Attachment 2. BCD Consultation log

Date	Attendees	Summary of discussion

14 October 2021	• BCD
	• Transgrid
	• Aurecon
	• Niche
		Update on corridor and route options:
		• PACR lodged in July 2021
		  ▪ Key change: shifted from a single circuit to a double circuit configuration
		  ▪ Result: decrease in overall alignment length and decrease in easement width i.e. less environmental impact
		  ▪ Comment period ended mid-September 2021
		• Engagement
		  ▪ July 2021 – Stowe Report released
		  ▪ July/August 2021 – Changes to Community and Stakeholder Engagement Team to improve landowner engagement and bring in line with best practice
		• HumeLink Revised Corridor
		  ▪ Released to the public in September 2021
		  ▪ Eliminated section through Bago/Green Hills State Forest
		  ▪ Eliminated section from Wagga Wagga to Gobarralong
		  ▪ Narrowed corridor in Bannaby area
		  ▪ Three route options under assessment in Tumut/Blowering area
		Key project activities completed and planned
		• Surveys completed/underway
		• Agency engagement ongoing
		• Scoping Report being updated based on revised corridor, lodgement planned for late 2021
		• Heritage surveys will commence November 2021
		• Refined 200m corridor planned February 2022, excluding the Tumut area
		Survey plan overview
		• Current spring survey is the last full season survey
		• Access is a key limitation to survey effort
		• Questions for BCD re: assumed presence
		• BCD indicated assuming presence will drive up offset costs for species:
		  ▪ Golden Sun Moth will need to be surveyed this spring (including on Category 1 lands)
		  ▪ Superb Parrot- nesting habitat would need to be avoided
		  ▪ Swift Parrot- strongly recommend completing surveys
		Avoid and mitigate considerations
		• Questions for BCD re: approach to secondary approvals and credit deferral
		• BCD has a strong preference to avoid post-approval surveys for elements that should inform the BDAR
		• EIS is based on high level design and refinement is ongoing. Transgrid are looking for opportunity to refine assumed presence species offset during the post-approval phase as design refinements are being made
		• BCD indicated that mitigation measures need to be feasible and achievable. Opportunity to justify “Avoidance” will be jeopardised

Date	Attendees	Summary of discussion
		due to a lack of access to land and extent of survey completed. Risk with credit deferral is that credit costs may rise in the post-approval stage. Approach to mapping Category 1 lands • Questions for BCD re: pathways for determination of Category 1 lands • BCD have developed an approach that would be suitable for HumeLink assessment Assessment of prescribed impacts associated with exotic vegetation • Pine forests and exotic pastures may offer habitat for threatened species • Seeking BCD guidance on potential approaches BCD engagement plan for further consultation • Seeking to engage in regular consultation with BCD • Niche to provide information for discussion in workshops ~one week in advance • Top priority is a workshop to review existing HumeLink survey gaps and proposed approach to close these out • Longer workshops would be useful General discussion • BCD indicated there were a number of technical issues that BCD would appreciate this level of engagement on • Niche should consider advice provided by BCD to ELA regarding data gaps and to TG Snowy 2.0 Team on bushfire affected land • HumeLink team working to apply lessons learnt from other Transgrid projects where BCD have provided advice • BCD will share a list of technical issues that BCD would like to engage with HumeLink on • BCD to confirm BAM plot requirements determined for the project footprint overall and not calculated separately for each IBRA subregion. • BCD asked for copy of the current corridor
18 November 2021	• BCD • Transgrid • Aurecon • Niche	Overview and aims of workshop: • Provide an understanding of limitations to survey • Provide an update on approaches to dealing with survey limitations • Presentation of BAM principles relevant to survey limitations. • BCD indicated they were particularly interested in the allocation of 'degraded habitats' for certain species and appropriate filtering of highest risk in those areas Land access and implications for field survey: • BCD: Is Transgrid planning to use the Electricity Supply Act to gain access to property? • Transgrid: ▪ Not at this stage. As the project gets closer to approval and as property negotiations are progressing then the Act may be used to access property. Likewise with compulsory acquisition process ▪ Ongoing negotiations with landowners is focusing on Consent to Enter process. ▪ Property negotiation process is expected to commence Q1 2022

Date	Attendees	Summary of discussion
		▪ As the corridor narrows there have been greater challenges in retaining C2Es – particularly in the Tumut area ▪ Landowners in Tumut area are pressing Transgrid to select alignment through National Parks rather than through private property • Transgrid have a Community and Stakeholder Engagement (CSE) team and significant focus is spent on landowner engagement and concerns • Access is a known key risk to the project planning at this stage • Field surveys planned until the end of February 2022 at this stage. Niche Spring and Summer surveys to supplement to ELA Autumn and Winter surveys. Access and seasonality have had to be considered throughout all survey planning undertaken to date. Current program for BDAR will not allow for Autumn, Winter or Spring surveys in 2022. • BCD comments: ▪ A program for the BDAR and the ecological surveys was requested. ▪ No SEARs yet, no alignment yet. How can the project demonstrate adequate survey coverage? ▪ Golden Sun Moth (GSM), Superb Parrots for example. No alignment finalised. No SEARs – how can sufficient survey be demonstrated? ▪ Assumed presence should be the last resort and would not be considered an appropriate method. ▪ Assumed presence is detailed in the BAM guidelines. • Niche response: ▪ Understanding of likely SEARs would indicate that surveys have been sufficient. ▪ BAM guidelines will be followed. ▪ The survey effort has captured multiple route options where relevant. • BCD are seeking reassurance that survey effort to date is sufficient. When can the survey data be provided of the survey effort for BCD review? ▪ ELA data is being unpacked. Niche are in process of consolidating the survey data and can provide prior to next BCD meeting Focus is being placed on avoidance of impacts, micro siting assets based on field surveys. Focus is on maximising survey effort in the time remaining for the process ▪ Acknowledge that the project has provided information to date and that a follow up request has been made. Effort is being made to supply BCD with data without comprising capacity for field survey • Species polygons being refined based on PCT mapping and fauna habitat dataset – being updated as new data is collected • BCD comment: Restricted access around Tumut area – considering existing easements, publicly accessible areas, Travelling Stock Reserves (TSR)? ▪ Yes – Blowering route (eastern most route) is paralleling existing easement. However, access to existing easement has also been a challenge ▪ Considering representative surveys within TSRs where possible

Date	Attendees	Summary of discussion
		• Niche presented GSM as an example of land access implications for field surveys ▪ Historic GSM survey effort within the region and Pre-settlement Natural Temperature Grasslands mapping insufficient to inform likely habitat extent for the species ▪ Example of potential desktop GSM habitat mapping approach using LiDAR imagery discussed ▪ Remote sensing/mapping of grasslands is problematic without a high level of field validation. This may prove to be an unreliable method – apart from identifying exotic and native grasslands. ▪ Can only refine polygons that we have sight on. Exclude exotic species – but assumed presence may be required until post-approval survey can be undertaken. ▪ For those areas that can't be accessed need to consider how avoidance can be demonstrated (before the post-approval survey opportunities). Will also assist in minimising offsets to a more realistic value. ▪ There are minimum design considerations however design and placement of towers can be micro sited to avoid impacts. ▪ BCD indicated they may have some learnings from Rye Park project that could be useful for desktop mapping of GSM habitats. Noted it was a challenge to remotely map exotic grasslands. However, GSM habitat is generally compatible with placement of transmission towers. • Prescribed impacts assessment and stewardship site opportunities? ▪ Transgrid indicated stewardship site opportunities across multiple projects and regions are being investigated ▪ BCD raised point about impacts and future maintenance. Appropriate mitigation measures will need to be identified in the BDAR/EIS. • Whilst GSM are known to occur within exotic grasslands, protection of exotic grasslands due to GSM presence over native grasslands without GSM should not be considered a good conservation outcome. ▪ BCD highlighted need to consider future operational maintenance (including access tracks) and impacts on grasslands as well as weed spread around access tracks. ▪ BCD: Consider footprint direct impacts presented in PEC projects and Snowy 2.0 Transmission. For instance, access track in steep topography will need to account for erosion and sedimentation control measures. • Ensure construction impacts are assessed on biodiversity values. BCD will need to see these impacts clearly documented and appropriately considered. ▪ Indirect impacts and partial impacts are not the same and need to be separately considered and assessed ▪ Construction areas impacting biodiversity impacts would be considered direct impacts, not partial impacts if they cannot be returned to their previous biodiversity values ▪ Avoidance measures would be applied wherever possible to ensure critical habitats are not impacted by construction laydown areas

Date	Attendees	Summary of discussion

		• Further discussion regarding opportunities where LiDAR imagery could be used to assess GSM habitat suitability including biomass, shading and exotic v native grasslands.
		• PCT mapping and modelling
		  ▪ Mapping species habitat polygons under the BAM using ESRI. This is an iterative process that considers new data as it comes to hand. Current model inputs limited to PCT/ veg zone mapping and geographic constraints. Next step is to factor in Habitat Constraints.
		• BCD: Are vegetation zones and associated BAM plot requirements calculated for each IBRA sub-region separately?
		  ▪ We would only look to use plot data from other regions where it would be above min plot requirements and would result in a more representative VI score being obtained. Use of plot data from other regions would be clearly documented within the BDAR.
		• BCD: Use of BAM plot data across multiple IBRA sub-regions would need to be considered on a case by case basis
		  ▪ Niche: Can we request new PCT assignation translations for the DPIE pre-release State Vegetation Mapping? This has been requested but have been told it will not be available until Jan 2022.
		  ▪ BCD: Translations will not be able to be released early.
		• BAM Calculator and establishment of large linear projects in the Calculator
		  ▪ BCD: Veg zones extents for each IBRA subregion will need to be clearly delineated and consistent between the BDAR, the BAM-C and the GIS spatial datasets. Direct, indirect and partial impacts for veg zones must all be documented within the one child case for relevant IBRA subregion.
		  ▪ BCD: Patch size analysis needs to consider contiguous vegetation that extends beyond the study corridor
		Category 1 lands mapping methodology
		• Niche to provide BCD with proposed methodology for comment. Niche then to complete Cat 1 mapping and provide to BCD for review.
		• BCD comment:
		  ▪ Would be useful to undertake a review of mapping accuracy by ground-truthing number of areas determined as exotic vs native grasslands. This would speak to accuracy and suitability of this desktop mapping approach for lands where survey access cannot be achieved.
		  ▪ Do not rely purely on land use mapping as an indicator.
		  ▪ Scattered trees within paddocks are considered Category 2 lands. Need to be separated out.
		  ▪ Draw around crowns unless evidence of cultivation (i.e. plough lines) under canopy.
		  ▪ Note that woodland vegetation communities can have very sparse canopy tree layer.
		Severely burnt sites and assessment methodology
		• GEEBAM superseded by FESM. BCD prefer usage of FESM method.
		• Can survey for *Caladenia montana* as per other Transgrid projects. BioNet data not that useful for this purpose. All available scientific

Date	Attendees	Summary of discussion
		knowledge for species would need to be utilised to inform approach and whether it is suitable to undertake survey. This would need to be thoroughly documented in the BDAR and can make for a very lengthy BDAR. • Flora surveys post bushfire assessment will differ from fauna surveys • Opportunity to supplement BDAR with expert report for specific species.
16 December 2021	• BCD • Transgrid • Aurecon • Niche	Overview and aims of workshop • Overview of work completed to date • Category 1 land assessment approach • Review of current access around the Tumut area • Timing and priorities for next meeting Introductory / general discussion • Licence agreement from the mapping team for NVR. Not publicly available. ▪ Needs to be signed by the legal team beforehand • BCD: Have you talked to planning and assessment regarding inaccessible areas? ▪ Transgrid: Have brought this up and has also been an issue on PEC. Percentage includes both options around Tumut, 70% coverage. DPIE have drafted a letter to the remaining 10% of access stating that the project is CSSI. Unsure if this letter has been distributed yet. Formal landowner negotiations have commenced June 2021 this year. • How does this fit with the planning process timeline? Does this fit with the EIS? ▪ Transgrid is heading into a meeting Monday 20/12 to discuss the proposed schedule ▪ Transgrid: Want to have the Tumut decision made tail end of January 2022 and beginning of February 2022 beforehand ▪ Some cases inaccessible lands will be an issue. For example, property access to an existing easement will still need to be accessed with a police escort. Will have to use different methods for locations such as these Survey progress update: • Anticipated completion by mid-January 2022 Approach to Category 1 land assessment: • NVR 2017 layer data would be used when this becomes available • Niche indicated some of the assumptions include: ▪ All publicly available layers are assumed to be correct ▪ Consultation of historical aerial imagery was used in production of above layers and was therefore not repeated • Limitations include: ▪ Layers are raster, there are some pixelated boundaries ▪ Until we receive 2017 Woody Vegetation layer, no manual processing/checking has been done • BCD comment: ▪ Once licence agreement signed, will have the NVR map so can extrapolate out the data. It would be possible to then validate the draft set that is given against the NVR map.

Date	Attendees	Summary of discussion
		▪ At least we need the rationale behind the approach/data and then this can be agreed ▪ Would want to spend more time on scrutinising particular areas that there isn't access to ▪ 2017 NVR data individual trees are classified as Cat 2. Draft NVR map for either PEC or Inland Rail that is they produce maps that doesn't cause any issues around privacy and having them publicly available. ▪ Just don't include as a map but rather just describe the process ▪ Niche: The preferred approach is manual corrections as well as cross-referencing against the NVR map. • BCD: Did you have a response to the methodology as we were concerned that no biodiversity assessment for Cat 1 land was undertaken? This is based on concerns across the State in relation to checking the prescribed impacts for threatened species ▪ If it was native vegetation cleared for GSM, it's not prescribed, if it is non-native vegetation cleared for GSM, then it's prescribed ▪ Don't have an updated methodology right now for the creation of offset liability for non-native vegetation. This is in draft model and currently under review ▪ Sort of use a test of significance as the tool to quantify the impact. However, offsetting needs to be discussed on a case by case basis ▪ Prescribed impact can also be direct impacts, such as clearing ▪ Talking about offset amount, this doesn't mean that you apply mitigation values ▪ Difficult to predict what will happen with offsets. Once you determine what your impacts and values are then have a basis for requirements. Let the process flow through and then come back together to discuss what the outcomes are. Alternatives of on ground survey based on access conditions: • Transgrid: Decision will be made in Jan/Feb for Tumut/Blowering routes • Niche: conversation with DPE regarding acceptable level of access and also what can be progressed in the meantime • BCD: Have you done an analysis against the previous slide for the percentage of inaccessibility? Have you had a look at how much you can reduce the percentage using the other options for survey? • Niche: remote survey options being considered for inaccessible lands include aerial LiDAR survey, use of public access points, drone/ helicopter surveys. • BCD: could there be issues with drone access then? For example, would you need property access? • Transgrid: ▪ Can't fly over people's properties with prior consent ▪ Proposed towers are higher than the existing ones located north of Greenhills State Forest. The existing spans a number of gullies and the engineers are currently looking at ways to mitigate impacts

Date	Attendees	Summary of discussion
		• BCD: are you looking at the height on the lines and the height of the trees? • Transgrid: there is a specified separation distance between the two. Working with the easement management team and the engineers, looking at what portions to span • Niche: Land access issues may increase offset cost estimates and perversely incentivize higher constraint route options. Also to note, where alternative route options considered to avoid impacts, this means that it moves it from an area previously surveyed to an area that can't be accessed or hasn't been surveyed. Therefore, this leads to larger areas that you'd have to assume presence and in the long run doesn't necessarily cost less ▪ BCD: maybe the project needs a longer timeframe to allow for access and be able to gain access to survey these areas? ▪ Moving areas is a secondary avoidant impact. Would prefer to have Cat 1 land without threatened species.
24 January 2022	• BCD • Transgrid • Aurecon • Niche	Overview and aims of workshop: • Assist in defining a starting polygon for: areas requiring targeted survey and in the absence of survey would require assumed presence for each species (and hence a species polygon • Discuss priority fauna species that are considered higher risk (in terms of impacts, higher cost) or for which there is potential to significantly reduce survey areas based on agreed to limiting/ degraded habitat factors and alternative/supplementary survey approaches HumeLink species list and methodology: • Refer to species habitat modelling methodology supporting documentation • Species list for all species listed in the IBRA subregions • Niche indicated the preliminary species model has only been run once, uses GIS analysis that applies BAM methodology • BCD comment: ▪ This process did not occur on PEC East and West and Inland Rail. o These projects started at PCT level first. o This methodology will need to be agreed upon. ▪ BAM calculator allows for PCT data to be ticked that will identify species o Can confirm BioNet geographic constraints data for HumeLink project area has recently been reviewed and updated in the BAM calculator o Current BAM rule: Can only exclude species if their habitat constraints are not present (eg. can only exclude Powerful Owls if suitable breeding hollows are not present) o For the BAM calculator, you need a separate case for each IBRA subregion o BAM was set-up to assess large linear projects also o Veg validations should be undertaken rather developing a model that has never been undertaken before. BCD are not comfortable with development of

Date	Attendees	Summary of discussion
		models. BCD may not agree with outcomes of a model and that may result in the loss of time and cost. o BCD want an understating of how the process works and ensure that this is clear in the reporting • Niche comment: ▪ BAM calculator can be limiting when assessing large linear projects and does not allow for geographic representation of habitat extent. Therefore a methodology that applies the BAM methodology has been developed for this purpose. BAM calculator can also result in over estimate of species requiring targeted survey. ▪ Model has not been developed to replace vegetation survey but rather to supplement/improve the BAM methodology to develop project specific, site specific data that the BAM does not allow for. Development of a spatial tool that allows for most accurate species surveys for the HumeLink project. Will allow a level of transparency that the BAM calculator desktop method does not always allow. ▪ Concerns will be taken on board as to how the model aims at improving limitations in the BAM calculator and aim to respond to BCD regarding to these concerns. • Question on the Flow Chart in the model methodology document – what BCD need is to understand exactly what data and the name/source of the datasets that have been used so that BCD can provide guidance on limitations of the datasets. Example: some of the datasets are state-wide and may have limitations when being applied to the modelling at site-specific scale. ▪ Niche will only be using datasets that would be considered fit for purpose along with data collected from site. Defining a starting polygon • Niche: Species model would be used to explain why species has been dropped from BAM calculator • Example with squirrel gliders – patch size is not a good indicator here ▪ Niche: Individual hollow trees would be surveyed in such an example. PCT mapping discussion • PCT mapping accuracy is critical. BCD will provide feedback on this separately. • Land access limited, Niche require additional site access to improve mapping confidence Discussion of high priority fauna species • Gang Gang Cockatoo ▪ BCD: could look to implement age class mapping to identify mature stands of trees in forest. Has been used before for glider and Glossy Black-cockatoo habitat mapping. ▪ Niche has been using height data derived from LiDAR data to map vegetation height ▪ BCD: the process requires a lot of ground-truthing and may not be a suitable alternative ▪ Advice to other Snowy projects was that this could not be done and therefore they had to assume presence. ▪ Recent bushfires have impacted ability to assess canopy remotely

Date	Attendees	Summary of discussion
		▪ BCD: recommend design/ clearing assumptions are finalised with Transgrid so that clearing avoidance measures can be locked in ▪ Transgrid: where possible, designing to limit impacts is being considered o Lessons learnt from PEC projects are considered. Contractor is not currently on board so Early Contractor Engagement not currently occurring but lessons learnt from PEC will be considered at this stage and these can be passed on to the contractor as part of contract specifications. ▪ Bushfire affected areas could be removed from the modelling processes. • Glossy Black-cockatoo ▪ BCD: species can travel and move over large scale areas. Local presence of *Allocasuarina* can be used as a good indicator of species presence but breeding still reliant on hollow presence. • Powerful Owl & Masked Owl ▪ BCD: species requires presence of old growth hollow bearing trees ▪ Paddock habitats would still need to be considered where in direct proximity to habitats with suitable vegetation/ hollows ▪ Any deviation from BAM guidelines – a requests needs to be put to BAM Support (via email). For example – deviation from buffer distances for large owls • Squirrel Glider ▪ BCD: presence of acacia in mid-storey is pretty important. Usually associated with presence of squirrel gliders. o Presence of the food source is normally associated with presence of habitat so should inform both breeding and foraging habitat o If the trees are scattered (more than 100m apart) it is unlikely that they would be used by squirrel gliders. This may not be in the BAM however research suggests that gliding cannot occur a distances greater than this. Therefore they could be excluded at these greater distances of tree scattering. • Superb Parrot ▪ BCD: very difficult species to exclude as known to nest in paddocks where suitable hollows are present. Will come down to presence of hollows. • Eastern Pygmy Possum ▪ BCD: the species won't occur in relictual (i.e. <10% cover) landscapes o Unlikely to occur where mid-storey is absent - lack of nectar sources ▪ Niche: LiDAR information (height of vegetation layers) can be relied upon to inform lands with no mid-storey present o BCD: what is the buffer for the LiDAR information with relation to the offset of the HumeLink alignment and the existing powerlines. Need to consider the entire patch associated with the species.

Date	Attendees	Summary of discussion

		• Large-eared Pied Bat
		  ▪ Niche indicated have been moved to full species credits
		  ▪ BCD: would need to get specialist advice on these
		  ▪ Likelihood of presence in subregions – can be passed on to species specialist
		• Sloane's Froglet
		  ▪ BCD: put together the layers that have been used that are associated with mapping and modelling and this can be taken to the species specialists for feedback
		• Brush-tailed Phascogale & Koala
		  ▪ BCD: if anywhere, they are likely to be in the north-east of the alignment towards the Bannaby area
		  ▪ Can BCD provide any guidance on identifying surveys areas in the absence of species records?
		  ▪ BCD: Derived Native Grassland (DNG) mapping should be prioritised and be brought into the model
		  ▪ BCD: mapping of woodlands CEEC – Can this be relied upon?
		  o Start with SEED. Can you provide a list of PCTs/TECs?
		  o Niche will provide
		• Priority grassland fauna species
		  ▪ Pink-tailed Legless Lizard
		  o Niche need to ensure we are gathering the correct habitat information on the ground
		  o Requested to send through species specific question to BCD
		  ▪ Striped Legless Lizard- expert report
		  ▪ Golden Sun Moth
		  o Niche indicated poor survey season due to colder, wetter summer
		  o BCD: January may have been better however if not, mapping may need to be relied upon here.
		Other business
		• Can the source of the habitat constraint please be included in the species list. This will help inform BCD in their analysis of the species list.
		• BCD requested to get a clearer understanding on where field-based verification is being relied upon and where state-wide mapping is being relied upon within the Vegetation Zones dataset provided. Can this be clarified?
		  ▪ Niche indicated all mapping provided has been developed based on field-based mapping
		  ▪ Areas not mapped will rely on state-wide mapping
		  ▪ State-wide mapping has been used to identified survey requirements

1 July 2022	• BCD • Aurecon • Niche	General • Challenges of the BAM and applying it to a large linear project • Seeking BCD endorsement of planned approach Method for mapping Cat 1 lands: • BCD indicates they are comfortable with Niche's approach. This is in keeping with what had been discussed in previous workshops between HumeLink and BCD. • Written justification required if mapping Category 2 lands

Date	Attendees	Summary of discussion
		• BCD: What is happening with the 29 differences identified in the NVR mapping? If there is conflicting data, then taking precautionary principal. • Niche: NVR mapping shows some differences between Cat 1 and Cat 2. In these instances, would be deferring to Cat 2. Filtering processes under the BAM for species credit species: • BCD comments: ▪ Can justification not be included in the BDAR as to how a value was developed and impacts on subsequent calculations. ▪ You cannot capture it in the BAM calculator, but it can be justified in the BDAR. If your reasoning for how/why this value changes across the alignment is captured in the BDAR – then this is how you capture and justify your method within the spatial data rather than in the BAM calculator. You end up treating the different spatial data as separate records of that given unit. Justification must be included in the spatial data. ▪ Is there a risk that some species (shown in Table 2 in information provided) will be left out? • Niche comments: ▪ Calculator only allows for a single value to be entered for the development despite long linear projects having a range of native veg cover values from end to end ▪ Will require revision, but the filters are legitimately allowed for under the BAM for good reason. The “relictual” cover species will always be included as they only require 10% score. However, “intact” species will be removed where we assess the score to be below 70% ▪ Looking for an agreement from BCD of this approach to target species and exclude certain credit species from certain areas based on this approach. • Niche looking for feedback on what is considered native vegetation and what is not considered in native vegetation • BCD comments: ▪ Derived native grasslands have to be included in native vegetation calculations. Derived native grasslands would still be included as a candidate species. ▪ Providing justification within the BDAR from literature etc as to why this scenario has been excluded for X or Y species ▪ Using a secondary native vegetation cover approach to justify your survey approach needs to be justified in the BDAR. However, the standard approach needs to be taken at the front end of the BAM calculator, and then justifying the secondary approach in the BDAR. ▪ A VI plot would need to be used to justify any approach outside of the BAM 2020 approach. • Niche comments: ▪ Challenge of derived native grasslands PCTs. The main point is that once canopy cover is removed certain species of fauna species will no longer use the derived PCTs. ▪ Example Sooty Owl breeding habitat, once the canopy cover is removed across the landscape these areas would no longer be used and surveys never find such species. As such,

Date	Attendees	Summary of discussion
		the need to include derived native grasslands and native cover becomes problematic when trying to assess. Uncertain if the current BAM methodology allows for a discount to native cover to be applied in these scenarios. ▪ The other issue is the change of rules to derived native vegetation between 2017 and 2020. The approach to removal of canopy cover has been updated but the candidate species have not been updated to reflect this change in rules. ▪ Will end up choosing the highest value in the calculator to acknowledge that there are areas of high native cover (we do not wish to remove species where it is appropriate to consider them) then we intend to apply filters in particular areas (of low cover) and justifying in the BDAR and with spatial data how the HumeLink approach was derived. Access • Niche indicated an improvement to access and alignment has been refined • BCD: It would be good to identify which areas have been subject to intensive investigation in the spatial data • Niche agreed that an update of survey coverage would be provided. It was communicated that the supplied vegetation mapping layer indicates where field survey has been completed. Patch size • BCD indicates Niche's suggested approach seems reasonable, seems to conform with the BAM methodology • Niche seeking feedback on large scale patch sizes and allocation of patch size within the same vegetation zones for example. Looking at opportunity to work outside of the calculator to split up patch size classes across a PCT zone. • BCD comments: ▪ Will only be an issue in areas where you are over the condition threshold. May find it easier to split into two zones and use the BAM calculator. Or, if you have hundreds of zones and justify why patch sizes were excluded due to small size or isolation from other areas of vegetation. Think about how you can make this clear-cut justification in the BDAR. ▪ Using the BAM calculator for all of this will have benefits later in the HumeLink project process, especially post-approval updates. I would be much more comfortable all of this being included in the calculator. The scenario discussed shouldn't have an impact on the calculations as these will be smaller or poorer quality areas. ▪ Having very strong "line of sight" justification of your approach in the BDAR will be critical ▪ When we receive mountains of field data and then review BAM calculator and the BDAR, if there is not a strong justification why certain things are being done with candidate species that may not be reflected in the spatial data then this can make it very difficult to review the BDAR. Do not just say "no" or "null". Take the time to include robust justification.

Date	Attendees	Summary of discussion
		▪ Include rationale and clear steps as to how you have got to where you got to. A likelihood of occurrence table could be useful here. ▪ Will need to see this to be confident of the robustness of the survey effort. This will be critical over a project of this size. • Niche comments: ▪ Will like to use the BAM calculator wherever we can. However, there we will have to work out if this becomes unwieldy. ▪ So long as the outcomes are in accordance with BAM intentions, we are happy to make this the preferred method. Next steps ▪ BCD: Snowy 2.0 approach of having species specialists who were intimate with the species that may have been pulled into the assessment due to proximity to local records or historic records, having species specialists provided great benefits in justifying why particular species could be excluded. ▪ BCD to provide formal feedback. Other business: ▪ BCD noted to consider Match Stick Grasshopper. This has been added to the species list and will be pulled into the assessment across all regions. Conclusions/Actions ▪ General acceptance and support at face value on the methods being proposed and their application to address the BAM assessment. Further consideration will need to occur based on how some of the identified methods would be implemented and results ▪ BCD to present methods to the BAM support team and other relevant staff for further consideration ▪ Niche to provide an update on survey coverage and refined footprint ▪ Next meeting agenda items to be developed and communicated ▪ Niche to include any assumptions and methods around use of patch size and native vegetation calculations within their BDAR/supporting documentation. It will be important for BCD to have clarity on how and where certain decisions have been applied and what impact this has for example on specific species ▪ Some case examples would be useful to look at in future consultation.
24 August 2022	• BCD • DPE • Transgrid • Aurecon • Niche	Meeting outline and objectives • Survey coverage, BCD's position on BAM compliance and survey adequacy • Accessible and inaccessible areas – strategies to address survey gaps Survey access to date • BCD request for data gaps to be addressed, if BCD identifies any on properties for which C2Es have been revoked?

