18/08/2023	BAM Data version * 61
Assessor Number BAAS17040	Assessment Type Major Projects	BAM Case Status Finalised
Assessment Revision 5	Date Finalised 18/08/2023	

* Disclaimer: BAM data last updated may indicate either complete or partial update of the BAM calculator database. BAM calculator database may not be completely aligned with Bionet.

List of Species Requiring Survey

Name	Presence	Survey Months
Acacia ausfeldii Ausfeld's Wattle	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Ammobium craspedioides Yass Daisy	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Aprasia parapulchella Pink-tailed Legless Lizard	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?

Bossiaea fragrans Bossiaea fragrans	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Burhinus grallarius Bush Stone-curlew	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Caladenia concolor Crimson Spider Orchid	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Callocephalon fimbriatum Gang-gang Cockatoo	Yes (surveyed)	☑ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☑ Dec ☐ Survey month outside the specified months?
Calyptorhynchus lathami Glossy Black-Cockatoo	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Cercartetus nanus Eastern Pygmy-possum	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?

Crinia sloanei Sloane's Froglet	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Cullen parvum Small Scurf-pea	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Delma impar Striped Legless Lizard	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Euphrasia arguta Euphrasia arguta	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Grevillea wilkinsonii Tumut Grevillea	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Haliaeetus leucogaster White-bellied Sea-Eagle	Yes (surveyed)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☑ Nov ☑ Dec ☐ Survey month outside the specified months?

Hieraaetus morphnoides Little Eagle	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Keyacris scurra Key's Matchstick Grasshopper	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Leucochrysum albicans subsp. tricolor Hoary Sunray	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Lophoictinia isura Square-tailed Kite	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Myotis macropus Southern Myotis	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Ninox connivens Barking Owl	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?

Ninox strenua Powerful Owl	Yes (surveyed)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☑ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Petaurus norfolcensis Squirrel Glider	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Petaurus norfolcensis - endangered population Squirrel Glider in the Wagga Wagga Local Government Area	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Phascolarctos cinereus Koala	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
Polytelis swainsonii Superb Parrot	Yes (surveyed)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☑ Nov ☐ Dec ☐ Survey month outside the specified months?
Prasophyllum petilum Tarengo Leek Orchid	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?

Prasophyllum sp. Wybong Prasophyllum sp. Wybong	Yes (assumed present)	☐ Jan ☐ Feb ☐ Mar ☐ Apr ☐ May ☐ Jun ☐ Jul ☐ Aug ☐ Sep ☐ Oct ☐ Nov ☐ Dec ☐ Survey month outside the specified months?