Date	Attendees	Summary of discussion
		▪ Effort was provided by Niche in the previous PDF document issued to BCD, does not identify effort per property but within associated IBRA subregion. There are not many properties where access has been revoked. Accessible areas: Survey approach to date • Unlikely to satisfy survey guidelines in all areas for species and will rely on assumed presence and expert opinion (including input from BCD or expert reporting) where there is a shortfall in survey effort. E.g. Golden Sun Moth – weather conditions were not conducive to sightings. Likely to have another wet summer. • Niche do not intent to revisit surveyed areas unless BCD consider critical for further analysis and highlights the need for further survey at specific sites • BCD still digesting all the information provided by Niche. • BCD are interested in the unsurveyed areas and Niche's approach to addressing gaps. Inaccessible areas: Land access prioritisation • Niche approach has been based on prioritisation and likelihood and timing of future access • Niche continuing to seek new access – survey planned for September and October • Probable C2Es – Survey early to mid-2023, all remaining land to be covered post approval. Transgrid continuing to seek additional C2Es. Percent coverage are a best guess based on land owner sentiment. • Niche look to balance conservatism with knowledge of comparable areas and results from representative areas. Also including expert input from BCD and others. • Making use of high-quality LiDAR imagery captured in 2022 for HumeLink. Next steps / discussion items • BCD comments: ▪ BDAR will need to clearly explain how avoidance has been demonstrated, which can be difficult for long linear projects. How it all fits in to the BDAR will need to be thought about. ▪ BCD to provide thoughts on what BCD are looking for in terms of avoidance and mitigation. ▪ Has Transgrid considered playing with the tower heights to minimise vegetation clearing requirements ▪ How will you address partial impacts? How are defining high conservation values (HCV) – e.g. areas that may not be EECs but have high value habitat? How you will use this to demonstrate avoidance? o BCD keen to discuss approach to partial impacts early on in the process. • Transgrid comments ▪ Tower heights will only be considered on a case-by-case basis where it will deliver most benefit. Consideration of minimising TECs has already taken place at a high level, especially with route selection. • Niche comments: ▪ Will need to finalise Cat 1 lands determination and application in relation to CEECs

Date	Attendees	Summary of discussion
		▪ Is the BCD/DPE concerned that there is risk in approving based on a project offset obligation that could change when further survey work is completed post-approval for areas that could not be ground-verified? BCD/DPE did not comment on whether they were concerned about approach. ▪ Developed a framework using ESRI GIS software for the identification of HCV. o Would like to get BCD input into how partial impacts should be quantified. • Niche are looking at undertaking plots in existing easements to provide rigor to the calculation of future VI within areas of partial clearing. Will need to understand if the BCD are wanting the BDAR to document the future VI immediately post-construction or in the longer-term once impacts from clearing have stabilised. ▪ BCD: it would be really good to see a subset of the spatial data (i.e. habitat mapping/species polygon process), as this will provide BCD with a greater understanding of the steps taken to assign species polygons to areas o Niche could provide as part of upcoming species specific workshops o BCD will provide a written response on the information provided. • DPE: would prefer to avoid significant updates to the BDAR between the Adequacy Review and Response to Submissions phase. We will contact AK about this comment as the audio was an issue.
19 October 2022	• BCD Southeast • BCD Southwest • BCD species specialists • Transgrid • Aurecon • Niche	Meeting outline and objectives • Review of objectives against BAM requirements • Overview of relevant data sources used to conduct steps 5.2 – 5.3 of BAM 2020 • Workshopping for each species to achieve the objectives - application of 5.2.2 – 5.2.5 of BAM 2020 • Confirmation of outstanding queries to be resolved. Review of objectives against BAM requirements • Niche looking to focus discussion on filters that can be applied as a part of the BAM habitat suitability assessment (BAM 2020 Section 5.2-5.3) including vagrancy and habitat constraints considerations for candidate species. Overview of relevant data sources used to conduct steps 5.2 – 5.3 of BAM 2020 • Data comes from BioNet and incorporated into the BAM calculator • Largest patch size has been assumed • Species list per IBRA sub-region to be updated following BCD feedback • Niche have developed species list in spreadsheet by adapting the BAM calculator with the BioNet data exports ▪ Developed to the purposes of ongoing consultation and workshops ▪ BDAR will present species list as generated by the BAM Calculator. Species workshop for each species to achieve objectives – application of 5.2.2. – 5.2.5 of BAM 2020

Date	Attendees	Summary of discussion
		• Refer to attached spreadsheet for BCD comments and assigned actions where relevant for each species discussed. Next steps / discussion items • Frog and bat specialists at BCD to be consulted on species as assigned • Broad-headed Snake and GHFF – some spatial analysis required to be provided to BCD to justify approach. Niche to provide BCD with karst and cliffline mapping for review • Flora to be discussed at a future workshop • Niche provided 2x data sets ▪ Areas provided for full clearing and partial clearing (note: access tracks currently missing) ▪ Revised veg zone mapping for the project footprint.

Attachment 3. Vegetation within category 1- exempt land

Table A1- 1 to Table A1- 5 outlines the vegetation zones occurring within Category 1 exempt lands mapped according to the Native Vegetation Regulatory (NVR) Map method statement (DPE, 2022). Each table represents a separate IBRA subregion. Pink cells are vegetation zones identified as high conservation value. These have been excluded from the final Category 1 lands map and clearing impacts associated with these vegetation zones fully considered within the BDAR. Note that no Category 1 exempt lands were mapped within the Snowy Mountains IBRA subregion.

Table A1- 1: Vegetation zones within Category 1 exempt lands mapped for the Bondo IBRA subregion

Attachment 4. Assessment against the DPIE (2020) burnt area guideline

This attachment presents the results of bushfire assessments undertaken within lands impacted by the 2019-20 Dunns Road Bushfire. A total of 97 assessments were completed in accordance with the *'Guideline for applying the Biodiversity Assessment Method at severely burnt sites'* (DPIE, 2020e), including:

- 39 initial site assessments completed by ELA within 9 months post-fire (Table A4- 2)
- 58 subsequent site assessments completed by Niche approximately three years post-fire (Table A4- 1).

The results of the assessment are presented below relative to each vegetation zone and Fire Extent Severity Map (FESM) category.

Table A4- 1: Severely burnt vegetation zones and assessment against the DPIE (2020e) guideline – Niche 2022

Survey details				DPIE 2020e guideline criteria					Survey results
Burnt Assessment ID (Easting, Northing: MGA 1994 GDA 55)	**Date of Survey**	**IBRA Subregion**	**FESM* Category**	**Additional Field Observations - Adjacent Vegetation Burn Status, Topography and Soil/ Geology**	**Tree/ Canopy Guideline Criteria**	**Understorey Guideline Criteria**	**Ground Cover Guideline Criteria**	**Habitat guideline criteria**	
Vegetation Zone: 268_Low									
WM05307 (575292, 6087237)	17/5/22	Inland Slopes	Low severity	DNG, no canopy, Downslope gully woodland largely in burnt with minor trunk scorch. Clay, Siltstone or mudstone outcrops scattered, Within Hills, on Mid slope, 413 AHD; 15/20 degrees slope NE facing 29 degrees	Trees Species Richness unidentified: No, Dominant tree species unidentified: No, Canopy trees consumed: No, Length of epicormic growth: < 1	Understorey plants consumed: No, Understorey regrowth present: No	Groundcover plants consumed: No, Groundcover regrowth present: No, Ground scorch evident: No	Logs consumed: No, Pre-fire surface litter (if expected) is consumed: No, Soil organic layer consumed: No, Ash and charred organic matter present: No, HBT plot completed: Not applicable	Not Severely Burnt

Attachment 5. Floristic plot data

This Attachment presents the floristic plot data for each Biodiversity Assessment Method (BAM) plot as entered into the BAM Calculator (BAM-C). This is presented separately for each IBRA subregion in Table A5- 1 to Table A5- 22. Plot codes referenced at the top of each table are documented in Attachment 10 in relation to each PCT and in Attachment 6 in relation to each vegetation zone. Cover (C) and abundance (A) scores are provided for plant species where they occurred within each BAM plot.

Table A5- 1: Bungonia BAM floristic data

Cheilanthes sieberi	Rock Fern					0.1	1
Chiloglottis reflexa	-						
Chloris truncata	Windmill Grass						
Chondrilla juncea	Skeleton Weed						
Chrysocephalum apiculatum	Common Everlasting						
Cirsium arvense	Perennial Thistle			0.5	1		
Cirsium vulgare	Spear Thistle					0.1	1
Convolvulus angustissimus	-						
Convolvulus erubescens	Pink Bindweed						
Conyza bonariensis	Flaxleaf Fleabane					0.1	1
Cotula australis	Common Cotula						
Crataegus monogyna	Hawthorn						
Cryptandra amara	Bitter Cryptandra						
Cymbonotus lawsonianus	Bear's Ear						
Cynodon dactylon	Common Couch						
Cynosurus cristatus	Crested Dog's Tail	0.2	1				
Cynosurus echinatus	Rough Dog's Tail					25	1
Cyperus eragrostis	Umbrella Sedge						
Cyperus sp.	-						
Dactylis glomerata	Cocksfoot	0.1	1	80	1	3	1
Daucus glochidiatus	Native Carrot						
Daviesia latifolia	Bitter-pea						
Desmodium gunnii	Slender Tick-trefoil						
Desmodium varians	Slender Tick-trefoil					0.1	1
Dianella caerulea	Blue Flax-lily						
Dianella longifolia	Blueberry Lily						
Dianella revoluta	Blueberry Lily						
Dichelachne inaequiglumis	-						
Dichelachne micrantha	Shorthair Plumegrass						
Dichelachne parva	-						
Dichelachne rara	-						
Dichopogon fimbriatus	Nodding Chocolate Lily						
Dichopogon strictus	Chocolate Lily						
Dillwynia retorta	-						
Drosera spatulata	-						
Dysphania pumilio	Small Crumbweed						
Echium plantagineum	Patterson's Curse						

Scientific Name	Common Name	BY093436		BY1004EA		BY056C93	
		C	A	C	A	C	A
Einadia hastata	Berry Saltbush						
Einadia nutans	Climbing Saltbush						
Eleusine indica	Crowsfoot Grass						
Eleusine tristachya	Goose Grass						
Elymus scaber	Common Wheatgrass	0.2	1				
Epilobium billardierianum	-						
Eragrostis brownii	Brown's Lovegrass						
Eragrostis curvula	African Lovegrass						
Eragrostis parviflora	Weeping Lovegrass						
Eragrostis pilosa	Soft Lovegrass						
Eragrostis trachycarpa	A Lovegrass						
Eucalyptus blakelyi	Blakely's Red Gum					20	1
Eucalyptus bridgesiana	Apple Box						
Eucalyptus dalrympleana	Mountain Gum						
Eucalyptus dives	Broad-leaved Peppermint						
Eucalyptus elata	River Peppermint						
Eucalyptus goniocalyx	Bundy						
Eucalyptus macrorhyncha	Red Stringybark						
Eucalyptus mannifera	Brittle Gum						
Eucalyptus melliodora	Yellow Box			40	1	1	1
Eucalyptus pauciflora	White Sally						
Eucalyptus radiata	Narrow-leaved Peppermint						
Eucalyptus rossii	Inland Scribbly Gum						
Eucalyptus sieberi	Silvertop Ash						
Eucalyptus stellulata	Black Sally						
Eucalyptus viminalis	Ribbon Gum						
Euchiton involucratus	Star Cudweed						
Euchiton japonicus	-					0.1	1
Euchiton sp.	A Cudweed						
Euchiton sphaericus	Star Cudweed					0.1	1
Euphorbia drummondii	Caustic Weed						
Festuca elatior	Tall Fescue						
Fimbristylis sp.	-						
Galium sp.	-						
Gamochaeta americana	Cudweed					0.1	1
Geranium homeanum	-						
Geranium neglectum	-						

Scientific Name	Common Name	BY093436		BY1004EA		BY056C93	
		C	A	C	A	C	A
Geranium retrorsum	Cranesbill Geranium						
Geranium solanderi	Native Geranium			0.1	1		
Glycine tabacina	Variable Glycine						
Gompholobium aspalathoides	-						
Gonocarpus tetragynus	Poverty Raspwort					0.1	1
Goodenia hederacea	Ivy Goodenia						
Goodenia hederacea subsp. *hederacea*	-						
Hardenbergia violacea	False Sarsaparilla						
Hemarthria uncinata	Matgrass						
Hibbertia obtusifolia	Hoary Guinea Flower						
Hibbertia riparia	-						
Holcus lanatus	Yorkshire Fog	0.1	1			0.1	1
Hordeum leporinum	Barley Grass						
Hordeum vulgare	Barley			0.2	1		
Hovea heterophylla	-						
Hovea lanceolata	-						
Hovea linearis	-						
Hydrocotyle laxiflora	Stinking Pennywort					0.1	1
Hypericum gramineum	Small St John's Wort					0.1	1
Hypericum perforatum	St. Johns Wort						
Hypochaeris glabra	Smooth Catsear						
Hypochaeris radicata	Catsear	1	1			0.5	1
Isotoma fluviatilis	Swamp Isotome						
Juncus australis	Rush						
Juncus capitatus	-						
Juncus filicaulis	-						
Juncus homalocaulis	-					0.1	1
Juncus radula	-						
Juncus sp.	A Rush						
Juncus usitatus	-					0.1	1
Leptomeria acida	Sour Currant Bush						
Leptorhynchos squamatus	Scaly Buttons						
Leptorhynchos squamatus subsp. *squamatus*	-						
Leucochrysum albicans var. *tricolor*	Hoary Sunray						
Leucopogon fletcheri subsp. *brevisepalus*	-						
Leucopogon sp.	A Beard-heath						
Linum marginale	Native Flax						

Scientific Name	Common Name	BY093436		BY1004EA		BY056C93	
		C	A	C	A	C	A
Lissanthe strigosa	Peach Heath						
Lobelia pedunculata	Matted Pratia						
Lolium perenne	Perennial Ryegrass			0.5	1		
Lomandra bracteata	Mat-rush						
Lomandra filiformis	Wattle Matt-rush	0.1	1				
Lomandra filiformis subsp. *coriacea*	Wattle Matt-rush						
Lomandra longifolia	Spiny-headed Mat-rush						
Lomandra multiflora subsp. *multiflora*	Many-flowered Mat-rush						
Luzula densiflora	Woodrush						
Luzula sp.	-						
Lysimachia arvensis	Scarlet Pimpernel						
Lysimachia japonica	-						
Lythrum hyssopifolia	Hyssop Loosestrife			0.1	1		
Malva parviflora	Small-flowered Mallow						
Medicago minima	Woolly Burr Medic						
Melichrus urceolatus	Urn Heath						
Microlaena stipoides	Weeping Grass	70	1			10	1
Microlaena stipoides var. *stipoides*	Weeping Grass						
Microtis rara	Scented Onion Orchid						
Microtis sp.	-						
Microtis unifolia	Common Onion Orchid						
Modiola caroliniana	Red-flowered Mallow			0.1	1		
Nassella neesiana	Chilean Needle Grass						
Nassella trichotoma	Serrated Tussock						
Olearia microphylla	-						
Onopordum acanthium	Scotch Thistle						
Opercularia diphylla	Stinkweed					0.1	1
Opercularia hispida	Hairy Stinkweed						
Oreomyrrhis eriopoda	Australian Carraway						
Oreomyrrhis sp.	-						
Oxalis corniculata	Creeping Oxalis						
Oxalis perennans	-	0.1	1			0.1	1
Oxalis sp.	-						
Panicum effusum	Hairy Panic						
Panicum simile	Two-colour Panic					0.2	1
Paronychia brasiliana	Chilean Whitlow Wort, Brazilian Whitlow						
Paspalum dilatatum	Paspalum						

Scientific Name	Common Name	BY093436		BY1004EA		BY056C93	
		C	A	C	A	C	A
Persoonia linearis	Narrow-leaved Geebung						
Petrorhagia dubia	-						
Petrorhagia nanteuilii	Proliferous Pink					0.1	1
Petrorhagia prolifera	Proliferous Pink	0.1	1				
Phalaris aquatica	Phalaris						
Phleum pratense	Timothy						
Phytolacca octandra	Inkweed						
Pimelea curviflora	Rice Flower						
Pimelea curviflora var. *sericea*	-						
Pimelea linifolia	Slender Rice Flower						
Plantago lanceolata	Lamb's Tongues					0.1	1
Plantago varia	-						
Platysace lanceolata	Shrubby Platysace						
Poa labillardierei var. *labillardierei*	Tussock					0.2	1
Poa sieberiana	Snowgrass						
Poaceae indeterminate	Grasses, reeds and bamboos						
Podolepis jaceoides	Showy Copper-wire Daisy						
Pomax umbellata	Pomax						
Poranthera microphylla	Small Poranthera						
Prunella vulgaris	Self-heal						
Pteridium esculentum	Bracken						
Pultenaea microphylla	A Bush Pea						
Pultenaea subspicata	Low Bush-pea						
Quercus robur	English Oak						
Ranunculus lappaceus	Common Buttercup						
Rhytidosporum procumbens	-						
Rosa rubiginosa	Sweet Briar						
Rubus anglocandicans	Blackberry						
Rubus fruticosus sp. *agg.*	Blackberry complex						
Rumex acetosella	Sheep Sorrel	0.1	1	0.1	1	0.1	1
Rumex brownii	Swamp Dock			0.1	1		
Rumex crispus	Curled Dock						
Rumex obtusifolius	Broadleaf Dock						
Rytidosperma carphoides	Short Wallaby Grass						
Rytidosperma pallidum	Redanther Wallaby Grass; Silvertop Wallaby Grass						
Rytidosperma racemosum	Wallaby Grass			0.5	1	5	1
Rytidosperma setaceum	Small-flowered Wallaby-grass	10	1				

Scientific Name	Common Name	BY093436		BY1004EA		BY056C93	
		C	A	C	A	C	A
Rytidosperma sp.	-	2	1				
Schoenus apogon	Fluke Bogrush					0.5	1
Scleranthus biflorus	Two-flowered Knawel						
Scleranthus fasciculatus	-						
Senecio madagascariensis	Fireweed						
Senecio microbasis	-						
Senecio prenanthoides	-						
Senecio quadridentatus	Cotton Fireweed						
Senecio sp.	Groundsel, Fireweed						
Setaria parviflora	-						
Silybum marianum	Variegated Thistle						
Solanum nigrum	Black-berry Nightshade						
Solenogyne dominii	-						
Solenogyne gunnii	Solengyne						
Sonchus asper	Prickly Sowthistle						
Sonchus oleraceus	Common Sowthistle						
Sporobolus creber	Slender Rat's Tail Grass						
Stellaria pungens	Prickly Starwort						
Stylidium graminifolium	Grass Triggerplant						
Stylidium lineare	Narrow-leaved Triggerplant						
Stylidium sp.	-						
Themeda triandra	Kangaroo Grass					35	1
Tolpis barbata	Yellow Hawkweed						
Tolpis umbellata	Yellow Hawkweed						
Tricoryne elatior	Yellow Autumn-lily						
Trifolium arvense	Haresfoot Clover						
Trifolium campestre	Hop Clover						
Trifolium repens	White Clover	0.1	1	0.5	1		
Trifolium subterraneum	Subterranean Clover						
Triptilodiscus pygmaeus	Common Sunray						
Verbascum virgatum	Twiggy Mullein						
Veronica plebeia	Trailing Speedwell						
Viola betonicifolia	Native Violet						
Viola sp.	-						
Vittadinia cuneata	A Fuzzweed						
Vulpia bromoides	Squirrel Tail Fesque	0.5	1				
Vulpia myuros	Rat's Tail Fescue					0.5	1

Attachment 6: BAM plot function, structure and composition scores

This attachment presents the Biodiversity Assessment Method (BAM) plot function, structure and composition scores used to inform the Vegetation Integrity (VI) of Plant Community Types (PCTs) within the project footprint. Plot composition scores comprise a count of each growth form recorded as occurring within each plot. Structure scores relate to the percent cover of each growth form. Function scores include the number of large trees, a hollow-bearing tree (HBT) count, percent litter cover (LC), length of fallen logs (FLL) in metres and the presence/ absence each tree stem size class (1= present; 0= absent). This data is presented separately for each IBRA subregion within Table A6- 1 to Table A6- 6.

Where a vegetation zone occurs within multiple patch size classes, plot data has been replicated in the BAM-C to represent the data for that vegetation zone in each patch size class, as per the BAM.

Table A6- 1: Bungonia IBRA Subregion BAM plot function, structure and composition scores

TG = Tree Group, SG = Shrub Group, GG = Grass & Grass-like Group, FG = Forb Group, EG = Fern Group, OG = Other Group, HBT = Hollow-bearing Tree, LC = Litter Cover, FLL = Length of fallen Logs (m), Tree Stem Size Class (diameter breast height of trunk in cm), 5-10, 10-20, 20-30, 30-50 and 50-80, Regen = Tree Stem Size Class <5 cm

Attachment 7. BAM plot data used for vegetation zones with plot short fall

Table A7- 1. Vegetation zones with a BAM plot shortfall and consequent surrogate or duplicate plot use within the BAM-C

Data deficient vegetation zone					Surrogate/Duplicate plots					
IBRA subregion	**PCT**	**Condition class**	**Vegetation class**	**Surrogate or Duplicate plot used**	**Surrogate/duplicate plot code**	**IBRA subregion/region**	**PCT**	**Condition class**	**Vegetation class**	**Reason for surrogate/duplicate plot used**
Bungonia/South Eastern Highlands	283	Very low	Western Slopes Grassy Woodlands	Surrogate	YG001693 YYG001AA0 YG0056F6 WM05392C YG-042F	Inland Slopes/NSW South Western Slopes	277	Very low	Western Slopes Grassy Woodlands	This vegetation zone is only present within the project footprint in small, isolated patches between patches of higher quality vegetation. The zone could therefore not be accurately sampled with a plot.
Bungonia/South Eastern Highlands	1093	High	Southern Tableland Dry Sclerophyll Forests	Duplicate	BY052A65 BY052FAF BY083EC7 BY05274F BY0448CD	Crookwell/South Eastern Highlands	1093	High	Southern Tableland Dry Sclerophyll Forests	This zone is present in a singular patch in the project footprint. Part of the patch is only present within an inaccessible property.
Bungonia/South Eastern Highlands	1093	Moderate	Southern Tableland Dry Sclerophyll Forests	Duplicate	BY052BA4 BY0573C9	Crookwell/South Eastern Highlands	1093	Moderate	Southern Tableland Dry Sclerophyll Forests	Most of this vegetation zone is present within an inaccessible property.
Bungonia/South Eastern Highlands	1097	Moderate	Southern Tableland Wet Sclerophyll Forests	Surrogate	MA-092C MA09208C MA-014A2 MA092B25	Bondo/South Eastern Highlands	295	Moderate	Southern Tableland Wet Sclerophyll Forests	This vegetation zone is present within an inaccessible property.
Bungonia/South Eastern Highlands	1150	High	South East Dry sclerophyll Forests	Duplicate	BY010F5E	Bungonia/South Eastern Highlands	1150	High	South East Dry Sclerophyll Forests	Most of this vegetation zone is present within inaccessible properties. Therefore, the plot requirement was not met.
Bungonia/South Eastern Highlands	1150	Low	South East Dry sclerophyll Forests	Surrogate	BY-054D BY-037B BY034D07	Crookwell/South Eastern Highlands	1151	Low	South East Dry Sclerophyll Forests	This vegetation zone is present within inaccessible properties.

Data deficient vegetation zone					Surrogate/Duplicate plots					
IBRA subregion	**PCT**	**Condition class**	**Vegetation class**	**Surrogate or Duplicate plot used**	**Surrogate/duplicate plot code**	**IBRA subregion/region**	**PCT**	**Condition class**	**Vegetation class**	**Reason for surrogate/duplicate plot used**
Bungonia/South Eastern Highlands	1150	Very low	South East Dry sclerophyll Forests	Surrogate	BY-054C	Crookwell/South Eastern Highlands	1151	Very low	South East Dry Sclerophyll Forests	This vegetation zone is present within inaccessible properties.
Bungonia/South Eastern Highlands	1330	Very low	Southern Tableland Grassy Woodlands	Surrogate	BY066A52 BY0651CB BY065325	Crookwell/South Eastern Highlands	1330	Very low	Southern Tableland Grassy Woodlands	This vegetation zone is present within inaccessible properties.
Crookwell/South Eastern Highlands	280	Low	Western Slopes Grassy Woodlands	Duplicate	YG02401 YG026A72	Murrumbateman/South Eastern Highlands	280	Low	Western Slopes Grassy Woodlands	Within the Crookwell subregion, this vegetation zone is present within a small patch, part of which is located in an inaccessible property.
Crookwell/South Eastern Highlands	283	Moderate	Western Slopes Grassy Woodlands	Surrogate	BY10369E BY10345E	Murrumbateman/South Eastern Highlands	283	Moderate	Western Slopes Grassy Woodlands	This vegetation zone is generally present in small, isolated patches and was not adequately sampled within this subregion.
Crookwell/South Eastern Highlands	283	Very low	Western Slopes Grassy Woodlands	Surrogate	YG026MP1	Murrumbateman/South Eastern Highlands	278	Very low	Western Slopes Grassy Woodlands	This vegetation zone is largely situated on one property within the Crookwell subregion which was not adequately sampled.
Crookwell/South Eastern Highlands	952	Very low	Subalpine Woodlands	Duplicate	BY-026A	Crookwell/South Eastern Highlands	952	Very low	Subalpine Woodlands	Except for one patch too small to sample, this vegetation zone is present in an inaccessible property.
Crookwell/South Eastern Highlands	1093	Very low	Southern Tableland Dry Sclerophyll Forests	Duplicate	BY-014L	Bungonia/South Eastern Highlands	1093	Very low	Southern Tableland Dry Sclerophyll Forests	This vegetation zone is largely situated on one property within the Crookwell subregion which was not adequately sampled.

Attachment 8. Survey dates and weather conditions

Weather conditions for each date in which field surveys were undertaken are presented in Table A8- 1. Climate data was retrieved from the Wagga Wagga weather station (35.16° S, 147.46° E). Survey conditions specific to Golden Sun Moth (*Synemon plana*) are provided in Table A8- 2. These were retrieved from the Burrinjuck Dam weather station (35° S, 148.6° E).

It should be noted:

- Blank cells denote where there are Bureau of Meteorology data deficiencies for the survey period.
- The climate data below is intended to provide a general indication of weather conditions across the extent of the project footprint at the time of survey. Localised daily survey conditions are likely to have varied slightly from those shown below.

Table A8- 1: Field survey conditions

1. Expert report - Alison Rowell, Biologist and Environmental Consultant.

Alison Rowell has worked as a consultant since 1992, specialising in threatened species in woodlands and grasslands in south-east NSW and the ACT, and has become technically adept in assessments of the Golden Sun Moth (*Synemon plana*) throughout this period.

She has carried out many surveys of the Golden Sun Moth (GSM) and its habitat, assessing the size and significance of populations and the extent and quality of habitat, and developing site management plans.

Methods used include walked transect and fixed-point surveys for flying males, retrieval of larvae, pupal case surveys, mark-release-recapture surveys, and broad and fine-scale habitat measurement and mapping. Sites assessed vary from very small to greater than 100 hectares, and include highway and light rail projects, and solar and wind farms.

Alison Rowell has also written policy documents and guidelines for Australian Capital Territory (ACT) government (including the ACT GSM Action Plan), Environmental Management Plans for GSM Offset sites and has contributed to GSM population biology research with others.

2. Golden Sun Moth (*Synemon plana*)

2.1 Conservation status

The Golden Sun Moth (GSM) was listed as critically endangered under the EPBC Act in 2002, then relisted to vulnerable in 2021. The relisting followed a review of its status, which found a significant increase in the last 20 years in its known extent of occurrence, area of occupancy and number of subpopulations (DAWE 2021). The species is now listed as vulnerable in New South Wales (NSW)(2022), Victoria (2022) and the ACT (2023).

No Commonwealth recovery plan was prepared for the GSM while it was listed as critically endangered, and when relisted as vulnerable it was recommended that there not be a recovery plan for the species.

The *Matters of National Environmental Significance significant impact guidelines 1.1* are therefore the relevant significant impact guidelines for the GSM (DOE 2013). The guidelines state that habitat critical to the survival of a species refers to areas that are necessary for activities such as foraging, breeding, roosting, or dispersal; for the long-term maintenance of the species; to maintain genetic diversity and long-term evolutionary development; or for the reintroduction of populations or recovery of the species.

Habitat critical to the survival of the Golden Sun Moth has yet to be identified but is likely to include all native grassland and open grassy woodland habitat occupied by the species. Due to its specialised habitat requirements and fragmented distribution, all occupied habitat is important for the breeding activity of subpopulations and the recovery of the species.

Large subpopulations or small well-connected subpopulations in high quality habitat would have higher ecological importance than small, discrete populations. High quality habitat would be made up of medium to large sites containing a grassy native ground layer with abundant larval food species, with low weed cover, inter-tussock spaces, and land management consistent with maintaining GSM habitat value. Sites near the limit of the species range, or a long distance from other known subpopulations are also likely to be important in conserving the full range of genetic diversity. Survey effort in southern NSW is still considered to be insufficient, mainly because the majority of habitat occurs on private land, therefore the true extent of their range and distribution within it is unconfirmed.

2.2 Description and biology

Unless otherwise stated, the information on the species in the sections below is drawn from the ACT GSM Action Plan (ACT Government 2017), the recent conservation advice (DAWE 2021), the NSW threatened species profile Golden Sun Moth - South Eastern Highlands: Distribution and vegetation associations | NSW Environment, Energy and Science and the personal experience of Alison Rowell.

The Golden Sun Moth (*Synemon plana* Walker 1854), is a medium-sized day-flying moth in the family Castniidae. Adult GSM have clubbed antennae (like butterflies) and no functional mouthparts, with the adults only living 1-2 days after emergence. Males and females differ in appearance and behaviour. The wingspan is 34 mm in males and 31 mm in females, and the abdomen of the female extends beyond the wings at rest. Males can fly for extended periods and distances, while the heavier females mainly walk or flutter short distances. Males are grey below and females are white. The upperside of the forewing is dark with pale grey patterning in both sexes, while in the male the hindwing is bronze and in females is bright yellow orange with black marginal spots.

GSM larvae develop underground where they are associated with the roots of a few species of grasses, mainly Wallaby grasses (*Rytidosperma* spp.), and to a lesser extent Speargrasses (*Austrostipa* spp.). Larvae are cream-coloured and late instars have a red-brown head capsule. The larvae pupate after developing for 1-2 years underground, and adults emerge on warm dry sunny days in spring and early summer, leaving the upper half of the empty red-brown pupal cases protruding from the soil near tussock bases.

In ACT/NSW populations, the flying period is usually between mid-October and early January, with a peak from mid-November to early December. The most reliable method of detecting GSM is searching for the males, which fly continuously during the warmest part of the day in search of females. The start and end dates of the flying season vary with rainfall and overnight temperatures, and numbers of adults recorded at a site during a season also varies greatly from year to year based on data compiled by A. Rowell from and for ACT and NSW government staff, researchers and consultants (ACT Government, 2015; Richter et al., 2013; Rowell & Evans, 2014; Rowell, 2019; Rowell, 2023; Zenviron, Tilt & Umwelt, 2022).

GSM was originally widespread in south-eastern Australia in native grasslands and open woodlands with a high component of Wallaby grasses. Moderate to high cover of the larval food plants is desirable due to the low mobility and short life span of the female, which walks or flutters between tussocks to lay eggs, and because larvae are likely to be able to move only a limited distance through soil if unable to complete their development on the roots of a single tussock.

Most of the ACT/NSW populations lie within a band about 130 km long and 40 km wide, running from the Queanbeyan to Boorowa districts, and most known sites are small and/or fragmented. Five major genetic clusters have been identified across ACT, NSW and Victoria, and genetic variation increases with the geographic distance between populations.

Relatively dry and open grassland within the Natural Temperate Grassland of the South Eastern Highlands community, which is listed as critically endangered under the EPBC Act, is thought to be the species' original preferred habitat. However, many such areas supporting this community have been destroyed or degraded since European settlement.

Grasslands, which have not been ploughed, heavily grazed or pasture-improved tend to retain cryptogams, bare ground and native forbs. They usually contain fewer exotic species and have lower and more stable biomass. They also retain the shorter species of Wallaby Grasses (*R. carphoides, R. auriculatum, R. laeve*), while more disturbed grasslands often contain more robust 'native pasture' species such as *R. caespitosum* and *Austrostipa bigeniculata* (SMEC, 2018). Small tussocks provide shelter and sites for larval development, and inter-tussock spaces are used for basking and for females to display and attract mates.

GSM are now found in native grassland, native pasture, open woodlands with a grassy understorey and secondary grasslands. It is likely that populations have spread into secondary grasslands after partial or complete clearing of trees, but these habitats usually support fewer moths than primary grassland. GSM also occurs in former dry forest communities where these were close to native grasslands and open woodlands. The density of Wallaby Grasses in secondary grassland tends to vary considerably at a small scale, with patches of high density scattered across sites.

GSM larvae have also been found among the roots of two introduced grasses, Chilean Needlegrass and Serrated Tussock. These grasses are however usually associated with disturbance and other weeds, and often develop high biomass if not grazed.

3. GSM in the HumeLink project area

The project occurs within two Interim Biogeographic Regionalisation of Australia (IBRA) regions known to contain GSM:

- South-Eastern Highlands region: Murrumbateman subregion
- NSW South-Western Slopes region: Inland Slopes subregion

The distribution of GSM records in NSW on the BioNet Atlas Database is shown in Figure 1. Note the isolated record near Tumut (Gocup), which is 70 km west of the most westerly record (Washpen) in the main cluster.

In these two IBRA subregions, GSM is associated with several vegetation formations including grasslands, grassy woodlands and dry sclerophyll forests, or grassy communities derived from these by clearing of trees. Many Plant Community Types (PCTs) within those formations have been identified as potential GSM habitat (BioNet and GSM threatened species profile on Office of Environment and Heritage (OEH) website).

The PCTs listed by OEH as being associated with the Inland Slopes subregion probably refer to the western sites of the northern half of the cluster of populations around Boorowa-Bowning (north of the project footprint) rather than the outlying Tumut site. This site is also only 3 km inside the Inland Slopes subregion and was not visited.

This report assesses the project footprint, the area within which direct impacts could occur from the project. The project footprint includes an indicative disturbance area, which is an estimated area to be directly disturbed during construction and operation of the project based on an indicative concept design and construction methodology. However, the indicative disturbance area may be subject to change during the detailed design phase with the potential for future impact avoidance and minimisation to be realised at this time. Biodiversity assessment activities (e.g. vegetation and habitat assessment) have been conducted throughout accessible areas of the project footprint with certain targeted survey activities occurring within the indicative disturbance area, which is the area used for all clearing and impact calculations.

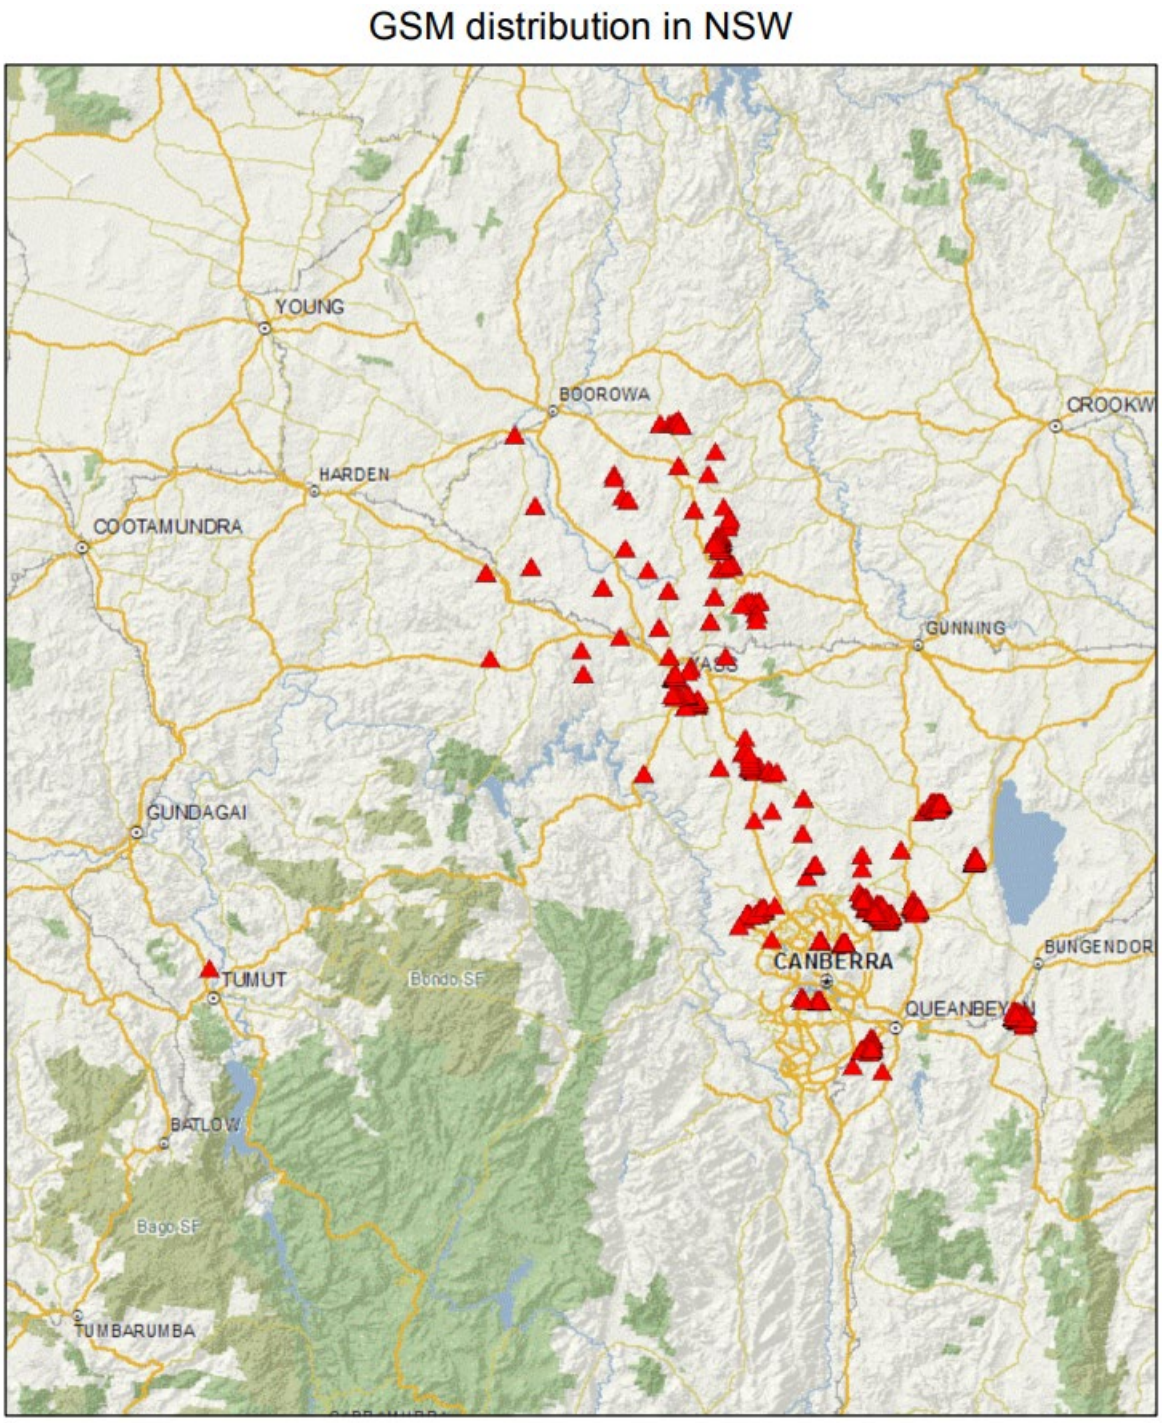

Figure 1. GSM distribution in NSW (from NSW BioNet Atlas Database)

4. Expert report approach

Broad GSM habitat polygons were to be delineated using vegetation community (PCT) mapping and floristic and condition score data previously collected from BAM plots in potentially suitable GSM habitat in the project footprint. These data would then be reviewed against data from 100 metre point intercept GSM habitat assessment transects from areas provisionally identified as suitable or unsuitable habitat based on proximity to known GSM sites and the vegetation community present.

A subset of the above sites across the project footprint in the Murrumbateman and Inland Slopes IBRA subregions was visited in November-December 2022 to undertake field evaluation of the above data.

A set of parameters indicating the potential for habitat to support Golden Sun Moth populations was then developed based on the collected data, GSM literature and Alison Rowell's knowledge.

Literature consulted is listed in Table 1.

5. Habitat assessment methods

The GSM habitat assessment incorporated best practice survey methods and habitat quality classification parameters to inform the creation of GSM habitat polygons identifying potential habitat within the indicative disturbance area. Relevant databases and scientific literature (Table 1) were reviewed prior to undertaking the field survey to identify data gaps and inform survey design.

5.1 Niche and Ecoresolve data collected in 2021

The initial delineation of potential habitat used the vegetation community (PCT) mapping to locate PCTs known to be associated with GSM in the Murrumbateman and Inland Slopes IBRA subregions (BioNet and DPE threatened species online profile 2023) and related these to previous GSM records from the NSW BioNet Atlas Database. This was followed by measurement of GSM habitat transects and visual surveys for flying GSM in potential habitat. Site photographs were taken in many cases and provided to Niche Environment & Heritage (Niche) for review.

GSM habitat assessment coverage throughout the Murrumbateman IBRA subregion was generally good (DAWE, 2021), with 60 habitat transects assessed (i.e. average 1 transect / 0.69 ha of potential habitat). The majority of known GSM records relevant to the project occur within this region and these habitats are therefore considered to have the highest potential for supporting GSM.

Within the Inland Slopes IBRA subregion, GSM habitat assessment coverage was lower (average ca. 1 transect / 1.8 ha of potential habitat) due to issues with private property access and other survey limitations. However, many parts of this region within the project footprint (predominantly the south-western section) do not coincide with the known range of GSM. The only known GSM record close to where the HumeLink alignment passes through the Inland Slopes subregion is a single site 3 km south of the footprint near Tumut. This population is 70 km west of the cluster of populations in the Murrumbateman subregion and has been identified as genetically distinct from this population, with no intermediate populations having been found 'within a 70 km radius despite extensive searching over a number of years' (Clarke & Whyte, 2003). The population near Tumut appears more closely related to Victorian populations than to the ACT/Yass/Murrumbateman cluster, which also suggests that there are unlikely to be stepping-stone populations between the Tumut site and the nearest Murrumbateman cluster (or they would probably share more genes). It is therefore thought to be unlikely that the project footprint would intersect with any stepping-stone populations within the Inland Slopes IBRA subregion.

5.2 Data assessment in 2022

In November-December 2022, Alison Rowell accompanied Arne Bishop of Ecoresolve to inspect a selection of sites in the Inland Slopes and Murrumbateman IBRA subregions that had received positive and negative assessments for GSM habitat suitability, supplementing field surveys conducted the year prior. Photographs were taken of vegetation condition, and plant species lists were made to check against previous data collected, with an emphasis on recording species and conditions both positively and negatively associated with GSM habitat. Notes were made on patch size and connectivity, and site characteristics such as slope, aspect, rocks, pasture improvement, weediness, site management, rockiness and other signs of recent and past disturbance.

The method used for assessing GSM habitat presence and quality in the field was based on that used in the northern ACT and developed by Alison in conjunction with SMEC for ACT government (SMEC, 2018a; SMEC, 2019) (below refer to Section 5.4 – 5.5).). The SMEC (2019) habitat condition classes were adapted to accommodate the conditions of the current project, as that classification did not allow for survey in grassy areas cleared from open forest communities, or the temporary biomass, weed and litter loads that were present in 2021-22 after two years of a La Nina weather system. Similarities in vegetation composition, structure and condition to nearby GSM sites where Alison has worked were noted. This includes Bango wind farm, Springdale solar farm, the Barton Highway duplication in NSW, and areas across the northern ACT.

After the site visits, the data was reviewed in GIS along with previously collected GSM data. As genera and functional plant/habitat attributes (rather than species) were recorded in the GSM habitat transects, it was necessary to review the nearest BAM plots and photographs to determine which actual species may have occurred on the GSM habitat transects, and to examine site photographs for further information on habitat condition.

PCTs present in the project footprint that were considered to be associated with this species include PCT 266, 277, 352 and 1330. In additional to the known primary PCT habitat associations of grasslands and open grassy woodlands, the following PCTs were also considered to provide suitable habitat opportunities for GSM in some locations within Murrumbateman: PCT 1093, 351, and 287. These are open forest vegetation types containing Red Stringybark and/or Brittle Gum, and the potential GSM habitat occurred in openings in the forest/woodland or where the trees had been cleared. Some of these open forest vegetation types are listed on the OEH GSM profile as having potential as habitat and GSM have been recorded in them during other projects in the Murrumbateman subregion and in the northern part of the ACT.

Some sites that were considered to be potential GSM habitat have been assessed based on their proximity to known GSM sites and the presence of suitable larval food grasses at the site (or in nearby BAM plots) rather than being strictly confined to the PCTs listed as being associated with GSM.

In consultation with Chani Wheeler of Niche, a series of filters for GSM attributes was developed to be applied to the data to refine the definition of potential GSM habitat in the project footprint.

After potential GSM habitat was identified in this way, further analysis was undertaken on data at the subsite level, reviewing more plot and transect data, photographs and Google Earth imagery of various ages to identify habitat attributes and likely disturbances such as tree regeneration, ploughing and pasture improvement.

A conservative approach to delineating potential GSM habitats was adopted in areas where data was deficient. In these locations, potential habitats were considered suitable for the species where they supported a known PCT association, intersected the known range of the species and aerial photo examination did not suggest the presence of dense woody vegetation or wetlands. GSM are known to occupy exotic grasslands containing Chilean Needle Grass, but exotic grasslands were excluded from consideration given the general lack of Chilean Needle Grass observations within the project footprint (based on the review of available plot and habitat assessment data).

The methods used to collect data and the way the assessment was undertaken are described in the text boxes below.

5.3 GSM habitat transects

Niche and Ecoresolve undertook 93 100m step-point transects in areas of potential Golden Sun Moth habitat. A dominant habitat feature was recorded at each 1 m interval of the transect, from the following list:

- Bare earth/soils
- Cryptogams
- Litter/dead vegetation
- Perennial native grass – Other
- Perennial native grass – *Austrostipa* spp.
- Perennial native grass – *Rytidosperma* spp.
- Other native grass (non-Golden Sun Moth food)
- Exotic Golden Sun Moth food plants – Other
- Exotic Golden Sun Moth food plants – Chilean Needle Grass
- Exotic Golden Sun Moth food plants – Serrated Tussock
- Perennial exotic grass (non-Golden Sun Moth food)
- Annual exotic grass
- Exotic forbs.

The list above does not record native forbs (good indicators of the amount of past disturbance), and there is a possible duplication of categories with 'perennial native grass – other' and 'other native grass (non-Golden Sun Moth food)'.

The lack of species identification in the larval food plant categories means that the presence of large tussock grasses in the same genera as food plants (but not known to be used by GSM larvae) can affect the determination of habitat suitability. These include *Austrostipa densiflora* and *Rytidosperma pallidum* (both associated with open forest more than primary grasslands). Species lists from nearby BAM plots and photographs from plots and transects were used to identify these and to therefore remove some sites from the GSM potential habitat list.

5.4 GSM habitat quality classification (adapted from SMEC, 2019)

High-quality habitat (none seen in project footprint)

Primary Natural Temperate Grasslands (NTG) or native pasture dominated by native larval food plants i.e. smaller *Rytidosperma* spp. and/or *Austrostipa* spp.), with low weed cover and some bare ground. Most (but not necessarily all) of the following minimum values should be met:

- 10% cover *Rytidosperma* spp. or 15% cover *Rytidosperma* spp. and *Austrostipa* spp. combined
- >5% bare ground
- < 5% exotic broadleaf
- Low to moderate biomass
- Litter sparse to moderate (<25% cover of litter)
- Moderate to high native plant diversity (>12 native species per 20m x 20m area)

Moderate-quality habitat

Primary (none identified in project footprint) or secondary grassland, with a moderate component of smaller *Rytidosperma* spp. and/or *Austrostipa* spp., and/or moderate weed cover. Most (but not necessarily all) of the following minimum values should be met:

- 5% cover *Rytidosperma* spp. or 10% cover *Rytidosperma* spp. and/or *Austrostipa* spp. combined
- 3% bare ground
- < 10% exotic broadleaf
- Low to moderate biomass
- Litter sparse to moderate (<25% cover of litter)
- Moderate native plant diversity (>8 native species per 20m x 20m area)

Low-quality habitat

Larval food plants (*Rytidosperma* spp., *Austrostipa* spp. and/or Chilean Needle Grass) are a minor component of the ground layer, growing sparsely or in patches among unsuitable vegetation (i.e. not larval food species), and other minimum values are met:

- *Rytidosperma* spp. present
- 10% cover *Rytidosperma* spp. and/or *Austrostipa* spp. combined
- < 20% broadleaf

Chilean Needle Grass (CNG) dominated habitat (none seen in project footprint)

Grassland dominated by Chilean needle grass.

5.5 General characteristics of biomass classes (adapted from SMEC, 2019)

For all GSM habitat condition classes, the ideal biomass condition is low to medium, i.e. most areas without dense thatch or tall dense tussock grasses over 10 cm high.

Sites were not excluded due to higher than desirable biomass or weed cover if this was assessed to be a temporary condition associated with the previous La Nina seasons.

Very low biomass

- Tussocks up to 5 cm high
- bare ground very common between tussocks
- litter layer sparse/absent
- average grass sward height less than 4 cm

Low biomass

- Tussocks up to 10 cm high
- bare ground common between tussocks
- litter layer sparse
- average grass sward height 4 to 8 cm

Medium biomass

- Tussocks up to 20 cm high
- little bare ground between tussocks
- litter common but not continuous
- average grass sward height 8 - 12 cm

High biomass

- Tussocks greater than 20 cm high and closely spaced
- little or no bare ground
- litter layer continuous and thatched, may include subterranean clover
- average sward height greater than 12 cm

5.6 Positive filter features

Filter features **positively** associated with GSM habitat include larger patches of native grassland containing larval food species, preferably connected to other similar patches. These include:

- Areas cleared from Yellow Box-Red Gum grassy woodlands and similar vegetation types, with some or more of the following understorey characteristics:
-
    - Low biomass +/- patches of bare ground
        - Related to soil conditions or regular grazing
        - May include patches around rock outcrops, beside tracks, on compacted soil near dams or gates and on old tracks, may be surrounded by other native grasses or exotic pasture.
    - High cover of native grasses
    - Moderate to high cover of Wallaby Grasses, especially smaller species such as *Rytidosperma carphoides, R. auriculatum, R. laeve*
        - Smaller species can be overtopped or disappear with pasture improvement or under-grazing
    - Rough or Tall Speargrass (*Austrostipa scabra, A. bigeniculata*), Redleg Grass, Nine-awn Grass
    - Cryptogams
        - Indicates available bare ground, low disturbance, little or no pasture improvement
    - Small intertussock forbs such as *Lomandra bracteata*, *Chamaesyce drummondii, Triptilodiscus pygmaeus, Vittadinia muelleri, Solenogyne dominii, Cymbonotus lawsonianus, Crassula sieberiana, Chrysocephalum apiculatum, Enneapogon nigricans, Convolvulus angustissimus, Plantago varia, Wahlenbergia communis/luteola/gracilis*
        - Indicates intertussock spaces, low past disturbance, long-term maintenance of low to medium biomass, little or no pasture improvement.
- Areas cleared from grassy open forest communities containing Red Stringybark and/or Brittle Gum, Scribbly Gum, Long-leaved Box, Apple Box etc, with understorey characteristics as above.

5.7 Negative filter features

Filter features **negatively** associated with GSM habitat include grassy areas:

- Dominated by non-food grass species such as *Microlaena stipoides,* and *Themeda triandra*, may be associated with more moisture, higher biomass, southerly aspect, deeper soils, less stock grazing.
- Cleared from open forest habitats wetter than above or containing a significant shrub component, especially *Leptospermum, Kunzea, Bursaria*.
- Cleared from forest or woodland but with dense eucalypt regeneration.
- Cleared from forest and containing large unsuitable tussocks such as *Austrostipa densiflora* and *Rytidosperma pallidum.*
- Poorly-drained sites and/or supporting semi-wetland vegetation such as many rushes and sedges, *Carex appressa*, *Rytidosperma duttonianum, Haloragis heterophylla, Lythrum hyssopifolium, Mentha diemenica, Drosera, Pratia, Isotoma, Luzula, Stylidium, Poa labillardierei*, *Paspalum dilatatum*.
- Steep or south-facing slopes
- High biomass/improved pasture sites with GSM food plants scattered sparsely among exotic grasses rather than in discrete patches, especially with *Phalaris, Lolium, Dactylis, Trifolium subterraneum, Avena* spp. - these species lead to high biomass and dense thatch after vegetation collapse.
- Site with tall weeds or affected by previous weed control, soil disturbance/ploughing, sheet erosion.

6. Results

No GSM were observed in the Niche November 2021 surveys for flying adults at 29 locations in the Murrumbateman section of the project footprint considered to be potential GSM habitat. However, this should not be taken as evidence of absence, as 2021-22 was a very poor year for GSM observations in ACT/NSW, with the larval development period of the emerging adults possibly spanning the 2019 drought year and 2020/21 wet years. Shared data from 112 site visits by numerous other consultants and government staff across the known ACT/NSW distribution area showed that very low numbers of adults emerged in 2021, including in several well-surveyed reference populations. Three days of surveys in December 2021 around Yass and Murrumbateman for a different project found no GSM at several sites with substantial cover of food plants (R. Speirs Capital Ecology, shared data, 2021). Low numbers of records continued in the district in the 2022-23 flying season.

Classification of the collated field data resulted in the identification of numerous potential GSM habitat polygons in the Murrumbateman and Inland Slopes IBRA subregions (see Figure 13-4 of the BDAR). Within these, the total predicted impact to GSM habitat within the indicative disturbance area as a result of project construction and operation is 38.64 ha of potential habitat. Of this 38.64 ha of habitat, 2.75 ha occurs within Category 1 exempt lands.

No high-quality habitat was identified, as no Natural Temperate Grassland occurred in the project footprint.

A few patches of moderate quality habitat were identified, e.g. at Dalton in the Murrumbateman subregion. Such sites contained secondary grassland with areas of high cover of low biomass Wallaby Grasses and patches of bare ground.

Most of the GSM habitat fell into the low-quality category, or between low and moderate, due to degradation and fragmentation associated with grazing and pasture improvement. Almost all of the GSM habitat identified from BAM and habitat transect data, site photographs and validation visits was in small patches scattered across sites and separated by areas of unsuitable land use, landform or vegetation. Habitat identified as secondary grassland is vulnerable to loss through tree regeneration.

The scattered distribution of moderate to low quality GSM habitat patches is typical of other grazed sites in the Murrumbatemen subregion identified during surveys ahead of wind farms, solar farms and highway duplication (e.g. ERM, 2013, NGH Environmental, 2014, Niche,2018, NSW Government, 2019). It is likely that much of the landscape surrounding the project footprint is similar and would contain patches of potential GSM habitat in the same condition.

7. Potential Impacts

7.1 Potential direct impacts

Total impacts to GSM habitat have been identified as 38.64 ha, including 2.75 ha of Category 1 exempt lands. Almost all of this habitat is assumed to be within the Total Clearing Zone (TCZ) (refer to Section 13.1 of the BDAR). This is a worst-case scenario, as some areas damaged during construction and wire raising may recover naturally or through rehabilitation as above.

The remaining loss is in the Easement Clearing Zones (ECZ) and possibly Hazard Tree Zones (HTZ). In these areas clearing and ongoing suppression of tall-growing vegetation will be undertaken under transmission lines, but soil disturbance (and hence ground layer vegetation removal) is generally not required. The eventual result from suppression of tree and shrub regeneration in these zones and along maintenance tracks may result in an increase in the area of grassland and potential GSM habitat beyond the existing areas. GSM often naturally occur along track edges, where soil conditions often favour smaller native tussock species. This effect could be enhanced by replanting of track verges and disturbed areas adjacent to existing GSM habitat as well as within patches, using small species of locally occurring Wallaby Grasses and Speargrasses.

7.2 Potential indirect impacts

Indirect impacts to GSM habitat may include:

- Run-on of water and sediment to habitats as a result of changed hydrology causing changes in soil moisture, vegetation composition and biomass, and reducing habitat quality
- Introduction of weeds affecting habitat viability
- Trampling of grasses by machinery during construction.

These impacts can be mitigated by planning to minimise vehicle use inside habitat zones, use of sediment fencing, appropriate shaping of tracks and transmission line benches and post-construction rehabilitation/ revegetation.

7.3 Potential additional (prescribed) biodiversity impacts on areas of habitat connectivity

In modified pastoral landscapes, GSM habitat typically occurs as small patches of suitable native grasses among unsuitable vegetation such as exotic pasture, forest or areas of tree regeneration. GSM have poor powers of dispersal, with habitat patches more than 200 metres apart assumed to be effectively isolated. This is likely to be the existing case in much of the potential GSM habitat in the project footprint.

Clearing small patches of habitat may create breaks in connectivity within the project footprint and between the footprint and adjacent areas. This could be mitigated by revegetation/rehabilitation using small locally occurring species of Wallaby Grasses and Speargrasses within the footprint as described above, with the intention of creating connected corridors between patches.

The ongoing maintenance of ECZ and unsealed maintenance tracks also has the potential to create links between previously isolated GSM habitat patches. This could be enhanced by rehabilitation of track verges and disturbed areas with native grasses where they lie between areas of potential habitat, to create stepping-stone habitat for GSM to move within and outside the footprint.

8. Avoiding and minimising impacts

Impacts on GSM habitat during construction and operation will be avoided or minimised as outlined in the environmental mitigation measures component of the BDAR (Section 12). Mitigation measures include:

- Refined mapping of GSM habitat in impacted areas before construction. The mapping of GSM habitat has identified broad locations within the project footprint where scattered or continuous patches of suitable habitat occur or are likely to occur, and pre-construction mapping of impacted areas would show specific locations of habitat patches (refer to EMM B1).
- Where possible, surveys for flying male GSM under suitable conditions in spring to confirm their presence on sites with the highest potential, to focus avoidance and mitigation efforts (refer to EMM B2).
- Micrositing of transmission line infrastructure, associated work sites and other disturbances such as laydown areas to avoid native grassland/mapped GSM habitat where possible (refer to EMM B1).
- Using existing tracks where possible and planning routes and activities within the construction zone to avoid mapped habitat (refer to EMM B4).
- Rehabilitation of habitat that is disturbed by construction with appropriate native grasses, without use of fertiliser or clover. Plantings should include C3 grasses that are GSM larval food plants such as grassland Wallaby Grasses (*Rytidosperma* spp.) and Speargrasses (*Austrostipa bigeniculata*), *A. scabra*, and a low biomass dryland C4 grass (Redleg Grass (*Bothriochloa macra*)). A temporary nurse crop such as sterile Ryecorn could be used to stabilise the soil and suppress weeds during establishment (refer to EMM B18).
- Biosecurity measures implemented during construction to prevent the introduction and minimise the spread of existing weeds within the project footprint (B19).
- Follow-up weed control of replanted areas as part of track and site post-construction and operational maintenance programs (refer to EMM B20).

9. Conclusion

Through the synthesis of a desktop review of the relevant literature and existing data, and the collation of the findings of GSM field surveys undertaken in 2021 and 2022, it was found that GSM has the potential to occur within the project footprint.

Although no individuals were identified during field surveys and the only known nearby GSM record is a single site 3 km south of the project footprint in the Inland Slopes subregion near Tumut, suitable potential habitat was identified within the project footprint. The quality of this habitat, as determined by the parameters outlined in Sections 5.4-5.7, varied from low to moderate. Moderate quality GSM habitat was sparse and found only in secondary grassland with areas of high cover of low biomass Wallaby Grasses and patches of bare ground. Low quality GSM habitat accounted for most potential habitat identified and generally occurred in small, discrete patches subject to degradation and fragmentation as a result of grazing and pasture improvement.

GSM habitat polygon modelling found that project construction and operation is predicted to impact up to 38.64 ha of potential GSM habitat within the indicative disturbance area (2.75 ha of which is Category 1 exempt land). As such, avoidance and mitigation measures tailored specifically to the GSM, as outlined in Section 8, will be employed to reduce the likelihood and extent of impacts to potential GSM habitat. Where impacts cannot be avoided, biodiversity offset requirements will be met if required.

Attachment 10. Plant community type descriptions

PCT 5 - River Red Gum herbaceous-grassy very tall open forest wetland on inner floodplains in the lower slopes sub-region of the NSW South Western Slopes Bioregion and the eastern Riverina Bioregion	
Vegetation formation	Forested Wetlands
Vegetation class	Inland Riverine Forests
Conservation status	PCT 5 is not associated with a TEC.
% remaining in NSW	60
Extent	PCT 5 is typically found on levees or other raised landform elements adjacent to rivers and wetlands on silty-sandy loam-clay soils. The PCT is mainly distributed along the Murray and Murrumbidgee Rivers with small areas on the Lachlan River and semi-arid climate regions of south-western NSW and Victoria.
Diagnostic canopy species for PCT 5	*Eucalyptus camaldulensis* subsp. *camaldulensis* (River Red Gum) is often the only canopy species in this PCT.
Diagnostic midstorey species for PCT 5	The shrub layer is sparse or absent with *Acacia dealbata* (Silver Wattle) sometimes present. Other species that are known to occur occasionally are, *Exocarpos strictus* (Dwarf Cherry), *Amyema miquelii* (Box Mistletoe), *Pultenaea foliolosa* (A Bush Pea), *Acacia baileyana* (Cootamundra Wattle), *Acacia verniciflua* (Varnish Wattle), *Cassinia aculeata* (Dolly Bush), *Hibbertia obtusifolia* (Hoary Guinea Flower), *Dodonaea viscosa* subsp. *spatulata* (Broad-leaf Hopbush) and *Leptospermum brevipes* (Slender Tea-tree).
Diagnostic groundcover species for PCT 5	The ground cover may be mid-dense or dense and is typically dominated by grass species such as, *Bothriochloa macra* (Red Grass), *Lachnagrostis filiformis, Hemarthria uncinata* var. *uncinata*, *Cynodon dactylon* (Common Couch), *Rytidosperma racemosum* (Wallaby Grass), *Elymus scaber* (Common Wheatgrass), *Pseudoraphis spinescens* (Spiny Mudgrass), *Rytidosperma caespitosum* (Ringed Wallaby Grass), *Paspalidium jubiflorum* (Warrego Grass), and *Poa labillardierei* (Snow Grass). Sedge species are also common, such as Carex *tereticaulis, Juncus amabilis, Juncus flavidus, Carex appressa* (Tall Sedge), *Carex inversa* (Knob Sedge), *Eleocharis acuta, Eleocharis pusilla, Persicaria prostrata* (Creeping Knotweed) and *Juncus subsecundus* (Finger Rush). Other common species include, *Wahlenbergia fluminalis* (River Bluebell), *Centipeda cunninghamii* (Common Sneezeweed), *Lobelia concolor* (Poison Pratia), *Ranunculus undosus* (Swamp Buttercup), *Epilobium billardiereanum* subsp. *cinereum*, *Oxalis perennans*, *Verbena hispida* (Rough Verbena), *Alternanthera denticulata* (Lesser Joyweed), and *Eclipta platyglossa* (Yellow Twin-heads).
Condition and presence of weeds	PCT 5 occurs in the project footprint as two condition types: • Low • High

PCT 5 - River Red Gum herbaceous-grassy very tall open forest wetland on inner floodplains in the lower slopes sub-region of the NSW South Western Slopes Bioregion and the eastern Riverina Bioregion	
	A low cover of weed species is present throughout most of PCT 5, with *Trifolium repens* (White Clover) being the most commonly recorded weed.
Justification of evidence used to identify the PCT	As mentioned above, PCT 5 mainly occurs on levees adjacent to rivers and wetlands on silty-sandy loam-clay soils in the NSW South-western Slopes Bioregion. 82% of PCT 5 in the project footprint occurs in the Murrumbidgee - Tarcutta Channels and Floodplains Mitchell Landscape while another 15% occurs on the Upper Murrumbidgee Gorge landscape. Both of these landscapes align to the landscape description of the PCT. The remaining 3% of mapped PCT 5 is in the Doura Volcanics landscape. This small area most likely comprises the edges of the PCT. During surveys of the site, PCT 5 was observed along the edges of rivers and streams which also matches the landscape position of the PCT. Additionally, the diagnostic canopy species *Eucalyptus camaldulensis* subsp. *camaldulensis*, is the dominant species recorded in PCT. A shrub layer is generally absent in the plots sampled which is diagnostic of PCT 5. The sparsity could also be attributed to the fact that PCT 5 in the project footprint has been grazed and therefore lacks an established midstorey. Plots sampled confirm the presence of a grassy ground cover with characteristic species present including *Bothriochloa macra* (Red Grass) and *Cynodon dactylon* (Common Couch). A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 5 within the project footprint is shown in Figure 6-1. PCT 5 within the project footprint does not align with any TECs listed under the BC Act or EPCT Act.

PCT 5 - River Red Gum herbaceous-grassy very tall open forest wetland on inner floodplains in the lower slopes sub-region of the NSW South Western Slopes Bioregion and the eastern Riverina Bioregion	
	 Photo 2. High condition woodland (photo taken at plot WM0248F6)
Number of plots sampled	Three plots were sampled within the Inland Slopes bioregion: Low condition: • YG035B13 High condition: • WM0248F6 • WM02478C

PCT 266 - White Box grassy woodland in the upper slopes sub-region of the NSW South Western Slopes Bioregion	
Vegetation formation	Grassy Woodlands
Vegetation class	Western Slopes Grassy Woodlands
Conservation status	PCT 266 aligns to the TEC White Box Yellow Box Blakely's Red Gum Grassy Woodland and Derived Native Grassland which is listed as a Critically Endangered Ecological Community (CEEC) under the BC and EPBC Acts.
% remaining in NSW	6
Extent	PCT 266 occurs on slopes and crests in hill landform patterns in the South Western Slopes Bioregion. It generally occurs on lower parts of the landscape where soil fertility is relatively high. PCT 266 occurs on soils derived from a variety of lithologies including shale, limestone, fine grained metamorphic rocks, granite and basalt.
Diagnostic canopy species for PCT 266	*Eucalyptus albens* (White Box) is often the only canopy species in this PCT, however, other species that may be present include *Brachychiton populneus* (Kurrajong), *Eucalyptus blakelyi* (Blakely's Red Gum), *Eucalyptus bridgesiana* (Apple Box) and *Eucalyptus melliodora* (Yellow Box).
Diagnostic midstorey species for PCT 266	The shrub layer is usually sparse or absent depending on grazing history and soil type, however diagnostic species include; *Acacia decora* (Western Silver Wattle), *Acacia implexa* (Hickory Wattle), *Acacia deanei* subsp. *paucijuga* (Green Wattle), *Acacia genistifolia* (Early Wattle), *Acacia penninervis* var. *penninervis* (Mountain Hickory), *Acacia buxifolia* subsp. *buxifolia* (Box-leaved Wattle), *Acacia paradoxa* (Kangaroo Thorn), *Dodonaea viscosa* subsp. *cuneata* (Wedge-leaf Hop-bush), *Bursaria spinosa* subsp. *spinosa* (Native Blackthorn), *Cassinia aculeata* (Dolly Bush) and *Hibbertia riparia* (Erect Guinea-flower).
Diagnostic groundcover species for PCT 266	The ground cover is typically mid-dense to dense and can be diverse in grass and forb species. Diagnostic species include; *Themeda triandra* (Kangaroo Grass), *Poa sieberiana* (Snowgrass), *Wurmbea dioica* (Early Nancy), *Cymbonotus lawsonianus* (Bear's Ear), *Aristida behriana* (Bunch Wiregrass), *Panicum effusum* (Hairy Panic), *Rytidosperma auriculatum* (Lobed Wallaby Grass), *Rytidosperma caespitosum* (Ringed Wallaby Grass), *Microlaena stipoides* (Weeping Grass), *Austrostipa bigeniculata* (Yanganbil), *Bothriochloa macra* (Red Grass), *Elymus scaber* (Common Wheatgrass), *Aristida ramosa* (Purple Wiregrass), *Enteropogon acicularis* (Curly Windmill Grass), *Austrostipa aristiglumis* (Plains Grass), *Rytidosperma monticola* (Mountain Wallaby Grass) and *Gonocarpus elatus* (A Raspwort).
Condition and presence of weeds	PCT 266 occurs in the project footprint as three condition types: • Low • Moderate • High Exotic species are present throughout most of PCT 266 in the project footprint with a higher portion recorded in the Low and Moderate condition zones. Commonly recorded exotic species comprise pasture grasses and wind dispersed species of the Poaceae (grass) and Asteraceae (daisy) families.
Justification of evidence used	As mentioned above, PCT 266 mainly occurs in the NSW South-western Slopes Bioregion, with some areas also within the South Eastern Highlands Bioregion. It is located between 300 - 600 m altitude

PCT 266 - White Box grassy woodland in the upper slopes sub-region of the NSW South Western Slopes Bioregion	
to identify the PCT	and on soils derived from a variety of lithologies including shale, limestone, fine grained metamorphic rocks, granite and basalt. All of PCT 266 in the project footprint is between 299 – 658 m asl, and occurs on a range of lithologies. Within PCT 266 in the project footprint, *Eucalyptus albens* is often the dominant canopy species, which is diagnostic of PCT 266. Other diagnostic canopy species including *Brachychiton populneus* (Kurrajong) and *Eucalyptus blakelyi* (Blakely's Red Gum) were recorded in moderate to low abundance across PCT 266 in the project footprint. *Eucalyptus macrorhyncha* was also recorded in one plot of PCT 266. Given it was in low abundance (one stem), this variation may be attributed to ecotonal differences. The wooded areas of this PCT have a sparse midstorey which can be diagnostic of PCT 266. The sparsity is most likely attributed to the fact that most areas of PCT 266 in the project footprint has been grazed and therefore lack an intact midstorey. Plots sampled confirm the presence of groundcover species diagnostic of PCT 266, including *Poa sieberiana* (Snowgrass), *Aristida behriana, Panicum effusum*, *Rytidosperma spp.*, *Microlaena stipoides*, *Austrostipa bigeniculata*, *Bothriochloa macra*, *Elymus scaber* and *Aristida ramosa*. A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 266 within the project footprint is shown in Figure 6-1.
How it meets the BC Act Determination	As outlined in Section 6.5.1 and Table 6-10 of the BDAR, PCT 266 in Low, Moderate and High condition aligns to the BC Act listed White Box Yellow Box Blakely's Red Gum Grassy Woodland and Derived Native Grassland.
How it meets the EPBC Act Determination	As outlined in Section 6.5.1 and Table 6-11 of the BDAR, PCT 266 in Moderate and High condition aligns to the EPBC Act listed White Box Yellow Box Blakely's Red Gum Grassy Woodland and Derived Native Grassland.

Number of plots sampled	Fifteen plots were sampled, including thirteen in the Inland Slopes bioregion, and one in the Murrumbateman bioregion: Low condition: • MA089714 • YG037B35 Moderate condition: • YG007FE8 • MA0926A9 • 06 High condition: • MA2-067B • YG007C9C • YG-042A • YG037-1 • 6699ABB5 • YG040-1 • YG040-4 • YG040-3 • YG040-2 • WM0083F2

PCT 268 - White Box - Blakelys Red Gum - Long-leaved Box - Nortons Box - Red Stringybark grass-shrub woodland on shallow soils on hills in the NSW South Western Slopes Bioregion	
Vegetation formation	Grassy Woodlands
Vegetation class	Western Slopes Grassy Woodlands
Conservation status	PCT 268 aligns to the TEC White Box Yellow Box Blakely's Red Gum Grassy Woodland and Derived Native Grassland which is listed as a CEEC under the BC and EPBC Acts.
% remaining in NSW	37
Extent	PCT 268 occurs on shallow clay or loamy clay soils derived from fine grained sedimentary, metamorphic or igneous substrates on hillcrests hillslopes in low hill and hill landform patterns in the upper slopes sub-region of the NSW South-western Slopes Bioregion.
Diagnostic canopy species for PCT 268	Dominant canopy species include *Eucalyptus albens* (White Box), *Eucalyptus polyanthemos* (Red Box), *Eucalyptus blakelyi* (Blakely's Red Gum), *Eucalyptus macrorhyncha* (Red Stringybark), and *Eucalyptus goniocalyx* (Long-leaved Box). In some areas this PCT can contain *Eucalyptus sideroxylon* (Mugga Ironbark) and *Eucalyptus nortonii* (Large-flowered Box).
Diagnostic midstorey species for PCT 268	The midstorey of PCT 268 is typically sparse and includes *Acacia implexa* (Hickory Wattle), *Acacia genistifolia* (Early Wattle), *Dillwynia sericea* (Egg and Bacon Peas, Parrot Peas), *Lissanthe strigosa* (Peach Heath), *Acacia decora* (Western Silver Wattle), *Bursaria spinosa* subsp. *spinosa* (Native Blackthorn), *Daviesia latifolia* (Bitter-pea), *Melichrus urceolatus* (Urn Heath), *Acacia paradoxa* (Kangaroo Thorn), *Hibbertia obtusifolia* (Hoary Guinea Flower), *Hibbertia riparia* (Erect Guinea-flower), *Persoonia rigida, Pultenaea lapidosa* (Stoney Bush-pea), *Leucopogon virgatus* (Common Beard-heath) and *Xanthorrhoea glauca*.
Diagnostic groundcover species for PCT 268	PCT 268 generally has a mid-dense ground cover with typical species including *Dianella revoluta* var. *revoluta* (A Blue Flax Lily), *Lomandra filiformis* subsp. *coriacea* (Wattle Matt-rush), *Hydrocotyle laxiflora* (Stinking Pennywort), *Acaena ovina* (Acaena), *Lobelia purpurascens* (Whiteroot), *Hypericum gramineum* (Small St John's Wort), *Ajuga australis* (Austral Bugle), *Wahlenbergia stricta* subsp. *stricta* (Tall Bluebell) and *Dichopogon strictus* (Chocolate Lily). Commonly occurring grasses included *Poa sieberiana* (Snowgrass), *Elymus scaber* (Common Wheatgrass), *Aristida ramosa* (Purple Wiregrass), *Austrostipa densiflora* (Foxtail Speargrass), *Rytidosperma caespitosum* (Ringed Wallaby Grass) and *Echinopogon ovatus* (Forest Hedgehog Grass).
Condition and presence of weeds	PCT 268 occurs in the project footprint as three condition types: • Low • Moderate • High Exotic species are present in ranging densities throughout PCT 268, typically with higher covers recorded in the Low condition zones. A large portion of exotic species comprise forb species such as *Rumex acetosella* (Sheep's Sorrel), *Trifolium* spp. (Clover) and *Hypericum perforatum* (St. Johns Wart). Exotic grasses present include *Paspalum dilatatum* (Paspalum) and *Eragrostis minor*. Exotic

PCT 268 - White Box - Blakelys Red Gum - Long-leaved Box - Nortons Box - Red Stringybark grass-shrub woodland on shallow soils on hills in the NSW South Western Slopes Bioregion	
	species present in the High condition zones were mostly wind dispersed species of the Poaceae (grass) and Asteraceae (daisy) families.
Justification of evidence used to identify the PCT	As mentioned above, PCT 268 mainly occurs on shallow clay or loamy clay soils derived from fine grained sedimentary, metamorphic or igneous substrates, which aligns with the two predominant Mitchell Landscapes (Adrah Hills and Ranges and Carabost Hills and Ranges) that PCT 268 occurs on within the project footprint. Additionally, diagnostic canopy species of PCT 268 include *Eucalyptus albens*, *Eucalyptus polyanthemos*, *Eucalyptus blakelyi* and *Eucalyptus macrorhyncha,* all of which were observed in high abundance throughout this PCT. The midstorey was typically sparse in this PCT within the project footprint, which is diagnostic of PCT 268. Midstorey species that were recorded in this PCT and are diagnostic of PCT 268 include *Acacia implexa*, *Acacia paradoxa*, *Dillwynia sericea*, *Melichrus urceolatus* and *Hibbertia obtusifolia*. Plots sampled confirmed the presence of groundcover species diagnostic of PCT 268, including *Lomandra filiformis* subsp. *coriacea, Hydrocotyle laxiflora*, *Poa sieberiana*, *Elymus scaber*, *Aristida ramosa*, *Schoenus apogon*, *Cheilanthes sieberi* subsp. *sieberi* and *Euchiton japonicus*. A full species list for all surveyed plots is in Appendix 5 and the extent of PCT 268 within the project footprint is shown in Figure 6-1.
How it meets the BC Act Determination	As outlined in Section 6.5.1 and Table 6-10 of the BDAR, PCT 268 in Low, Moderate and High condition aligns to the BC Act listed White Box Yellow Box Blakely's Red Gum Grassy Woodland and Derived Native Grassland.
How it meets the EPBC Act Determination	As outlined in Section 6.5.1 and Table 6-11 of the BDAR, PCT 268 in Moderate and High condition aligns to the EPBC Act listed White Box Yellow Box Blakely's Red Gum Grassy Woodland and Derived Native Grassland.

- WM057B25

PCT 277 – Blakely's Red Gum - Yellow Box grassy tall woodland of the NSW South Western Slopes Bioregion	
Vegetation formation	Grassy Woodlands
Vegetation class	Western Slopes Grassy Woodlands
Conservation status	PCT 277 aligns to the TEC White Box Yellow Box Blakely's Red Gum Grassy Woodland and Derived Native Grassland which is listed as a CEEC under the BC and EPBC Acts.
% remaining in NSW	6
Extent	PCT 277 is a widespread community found on hillslopes and plains mainly in the upper slopes sub-region of the NSW South-western Slopes Bioregion and east of Wagga Wagga. It typically occurs on deep, fertile, loam or clay soils derived from a range of substrates including fine-grained sedimentary and metamorphic rocks but also volcanics and fine-grained granite.
Diagnostic canopy species for PCT 277	*Eucalyptus blakelyi* (Blakely's Red Gum) and *Eucalyptus melliodora* (Yellow Box) are the two dominant canopy species of PCT 277 while *Eucalyptus bridgesiana* (Apple Box), *Eucalyptus goniocalyx* (Bundy) and *Eucalyptus microcarpa* (Western Grey Box) may also occasionally occur. Other associated canopy species include *Eucalyptus polyanthemos* subsp. *polyanthemos* (Red Box), *Eucalyptus albens* (White Box), *Eucalyptus conica* (Fuzzy Box) and *Callitris glaucophylla* (White Cypress Pine).
Diagnostic midstorey species for PCT 277	The shrub layer is typically sparse or absent however where present includes *Acacia dealbata* (Silver Wattle) and *Hibbertia obtusifolia* (Hoary Guinea Flower).
Diagnostic groundcover species for PCT 277	Depending on rainfall, the groundcover varies from sparse to dense and is typically dominated by grass species. These include *Themeda triandra* (Kangaroo Grass), *Poa sieberiana* (Snowgrass), *Bothriochloa macra* (Red Grass), *Aristida ramosa* (Purple Wiregrass), *Panicum effusum* (Hairy Panic), *Austrostipa spp., Rytidosperma auriculatum* (Lobed Wallaby Grass), *Rytidosperma setaceum* (Small-flowered Wallaby-grass), *Cymbopogon refractus* (Barbed Wire Grass) and *Elymus scaber* (Common Wheatgrass). Other diagnostic groundcover species of PCT 277 include *Juncus usitatus*, *Lomandra filiformis* subsp. *coriacea* (Wattle Matt-rush), *Geranium solanderi* var. *solanderi*, *Chrysocephalum apiculatum* (Common Everlasting), *Carex inversa* (Knob Sedge), *Cheilanthes sieberi* subsp. *sieberi* (Rock Fern), *Vittadinia cuneata* (A Fuzzweed), *Bulbine bulbosa* (Bulbine Lily) and *Dianella revoluta* var. *revoluta* (A Blue Flax Lily).
Condition and presence of weeds	PCT 277 occurs in the project footprint as four condition types: • Very low • Low • Moderate • High PCT 277 in the project footprint is typically adjacent to or within farmlands. Due to this, a high cover of pasture grasses (*Bromus catharticus*, *Phalaris aquatica*, *Holcus lanatus, Poa pratensis* and *Lolium*

PCT 277 – Blakely's Red Gum - Yellow Box grassy tall woodland of the NSW South Western Slopes Bioregion	
	species) and common farm weeds (*Rumex acetosella, Hypochaeris radicata* and *Onopordum acanthium*) were recorded in the Very low and Low condition zones of PCT 277.
Justification of evidence used to identify the PCT	As mentioned above, PCT 277 is widespread and can be found in a range of landscape contexts. The dominant canopy species of PCT 277, *Eucalyptus blakelyi* and *Eucalyptus melliodora*, were both observed as the co-dominant species throughout this PCT within the project footprint. Other characteristic canopy species recorded include *Eucalyptus goniocalyx* and *Eucalyptus polyanthemos* subsp. *polyanthemos*. In the wooded areas the midstorey comprised a sparse cover of Acacia species and *Hibbertia obtusifolia*, which is diagnostic of PCT 277. Plots sampled confirm the presence of groundcover species diagnostic of PCT 277, including *Themeda triandra*, *Bothriochloa macra*, *Aristida ramosa*, *Panicum effusum*, *Austrostipa scabra* subsp. *scabra*, *Austrostipa bigeniculata, Elymus scaber*, *Juncus usitatus*, *Lomandra filiformis* subsp. *coriacea, Geranium solanderi* var. *solanderi*, *Carex inversa* and *Cheilanthes sieberi* subsp. *sieberi.* A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 277 within the project footprint is shown in Figure 6-1.
How it meets the BC Act Determination	As outlined in Section 6.5.1 and Table 6-10 of the BDAR, PCT 277 in Very low, Low, Moderate and High condition aligns to the BC Act listed White Box Yellow Box Blakely's Red Gum Grassy Woodland and Derived Native Grassland.
How it meets the EPBC Act Determination	As outlined in Section 6.5.1 and Table 6-11 of the BDAR, PCT 277 in Moderate and High condition aligns to the EPBC Act listed White Box Yellow Box Blakely's Red Gum Grassy Woodland and Derived Native Grassland.

PCT 278 – Riparian Blakely's Red Gum - box - shrub - sedge - grass tall open forest of the central NSW South Western Slopes Bioregion	
Vegetation formation	Grassy Woodlands
Vegetation class	Western Slopes Grassy Woodlands
Conservation status	PCT 278 aligns to the TEC White Box Yellow Box Blakely's Red Gum Grassy Woodland and Derived Native Grassland which is listed as a CEEC under the BC and EPBC Acts.
% remaining in NSW	20
Extent	PCT 278 is found in gullies and on creek flats in hill landscapes or along creeks mainly in the Upper Slopes sub-region of the NSW South-western Slopes Bioregion. It typically occurs on deep alluvial silty clay-loam soils. The PCT is often found grading into the widespread PCT 277.
Diagnostic canopy species for PCT 278	PCT 278 is typically dominated by *Eucalyptus blakelyi* (Blakely's Red Gum) often with *Eucalyptus melliodora* (Yellow Box), *Eucalyptus bridgesiana* (Apple Box) and *Eucalyptus goniocalyx* (Long-leaved Box). *Eucalyptus microcarpa* (Western Grey Box) may also occasionally occur in this PCT.
Diagnostic midstorey species for PCT 278	The shrub layer is sparse but often has a high number of wattles present including *Acacia dealbata* (Silver Wattle), *Acacia paradoxa* (Kangaroo Thorn) and *Acacia deanei* subsp. *paucijuga* (Green Wattle). Other midstorey species characteristic of PCT 278 include *Styphelia triflora* (Pink Five-Corners), *Acrotriche rigida*, *Acacia acinacea* (Gold-dust Wattle) and *Dodonaea viscosa* subsp. *cuneata* (Wedge-leaf Hop-bush).
Diagnostic groundcover species for PCT 278	The groundcover of PCT 278 is often dense, and includes species such as *Carex appressa* (Tall Sedge), *Hydrocotyle laxiflora* (Stinking Pennywort), *Rumex brownii* (Swamp Dock), *Poa labillardierei* var. *labillardierei* (Tussock), *Microlaena stipoides* var. *stipoides* (Weeping Grass), *Carex inversa* (Knob Sedge), J*uncus subglaucus* (Rush), *Poranthera microphylla* (Small Poranthera), *Centipeda cunninghamii* (Common Sneezeweed), *Echinopogon ovatus* (Forest Hedgehog Grass), *Cynoglossum australe*, *Scutellaria humilis* (Dwarf Skullcap), *Elymus scaber* (Common Wheatgrass), *Dianella revoluta* var. *revoluta* (A Blue Flax Lily) and *Geranium retrorsum* (Cranesbill Geranium).
Condition and presence of weeds	PCT 278 occurs in the project footprint as three condition types: • Very low • Moderate • High Exotic species are present throughout PCT 278, typically with higher covers recorded in the Very low and Moderate condition zones. A large portion of the exotic species comprise grasses such as *Ehrharta erecta* (Panic Veldtgrass), *Eragrostis curvula* (African Lovegrass), *Lolium perenne* (Perennial Ryegrass), *Dactylis glomerata* (Cocksfoot) and *Holcus lanatus* (Yorkshire Fog).
Justification of evidence used to identify the PCT	As mentioned above, PCT 278 occurs in gullies and creek flats and is associated with deep alluvial silty clay-loam soils. These characteristics partially align with the areas mapped as PCT 278 within the project footprint. The majority of PCT 278 is mapped on the Boorowa Volcanics Mitchell Landscape (characterised by loam soils) and Murrumbidgee - Tarcutta Channels and Floodplains Mitchell Landscape (characterised by alluvial soils). Dominant canopy species of PCT 278 include *Eucalyptus blakelyi* and *Eucalyptus melliodora* and *Eucalyptus goniocalyx*, all of which were observed throughout this PCT.

PCT 278 – Riparian Blakely's Red Gum - box - shrub - sedge - grass tall open forest of the central NSW South Western Slopes Bioregion	
	A midstorey was generally absent in the plots sampled. This is most likely attributed to grazing which was evident across the PCT. Plots sampled confirm the presence of groundcover species diagnostic of PCT 278, including *Carex appressa*, *Hydrocotyle laxiflora*, *Rumex brownii*, *Microlaena stipoides* var. *stipoides*, *Carex inversa*, *Poranthera microphylla, Elymus scaber*, *Dianella revoluta* var. *revoluta*, *Acaena ovina*, *Persicaria* sp., *Ranunculus sessiliflorus* var. *sessiliflorus* and *Oxalis perennans.* A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 278 within the project footprint is shown in Figure 6-1.
How it meets the BC Act Determination	As outlined in Section 6.5.1 and Table 6-10 of the BDAR, PCT 278 in Very low, Moderate and High condition aligns to the BC Act listed White Box Yellow Box Blakely's Red Gum Grassy Woodland and Derived Native Grassland.
How it meets the EPBC Act Determination	As outlined in Section 6.5.1 and Table 6-11 of the BDAR, PCT 278 in Moderate and High condition aligns to the EPBC Act listed White Box Yellow Box Blakely's Red Gum Grassy Woodland and Derived Native Grassland.

PCT 280 – Red Stringybark - Blakelys Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South Western Slopes Bioregion	
Vegetation formation	Grassy Woodlands
Vegetation class	Western Slopes Grassy Woodlands
Conservation status	PCT 280 aligns to the TEC White Box Yellow Box Blakely's Red Gum Grassy Woodland and Derived Native Grassland which is listed as a CEEC under the BC and EPBC Acts.
% remaining in NSW	20
Extent	PCT 280 occurs on red- brown loamy clay soils derived from granite, granodiorite, sedimentary or metamorphic rocks and is situated on steep hillslopes and hillcrests in hilly country from Cootamundra and eastwards in the NSW South-western Slopes Bioregion.
Diagnostic canopy species for PCT 280	PCT 280 is typically dominated by *Eucalyptus macrorhyncha* (Red Stringybark) and *Eucalyptus blakelyi* (Blakely's Red Gum), sometimes with *Eucalyptus goniocalyx* (Bundy) or *Eucalyptus melliodora* (Yellow Box) also present. Other occasional species include *Eucalyptus polyanthemos* subsp. *polyanthemos* (Red Box), *Eucalyptus dealbata* (Tumbledown Red Gum), *Callitris endlicheri* (Black Cypress Pine) and *Brachychiton populneus* subsp. *populneus* (Kurrajong).
Diagnostic midstorey species for PCT 280	The shrub layer of PCT 280 is sparse to mid-dense with diagnostic species including *Lissanthe strigosa* subsp. *strigosa* (Peach Heath), *Bursaria spinosa* (Native Blackthorn), *Acacia buxifolia* subsp. *buxifolia* (Box-leaved Wattle), *Pultenaea foliolosa* (A Bush Pea), *Acacia baileyana* (Cootamundra Wattle), *Acacia verniciflua* (Varnish Wattle), *Cassinia aculeata* (Dolly Bush), *Hibbertia obtusifolia* (Hoary Guinea Flower), *Dodonaea viscosa* subsp. *spatulata* (Broad-leaf Hopbush) and *Leptospermum brevipes* (Slender Tea-tree).
Diagnostic groundcover species for PCT 280	PCT 280 often has a mid-dense groundcover dominated by grass and grass-like species. These include *Rytidosperma setaceum* (Small-flowered Wallaby-grass), *Austrostipa densiflora* (Foxtail Speargrass), *Themeda triandra* (Kangaroo Grass), *Aristida ramosa* (Purple Wiregrass), *Elymus scaber* (Common Wheatgrass) and *Lomandra bracteata* (Mat-rush). Characteristic forbs include *Chrysocephalum semipapposum* (Clustered Everlasting), *Dianella revoluta* var. *revoluta* (A Blue Flax Lily), *Xerochrysum viscosum* (Sticky Everlasting), *Hydrocotyle laxiflora* (Stinking Pennywort), *Stackhousia monogyna* (Creamy Candles), *Gonocarpus tetragynus* (Poverty Raspwort), *Hardenbergia violacea* (False Sarsaparilla), *Crassula sieberiana* (Australian Stonecrop), *Triptilodiscus pygmaeus* (Common Sunray), *Stuartina muelleri* (Spoon Cudweed) and *Stypandra glauca* (Nodding Blue Lily).
Condition and presence of weeds	PCT 280 occurs in the project footprint as four condition types: • Very low • Low • Moderate • High Exotic species are present throughout PCT 280, typically with higher covers recorded in the Very low, Low and Moderate condition zones. A large portion of exotic species comprise grass species such as *Nassella trichotoma* (Serrated Tussock), *Briza maxima* (Quaking Grass), *Holcus lanatus* (Yorkshire Fog), *Lolium perenne* (Perennial Ryegrass) and *Vulpia bromoides* (Squirrel Tail Fesque). The exotic

PCT 280 – Red Stringybark - Blakelys Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South Western Slopes Bioregion	
	forb species *Rumex acetosella* (Sheep Sorrel) and *Trifolium repens* (White Clover) were also recorded in high cover across the sampled plots.
Justification of evidence used to identify the PCT	As mentioned above, PCT 280 occurs on soils derived from granite, granodiorite, sedimentary or metamorphic rocks on steep hillslopes and hillcrests in hilly country. The majority of PCT 280 in the project footprint occurs on the Minjary Hills and Ranges, Carabost Hills and Ranges and Adelong Granite Ranges Mitchell Landscapes, all of which are characterised by steep hills and ranges. A portion of PCT 280 also occurs on Boorowa Volcanics which is characterised by undulating low hills. Dominant canopy species of PCT 280 include *Eucalyptus macrorhyncha* and *Eucalyptus blakelyi*, both of which were observed with a high cover throughout PCT 280 in the project footprint. Other diagnostic canopy species recorded include *Eucalyptus goniocalyx*, *Eucalyptus melliodora* and *Eucalyptus polyanthemos* subsp. *polyanthemos*. In the wooded areas, the midstorey ranged from sparse to dense with several diagnostic species present, including *Lissanthe strigosa* subsp. *strigosa*, *Bursaria spinosa* and *Hibbertia obtusifolia*. Plots sampled confirm the presence of groundcover species diagnostic of PCT 278, including *Themeda triandra, Elymus scaber, Chrysocephalum semipapposum, Hydrocotyle laxiflora, Crassula sieberiana*, *Triptilodiscus pygmaeus* and *Cheilanthes sieberi* subsp. *sieberi*. A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 280 within the project footprint is shown in Figure 6-1.
How it meets the BC Act Determination	As outlined in Section 6.5.1 and Table 6-10 of the BDAR, PCT 280 in Very low, Low, Moderate and High condition aligns to the BC Act listed White Box Yellow Box Blakely's Red Gum Grassy Woodland and Derived Native Grassland.
How it meets the EPBC Act Determination	As outlined in Section 6.5.1 and Table 6-11 of the BDAR, PCT 280 in Moderate and High condition aligns to the EPBC Act listed White Box Yellow Box Blakely's Red Gum Grassy Woodland and Derived Native Grassland.

Number of plots sampled	Twenty-five plots were sampled within the Crookwell, Inland Slopes and Murrumbateman bioregions. Very low condition:

PCT 280 – Red Stringybark - Blakelys Red Gum +/- Long-leaved Box shrub/grass hill woodland of the NSW South Western Slopes Bioregion	
	• MA05903-01 Low condition: • YG026A72 • YG02401 Moderate condition: • BY044D31 • MA098668 • YG02634E • BY1200488D • BY12003FEA • BY115C0D • MA079A30 • MA079E17 • WM046356 • BY0447A5 High condition: • MA-086A • MA-087A • YG02001 • MA05903706 • YG020D4B • YG020259 • MA05903241 • MA05905-01 • BY1155B8 • BY115ABC • WM046FC8 • WM0469C6

	PCT 283 – Apple Box - Blakelys Red Gum moist valley and footslopes grass-forb open forest of the NSW South Western Slopes Bioregion
Vegetation formation	Grassy Woodlands
Vegetation class	Western Slopes Grassy Woodlands
Conservation status	PCT 283 aligns to the TEC White Box Yellow Box Blakely's Red Gum Grassy Woodland and Derived Native Grassland which is listed as a CEEC under the BC and EPBC Acts
% remaining in NSW	9
Extent	PCT 283 typically occurs on clay loams or silty clay loam soils derived from colluvium or sedimentary, metamorphic, igneous or volcanic substrates on flats and gentle hillslopes in hill landscape patterns of the NSW South-western Slopes Bioregion.
Diagnostic canopy species for PCT 283	PCT 283 is typically dominated by *Eucalyptus bridgesiana* (Apple Box) often with *Eucalyptus blakelyi* (Blakely's Red Gum) and/or *Eucalyptus melliodora* (Yellow Box). *Eucalyptus macrorhyncha* (Red Stringybark) may also occur in this PCT.
Diagnostic midstorey species for PCT 283	The shrub layer is very sparse to absent, but where present, species may include *Acacia dealbata* (Silver Wattle), *Acacia implexa* (Hickory Wattle), *Acacia paradoxa* (Kangaroo Thorn), *Cassinia aculeata* (Dolly Bush), *Leptospermum continentale* (Prickly Teatree), *Callistemon sieberi* (River Bottlebrush), *Pultenaea procumbens* and *Pultenaea subspicata* (Low Bush-pea).
Diagnostic groundcover species for PCT 283	The ground cover is mid-dense to dense and dominated by grass and grass like species such as *Bothriochloa macra* (Red Grass), *Carex appressa* (Tall Sedge), *Cyperus lucidus* (Leafy Flat Sedge), *Echinopogon ovatus* (Forest Hedgehog Grass), *Elymus scaber* var. *scaber*, *Eragrostis parviflora* (Weeping Lovegrass), *Juncus subsecundus* (Finger Rush), *Juncus vaginatus, Luzula densiflora* (Woodrush), *Luzula meridionalis, Microlaena stipoides* var. *stipoides* (Weeping Grass), *Panicum effusum* (Hairy Panic), *Poa sieberiana* (Snowgrass), *Schoenus apogon* (Fluke Bogrush) and *Themeda triandra* (Kangaroo Grass). Characteristic forb species include *Acaena ovina* (Acaena), *Arthropodium minus* (Small Vanilla Lily), *Bulbine bulbosa* (Bulbine Lily), *Craspedia variabilis* (Common Billy-buttons), *Cymbonotus lawsonianus* (Bear's Ear), *Drosera auriculata, Drosera peltata* (A Sundew), *Epilobium billardiereanum* subsp. *hydrophilum, Gonocarpus tetragynus* (Poverty Raspwort), *Haloragis heterophylla* (Variable Raspwort), *Hydrocotyle laxiflora* (Stinking Pennywort), *Hypericum gramineum* (Small St John's Wort), *Hypoxis hygrometrica* var. *hygrometrica*, *Lythrum hyssopifolia* (Hyssop Loosestrife), *Microseris lanceolata* (Yam Daisy), *Plantago gaudichaudii* (Narrow Plantain), *Plantago hispida*, *Plantago varia*, *Poranthera microphylla* (Small Poranthera), *Ranunculus inundatus* (River Buttercup), *Rumex brownii* (Swamp Dock), *Scleranthus pungens* (Prickly Knawel), *Senecio hispidulus* (Hill Fireweed), *Senecio prenanthoides, Senecio quadridentatus* (Cotton Fireweed), *Senecio tenuiflorus* (A fireweed), *Solenogyne dominii , Tricoryne elatior* (Yellow Autumn-lily), *Urtica incisa* (Stinging Nettle), *Viola betonicifolia* (Native Violet), *Viola hederacea* (Ivy-leaved Violet), *Vittadinia cuneata* (A Fuzzweed), *Wahlenbergia communis* (Tufted Bluebell), *Wahlenbergia gracilis* (Sprawling Bluebell), *Wahlenbergia stricta* subsp. *stricta* (Tall Bluebell) and *Wurmbea dioica* subsp. *dioica* (Early Nancy). Commonly occurring ferns include *Cheilanthes austrotenuifolia* (Rock Fern) and *Pteridium esculentum* (Bracken) while the climber *Glycine clandestina* (Twining glycine) is also often present.
Condition and presence of weeds	PCT 283 occurs in the project footprint as five condition types: • Very low

	• Low • Moderate • High • Very high Exotic species are present in relatively high covers throughout PCT 283. A large portion of recorded exotic species comprise grasses such as *Nassella trichotoma* (Serrated Tussock), *Cynosurus echinatus* (Rough Dog's Tail), *Dactylis glomerata* (Cocksfoot) and *Phalaris aquatica* (Phalaris).
Justification of evidence used to identify the PCT	PCT 283 occurs on the Minjary Hills and Ranges, Oberon - Kialla Granites and Dalton Hills Mitchell Landscapes which are characterised by steep or undulating hills and sandy or clay loam soils which is consistent with the landscape description of PCT 283. Canopy species recorded in the PCT include a co-dominance of *Eucalyptus bridgesiana* and *Eucalyptus blakelyi* with *Eucalyptus melliodora* and *Eucalyptus macrorhyncha* present in lower numbers. The diagnostic species *Acacia dealbata* was recorded in the midstorey of several plots of PCT 283. *Cassinia sifton* (Sifton's Bush) was also recorded in several plots. Whilst this species is not a diagnostic species, its presence can most likely be attributed to a history of disturbance as *Cassinia sifton* is a known pioneer species, particularly in less fertile areas. Plots sampled confirm the presence of groundcover species diagnostic of PCT 283, including *Bothriochloa macra* (Red Grass), *Carex appressa* (Tall Sedge), *Echinopogon ovatus* (Forest Hedgehog Grass), *Elymus scaber* var. *scaber, Luzula* sp.*, Microlaena stipoides, Panicum effusum* (Hairy Panic), *Schoenus apogon* (Fluke Bogrush), *Themeda triandra* (Kangaroo Grass), *Acaena ovina* (Acaena), *Cymbonotus* sp.*, Epilobium* sp.*, Gonocarpus tetragynus* (Poverty Raspwort), *Haloragis heterophylla* (Variable Raspwort), *Hydrocotyle laxiflora* (Stinking Pennywort), *Hypericum gramineum* (Small St John's Wort), *Lythrum hyssopifolia* (Hyssop Loosestrife), *Senecio prenanthoides, Senecio quadridentatus* (Cotton Fireweed), *Solenogyne dominii, Tricoryne elatior* (Yellow Autumn-lily), and *Wahlenbergia stricta.* A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 283 within the project footprint is shown in Figure 6-1.
How it meets the BC Act Determination	As outlined in Section 6.5.1 and Table 6-10 of the BDAR, PCT 283 in Very low, Low, Moderate, High and Very high condition aligns to the BC Act listed White Box Yellow Box Blakely's Red Gum Grassy Woodland and Derived Native Grassland.
How it meets the EPBC Act Determination	As outlined in Section 6.5.1 and Table 6-10 of the BDAR, PCT 280 in Moderate, High and Very high condition aligns to the EPBC Act listed White Box Yellow Box Blakely's Red Gum Grassy Woodland and Derived Native Grassland.

	PCT 285 – Broad-leaved Sally grass - sedge woodland on valley flats and swamps in the NSW South Western Slopes Bioregion and adjoining South Eastern Highlands Bioregion
Vegetation formation	Dry Sclerophyll Forests (Shrub/grass sub-formation)
Vegetation class	Upper Riverina Dry Sclerophyll Forests
Conservation status	PCT 285 is not associated with a TEC.
% remaining in NSW	25
Extent	PCT 285 typically occurs in remnants along drainage lines and on the edges of swamps in the Tumut to Tumbarumba region. Many areas have been cleared for agriculture or pine plantations, and only some small stands occur in reserves. PCT 285 occurs on alluvial or colluvial organic grey to brown podzolic clay loam soils, on poorly drained valley flats, surrounding swamps or lining creeks in hill or mountain landscapes generally above 600 m altitude in the southern section of the NSW South Western Slopes and adjoining South Eastern Highlands Bioregions. The underlying lithology is mainly granite or granodorite.
Diagnostic canopy species for PCT 285	PCT 285 is typically dominated by *Eucalyptus camphora subsp. humeana*, *Eucalyptus stellulata* (Black Sally), *Eucalyptus robertsonii subsp. robertsoni*i and *Eucalyptus bridgesiana* (Apple Box).
Diagnostic midstorey species for PCT 285	The shrub layer is usually sparse and includes the tall shrubs *Acacia dealbata* (Silver Wattle), *Acacia melanoxylon* (Black Wood), *Acacia kettlewelliae*, *Leptospermum continentale* (Prickly Teetree) and the low shrubs *Mirbelia oxylobioides* (Mountain Mirbelia), *Hibbertia obtusifolia* (Hoary Guinea Flower), *Hovea linearis*, *Cassinia aculeata* (Dolly Bush), *Epacris breviflora* and rarely *Bossiaea foliosa* (Leafy Bossiaea). The tall tree fern *Dicksonia antarctica* (Soft Treefern) occurs in some narrow creeks.
Diagnostic groundcover species for PCT 285	The ground cover is usually dense being dominated by grass and grass like species such as *Poa labillardierei var. labillardierei*, *Microlaena stipoides var. stipoides* (Weeping Grass), *Bothriochloa macra* (red Grass), *Echinopogon ovatus* (Forest Hedgehog Grass), *Carex appressa* (Tall Sedge), *Juncus holoschoenus*, *Themeda australis*, *Phragmites australia*, *Eleocharis sphacelate* (Tall Spike Rush), *Carex fascicularis* (Tassel Sedge), *Juncus sarophorus*, *Elymus scaber var. scaber* (Wheatgrass), *Lomandra confertifolia subsp. rubiginosa*, *Lomandra longifolia* and *Lepidosperma laterale*. Characteristic forbs include *Senecio bathurstianus*, *Hydrocotyle laxiflora* (Stinking Pennywort), *Ranunculus lappaceus* (Common buttercup), *Geranium neglectum*, *Acaena novae-zelandie* (Bidgee-widgee), *Rubus parvifolius* (Native Raspberry), *Mentha diemenica* (Slender Mint) and *Asperula conferta*. The ferns and climbers *Clematis aristata*, *Calochlaena dubia* (Rainbow Fern), *Blechnum nudum* (Fishbone Water Fern), *Adiantum aethiopicum*, and *Pteridium esculentum* (Bracken Fern) may also occur.
Condition and presence of weeds	PCT 285 occurs in the project footprint in Low condition. Exotic species are present throughout PCT 285, with a large portion of weeds comprising of wind dispersed species of the Poaceae (grass) and Asteraceae (daisy) families.
Justification of evidence used to identify the PCT	A large amount of PCT 285 within the project footprint is severely burnt and could therefore not be sampled using BAM plots. However, field observations identified that PCT 285 was the likely the best fit PCT for the vegetation based off the presence of diagnostic canopy species. The landscape position is also consistent with PCT 285, as it is situated along drainage lines and poorly drained valley flats. Within the project footprint PCT 285 is situated within the Tooma Granite Ranges Mitchell Landscape which conforms with the landscape description for PCT 285 which states the PCT has an underlying lithology of granite or granodorite.
Photos	N/A

Number of plots sampled	No plots were able to be sampled.

PCT 287 – Long-leaved Box - Red Box - Red Stringybark mixed open forest on hills and hillslopes in the NSW South Western Slopes Bioregion	
Vegetation formation	Dry Sclerophyll Forests (Shrubby sub-formation)
Vegetation class	Western Slopes Dry Sclerophyll Forests
Conservation status	PCT 287 has no associated TEC.
% remaining in NSW	33
Extent	PCT 287 typically occurs clay soils derived from a range of substrates including granite, metamorphic rocks, fine-grained sedimentary and volcanic rocks on hillslopes in hill landform patterns mainly in the NSW South-western Slopes Bioregion and extending onto the South Eastern Highlands Bioregion.
Diagnostic canopy species for PCT 287	PCT 287 is typically dominated by *Eucalyptus goniocalyx* (Bundy), *Eucalyptus macrorhyncha* (Red Stringybark) and *Eucalyptus polyanthemos* subsp. *polyanthemos* (Red Box). Other canopy species may include *Eucalyptus melliodora* (Yellow Box), *Callitris endlicheri* (Black Cypress Pine) *Eucalyptus albens* (White Box) and *Eucalyptus sideroxylon* (Mugga Ironbark).
Diagnostic midstorey species for PCT 287	The shrub layer is sparse and includes species such as *Brachyloma daphnoides* subsp. *daphnoides* (Daphne Heath), *Acacia paradoxa* (Kangaroo Thorn), *Cassinia aculeata* (Dolly Bush), *Acacia buxifolia* subsp. *buxifolia* (Box-leaved Wattle), *Lissanthe strigosa* subsp. *strigosa* (Peach Heath), *Persoonia sericea, Leptospermum continentale* (Prickly Teatree), *Dillwynia sericea* (Egg and Bacon Peas), *Hibbertia obtusifolia* (Hoary Guinea Flower), *Indigofera australis* (Australian Indigo), *Melichrus urceolatus* (Urn Heath), *Acacia dealbata* (Silver Wattle), *Acacia implexa* (Hickory Wattle), *Daviesia latifolia* (Bitter-pea), *Pultenaea foliolosa* (A Bush Pea), *Pultenaea pedunculata* (Matted Bush-pea), *Pultenaea cunninghamii*, *Cassinia laevis* (Cough Bush) and *Bursaria spinosa* subsp. *spinosa* (Native Blackthorn).
Diagnostic groundcover species for PCT 287	The ground cover is mid-dense and includes grass and grass like species such as *Aristida ramosa* (Purple Wiregrass), *Bothriochloa macra* (Red Grass), *Dichelachne micrantha* (Shorthair Plumegrass), *Echinopogon ovatus* (Forest Hedgehog Grass), *Eragrostis parviflora* (Weeping Lovegrass), *Juncus subsecundus* (Finger Rush), *Juncus vaginatus, Lepidosperma laterale* (Variable Sword-sedge), *Lomandra filiformis* subsp. *coriacea* (Wattle Matt-rush), *Luzula densiflora* (Woodrush), *Panicum effusum* (Hairy Panic), *Poa sieberiana* var. *sieberiana* (Snowgrass), *Rytidosperma pallidum* (Redanther Wallaby Grass), *Rytidosperma pilosum* (Smooth-flowered Wallaby Grass), *Rytidosperma racemosum* var. *racemosum* (Wallaby Grass), *Schoenus apogon* (Fluke Bogrush) and *Themeda triandra* (Kangaroo Grass). Forb species characteristic of PCT 287 include *Acaena novae-zelandiae* (Bidgee-widgee), *Ajuga australis* (Austral Bugle), *Bulbine bulbosa* (Bulbine Lily), *Chrysocephalum apiculatum* (Common Everlasting), *Chrysocephalum semipapposum* (Clustered Everlasting), *Cymbonotus preissianus* (Austral Bear's Ear), *Dichopogon strictus* (Chocolate Lily), *Drosera peltata* (A Sundew), *Epilobium billardiereanum* subsp. *cinereum*, *Galium gaudichaudii* (Rough Bedstraw), *Gonocarpus tetragynus* (Poverty Raspwort), *Goodenia hederacea* subsp. *hederacea*, *Hydrocotyle laxiflora* (Stinking Pennywort), *Hypericum gramineum* (Small St John's Wort), *Lythrum hyssopifolia* (Hyssop Loosestrife), *Microseris lanceolata* (Yam Daisy), *Plantago gaudichaudii* (Narrow Plantain), *Plantago varia, Scutellaria humilis* (Dwarf Skullcap), *Senecio lautus* subsp. *dissectifolius*, *Senecio*

PCT 287 – Long-leaved Box - Red Box - Red Stringybark mixed open forest on hills and hillslopes in the NSW South Western Slopes Bioregion	
	prenanthoides, Senecio quadridentatus (Cotton Fireweed), *Senecio tenuiflorus* (A fireweed), *Solenogyne dominii, Stypandra glauca* (Nodding Blue Lily), *Tricoryne elatior* (Yellow Autumn-lily), *Viola betonicifolia* (Native Violet), *Vittadinia cuneata* (A Fuzzweed), *Wahlenbergia communis* (Tufted Bluebell), *Wahlenbergia gracilis* (Sprawling Bluebell), *Wahlenbergia stricta* subsp. *stricta* (Tall Bluebell) and *Wurmbea dioica* subsp. *dioica* (Early Nancy). The rock ferns *Cheilanthes austrotenuifolia* (Rock Fern) and *Cheilanthes sieberi* (Rock Fern) may also be present.
Condition and presence of weeds	PCT 287 occurs in the project footprint as four condition types: • Very low • Low • Moderate • High Exotic species are present in moderate densities throughout PCT 287. Typically higher covers of exotic species were recorded in the Very low and Low condition zones, with the exotic pasture grass *Lolium perenne* (Perennial Ryegrass), and exotic forbs *Rumex acetosella* (Sheep Sorrel) and *Trifolium subterraneum* (Subterranean Clover) frequently present as well as the climber *Rubus fruticosus* sp. agg. (Blackberry complex).
Justification of evidence used to identify the PCT	Most of PCT 287 in the project footprint occurs on Mitchell Landscapes characterised by steep to undulating hills (Adelong Granite Ranges, Boorowa Volcanics, Carabost Hills and Ranges, Gunning Hills and Minjary Hills and Ranges), which aligns with hillslopes in hill landform patterns characteristic of PCT 287. Canopy species recorded in the PCT include a co-dominance of *Eucalyptus goniocalyx, Eucalyptus macrorhyncha* and *Eucalyptus polyanthemos,* which are all characteristic canopy species of PCT 287. The diagnostic species *Eucalyptus melliodora* was also recorded in two plots. A shrub layer is absent in the plots sampled. Plots sampled confirm the presence of groundcover species diagnostic of PCT 287. These diagnostic species present include *Bothriochloa macra, Lomandra filiformis* subsp. *coriacea, Poa sieberiana* var. *sieberiana*, *Rytidosperma racemosum* var. *racemosum*, *Cymbonotus* sp., *Epilobium billardiereanum, Gonocarpus tetragynus, Hypericum gramineum, Lythrum hyssopifolia, Scutellaria humilis, Tricoryne elatior* and *Wahlenbergia communis*. A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 287 within the project footprint is shown in Figure 6-1.

Number of plots sampled

Eleven plots were sampled within the Inland Slopes and Murrumbateman bioregions:

Very low condition:

- YG0138B4

Low condition:

- YG0130F0
- YG013BA5
- BY1060BE
- WM058E47

Moderate condition:

- YG013560
- YG013C29
- BY15469A

High condition:

- YG030D4A
- YG013C042
- YG01331A

PCT 290 - Red Stringybark - Red Box - Long-leaved Box - Inland Scribbly Gum tussock grass - shrub low open forest on hills in the southern part of the NSW South Western Slopes Bioregion	
Vegetation formation	Dry Sclerophyll Forests (Shrub/grass sub-formation)
Vegetation class	Upper Riverina Dry Sclerophyll Forests
Conservation status	PCT 290 is not associated with a TEC.
% remaining in NSW	33
Extent	PCT 290 occurs on well-drained upper hillslopes and hillcrests on steep hills mainly in the southern part of the upper slopes sub-region of the NSW South-western Slopes Bioregion from the upper Murray River region to Livingstone National Park south of Wagga Wagga. The PCT is associated with shallow red to brown to yellow podzolic sandy clay-loam soils derived mainly from siliceous metamorphic, sedimentary and igneous substrates.
Diagnostic canopy species for PCT 290	The canopy is dominated by *Eucalyptus macrorhyncha* (Red Stringybark), *Eucalyptus polyanthemos* (Red Box) and *Eucalyptus goniocalyx* (Long-leaved Box), with *Eucalyptus rossii* (Inland Scribbly Gum) and *Eucalyptus blakelyi* (Blakely's Red Gum) occasionally present.
Diagnostic midstorey species for PCT 290	The midstorey of PCT 290 is typically sparse, however may be denser in areas with a less frequent fire regime. Diagnostic midstorey species include *Brachyloma daphnoides* subsp. *daphnoides*, *Dillwynia phylicoides* (Parrot-pea), *Hibbertia obtusifolia* (Hoary Guinea Flower), *Xanthorrhoea glauca* subsp. *angustifolia*, *Acacia dealbata* (Silver Wattle), *Phyllanthus hirtellus* (Thyme Spurge), *Daviesia leptophylla*, *Calytrix tetragona* (Common Fringe-myrtle), *Pultenaea procumbens*, *Acacia paradoxa* (Kangaroo Thorn), *Leucopogon ericoides* (Pink Beard-heath), *Leucopogon attenuatus* (A Beard-heath), *Lissanthe strigosa* subsp. *strigosa* (Peach Heath), *Melichrus urceolatus* (Urn Heath), *Grevillea ramosissima* (Fan Grevillea) and *Grevillea floribunda* (Seven Dwarfs Grevillea).
Diagnostic groundcover species for PCT 290	The ground cover is typically mid-dense to sparse and includes species such as: *Poa sieberiana* var. *sieberiana* (Snowgrass), *Rytidosperma erianthum* (Wallaby Grass), *Gonocarpus tetragynus* (Poverty Raspwort), *Cheilanthes sieberi* subsp. *sieberi* (Rock Fern), *Goodenia hederacea* subsp. *hederacea*, *Stypandra glauca* (Nodding Blue Lily), *Lomandra filiformis* subsp. *coriacea* (Wattle Matt-rush), *Lomandra filiformis* subsp. *filiformis*, *Dianella revoluta* var. *revoluta* (A Blue Flax Lily), *Hypericum gramineum* (Small St John's Wort), *Poranthera microphylla* (Small Poranthera), *Craspedia variabilis* (Common Billy-buttons), *Dichelachne micrantha* (Shorthair Plumegrass), *Dichelachne rara*, *Hydrocotyle laxiflora* (Stinking Pennywort), *Senecio prenanthoides*, *Thysanotus patersonii* (Twining Fringe-Lily), *Opercularia hispida* (Hairy Stinkweed), *Pomax umbellata* (Pomax), *Microseris lanceolata* (Yam Daisy), *Microtis unifolia* (Common Onion Orchid), *Wahlenbergia stricta* subsp. *stricta* (Tall Bluebell), *Drosera auriculata*, *Senecio quadridentatus* (Cotton Fireweed), *Senecio bathurstianus*, *Lepidosperma laterale* (Variable Sword-sedge), *Geranium solanderi* var. *solanderi*, *Hovea linearis*, *Hardenbergia violacea* (False Sarsaparilla), *Ranunculus sessiliflorus* var. *sessiliflorus*, *Daucus glochidiatus* (Native Carrot), *Drosera auriculata* and *Crassula sieberiana* (Australian Stonecrop).
Condition and presence of weeds	PCT 290 occurs in the project footprint as three condition types: • Very low • Low • High

PCT 290 - Red Stringybark - Red Box - Long-leaved Box - Inland Scribbly Gum tussock grass - shrub low open forest on hills in the southern part of the NSW South Western Slopes Bioregion	
	Exotic species are present throughout PCT 290, typically with higher covers recorded in the Very low and Low condition zones, with a large portion of weeds comprising wind dispersed species of the Poaceae (grass) and Asteraceae (daisy) families.
Justification of evidence used to identify the PCT	In the project footprint, this PCT occurs predominantly on Mitchell Landscapes characterised by steep hillslopes (Tooma Granite Ranges, Carabost Hills and Ranges, Minjary Hills and Ranges, Dalton Hills, Boorowa Volcanics and Doura Volcanics). Given this, the vegetation mapped in the project footprint aligns to the landscape description for PCT 290. Additionally, a co-dominance of *Eucalyptus macrorhyncha* and *Eucalyptus rossii* were recorded throughout this PCT. Other common canopy species recorded in the plots sampled include *Eucalyptus polyanthemos* and *Eucalyptus goniocalyx*, and to a lesser extent *Eucalyptus blakelyi*. These canopy species recorded in the plots sampled align to PCT 290. In the wooded areas of PCT 290 the midstorey ranged from a sparse to mid-dense cover of shrubs which is characteristic of PCT 290. Diagnostic shrub species recorded in the plots sampled include *Brachyloma daphnoides* subsp. *daphnoides*, *Hibbertia obtusifolia*, *Acacia dealbata*, *Phyllanthus hirtellus*, *Pultenaea procumbens*, *Leucopogon ericoides*, *Lissanthe strigosa* subsp. *strigosa* and *Melichrus urceolatus*. *Cassinia sifton* (Sifton's Bush) was also recorded in majority of the plots with a moderate cover. *Cassinia sifton* is a pioneer species that is known to colonise disturbed areas, therefore its presence in the sampled plots can be attributed to past and present disturbances. Plots sampled confirm the presence of groundcover species diagnostic of PCT 290, including *Poa sieberiana* var. *sieberiana*, *Gonocarpus tetragynus, Cheilanthes sieberi* subsp. *sieberi*, *Goodenia hederacea* subsp. *hederacea*, *Stypandra glauca*, *Lomandra filiformis* subsp. *coriacea*, *Lomandra filiformis* subsp. *filiformis*, *Dianella revoluta* var. *revoluta*, *Hypericum gramineum*, *Poranthera microphylla*, *Dichelachne micrantha*, *Hydrocotyle laxiflora*, *Senecio prenanthoides*, *Pomax umbellata*, *Wahlenbergia stricta* subsp. *stricta*, Drosera peltata, *Lepidosperma laterale*, *Geranium solanderi* var. *solanderi*, *Hovea linearis*, *Hardenbergia violacea*, *Daucus glochidiatus* and *Crassula sieberiana*. *Hardenbergia violacea* and *Cheilanthes sieberi* were also recorded throughout the PCT. A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 290 within the project footprint is shown in Figure 6-1.

Photo 29. High condition woodland (photo taken at plot WM057IS2)

Number of plots sampled	Eight plots were sampled within the Inland Slopes bioregion: Very low condition: • WM0598AD • WM059CE5 Low condition:

PCT 290 - Red Stringybark - Red Box - Long-leaved Box - Inland Scribbly Gum tussock grass - shrub low open forest on hills in the southern part of the NSW South Western Slopes Bioregion	
	• YG035805 • WM058DCC • WM0580FD • WM05876E High condition: • WM057IS2 • WM057742

	PCT 294 – Nortons Box - Red Box - White Box tussock grass open forest of the southern section of the NSW South Western Slopes Bioregion
Vegetation formation	Dry Sclerophyll Forests (Shrub/grass sub-formation)
Vegetation class	Upper Riverina Dry Sclerophyll Forests
Conservation status	PCT 294 is not associated with a TEC.
% remaining in NSW	53
Extent	PCT 294 occurs on shallow clay loam soils derived from sedimentary and igneous substrates (granite) in hill landform patterns on hillslope landform elements in the southern part of the NSW South-western Slopes Bioregion.
Diagnostic canopy species for PCT 294	PCT 294 is typically dominated by *Eucalyptus nortonii* (Nortons Box) with *Eucalyptus polyanthemos* (Red Box). *Eucalyptus macrorhyncha* (Red Stringybark) and *Eucalyptus albens* (White Box) is often co-occurring.
Diagnostic midstorey species for PCT 294	The shrub layer of PCT 294 is very sparse and may include *Acacia dealbata* (Silver Wattle), *Cassinia arculata* (Dolly Bush), *Hibbertia obtusifolia* (Hoary Guinea Flower), *Calytrix tetragona* (Common Fringe-myrtle), and *Pultenaea procumbens*.
Diagnostic groundcover species for PCT 294	The diagnostic grass species of PCT 294 include *Joycea pallida* (Silvertop Wallaby Grass), *Poa sieberiana* (Snowgrass), *Elymus scaber var. scaber* (Wheatgrass), *Microlaena stipoides var. stipoides* (weeping grass), *Austrodanthonia pilosa* (Smooth-flowered Wallaby Grass), *Dichelachne hirtella* (Plumegrass), and *Echinopogon ovatus* (Forest Hedgehog Grass). The graminioise *Lomandra filiformis subsp. coriacea* (wattle Matt-rush) is usually common and the rush *Luzula densiflora* (Woodrush) is often present. Forb species include *Acaena novae-zelandiae* (bidgee-widgee), *Gonocarpus tetragynus* (Poverty Raspwort), *Dichondra repens* (Kidney Weed), *Hydrocotyle laxiflora* (Stinking Pennywort), *Cymbonotus preissianus* (Austral Bear's Ear), *Rumex brownii* (Swamp Dock), *Poranthera microphylla* (Small Poranthera), *Daucus glochidiatus* (Native Carrot), *Wahlenbergia stricta supsp*. Stricta (Tall Bluebell), *Dichopogon strictus* (Chocolate Lily), *Myosotis discolor* (Forget-me-not), *Geranium solanderi var. solanderi, Geranium. retrorsum, Senecio tenuilflorus, Senecio quadridentatus* (Cotton Fireweed), *Senecio bathurstianus,* and *Senecio prenanthoides*.
Condition and presence of weeds	PCT 294 occurs in the project footprint as two condition types: • Low • Moderate Exotic species are present throughout PCT 294, with a large portion of weeds comprising of wind dispersed species of the Poaceae (grass) and Asteraceae (daisy) families.
Justification of evidence used to identify the PCT	PCT 294 within the project footprint is situated on the Doura Volcanics Mitchell Landscape which is associated with rolling and undulating hills with occasional peaks on Silurian dacite, crystal tuff, sandstone and minor limestone. This is generally consistent with the landscape description of PCT 294. Plots sampled within PCT 294 had a canopy dominated by *Eucalyptus macrorhyncha* with *Eucalyptus albens* also present. *Eucalyptus polyanthemos* and *Eucalyptus nortonii* were not recorded within a plot however were often co-dominant canopy species. While *Eucalyptus nortonii* was not always the dominant

	canopy species, PCT 294 is still considered to be the best fit PCT, particularly with the presence of all the diagnostic canopy species. The shrub layer of PCT 294 within the project footprint contained the diagnostic species *Cassinia aculeata.* Diagnostic groundcover species for PCT 294 present within the plots sampled for PCT 294 include *Geranium solanderi, Daucus glochidiatus, Wahlenbergia stricta, Elymus scaber, Rumex brownie*, *Wurmbea dioica subsp. dioica*, *Cheilanthes austrotenuifolia*, *Microlaena stipoides*, *Oxalis perennans*, *Senecio quadridentatus* and *Senecio bathurstianus.* A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 294 within the project footprint is shown in Figure 6-1.
Photos	 **Photo 30. Low condition woodland (photo taken at plot 28)**

	 Photo 31. Moderate condition woodland (photo taken at plot 22)
Number of plots sampled	Five plots were sampled within the Inland Slopes bioregion: Low condition: • 28 Moderate condition: • 22 • 23 • 27 • 29

PCT 295 - Robertsons Peppermint - Broad-leaved Peppermint - Nortons Box - stringybark shrub-fern open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion	
Vegetation formation	Wet Sclerophyll Forests (Grassy sub-formation)
Vegetation class	Southern Tableland Wet Sclerophyll Forests
Conservation status	PCT 295 is not associated with a TEC.
% remaining in NSW	60
Extent	PCT 295 occurs on flats and sheltered southern and eastern aspects in hill or mountain landform patterns in the southern portion of the NSW South-western Slopes Bioregion and south-western edge of the South Eastern Highlands Bioregion. Typical lithology includes deep brown to loamy clay soils including red and brown podosols derived from granite, metamorphic and sedimentary rocks.
Diagnostic canopy species for PCT 295	The canopy is often dominated by *Eucalyptus robertsonii* subsp. *robertsonii* (Robertson's Peppermint) with *Eucalyptus macrorhyncha* (Red Stringybark), and sometimes with *Eucalyptus nortonii* (Large-flowered Bundy) or *Eucalyptus mannifera* subsp. *mannifera.* Other species that may occur in PCT 295 are *Eucalyptus dives* (Broad-leaved Peppermint) and *Eucalyptus bicostata* (Eurabbie).
Diagnostic midstorey species for PCT 295	The midstorey is typically sparse and includes *Acacia dealbata* (Silver Wattle), *Platylobium formosum* subsp. *formosum*, *Acrotriche serrulata* (Honeypots), *Acacia rubida* (Red-stemmed Wattle), *Cassinia sifton* (Sifton Bush), *Pimelea linifolia* subsp. *linifolia*, *Hibbertia obtusifolia* (Hoary Guinea Flower), *Olearia erubescens* (Pink-tip Daisy-bush), *Daviesia latifolia* (Bitter-pea), *Acrotriche divaricata*, *Acacia melanoxylon* (Blackwood), *Cassinia longifolia*, *Dodonaea viscosa* subsp. *spatulata* (Broad-leaf Hopbush), *Goodia lotifolia* var. *lotifolia* (Golden Tip), *Lomatia myricoides* (River Lomatia) and *Leucopogon virgatus* (Common Beard-heath).
Diagnostic groundcover species for PCT 295	The ground cover is typically dense and is dominated by grasses, forbs and ferns. Grass and grass like species include *Elymus scaber* subsp. *scaber* (Common Wheatgrass), *Lomandra longifolia* (Spiny-headed Mat-rush), *Luzula densiflora* (Woodrush), *Microlaena stipoides* var. *stipoides* (Weeping Grass), *Poa sieberiana* var. *cyanophylla*, *Poa sieberiana* var. *sieberiana* (Snowgrass), *Rytidosperma erianthum* (Wallaby Grass) and *Rytidosperma pallidum* (Redanther Wallaby Grass). Forbs characteristic of PCT 295 include *Acaena novae-zelandiae* (Bidgee-widgee), *Arthropodium milleflorum* (Pale Vanilla-lily), *Asperula conferta* (Common Woodruff), *Craspedia variabilis* (Common Billy-buttons), *Cynoglossum suaveolens* (Sweet Hound's-tongue), *Daucus glochidiatus* (Native Carrot), *Dianella revoluta* var. *revoluta* (A Blue Flax Lily), *Euchiton gymnocephalus, Galium migransm, Galium propinquum* (Maori Bedstraw), *Geranium solanderi* var. *solanderi*, *Gonocarpus tetragynus* (Poverty Raspwort), *Hydrocotyle laxiflora* (Stinking Pennywort), *Hypericum gramineum* (Small St John's Wort), *Lagenifera stipitata* (Blue Bottle-daisy), *Oxalis perennans, Plantago varia, Poranthera microphylla* (Small Poranthera), *Ranunculus lappaceus* (Common Buttercup), *Rumex brownii* (Swamp Dock), *Senecio prenanthoides, Senecio tenuiflorus* (A fireweed), *Stellaria pungens* (Prickly Starwort), *Veronica calycina* (Hairy Speedwell), *Viola betonicifolia* (Native Violet), *Viola hederacea* (Ivy-leaved Violet) and *Wahlenbergia stricta* subsp. *stricta* (Tall Bluebell). Climbers which are diagnostic species for PCT 295 include *Billardiera scandens* var. *scandens*, *Clematis aristata* (Old Man's Beard), *Glycine clandestina* (Twining glycine), *Glycine tabacina* (Variable

PCT 295 - Robertsons Peppermint - Broad-leaved Peppermint - Nortons Box - stringybark shrub-fern open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion	
	Glycine), *Hardenbergia violacea* (False Sarsaparilla) and *Rubus parvifolius* (Native Raspberry) while diagnostic ferns species include *Asplenium flabellifolium* (Necklace Fern), *Blechnum nudum* (Fishbone Water Fern), *Pteridium esculentum* (Bracken) and *Pteridium esculentum* (Bracken).
Condition and presence of weeds	PCT 295 occurs in the project footprint as two condition types: • Very low • Moderate Exotic species are present in ranging densities throughout PCT 295, typically with higher covers recorded in the Very low condition zone. Exotic species commonly present comprise the forbs *Carthamus lanatus* (Saffron Thistle) and *Hypericum perforatum* (St. John's Wort) and the grasses *Anthoxanthum odoratum* (Sweet Vernal Grass), *Cynosurus echinatus* (Rough Dog's Tail) and *Vulpia myuros* (Rat's Tail Fescue).
Justification of evidence used to identify the PCT	PCT 295 occurs on flats and sheltered southern and eastern aspects in hill or mountain landform patterns in the southern portion of the NSW South-western Slopes Bioregion and south-western edge of the South Eastern Highlands Bioregion. The PCT in the project footprint is mapped on the Minjary Hills and Ranges, Mt Bundarbo Basalt Caps and Young Hills and Slopes Mitchell Landscapes, which are all characterised with hill or mountain landform patterns. Additionally, diagnostic canopy species of PCT 295 include *Eucalyptus macrorhyncha, Eucalyptus robertsonii, Eucalyptus dives* and *Eucalyptus mannifera* subsp. *mannifera*, all of which were observed throughout this PCT. The midstorey in the plots sampled was sparse which is characteristic of PCT 295. Where present midstorey species were diagnostic of PCT 295 and include *Acacia melanoxylon* and *Acrotriche serrulata*. Plots sampled confirm a dense groundcover and the presence of species diagnostic of PCT 295, including *Elymus scaber* subsp. *scaber*, *Microlaena stipoides* var. *stipoides*, *Acaena novae-zelandiae, Gonocarpus tetragynus*, *Rumex brownii* and *Pteridium esculentum*. A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 295 within the project footprint is shown in Figure 6-1.

PCT 295 - Robertsons Peppermint - Broad-leaved Peppermint - Nortons Box - stringybark shrub-fern open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion

Photos	 **Photo 32. Moderate condition woodland (photo taken at plot MA-092C)**
Number of plots sampled	Five plots were sampled within the Bondo bioregion: Very low condition: • MA09215E Moderate condition: • MA-014A2 • MA-092C • MA09208C • MA092B25

	PCT 296 – Brittle Gum - peppermint open forest of the Woomargama to Tumut region, NSW South Western Slopes Bioregion
Vegetation formation	Dry Sclerophyll Forests (Shrubby sub-formation)
Vegetation class	Southern Tableland Dry Sclerophyll Forests
Conservation status	PCT 296 is not associated with a TEC.
% remaining in NSW	40
Extent	PCT 296 occurs at altitudes over 500 m on light grey to brown podzolic loam or clay soils derived from granite or metasediments on steep hillslopes in hill or mountain landform patterns in the Woomargama to Tumut regions in the upper slopes sub-region of the NSW South-western Slopes Bioregion and adjacent South Eastern Highlands Bioregion.
Diagnostic canopy species for PCT 296	PCT 296 is typically dominated by Brittle Gum (*Eucalyptus mannifera subsp. manifera*) with Broad-leaved Peppermint (*Eucalyptus dives*) and Red Stringybark (*Eucalyptus macrorhyncha*)
Diagnostic midstorey species for PCT 296	Shrubs are sparse to mid-dense and may be diverse. They include *Hibbertia obtusifolia* (Hoary Guinea Flower), *Monotoca scoparia*, *Platylobium formosum subsp. formosum*, *Melichrus urceolatus* (Urn Heath), *Acacia dealbata* (Silver Wattle), *Grevillea polybractea* (Crimson Grevillea), *Dillwynia phylicoides* (Parrot-pea), *Boronia nana var. hyssopifolia*, *Hovea linearis*, *Daviesia latifolia* (Bitter-pea), *Cassinia aculeata* (Dolly Bush), *Acacia buxifolia* subsp. *buxifolia* (Box-leaved Wattle), *Acacia rubida* (Red-stemmed Wattle), *Acacia pravissima* (Wedge-leaved Wattle), *Indigofera australis* (Australian Indigo), *Persoonia chamaepeuce*, *Correa reflexa var. reflexa*, *Gompholobium virgatum var. virgatum*, *Grevillea lanigera* (Woolly Grevillea), *Cassinia longifolia* and *Bursaria spinosa* subsp. *lasiophylla* (Native Blackthorn).
Diagnostic groundcover species for PCT 296	The ground cover is sparse to mid-dense with grasses and forbs such as *Senecio tenuiflorus* (A fireweed), *Joycea pallida* (Silvertop Wallaby Grass), *Gonocarpus tetragynus* (Poverty Raspwort), *Hardenbergia violacea* (False Sarsaparilla), *Dianella revoluta var. revoluta* (A Blue Flax Lily), *Pomax umbellate*, *Poa sieberiana var. sieberiana* (Snowgrass), *Dichopogon strictus* (Chocolate Lily), *Poranthera microphylla* (Small Poranthera), *Hydrocotyle laxiflora* (Stinking Pennywort), *Hypericum gramineum* (Small St John's Wort), *Acaena novae-zelandiae* (Bidgee-widgee), *Stylidium graminifolium* (Grass Triggerplant), *Elymus scaber var. scaber* (Wheatgrass), *Thysanotus patersonii* (Twining Fringe-Lily), *Luzula flaccida* (Woodrush), *Drosera auriculata*, *Lomandra filiformis subsp. filiformis*, *Wahlenbergia stricta subsp. stricta* (Tall Bluebell) and *Billardiera scandens var. scandens*.
Condition and presence of weeds	PCT 296 occurs in the project footprint in Low condition.
Justification of evidence used to identify the PCT	Due to the small size of the patch of PCT 296 (0.10 ha) no plots were completed within this PCT. PCT 296 within the project footprint is situated within the Mt Bundarbo Basalt Caps Mitchell landscape which is associated with Flat topped hills and peaks of Tertiary basalt overlying Silurian-Devonian granite or Silurian dacite, andesite and sandstone. The soils are thin stony brown loams, while rubbly slopes with brown loams extend below the lower limit of the basalt onto thin skeletal clays and clay loams from underlying volcanics or deeper gritty clays from granite. This generally aligns with the landscape formation of PCT 296 which is described as occurring on light grey to brown podzolic loam or clay soils derived from granite or metasediments. The altitude of PCT 296 within the project footprint is also

	consistent with PCT 296, occurring at 750 m asl, which is over 500 m asl as stated in the landscape description. Therefore, the landscape position of PCT 296 within the project footprint aligns with PCT 296. The extent of PCT 296 within the project footprint is shown in Figure 6-1.
Photos	**N/A**
Number of plots sampled	No plots were completed within PCT 296.

PCT 297 - Broad-leaved Peppermint - Norton's Box - Red Stringybark tall open forest on red clay on hills in the southern part of the NSW South Western Slopes Bioregion	
Vegetation formation	Dry Sclerophyll Forests (Shrub/grass sub-formation)
Vegetation class	Upper Riverina Dry Sclerophyll Forests
Conservation status	PCT 297 is not associated with a TEC.
% remaining in NSW	62
Extent	PCT 297 typically occurs on shallow loamy clay soils derived from igneous, sedimentary or metamorphic rocks on ridges and upper slopes in the hills landform pattern in the southern section of the NSW South-western Slopes Bioregion.
Diagnostic canopy species for PCT 297	The canopy is often dominated by *Eucalyptus dives* (Broad-leaved Peppermint), *Eucalyptus nortonii* (Norton's Box) and *Eucalyptus macrorhyncha* (Red Stringybark). *Eucalyptus mannifera* subsp. *mannifera* (Brittle Gum) may also be present.
Diagnostic midstorey species for PCT 297	The midstorey is typically sparse and includes *Acacia dealbata* (Silver Wattle), *Cassinia aculeata* (Dolly Bush), *Hibbertia obtusifolia* (Hoary Guinea Flower), *Pimelea linifolia* subsp. *linifolia*, *Daviesia latifolia* (Bitter-pea), *Dillwynia phylicoides* (Parrot-pea), *Hibbertia calycina* (Lesser Guinea Flower), *Platylobium formosum* subsp. *formosum*, *Melichrus urceolatus* (Urn Heath) and *Acrotriche serrulata* (Honeypots).
Diagnostic groundcover species for PCT 297	The ground cover is typically mid-dense. Grass and grass like diagnostic species include *Echinopogon ovatus* (Forest Hedgehog Grass), *Elymus scaber var. scaber* (Wheatgrass), *Lomandra filiformis* subsp. *filiformis*, *Poa sieberiana* var. *sieberiana* (Snowgrass) and *Rytidosperma pallidum* (Redanther Wallaby Grass). Characteristic forbs of PCT 297 include *Acaena novae-zelandiae* (Bidgee-widgee), *Brachyscome multifida* var. *multifida*, *Brunonia australis* (Blue Pincushion), *Euchiton gymnocephalus*, *Gonocarpus tetragynus* (Poverty Raspwort), *Hovea linearis*, *Hydrocotyle laxiflora* (Stinking Pennywort), *Hypericum gramineum* (Small St John's Wort), *Oxalis perennans*, *Plantago hispida, Plantago varia, Podolepis jaceoides* (Showy Copper-wire Daisy), *Senecio quadridentatus* (Cotton Fireweed), *Stellaria pungens* (Prickly Starwort), *Viola betonicifolia* (Native Violet), *Wahlenbergia stricta* subsp. *stricta* (Tall Bluebell) and *Xerochrysum viscosum* (Sticky Everlasting). The fern *Pteridium esculentum* (Bracken) may also be present.
Condition and presence of weeds	PCT 297 occurs in the project footprint as two condition types: • Low • Moderate Exotic species are present in varying densities throughout PCT 297, typically with higher covers recorded in the Low condition zone. Frequently recorded exotic forbs include *Hypericum perforatum* (St. Johns Wort) and *Hypochaeris radicata* (Catsear) and the climber *Rubus fruticosus* sp. agg. (Blackberry complex).
Justification of evidence used	PCT 297 occurs on shallow loamy clay soils derived from igneous, sedimentary or metamorphic rocks on ridges and upper slopes in the hills landform pattern in the southern section of the NSW South-western Slopes Bioregion. The PCT in the project footprint is mapped on the Carabost Hills and

PCT 297 - Broad-leaved Peppermint - Norton's Box - Red Stringybark tall open forest on red clay on hills in the southern part of the NSW South Western Slopes Bioregion	
to identify the PCT	Ranges Mitchell Landscape which is characterised by thin stony gradational red brown earth and red-yellow texture-contrast soils. The diagnostic canopy species of PCT 297 *Eucalyptus nortonii* was recorded as the dominant species across the plots sampled. The midstorey in the plots sampled was sparse which is also characteristic of PCT 297. Where present, midstorey species were diagnostic of PCT 297 and include *Hibbertia obtusifolia, Pimelea* sp. and *Melichrus urceolatus*. Plots sampled confirm a dense groundcover and the presence of species diagnostic of PCT 297, including *Echinopogon ovatus, Lomandra filiformis* subsp. *filiformis*, *Poa sieberiana* var. *sieberiana*, *Acaena novae-zelandiae, Euchiton* sp., *Gonocarpus tetragynus, Hovea linearis, Hydrocotyle laxiflora, Hypericum gramineum, Oxalis perennans, Senecio quadridentatus, Stellaria* sp., *Wahlenbergia stricta* subsp. *stricta* and *Xerochrysum viscosum.* A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 297 within the project footprint is shown in Figure 6-1.

Number of plots sampled

Fourteen plots were sampled within the Inland Slopes bioregion:

Low condition:

- WM058F1D
- WM058EAA
- WM0581E8
- WM0584DB
- WM0587EC
- WM058C4E

Moderate condition:

- WM05881E
- WM05852D
- WM058C61
- WM058BE9
- WM0581C0
- WM058F00
- WM058E16
- WM058D03

PCT 299 - Riparian Ribbon Gum - Robertsons Peppermint - Apple Box riverine very tall open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion	
Vegetation formation	Dry Sclerophyll Forests (Shrubby sub-formation)
Vegetation class	Southern Tableland Dry Sclerophyll Forests
Conservation status	PCT 299 is not associated with a TEC.
% remaining in NSW	60
Extent	PCT 299 occurs on valley flats and along streams in mountain landforms in the southern-most part of the Inland Slopes subregion of the NSW South Western Slopes Bioregion and in the adjacent areas of the South Eastern Highlands Bioregion, generally between 350 and 850 m altitude, and is associated with Bondo and Inland Slopes subregions.
Diagnostic canopy species for PCT 299	The canopy of PCT 299 is dominated by *Eucalyptus viminalis* (Ribbon Gum) and *Eucalyptus robertsonii* (Robertsons Peppermint) with *Eucalyptus bridgesiana* (Apple Box) also sometimes present.
Diagnostic midstorey species for PCT 299	The shrub layer is very sparse and commonly includes *Acacia dealbata* (Mountain Cedar Wattle) and *Acacia melanoxylon* (Blackwood).
Diagnostic groundcover species for PCT 299	The ground cover is dense and may be dominated by grasses and forbs such as *Pteridium esculentum* (Bracken)*, Acaena novae-zelandiae* (Bidgee-widgee), *Geranium solanderi var. solanderi, Echinopogon ovatus* (Forest Hedgehog Grass), *Stellaria pungens* (Prickly Starwort), *Bothriochloa macra* (Red Grass)*, Acrotriche serrulata* (Honeypots), *Carex appressa* (Tall Sedge), *Hydrocotyle laxiflora* (Stinking Pennywort), *Elymus scaber var. scaber* (Wheatgrass)*, Cymbonotus preissianus* (Austral Bear's Ear), *Microlaena stipoides* var. *stipoides* (Weeping Grass), *Senecio tenuiflorus* (A fireweed)*, Rumex brownii* (Swamp Dock), *Acaena echinate* (Sheep's Burr), *Gonocarpus tetragynus* (Poverty Raspwort), *Lagenifera stipitate, Asperula conferta* (Common Woodruff), *Viola betonicifolia* (Native Violet), *Daucus glochidiatus* (Native Carrot), *Luzula flaccida* (Woodrush), *Alternanthera denticulate, Polystichum proliferum* (Mother Shield Fern) and *Juncus amabilis.*
Condition and presence of weeds	PCT 299 occurs in the Project footprint as three condition types: • Very low • Low • Moderate Exotic species are present in ranging densities throughout PCT 299, typically with higher covers recorded in the Very low and Low condition zones, and a large portion of weeds comprising of wind dispersed species of the Poaceae (grass) and Asteraceae (daisy) families.
Justification of evidence used to identify the PCT	Within the project footprint, PCT 299 is generally present along or in close proximity to streams or on valley flats in mountainous terrain. This is consistent with the description of the landscape position of PCT 299.

PCT 299 - Riparian Ribbon Gum - Robertsons Peppermint - Apple Box riverine very tall open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion	
	Diagnostic canopy species of PCT 299 include *Eucalyptus viminalis* and *Eucalyptus macrorhyncha* both of which were recorded in this PCT. *Eucalyptus robertsonii subsp. robertsonii* and *Eucalyptus bridgesiana* are also diagnostic species, but were not recorded in this PCT. Plots sampled confirm the presence of groundcover species diagnostic of PCT 299, including *Pteridium esculentum, Geranium solanderi, Echinopogon ovatus, Bothriochloa macra, Hydrocotyle laxiflora, Elymus scaber, Microlaena stipoides, Senecio tenuiflorus* and *Gonocarpus tetragynus*. A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 299 within the project footprint is shown in Figure 6-1.
Photos	 **Photo 35. Very low condition woodland (photo taken at plot MA-092A)**

PCT 299 - Riparian Ribbon Gum - Robertsons Peppermint - Apple Box riverine very tall open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion

Photo 36. Low condition woodland (photo taken at plot MA-092B)

Photo 37. Moderate condition woodland (photo taken at plot WM0948A5)

Number of plots sampled	Nineteen plots were sampled within the Inland Slopes bioregion: Very low condition: • MA0925E7 • MA0924A0

PCT 299 - Riparian Ribbon Gum - Robertsons Peppermint - Apple Box riverine very tall open forest of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion	
	• MA-092A • MA092947 • MA092CD8 Low condition: • MA-092B • MA09278F Moderate condition: • MA092C50 • WM0948A5 • WM06034286 • MA092B90 • WM06034F98 • WM06034B60 • MA092259 • WM06034A41 • MA092743 • WM0940C2 • WM06034CF4 • MA092318

PCT 300 Ribbon Gum – Narrow-leaved (Robertsons) Peppermint montane fern – grass tall open forest on deep clay loam soils in the upper NSW South Western Slopes Bioregion and western Kosciuszko escarpment	
Vegetation formation	Wet Sclerophyll Forests (Grassy sub-formation)
Vegetation class	Southern Tableland Wet Sclerophyll Forests
Conservation status	PCT 300 is not associated with a TEC.
% remaining in NSW	80
Extent	PCT 300 occurs on deep red-brown loam soils derived from granite and sedimentary substrates on sheltered hillslopes in a mountain landform pattern in elevations between 700 and 1150 m. It is found on the south-western edge of the south Eastern Highlands Bioregion including in Kosciuszko National Park and in the southern Upper Slopes sub-region of the NSW South-western Slopes Bioregion including a patch on Mount Ikes in Boogandyera Nature Reserve where a pure stand of *Eucalyptus viminalis* occurs on the summit.
Diagnostic canopy species for PCT 300	PCT 300 is described as a tall to very tall open forest dominated by Ribbon Gum *(Eucalyptus viminalis)* with Robertsons Peppermint *(Eucalyptus robertsonii)* and occasionally Broad-leaved Peppermint *(Eucalyptus dives).*
Diagnostic midstorey species for PCT 300	The midstorey may be dense or sparse depending on the time since it was last burnt. Midstorey species present include *Acacia dealbata* (Silver Wattle)*, Cassinia aculeata* (Dolly Bush)*, Lomatia myricoides* (River Lomatia)*, Platylobium formosum subsp. formosum, Acrotriche serrulata* (Honeypots)*, Senecio velleioides, Coprosma quadrifida* (Prickly Currant Bush)*, Coprosma hirtella* (Coffee-berry) *and Acacia melanoxylon* (Blackwood). Ferns including *Polystichum proliferum* (Mother Shield Fern) and *Pteridium esculentum* (Bracken) may also be common.
Diagnostic groundcover species for PCT 300	Characteristic ground cover species of this PCT include the grasses *Poa meionectes, Microlaena stipoides var. stipoides* (Weeping Grass)*, Austrofestuca eriopoda* (Snow Fescue) and *Elymus scaber var. scaber* (Wheatgrass). A number of forb species may also be present including *Stellaria pungens* (Prickly Starwort)*, Laginifera stipitata* (Blue Bottle-daisy)*, Acaena novae-zelandiae* (Bidgee-widgee)*, Viola betonicifolia* (Native Violet)*, Dianella revoluta var. revoluta, Dianella tasmanica, Hydrocotyle laxiflora* (Stinking Pennywort) *and Dichondra repens* (Kidney weed). The rushes *Luzula densiflora* (Woodrush) or Luzula flaccida (Woodrush) may be common while the climbers *Glycine clandestina* (Twining Glycine) and *Clematis aristata* (Old Man's Beard) may also be present.
Condition and presence of weeds	PCT 300 occurs in the project footprint as three condition types: • Low • Moderate • High Exotic species are present in ranging densities throughout PCT 300, typically with higher covers recorded in the Low condition zone, and a large portion of weeds comprising of wind dispersed species of the Poaceae (grass) and Asteraceae (daisy) families.

PCT 300 Ribbon Gum – Narrow-leaved (Robertsons) Peppermint montane fern – grass tall open forest on deep clay loam soils in the upper NSW South Western Slopes Bioregion and western Kosciuszko escarpment	
Justification of evidence used to identify the PCT	PCT 300 within the project footprint is located within the Tooma Granite Ranges and Adelong Granite Ranges Mitchell Landscapes. The Tooma Granite Ranges landscape is associated with rounded hills, ranges and plateau om Silurian gneissic granite with red and yellow gritty texture-contrast soils. The Adelong Granite Ranges landscape is associated with steep hills and peaks on Silurian gneissic granite and Devonian massive granite. The soils are coarse loamy sand between rock outcrops and in crevices, then gritty gradational profiles developing to yellow harsh texture-contrast soils on lower slopes. The landscape description of PCT 300 generally aligns to these landscapes, described as deep red-brown loam soils derived from granite and sedimentary substrates on sheltered hillslopes. The diagnostic canopy species for PCT 300, *Eucalyptus robertsonii,* was dominant throughout PCT 300 within the project footprint. However, the other diagnostic canopy species for PCT 300, *Eucalyptus viminalis* and *Eucalyptus dives,* were not recorded within a plot. Midstorey species diagnostic of PCT 300 were recorded, including *Acacia dealbata*, *Platylobium formosum* and *Coprosma hirtella*. Plots sampled confirm the presence of groundcover species diagnostic of PCT 300, including *Pteridium esculentum, Acaena novae-zelandiae, Stellaria pungens, Rubus parvifolius, Viola betonicifolia, Wahlenbergia stricta, Elymus scaber, Glycine clandestine, Geranium solanderi, Hydrocotyle laxiflora, Cynoglossum suaveolens, Asperula conferta, Glycine clandestine, Clematis aristate* and *Gonocarpus tetragynus*. A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 300 within the project footprint is shown in Figure 6-1.
Photos	 **Photo 38. Low condition woodland (photo taken at plot MA094OUT2)**

PCT 301 - Drooping Sheoke - Ricinocarpos bowmanii - grasstree tall open shrubland of the Coolac - Tumut Serpentinite Belt	
Vegetation formation	Grassy Woodlands
Vegetation class	Western Slopes Grassy Woodlands
Conservation status	PCT 301 is associated with Coolac-Tumut Serpentinite Shrubby Woodland in the NSW South Western Slopes and South Eastern Highlands Bioregions listed as Endangered under the BC Act.
% remaining in NSW	28
Extent	PCT 301 occurs on shallow dark brown clays being euchrozem or red podzolic soils derived from a narrow band (approximately 50 km) of serpentinite and associated substrates between Coolac - Gundagai and Tumut in the NSW South-western Slopes Bioregion.
Diagnostic canopy species for PCT 301	The canopy is dominated by the small tree *Allocasuarina verticillata* (Drooping Sheoak). Taller trees are scattered and include *Eucalyptus nortonii* (Norton's Box), *Eucalyptus albens* (White Box) and occasionally *Brachychiton populneus* subsp. *populneus* (Kurrajong).
Diagnostic midstorey species for PCT 301	The midstorey is dominated by the diagnostic species *Ricinocarpos bowmanii* (Western Wedding Bush) and *Xanthorrhoea glauca* subsp. *angustifolia*. Other species that may be present include *Acacia implexa* (Hickory Wattle), *Acacia decora* (Western Silver Wattle), *Exocarpos cupressiformis* (Cherry Ballart) and *Acacia penninervis* var. *penninervis* (Mountain Hickory).
Diagnostic groundcover species for PCT 301	The ground cover ranges from sparse on exposed slopes to dense in creek lines. The low lying shrub *Spyridium parvifolium* (Dusty Miller) is common in this PCT. Grass and grass like species characteristic of this PCT include *Themeda triandra* (Kangaroo Grass), *Aristida ramosa* (Purple Wiregrass), *Rytidosperma laeve* (Wallaby Grass), *Bothriochloa macra* (Red Grass), *Poa sieberiana* var. *sieberiana* (Snowgrass), *Panicum effusum* (Hairy Panic), *Austrostipa scabra* subsp. *falcata* (Rough Speargrass), *Dianella revoluta* var. *revoluta* (A Blue Flax Lily), *Lomandra filiformis* subsp. *coriacea* (Wattle Matt-rush), *Rytidosperma racemosum* (Wallaby Grass), *Rytidosperma caespitosum* (Ringed Wallaby Grass), *Rytidosperma pilosum* (Smooth-flowered Wallaby Grass) and *Ptilotus spathulatus* f. spathulatus (Pussy-tails). Forbs include *Clematis microphylla* (Small-leaved Clematis), *Hypericum gramineum* (Small St John's Wort), *Euchiton japonicus* (Creeping Cudweed), *Acaena novae-zelandiae* (Bidgee-widgee), *Geranium solanderi* var. *solanderi*, *Viola betonicifolia* (Native Violet), *Stellaria pungens* (Prickly Starwort), *Senecio quadridentatus* (Cotton Fireweed), *Wahlenbergia communis* (Tufted Bluebell) and *Oxalis exilis.* The fern *Cheilanthes sieberi* subsp. *sieberi* may also occur.
Condition and presence of weeds	PCT 301 occurs in the project footprint as three condition types: • Low • Moderate • High Exotic species are present in ranging densities throughout PCT 301, typically with higher covers recorded in the Low condition zones. The most commonly occurring exotic species include the forb species *Centaurea solstitialis* (St Barnabys Thistle) and *Trifolium repens* (White Clover), and the grass species *Avena fatua* (Wild Oats) and *Bromus catharticus* (Prairie Grass).

PCT 301 - Drooping Sheoke - Ricinocarpos bowmanii - grasstree tall open shrubland of the Coolac - Tumut Serpentinite Belt	
Justification of evidence used to identify the PCT	As mentioned above, PCT 301 only occurs on soils derived from a narrow band of serpentinite and associated substrates between Coolac - Gundagai and Tumut. All of ground truthed PCT 301 in the project footprint occurs on the Cootamundra - Tumut Serpentinite and Ultramafics Mitchell Landscape which is consistent with the landscape description of the PCT. Diagnostic canopy species of PCT 301 include *Allocasuarina verticillata* and *Eucalyptus nortonii*, both of which were recorded in this PCT. In the wooded areas the midstorey was dominated by *Xanthorrhoea glauca* subsp. *angustifolia*. Other species diagnostic of PCT 301 were recorded, including *Ricinocarpos bowmanii*, *Acacia implexa*, *Exocarpos cupressiformis* and *Spyridium parvifolium*. Plots sampled confirm the presence of groundcover species diagnostic of PCT 301, including *Spyridium parvifolium, Themeda triandra*, *Aristida ramosa*, *Bothriochloa macra, Poa sieberiana* var. *sieberiana*, *Panicum effusum*, *Lomandra filiformis* subsp. *coriacea*, *Rytidosperma caespitosum,* and *Ptilotus spathulatus* f. *spathulatus*, *Hypericum gramineum*, *Acaena novae-zelandiae*, *Viola betonicifolia*, *Wahlenbergia communis*, *Oxalis exilis* and *Cheilanthes sieberi* subsp. *sieberi*. A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 301 within the project footprint is shown in Figure 6-1.
How it meets the BC Act Determination	As outlined in Section 6.5.2 and Table 6-12 of the BDAR, PCT 301 in Low, Moderate and High condition aligns to the BC Act listed Coolac-Tumut Serpentinite Shrubby Woodland.
Photos	 **Photo 41. Low condition woodland (photo taken at plot MA-089C)**

Photo 43. High condition woodland (photo taken at plot MA-014A5)

Number of plots sampled	Ten plots were sampled within the Inland Slopes bioregion: Low condition:

PCT 301 - Drooping Sheoke - Ricinocarpos bowmanii - grasstree tall open shrubland of the Coolac - Tumut Serpentinite Belt	
	• MA-089C • MA-014A4 • MA092960 • MA0926CA Moderate condition: • MA089096 • MA09247B High condition: • MA-089B • MA089A15 • MA-014A5 • MA0929CA

PCT 306 - Red Box - Red Stringybark - Nortons Box hill heath shrub - tussock grass open forest of the Tumut region	
Vegetation formation	Dry Sclerophyll Forests (Shrub/grass sub-formation)
Vegetation class	Upper Riverina Dry Sclerophyll Forests
Conservation status	PCT 306 is not associated with a TEC.
% remaining in NSW	66
Extent	PCT 306 is known to occur on steep upper hillslopes or hillcrests in mountainous terrain at 350 - 700 m altitude in the south-western of the South East Highlands and the upper slopes of the South Western Slopes.
Diagnostic canopy species for PCT 306	The canopy is dominated by *Eucalyptus polyanthemos* subsp. *polyanthemos, Eucalyptus macrorhyncha* (Red Stringybark), *Eucalyptus nortonii* (Large-flowered Bundy) and *Eucalyptus melliodora.*
Diagnostic midstorey species for PCT 306	The midstorey varies in density from dense in protected sites with better soils and lower fire frequency to sparse on shallow soils on steep ridges or where fire is more common. Typical shrub species include *Acacia pravissima* (Wedge-leaved Wattle), *Hibbertia obtusifolia* (Hoary Guinea Flower), *Dillwynia phylicoides* (Parrot-pea), *Pultenaea spinosa* (A Bush Pea), *Grevillea ramosissima subsp. ramosissima and Persoonia rigida.*
Diagnostic groundcover species for PCT 306	The ground cover is mid-dense to sparse and includes the tussock grass *Joycea pallida*, *Stypandra glauca* (Nodding Blue Lily) and *Poa sieberiana var. sieberiana* (Snow Grass) along with *Lomandra filiformis subsp. coriacea* (Wattle Matt-rush) and the forbs *Dianella revoluta var. revoluta* (A Blue Flax Lily), *Pomax umbellata* (Pomax), *Stylidium graminifolium* (Grass Triggerplant) and *Gonocarpus tetragynus* (Poverty Raspwort).
Condition and presence of weeds	PCT 306 occurs in the project footprint as three condition types: • Very low (we do not have access to this condition zone) • Low (we do not have access to this condition zone) • High (we do not have access to this condition zone) As no areas of PCT 306 could be accessed during site surveys, the presence of weeds is unknown. Condition classes of PCT 306 have been conservatively assigned based of aerial imagery.
Justification of evidence used to identify the PCT	Due to access not being granted, no surveys could be undertaken in the area of PCT 306. As a result, the vegetation was assigned to PCT 306 based off regional vegetation mapping, aerial imagery and landscape position. PCT 306 occurs on steep upper hillslopes or hillcrests in mountainous terrain at 350 - 700 m altitude in the south-western of the South East Highlands and the upper slopes of the South Western Slopes. Within the project footprint, PCT 306 is situated between 450 – 700 m altitude, largely on the upper slopes and crests which is consistent with the landscape position of PCT 306. The PCT in the project footprint occurs predominantly in the Adelong Granite Ranges Mitchell Landscape and to a smaller extent in the Minjary Hills and Ranges Landscape.

PCT 306 - Red Box - Red Stringybark - Nortons Box hill heath shrub - tussock grass open forest of the Tumut region	
	The Riverina Bioregion Extant Vegetation Map (DPIE 2019) was referenced in the mapping of PCT 306 in these areas, with the current mapping often conforming to the PCT assignment in the Riverina Bioregion Extant Vegetation Map. The extent of PCT 306 within the project footprint is shown in Figure 6-1.
Photos	**N/A**
Number of plots sampled	N/A

PCT 314 - Apple Box - Red Stringybark basalt scree open forest in the upper Murray River region	
Vegetation formation	Dry Sclerophyll Forests (Shrub/grass sub-formation)
Vegetation class	Upper Riverina Dry Sclerophyll Forests
Conservation status	PCT 314 is not associated with a TEC.
% remaining in NSW	50
Extent	PCT 314 is known to occur on scree over red earth soils derived from basalt on slopes in a very restricted area near Bogandyera Nature Reserve south of Tumbarumba in the upper Murray River valley in the NSW South-western Slopes Bioregion.
Diagnostic canopy species for PCT 314	The canopy is dominated by *Eucalyptus bridgesiana* (Apple Box) and *Eucalyptus macrorhyncha* (Red Stringybark).
Diagnostic midstorey species for PCT 314	The midstorey is typically sparse with species such as *Dodonaea viscosa* subsp. *spatulata* (Broad-leaf Hopbush), *Bursaria spinosa* subsp. *lasiophylla* (Native Blackthorn), *Indigofera australis* (Australian Indigo), *Cassinia longifolia, Acacia dealbata* (Silver Wattle) and *Rubus parvifolius* (Native Raspberry).
Diagnostic groundcover species for PCT 314	The ground cover is sparse or mid dense with a high proportion being rock scree. Grass and grass like species include, *Carex appressa* (Tall Sedge), *Carex inversa* (Knob Sedge), *Dichelachne micrantha* (Shorthair Plumegrass), *Echinopogon caespitosus* var. *caespitosus* (Tufted Hedgehog Grass), *Lomandra longifolia* (Spiny-headed Mat-rush) and *Poa sieberiana* var. *sieberiana* (Snowgrass). Forb species include *Bulbine glauca* (Rock Lily), *Microseris lanceolata* (Yam Daisy), *Plantago varia*, *Scutellaria humilis* (Dwarf Skullcap), *Senecio bathurstianus* and *Senecio quadridentatus* (Cotton Fireweed). Fern species include *Cheilanthes austrotenuifolia* (Rock Fern), *Pellaea calidirupium* and *Pteridium esculentum* (Bracken). Climbers include *Desmodium varians* (Slender Tick-trefoil).
Condition and presence of weeds	PCT 314 occurs in the project footprint as four condition types: • Very high • Moderate • Low • Very low Exotic species are present in PCT 314 in Very low, Low and Moderate condition zones. Exotic species with a high cover include exotic forbs *Hypericum perforatum* (St. John's Wort) and *Hypochaeris radicata* (Catsear), the grass *Holcus lanatus* (Yorkshire Fog) and the climber *Rubus anglocandicans* (Blackberry).
Justification of evidence used to identify the PCT	As mentioned above, PCT 314 is known to occur on scree over red earth soils derived from basalt on slopes. The PCT in the project footprint occurs predominantly in the Adelong Granite Ranges Mitchell Landscape and to a smaller extent in the Minjary Hills and Ranges Landscape. Additionally, diagnostic canopy species of PCT 314 include *Eucalyptus macrorhyncha* and *Eucalyptus bridgesiana*, both of which were recorded in this PCT.

PCT 314 - Apple Box - Red Stringybark basalt scree open forest in the upper Murray River region	
	The midstorey was sparse to mid dense, which is characteristic of PCT 314. Diagnostic species recorded include *Dodonaea viscosa*, *Bursaria spinosa* subsp. *lasiophylla*, *Cassinia longifolia* and *Rubus parvifolius*. Plots sampled confirm the presence of groundcover species diagnostic of PCT 314, including *Dichelachne micrantha, Echinopogon caespitosus* var. *caespitosus, Lomandra longifolia, Poa sieberiana* var. *sieberiana, Senecio quadridentatus, Pellaea calidirupium* and *Pteridium esculentum.* A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 314 within the project footprint is shown in Figure 6-1.
Photos	 **Photo 44. Very low condition woodland (photo taken at plot MA032579)**

PCT 314 - Apple Box - Red Stringybark basalt scree open forest in the upper Murray River region	
	 Photo 45. Moderate condition woodland (photo taken at plot MA021-01)
Number of plots sampled	Seven plots were sampled within the Inland Slopes bioregion, including: Very low condition: • MA032A81 • MA032579 Moderate condition: • MA021-01 • MA021BE8 • MA0216BB • MA059030D1 • MA059032E2

PCT 316 - Nortons Box - Red Box - Red Stringybark +/- Nodding Flax Lily forb-grass open forest mainly on the Tumut region	
Vegetation formation	Grassy Woodlands
Vegetation class	Western Slopes Grassy Woodlands
Conservation status	PCT 316 is not associated with a TEC.
% remaining in NSW	37
Extent	PCT 316 is known to occur on steep slopes and crests in hilly terrain in the Minjary Ranges and surrounding region north of Tumut on the South Western Slopes.
Diagnostic canopy species for PCT 316	The canopy is dominated by *Eucalyptus nortonii* (Large-flowered Bundy), *Eucalyptus polyanthemos* (Red Box), *Eucalyptus macrorhyncha* (Red Stringybark), *Callitris endlicheri* (Black Cypress Pine), *Eucalyptus blakelyi* (Blakely's Red Gum), *Brachychiton populneus subsp. populneus* and *Eucalyptus melliodora* (Yellow Box).
Diagnostic midstorey species for PCT 316	The midstorey is very sparse, but many include species such as *Acacia buxifolia subsp. buxifolia* (Box-leaved Wattle), *Brachyloma daphnoides subsp. daphnoides, Acacia verniciflua* (Varnish Wattle), *Acacia implexa* (Hickory Wattle), *Hibbertia obtusifolia* (Hoary Guinea Flower), *Acacia gunnii* (Ploughshare Wattle), *Dodonaea viscosa subsp. cuneata* (Wedge-leaf Hop-bush) and *Dillwynia sericea* (Egg and Bacon Peas).
Diagnostic groundcover species for PCT 316	The ground cover is dense with a high proportion of grasses and forbs, and the potential to become weedy. Grass and grass-like species include *Poa sieberiana* var. *sieberiana* (Snowgrass), *Austrodanthonia racemosa var. racemose* (Wallaby Grass), *Dichelachne sieberiana*, *Elymus scaber var. scaber* (Wheatgrass), *Bothriochloa macra* (Red Grass), *Carex breviculmis*, *Lomandra filiformis subsp. filiformis*, *Lomandra filiformis subsp. coriacea* (Wattle Matt-rush) and *Luzula densiflora* (Woodrush). Forb species include *Stypandra glauca* (Nodding Blue Lily), *Poranthera microphylla* (Small Poranthera), *Bulbine bulbosa* (Bulbine Lily), *Euchiton gymnocephalus*, *Daucus glochidiatus* (Native Carrot), *Cynoglossum austral*, *Wahlenbergia multicaulis* (Tadgell's Bluebell), *Oxalis perennans*, *Hydrocotyle laxiflora* (Stinking Pennywort), *Microtis unifolia* (Common Onion Orchid), *Stellaria pungens* (Prickly Starwort), *Hypericum gramineum* (Small St John's Wort), *Geranium retrorsum* (Cranesbill Geranium), *Gonocarpus tetragynus* (Poverty Raspwort), *Cymbonotus preissianus* (Austral Bear's Ear), *Wahlenbergia stricta subsp. stricta* (Tall Bluebell), *Microseris lanceolata* (Yam Daisy), *Acaena echinate* (Sheep's Burr), *Scutellaria humilis* (Dwarf Skullcap) and *Dianella revoluta var. revoluta*. Fern species include *Cheilanthes austrotenuifolia* (Rock Fern). Climbers include *Glycine clandestina* (Twining glycine).
Condition and presence of weeds	PCT 316 occurs in the project footprint as three condition types: • Low • Moderate • Very high Exotic species are present in PCT 316 in Low and Moderate condition zones. Exotic species with a high cover include exotic forbs *Hypericum perforatum* (St. John's Wort) and *Hypochaeris radicata* (Catsear), and the grass *Vulpia Myuros* (Rat's Tail Fescue).

PCT 316 - Nortons Box - Red Box - Red Stringybark +/- Nodding Flax Lily forb-grass open forest mainly on the Tumut region	
Justification of evidence used to identify the PCT	As mentioned above, PCT 316 is known to occur on steep slopes and crests in hilly terrain in the Minjary Ranges and surrounding region north of Tumut. The PCT in the project footprint occurs predominantly in the Adelong Granite Ranges Mitchell Landscape and to a smaller extent in the Minjary Hills and Ranges Landscape. In these areas PCT 316 occurs on steep slopes and crests which aligns with the landscape description of PCT 316. The diagnostic canopy species of PCT 316, *Eucalyptus macrorhyncha* and *Eucalyptus bridgesiana*, were dominant throughout PCT 316 in the project footprint. *Eucalyptus blakelyi* and *Eucalyptus polyanthemos* were also recorded which are also both diagnostic species. The midstorey was sparse, which is characteristic of PCT 316. Recorded diagnostic species include *Brachyloma daphnoides subsp. daphnoides* and *Hibbertia obtusifolia.* Plots sampled confirm the presence of groundcover species diagnostic of PCT 316, including *Bothriochloa macra, Lomandra filiformis, Luzula densiflora Poa sieberiana var. sieberiana, Bulbine bulbosa, Cymbonotus preissianus, Cynoglossum australe, Gonocarpus tetragynus, Hydrocotyle laxiflora, Hypericum gramineum, Poranthera microphylla, Stellaria pungens* and *Stypandra glauca.* A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 316 within the project footprint is shown in Figure 6-1.

PCT 316 - Nortons Box - Red Box - Red Stringybark +/- Nodding Flax Lily forb-grass open forest mainly on the Tumut region	
	 Photo 48. Very high condition woodland (photo taken at plot MA0518AA)
Number of plots sampled	Seven plots were sampled within the Inland Slopes bioregion, including: Low condition: • MA0515FE • MA0518FD Moderate condition: • MA05134E Very high condition: • MA051576 • MA0518AA • MA0510DF • MA051544

PCT 319 - Tumbledown Red Gum - White Cypress Pine hill woodland in the southern part of the NSW South Western Slopes Bioregion	
Vegetation formation	Semi-arid Woodlands (Shrubby sub-formation)
Vegetation class	Inland Rocky Hill Woodlands
Conservation status	PCT 319 is not associated with a TEC.
% remaining in NSW	40
Extent	PCT 319 is known to occur on shallow loamy grey clay soils derived from granite or sedimentary rocks on slopes and low ridges in low hill or hill landscape patterns in the southern part of the NSW South-western Slopes Bioregion.
Diagnostic canopy species for PCT 319	The canopy is dominated by *Eucalyptus dealbata* (Tumbledown Red Gum), although *Callitris glaucophylla* (White Cypress Pine) and *Eucalyptus macrorhyncha* (Red Stringybark) may be common on slopes. Other species that may be present in the canopy include *Callitris endlicheri* (Black Cypress Pine), *Eucalyptus albens* (White Box) and *Acacia doratoxylon* (Currawang).
Diagnostic midstorey species for PCT 319	The midstorey is typically sparse with species such as *Acacia buxifoli*a subsp. *buxifolia* (Box-leaved Wattle), *Melichrus urceolatus* (Urn Heath), *Brachyloma daphnoides* subsp. *daphnoides* (Daphne Heath), *Acacia dealbata* (Silver Wattle), *Daviesia leptophylla*, *Acacia pycnantha* (Golden Wattle) and *Dillwynia sericea* (Egg and Bacon Pea).
Diagnostic groundcover species for PCT 319	The ground cover is sparse and may contain some stony soils or rocky outcrops. Small shrubs include *Acrotriche serrulata* (Honeypots) and *Pimelea curviflora* var. *curviflora*. Grass and grass like species include *Aristida jerichoensis* var. *subspinulifera* (Jericho Wiregrass), *Aristida ramosa* (Purple Wiregrass), *Austrostipa scabra* subsp. *falcata* (Rough Speargrass), *Lomandra filiformis* subsp. *coriacea* (Wattle Matt-rush), *Microlaena stipoides* var. *stipoides* (Weeping Grass), *Poa sieberiana* (Snowgrass), *Rytidosperma erianthum* (Wallaby Grass), *Rytidosperma pallidum* (Redanther Wallaby Grass), *Rytidosperma racemosum* var. *racemosum* (Wallaby Grass) and *Themeda triandra* (Kangaroo Grass). Forbs include, *Asperula conferta* (Common Woodruff), *Chrysocephalum apiculatum* (Common Everlasting), *Dianella revoluta* var. *revoluta* (A Blue Flax Lily), *Gonocarpus elatus* (A Raspwort), *Gonocarpus tetragynus* (Poverty Raspwort), *Goodenia hederacea* subsp. *hederacea*, *Hydrocotyle laxiflora* (Stinking Pennywort), *Hypericum gramineum* (Small St John's Wort), *Microseris lanceolata* (Yam Daisy), *Stypandra glauca* (Nodding Blue Lily) and *Xerochrysum viscosum* (Sticky Everlasting). The fern *Cheilanthes sieberi* subsp. *sieberi* (Rock Fern) and *Hardenbergia violacea* (False Sarsaparilla) are often present in this PCT.
Condition and presence of weeds	PCT 319 occurs in the project footprint as two condition types: • Low • High Exotic species are present throughout PCT 319. Most of the exotic species recorded comprise wind dispersed species from the Poaceae (grass) family including *Paspalum dilatatum* (Paspalum) and *Festuca pratensis* (Meadow Fescue).

PCT 319 - Tumbledown Red Gum - White Cypress Pine hill woodland in the southern part of the NSW South Western Slopes Bioregion	
Justification of evidence used to identify the PCT	As mentioned above, PCT 319 is known to occur on shallow loamy grey clay soils derived from granite or sedimentary rocks on slopes and low ridges in low hill or hill landscape patterns. The PCT in the project footprint occurs entirely in the Coffin Rock Granite Hills Mitchell Landscape which is characterised by rolling to steep rocky hills on granite. PCT 319 within the project footprint therefore aligns with the landscape description for the PCT. Additionally, diagnostic canopy species of PCT 319 include *Callitris glaucophylla*, which was recorded in the plots sampled. It is assumed that no other canopy species (diagnostic or otherwise) were recorded in the plots sampled due to past and present land use practices. However, *Eucalyptus dealbata* was recorded in several rapid data points collected throughout the PCT. The midstorey was absent in the plots sampled in this PCT, most likely due to past and present land use practices. Plots sampled confirm the presence of groundcover species diagnostic of PCT 319, including *Aristida ramosa, Austrostipa scabra, Microlaena stipoides* var. *stipoides, Hypericum gramineum* and *Cheilanthes sieberi* subsp. *sieberi.* A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 319 within the project footprint is shown in Figure 6-1.
Photos	 **Photo 49. Low condition woodland (photo taken at plot WM016B40)**

PCT 319 - Tumbledown Red Gum - White Cypress Pine hill woodland in the southern part of the NSW South Western Slopes Bioregion	
	 Photo 50. High condition woodland (photo taken at plot WM0139C1)
Number of plots sampled	Four plots were sampled within the Inland Slopes bioregion, including: Low condition: • WM016B40 • WM0138DE High condition: • WM0139C1 • WM013669

PCT 322 - Inland Scribbly Gum - Red Stringybark - Black Cypress Pine hillslope shrub-tussock grass open forest on mainly sandstone ranges in the NSW central western slopes	
Vegetation formation	Dry Sclerophyll Forests (Shrubby sub-formation)
Vegetation class	Western Slopes Dry Sclerophyll Forests
Conservation status	PCT 322 is not associated with a TEC.
% remaining in NSW	67
Extent	PCT 322 is known to occur on yellow to brown loam soil derived from chert, sandstone or granite on hillcrests and hillslopes in hill landform patterns in the central western slopes region of NSW being in the central and northern parts of the NSW South-western Slopes Bioregion.
Diagnostic canopy species for PCT 322	The canopy is dominated by *Eucalyptus rossii* (Inland Scribbly Gum), *Eucalyptus macrorhyncha* (Red Stringybark) and *Callitris endlicheri* (Black Cypress Pine). *Eucalyptus goniocalyx* (Long-leaved Box) *Eucalyptus sideroxylon* (Mugga Ironbark) and *Acacia doratoxylon* (Currawang) may also be present.
Diagnostic midstorey species for PCT 322	The midstorey is typically mid-dense with species such as *Grevillea floribunda* subsp. *floribunda* (Seven Dwarfs Grevillea), *Dillwynia sericea* (Egg and Bacon Peas), *Gompholobium huegelii* (Pale Wedge Pea), *Calytrix tetragona* (Common Fringe-myrtle), *Dillwynia phylicoides* (Parrot-pea), *Persoonia rigida, Brachyloma daphnoides* subsp. *daphnoides* (Daphne Heath), *Styphelia triflora* (Pink Five-Corners), *Leucopogon microphyllus* var. *microphyllus*, *Acacia buxifolia* subsp. *buxifolia* (Box-leaved Wattle), *Grevillea triternata*, *Hovea linearis, Leucopogon virgatus, Hibbertia obtusifolia* (Hoary Guinea Flower), *Melichrus urceolatus* (Urn Heath), *Allocasuarina diminuta* subsp. *diminuta, Xanthorrhoea glauca* subsp. *angustifolia, Hibbertia riparia, Cassinia aculeata* (Dolly Bush), *Pultenaea microphylla* (A Bush Pea), *Platysace ericoides, Lissanthe strigosa* subsp. *strigosa* (Peach Heath), *Leucopogon attenuatus* (A Beard-heath), *Hibbertia serpyllifolia* (Hairy Guinea Flower), *Crowea exalata*, *Grevillea ramosissima* subsp. *ramosissima* (Fan Grevillea), *Phyllanthus hirtellus* (Thyme Spurge), *Monotoca scoparia*, *Grevillea polybractea* (Crimson Grevillea), *Beyeria viscosa* (Sticky Wallaby Bush), *Daviesia umbellulata* and *Hibbertia calycina* (Lesser Guinea Flower).
Diagnostic groundcover species for PCT 322	The ground cover is sparse and includes small shrubs such as *Cryptandra ericoides* (Heathy Cryptandra) and *Pultenaea procumbens*. Grass and grass-like species include *Aristida jerichoensis* var. *subspinulifera* (Jericho Wiregrass), *Austrostipa scabra* subsp. *falcata* (Rough Speargrass), *Dichelachne micrantha* (Shorthair Plumegrass), *Lepidosperma laterale* (Variable Sword-sedge), *Lomandra filiformis* subsp. *coriacea* (Wattle Matt-rush), *Poa sieberiana* var. *sieberiana* (Snowgrass) and *Rytidosperma pallidum* (Redanther Wallaby Grass). Forbs include *Chrysocephalum semipapposum* (Clustered Everlasting), *Coronidium scorpioides* (Button Everlasting), *Dampiera purpurea*, *Dianella revoluta* var. *revoluta* (A Blue Flax Lily), *Gonocarpus tetragynus* (Poverty Raspwort), *Goodenia hederacea* subsp. *hederacea*, *Hypericum gramineum* (Small St John's Wort), *Laxmannia gracilis* (Slender Wire Lily), *Patersonia sericea* (Silky Purple-Flag), *Pomax umbellata* (Pomax), *Scutellaria humilis* (Dwarf Skullcap), *Stypandra glauca* (Nodding Blue Lily), *Thelymitra pauciflora* (Slender Sun Orchid), *Wahlenbergia gracilis* (Sprawling Bluebell) and *Wahlenbergia stricta* subsp. *stricta* (Tall Bluebell).The fern *Cheilanthes sieberi* subsp. *sieberi* (Rock Fern) and the climber *Hardenbergia violacea* (False Sarsaparilla) are also often present in this PCT.

PCT 322 - Inland Scribbly Gum - Red Stringybark - Black Cypress Pine hillslope shrub-tussock grass open forest on mainly sandstone ranges in the NSW central western slopes	
Condition and presence of weeds	PCT 322 occurs in the project footprint as three condition types: • Very low • Moderate • High Exotic species are present in low numbers throughout PCT 322, with the most commonly recorded exotic species being *Briza maxima* (Quaking Grass) and *Rumex acetosella* (Sheep's Sorrel).
Justification of evidence used to identify the PCT	As mentioned above, PCT 322 is known to occur on yellow to brown loam soil derived from chert, sandstone or granite on hillcrests and hillslopes in hill landform patterns. The PCT in the project footprint occurs entirely in the Boorowa Volcanics Mitchell Landscape which is characterised undulating low hills and rocky rises on sandstone. The landscape position of PCT 322 within the project footprint therefore aligns with the landscape description of PCT 322. Diagnostic canopy species of PCT 322 include *Eucalyptus goniocalyx* and *Eucalyptus rossii*, both of which were recorded in the plot sampled. The midstorey was moderately dense in the plots sampled which is also characteristic of PCT 322. Additionally several diagnostic species were recorded including *Brachyloma daphnoides, Cassinia arcuata, Hibbertia obtusifolia, Lissanthe strigosa, Melichrus urceolatus* and *Dillwynia sericea*. Plots sampled confirm the presence of groundcover species diagnostic of PCT 322, including *Austrostipa scabra, Lepidosperma laterale, Lomandra filiformis, Poa sieberiana, Gonocarpus tetragynus, Goodenia hederacea* subsp. *hederacea, Hypericum gramineum* and *Wahlenbergia stricta* subsp. *stricta.* A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 322 within the project footprint is shown in Figure 6-1.

PCT 322 - Inland Scribbly Gum - Red Stringybark - Black Cypress Pine hillslope shrub-tussock grass open forest on mainly sandstone ranges in the NSW central western slopes

Photo 53. High condition woodland (photo taken at plot BY1430A1)

Number of plots sampled

Three plots were sampled within the Murrumbateman bioregion, including:

Very low condition:

- BY142B2A

Moderate condition:

- BY14305C

High condition:

- BY1430A1

PCT 335 - Tussock grass - sedgeland fen - rushland - reedland wetland in impeded creeks in valleys in the upper slopes sub-region of the NSW South Western Slopes Bioregion	
Vegetation formation	Freshwater Wetlands
Vegetation class	Inland Floodplain Swamps
Conservation status	PCT 335 is not associated with a TEC.
% remaining in NSW	17
Extent	PCT 335 typically occurs on silty loam alluvial soils derived from sedimentary and volcanic substrates along watercourses where sediment has accumulated to form valley flats or where springs may feed valley soaks in east of the South Western Slopes and adjoining parts of the South Eastern Highlands.
Diagnostic canopy species for PCT 335	A canopy is often absent but *Eucalyptus blakelyi* (Blakely's Red Gum) and *Eucalyptus melliodora* (Yellow Box) may border or overhang swamps.
Diagnostic midstorey species for PCT 335	The midstorey is sparse but where present includes species such as *Phragmites australis* (Common Reed), *Typha domingensis* (Bullrush), *Acacia dealbata* (Silver Wattle) and *Harmogia densifolia*.
Diagnostic groundcover species for PCT 335	The ground cover is dense and typically dominated by *Poa labillardierei var. labillardierei* (Tussock Snow Grass), sedges including *Carex appressa* (Tall Sedge), and rushes such as *Juncus homalocaulis* and *Juncus fockei*. Other species include *Bothriochloa macra* (Red Grass), *Rumex brownie* (Swamp Dock), *Juncus holoschoenus, Acaena ovina* (Acaena), *Cynodon dactylon* (Common Couch), *Microlaena stipoides var. stipoides* (Weeping Grass), *Aristida ramosa var. ramose* (Purple Wiregrass), *Geranium neglectum, Geranium retrorsum* (Cranesbill Geranium), *Dichopogon fimbriatus* (Nodding Chocolate Lily), *Caesia parviflora var. parviflora, Xerochrysum viscosum* (Sticky Everlasting), *Arthropodium milleflorum* (Pale Vanilla-lily) and *Microtis unifolia* (Common Onion Orchid).
Condition and presence of weeds	PCT 335 occurs in the project footprint in High condition. Exotic species were recorded in low abundance throughout PCT 335. Species occasionally present included *Hypochaeris radicata* (Catsear), *Gamochaeta americana* (Cudweed) and *Cirsium vulgare* (Spear Thistle).
Justification of evidence used to identify the PCT	As mentioned above, PCT 335 typically occurs along watercourses where sediment has accumulated to form valley flats or where springs may feed valley soaks. Within the project footprint, PCT 335 is situated along a small creek and the adjoining valley flat and is therefore consistent with the landscape position of PCT 335. A canopy was absent from PCT 335 within the project footprint which is typical of the PCT. The midstorey was also very sparse, with very low abundance of *Hibbertia obtusifolia* and *Melichrus urceolatus,* which are not diagnostic species of PCT 335. Plots sampled confirm the presence of groundcover species diagnostic of PCT 335 including *Aristida ramosa, Bothriochloa macra, Juncus spp., Microlaeana stipoides var. stipoides* and *Poa labillardierei var. labillardierei.* A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 335 within the project footprint is shown in Figure 6-1.

PCT 335 - Tussock grass - sedgeland fen - rushland - reedland wetland in impeded creeks in valleys in the upper slopes sub-region of the NSW South Western Slopes Bioregion	
Photos	N/A
Number of plots sampled	Two plots were sampled within the Crookwell bioregion, including: High condition: • BY03412A • BY03426A

PCT 343 - Mugga Ironbark - Red Box - Red Stringybark - Western Grey Box grass/shrub woodland on metamorphic substrates in the Tarcutta - Gundagai region, NSW South Western Slopes Bioregion	
Vegetation formation	Dry Sclerophyll Forests (Shrubby sub-formation)
Vegetation class	Western Slopes Dry Sclerophyll Forests
Conservation status	PCT 343 is not associated with a TEC.
% remaining in NSW	22
Extent	PCT 343 typically occurs on clay soils derived from metamorphic rocks in the Tarcutta region and in the Brothers Mountain region between Nangus and Gundagai in the southern part of the NSW South-western Slopes Bioregion.
Diagnostic canopy species for PCT 343	The canopy is dominated by *Eucalyptus sideroxylon* (Mugga Ironbark), *Eucalyptus polyanthemos* (Red Box) and *Eucalyptus macrorhyncha* (Red Stringybark) with *Eucalyptus microcarpa* (Western Grey Box) also present. Other canopy species may include *Eucalyptus albens* (White Box) and *Eucalyptus blakelyi* (Blakely's Red Gum).
Diagnostic midstorey species for PCT 343	The midstorey is very sparse but where present includes species such as *Daviesia leptophylla*, *Acacia pycnantha* (Golden Wattle), *Cassinia laevis* (Cough Bush), *Dillwynia sericea* (Egg and Bacon Peas), *Melichrus urceolatus* (Urn Heath), *Acacia genistifolia* (Early Wattle), *Cassinia sifton* (Sifton Bush), *Einadia hastata* (Berry Saltbush), *Acacia paradoxa* (Kangaroo Thorn), *Leucopogon rufus*, *Hibbertia obtusifolia* (Hoary Guinea Flower), *Pultenaea foliolosa* (A Bush Pea), *Pultenaea altissima*, *Pultenaea procumbens*, *Brachyloma daphnoides* subsp. *daphnoides*, *Amyema pendula* subsp. *pendula* and *Grevillea lanigera* (Woolly Grevillea).
Diagnostic groundcover species for PCT 343	The ground cover is mid-dense to sparse and it typically dominated by tussock grasses such as *Rytidosperma erianthum* (Wallaby Grass), *Poa sieberiana* (Snowgrass), *Rytidosperma fulvum* (Wallaby Grass), *Austrostipa scabra* subsp. *falcata* (Rough Speargrass), *Austrostipa mollis* (Soft Speargrass) and *Dichelachne crinita* (Longhair Plumegrass). Other species include, *Dianella longifolia* var. *longifolia* (A Blue Flax Lily), *Stypandra glauca* (Nodding Blue Lily), *Opercularia hispida* (Hairy Stinkweed), *Juncus subsecundus* (Finger Rush), *Gonocarpus tetragynus* (Poverty Raspwort), *Geranium solanderi* var. *solanderi*, *Hydrocotyle laxiflora* (Stinking Pennywort), *Xerochrysum viscosum* (Sticky Everlasting), *Wahlenbergia stricta* subsp. *stricta* (Tall Bluebell), *Thysanotus patersonii* (Twining Fringe-Lily), *Goodenia hederacea* subsp. *hederacea*, *Dichopogon strictus* (Chocolate Lily), *Daucus glochidiatus* (Native Carrot), *Chrysocephalum apiculatum* (Common Everlasting), *Cheiranthera linearis* (Finger Flower), *Carex appressa* (Tall Sedge), *Lomandra filiformis* subsp. *coriacea* (Wattle Matt-rush), *Hypericum gramineum* (Small St John's Wort), *Luzula flaccida* (Woodrush), *Senecio prenanthoides*, *Wurmbea dioica* subsp. dioica (Early Nancy), *Thelymitra pauciflora* (Slender Sun Orchid), *Microtis unifolia* (Common Onion Orchid), *Pterostylis* sp. B, and *Hardenbergia violacea* (False Sarsaparilla).
Condition and presence of weeds	PCT 343 occurs in the project footprint as two condition types: • Very low • Moderate

PCT 343 - Mugga Ironbark - Red Box - Red Stringybark - Western Grey Box grass/shrub woodland on metamorphic substrates in the Tarcutta - Gundagai region, NSW South Western Slopes Bioregion	
	Exotic species are present throughout PCT 343, typically with higher covers recorded in the Very low condition zone. Commonly recorded weeds comprise forb species such as *Medicago sativa* (Lucerne) and *Trifolium repens* (White Clover), and grass species such as *Lolium multiflorum* (Italian Ryegrass) and *Vulpia bromoides* (Squirrel Tail Fesque).
Justification of evidence used to identify the PCT	As mentioned above, PCT 343 typically occurs on clay soils derived from metamorphic rocks in the Tarcutta region and in the Brothers Mountain region between Nangus and Gundagai. The PCT in the project footprint occurs in the Adrah Hills and Ranges Mitchell Landscape which is characterised by rolling hills, low ranges and peaks on predominantly metamorphic lithology (slate, phyllite and schist) but also sedimentary and igneous lithology. This is fairly consistent with the landscape description of PCT 343. Diagnostic canopy species of PCT 343 include *Eucalyptus sideroxylon* and *Eucalyptus macrorhyncha* both of which were recorded as the dominant species in the plots sampled. In the wooded areas the midstorey is predominantly very sparse which is a diagnostic of PCT 343. Plots sampled confirm the presence of groundcover species diagnostic of PCT 343, including *Poa sieberiana, Austrostipa scabra, Juncus subsecundus, Geranium solanderi* var. *solanderi, Hydrocotyle laxiflora* and *Hypericum gramineum.* A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 343 within the project footprint is shown in Figure 6-1.
Photos	 **Photo 54. Very low condition grassland (photo taken at plot WM034766)**

PCT 343 - Mugga Ironbark - Red Box - Red Stringybark - Western Grey Box grass/shrub woodland on metamorphic substrates in the Tarcutta - Gundagai region, NSW South Western Slopes Bioregion

Photo 55. Moderate condition woodland (photo taken at plot WM018002)

Number of plots sampled

Twelve plots were sampled within the Inland Slopes bioregion, including:

Very low condition:

- WM034766
- WM034767
- WM0334B9

Moderate condition:

- WMO45E81
- WM018002
- WM018003
- WM0187E3
- WM033A29
- WM033AC8
- WM035A55
- WM044C69
- WM044D65

PCT 349 - Inland Scribbly Gum - Red Stringybark open forest on hills composed of siliceous substrates in the mid-Murrumbidgee and upper Lachlan catchments mainly in the western South Eastern Highlands Bioregion	
Vegetation formation	Dry Sclerophyll Forests (Shrubby sub-formation)
Vegetation class	Southern Tableland Dry Sclerophyll Forests
Conservation status	PCT 349 is not associated with a TEC.
% remaining in NSW	50
Extent	PCT 349 is found in the upper Lachlan catchment region from Boorowa to Yass to north of Crookwell in the central part of the upper slopes sub-region but mainly in the western side of the South Eastern Highlands Bioregion. It is often on exposed aspects (from east to north to west). The PCT occurs on shallow grey to brown podzolic soils mainly derived from conglomerate and sandstone.
Diagnostic canopy species for PCT 349	The canopy is dominated by *Eucalyptus macrorhyncha* (Red Stringybark) and *Eucalyptus rossii* (Inland Scribbly Gum). *Eucalyptus goniocalyx* (Bundy) may also occur. *Eucalyptus polyanthemos* subsp. *polyanthemos* (Red Box) and *Eucalyptus dives* (Broad-leaved Peppermint) are less common in this PCT.
Diagnostic midstorey species for PCT 349	The midstorey is sparse or absent depending on fire and grazing history. Diagnostic species include *Daviesia leptophylla*, *Acacia gunnii* (Ploughshare Wattle), *Monotoca scoparia, Persoonia rigida, Gompholobium huegelii* (Pale Wedge Pea), *Brachyloma daphnoides* subsp. *daphnoides*, *Hibbertia obtusifolia* (Hoary Guinea Flower), *Hibbertia calycina* (Lesser Guinea Flower), *Phyllanthus hirtellus* (Thyme Spurge), *Acacia buxifolia* subsp. *buxifolia* (Box-leaved Wattle), *Pimelea linifolia* subsp. *linifolia*, *Dillwynia phylicoides* (Parrot-pea), *Leptospermum multicaule* (Silver Tea-tree), *Grevillea lanigera* (Woolly Grevillea), *Persoonia chamaepeuce, Tetratheca bauerifolia* and *Platylobium formosum* subsp. *formosum*.
Diagnostic groundcover species for PCT 349	The groundcover is dense in wet seasons and sparse in dry seasons. Diagnostic species include *Rytidosperma pallidum* (Redanther Wallaby Grass), *Poa sieberiana* var. *sieberiana* (Snowgrass), *Dianella revoluta* var. *revoluta* (A Blue Flax Lily), *Lomandra filiformis* subsp. *filiformis*, *Goodenia hederacea* subsp. *hederacea*, *Gonocarpus tetragynus* (Poverty Raspwort), *Poranthera microphylla* (Small Poranthera), *Hovea linearis*, *Hypericum gramineum* (Small St John's Wort), *Hardenbergia violacea* (False Sarsaparilla), *Stypandra glauca* (Nodding Blue Lily), *Stylidium graminifolium* (Grass Triggerplant), *Drosera auriculata*, *Thelymitra pauciflora* (Slender Sun Orchid), *Patersonia sericea* (Silky Purple-Flag), *Pomax umbellata* (Pomax), *Senecio prenanthoides*, *Hydrocotyle laxiflora* (Stinking Pennywort), *Luzula flaccida* (Woodrush), *Wahlenbergia stricta* subsp. *stricta* (Tall Bluebell), *Lomandra longifolia* (Spiny-headed Mat-rush), *Veronica plebeia* (Trailing Speedwell), *Dichelachne micrantha* (Shorthair Plumegrass), *Rhytidosporum procumbens* and *Dampiera purpurea*.
Condition and presence of weeds	PCT 349 occurs in the project footprint as three condition types: • Low • Moderate • High

PCT 349 - Inland Scribbly Gum - Red Stringybark open forest on hills composed of siliceous substrates in the mid-Murrumbidgee and upper Lachlan catchments mainly in the western South Eastern Highlands Bioregion	
	Exotic species in a low cover are present throughout PCT 349, with slightly higher covers recorded within the Moderate condition zone. This variation is predominantly attributed to a high cover of *Rumex acetosella* (Sheep's Sorrel) and *Hypochaeris radicata* (Catsear).
Justification of evidence used to identify the PCT	As mentioned above, PCT 349 is often on exposed aspects (from east to north to west) and occurs on shallow grey to brown podzolic soils mainly derived from conglomerate and sandstone. The PCT in the project footprint mainly occurs in the Dalton Hills Mitchell Landscape which can occur on sandstone lithologies. This is generally consistent with the landscape description of PCT 349. Additionally, diagnostic canopy species of PCT 349 include *Eucalyptus macrorhyncha, Eucalyptus rossii* and *Eucalyptus dives,* all of which were observed throughout this PCT. In the wooded areas the midstorey is generally sparse which is characteristic of PCT 349. Recorded diagnostic species of PCT 349 included *Acacia gunnii, Monotoca scoparia, Persoonia rigida, Gompholobium huegelii, Brachyloma daphnoides* subsp. *daphnoides, Hibbertia obtusifolia, Pimelea linifolia* subsp. *linifolia, Leptospermum multicaule* and *Grevillea lanigera*. Plots sampled confirm the presence of groundcover species diagnostic of PCT 349, including *Rytidosperma pallidum, Poa sieberiana* var. *sieberiana, Dianella revoluta* var. *revoluta, Lomandra filiformis, Goodenia hederacea* subsp. *hederacea, Gonocarpus tetragynus, Poranthera microphylla, Hypericum gramineum, Hardenbergia violacea, Stylidium graminifolium, Thelymitra* sp., *Hydrocotyle laxiflora, Luzula* sp., *Dichelachne micrantha* and *Rhytidosporum procumbens*. A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 349 within the project footprint is shown in Figure 6-1.

PCT 351 - Brittle Gum - Broad-leaved Peppermint - Red Stringybark open forest in the north-western part (Yass to Orange) of the South Eastern Highlands Bioregion	
Vegetation formation	Dry Sclerophyll Forests (Shrubby sub-formation)
Vegetation class	Southern Tableland Dry Sclerophyll Forests
Conservation status	PCT 351 is associated with the Mt Canobolas Xanthoparmelia Lichen Community TEC listed as Endangered under the BC Act. However, given the TEC has a highly restricted distribution (Mt Canobolas in central-western New South Wales), PCT 351 in the project footprint is not considered to align to the TEC.
% remaining in NSW	40
Extent	PCT 351 mainly occurs in the South Eastern Highlands Bioregion between Yass and Orange, typically on shallow, yellow to red podzolic clay to loam soils derived from sedimentary, metamorphic and igneous substrates on footslopes and hillslopes.
Diagnostic canopy species for PCT 351	The canopy is dominated by *Eucalyptus mannifera* subsp. *mannifera* (Brittle Gum) often with *Eucalyptus macrorhyncha* (Red Stringybark), *Eucalyptus dives* (Broad-leaved Peppermint), *Eucalyptus goniocalyx* (Long-leaved Box), and occasionally with *Eucalyptus cinerea* (Argyle Apple), *Eucalyptus rossii* (Inland Scribbly Gum) and *Eucalyptus polyanthemos* subsp. *polyanthemos* (Red Box).
Diagnostic midstorey species for PCT 351	The midstorey is sparse and include species such as *Daviesia leptophylla*, *Dillwynia sericea* (Egg and Bacon Peas), *Acacia gunnii* (Ploughshare Wattle), *Hibbertia obtusifolia* (Hoary Guinea Flower), *Monotoca scoparia*, *Dillwynia phylicoides* (Parrot-pea), *Gompholobium huegelii* (Pale Wedge Pea), *Pultenaea procumbens*, *Pultenaea spinosa* (A Bush Pea), *Leptospermum myrtifolium, Pultenaea subspicata* (Low Bush-pea), *Acacia dealbata* (Silver Wattle), *Acacia genistifolia* (Early Wattle), *Cassinia aculeata* (Dolly Bush), *Cassinia sifton* (Sifton Bush), *Leucopogon virgatus*, *Melichrus urceolatus* (Urn Heath), *Hibbertia riparia, Grevillea lanigera* (Woolly Grevillea), *Persoonia rigida*, *Platylobium formosum* subsp. *formosum*, *Acacia falciformis* (Broad-leaved Hickory) and *Brachyloma daphnoides* (Daphne Heath).
Diagnostic groundcover species for PCT 351	The groundcover varies from sparse to mid-dense and includes species such as *Poa sieberiana* var. *sieberiana* (Snowgrass), *Rytidosperma pallidum* (Redanther Wallaby Grass), *Dianella revoluta* var. *revoluta* (A Blue Flax Lily), *Gonocarpus tetragynus* (Poverty Raspwort), *Lomandra longifolia* (Spiny-headed Mat-rush), *Lomandra filiformis* subsp. *coriacea* (Wattle Matt-rush), *Hypericum gramineum* (Small St John's Wort), *Schoenus apogon* (Fluke Bogrush), *Lobelia pedunculata* (Matted Pratia), *Carex appressa* (Tall Sedge), *Viola betonicifolia* (Native Violet), *Stylidium graminifolium* (Grass Triggerplant), *Goodenia hederacea* subsp. *hederacea* (Ivy Goodenia), *Senecio quadridentatus* (Cotton Fireweed), *Hardenbergia violacea* (False Sarsaparilla), *Pteridium esculentum* (Bracken), *Echinopogon caespitosus* var. *caespitosus* (Tufted Hedgehog Grass), *Rytidosperma tenuius* (A Wallaby Grass), *Microlaena stipoides* var. *stipoides* (Weeping Grass), *Themeda triandra* (Kangaroo Grass), *Aristida ramosa* (Purple Wiregrass), *Juncus subsecundus* (Finger Rush), *Hardenbergia violacea* (False Sarsaparilla) and *Dampiera purpurea*.
Condition and presence of weeds	PCT 351 occurs in the project footprint as three condition types: • Very low • Low • Moderate

PCT 351 - Brittle Gum - Broad-leaved Peppermint - Red Stringybark open forest in the north-western part (Yass to Orange) of the South Eastern Highlands Bioregion	
	Exotic species are present in throughout PCT 351, typically with higher covers recorded in the Very low and Low condition zones. Commonly recorded weeds included the grass *Hordeum leporinum* (Barley Grass) and the forb *Medicago polymorpha* (Burr Medic).
Justification of evidence used to identify the PCT	As mentioned above, PCT 351 is found between Orange and Yass and is associated with clay to loam soils derived from sedimentary, metamorphic and igneous substrates. The PCT in the project footprint occurs on the Marilba Range, Burrinjuck Ridges and Dalton Hills Mitchell Landscapes, all of which are characterised by loam soils or clay subsoils. This therefore aligns with the landscape description of PCT 351. Additionally, diagnostic canopy species of PCT 351 include *Eucalyptus mannifera* subsp. *mannifera* often with *Eucalyptus macrorhyncha* and *Eucalyptus goniocalyx,* and occasionally *Eucalyptus rossii* is present, all of which were observed throughout this PCT. The midstorey is sparse in the wooded areas, which is diagnostic of PCT 351. Plots sampled confirm the presence of groundcover species diagnostic of PCT 351, including *Poa sieberiana* var. *sieberiana, Rytidosperma pallidum, Gonocarpus tetragynus, Hypericum gramineum, Schoenus apogon, Echinopogon* sp., *Microlaena stipoides* var. *stipoides* and *Aristida ramose*. A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 351 within the project footprint is shown in Figure 6-1.
Photos	 **Photo 59. Very low condition native grassland (photo taken at plot YG01909F)**

PCT 351 - Brittle Gum - Broad-leaved Peppermint - Red Stringybark open forest in the north-western part (Yass to Orange) of the South Eastern Highlands Bioregion

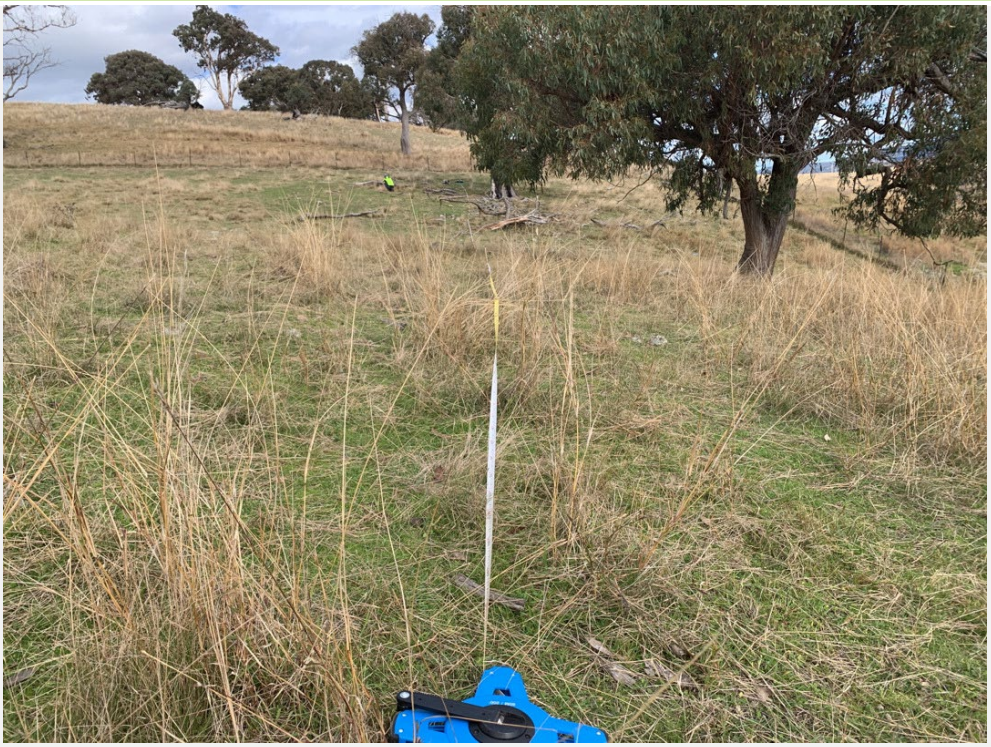

Photo 60. Low condition woodland (photo taken at plot YG0172F3)

Photo 61. Moderate condition woodland (photo taken at plot YG01601)

Number of plots sampled	Seven plots were sampled within the Murrumbateman bioregion, including: Very low condition:

PCT 351 - Brittle Gum - Broad-leaved Peppermint - Red Stringybark open forest in the north-western part (Yass to Orange) of the South Eastern Highlands Bioregion	
	• YG01909F Low condition: • YG0172F3 • YG0172F4 Moderate condition: • YG01933B • YG01601 • YG016E0A • YG016611

PCT 352 - Red Stringybark - Blakelys Red Gum hillslope open forest on meta-sediments in the Yass - Boorowa - Crookwell region of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion	
Vegetation formation	Dry Sclerophyll Forests (Shrubby sub-formation)
Vegetation class	Southern Tableland Dry Sclerophyll Forests
Conservation status	PCT 352 aligns to the TEC White Box Yellow Box Blakely's Red Gum Grassy Woodland and Derived Native Grassland which is listed as a Critically Endangered Ecological Community (CEEC) under the BC and EPBC Acts.
% remaining in NSW	14
Extent	PCT 352 occurs in the upper slopes of the NSW South-western Slopes and the western side of the South eastern Highlands Bioregions. The PCT occurs on shallow, red clay soils derived mainly from metamorphic substrates on hillslopes.
Diagnostic canopy species for PCT 352	The canopy is dominated by *Eucalyptus macrorhyncha* (Red Stringybark) and *Eucalyptus blakelyi* (Blakely's Red Gum), often with *Eucalyptus melliodora* (Yellow Box) or *Eucalyptus goniocalyx* (Long-leaved Box).
Diagnostic midstorey species for PCT 352	The midstorey is sparse or absent, but where present includes species such as *Acacia mearnsii* (Black Wattle), *Daviesia leptophylla*, *Brachyloma daphnoides* subsp. *daphnoides* (Daphne Heath), *Acacia implexa* (Hickory Wattle), *Acacia dealbata* (Silver Wattle), *Exocarpos cupressiformis* (Cherry Ballart), *Dillwynia sericea* (Egg and Bacon Peas) and *Pultenaea procumbens*.
Diagnostic groundcover species for PCT 352	The groundcover is often sparse and includes species such as *Bothriochloa macra* (Red Grass), *Rytidosperma racemosum* (Wallaby Grass), *Hydrocotyle laxiflora* (Stinking Pennywort), *Lomandra filiformis* subsp. *coriacea* (Wattle Matt-rush), *Rumex brownii* (Swamp Dock), *Desmodium varians* (Slender Tick-trefoil), *Gonocarpus tetragynus* (Poverty Raspwort), *Tricoryne elatior* (Yellow Autumn-lily), *Oxalis perennans*, *Geranium solanderi* var. *solanderi*, *Elymus scaber* (Common Wheatgrass), *Microlaena stipoides* var. *stipoides* (Weeping Grass), *Rytidosperma pilosum* (Smooth-flowered Wallaby Grass), *Rytidosperma pallidum* (Silvertop Wallaby Grass), *Poa sieberiana* (Snowgrass), *Juncus subsecundus* (Finger Rush) and *Luzula densiflora* (Woodrush).
Condition and presence of weeds	PCT 352 occurs in the project footprint as three condition types: • Very low • Low • Moderate Exotic species are present in ranging densities throughout PCT 352, with higher covers recorded in the Very low and Low condition zones. More commonly recorded species include the forbs *Carthamus lanatus* (Saffron Thistle), *Rumex acetosella* (Sheep's Sorrel), *Trifolium repens* (White Clover) and *Trifolium subterraneum* (Subterranean Clover).
Justification of evidence used to identify the PCT	As mentioned above, PCT 352 is found predominantly in western side of the South eastern Highlands is associated with red clay soils derived mainly from metamorphic substrates on hillslopes. The PCT in the project footprint occurs across several Mitchell Landscapes which are all characterised by steep or undulating hills, (Adelong Granite Ranges, Boorowa Volcanics, Dalton Hills, Marilba Range and Oberon – Kialla Granites) whilst the soils of these landscapes aren't generally from metamorphic

PCT 352 - Red Stringybark - Blakelys Red Gum hillslope open forest on meta-sediments in the Yass - Boorowa - Crookwell region of the NSW South Western Slopes Bioregion and South Eastern Highlands Bioregion	
	substrates, they are described as red or red to yellow soils. The landscape position of PCT 352 within the project footprint is therefore generally aligned to the landscape description of PCT 352. Additionally, diagnostic canopy species of PCT 352 include *Eucalyptus macrorhyncha, Eucalyptus blakelyi* and *Eucalyptus melliodora* all of which were observed throughout this PCT. Two non-diagnostic canopy species were recorded in this PCT (*Eucalyptus bridgesiana* and *Eucalyptus pauciflora*), which can most likely be attributed to ecotonal changes and variations. In the wooded areas the midstorey is very sparse which is characteristic of PCT 352. No diagnostic species of PCT 352 were recorded in the plots sampled. Plots sampled confirm the presence of groundcover species diagnostic of PCT 352, including *Bothriochloa macra, Hydrocotyle laxiflora, Lomandra filiformis, Rumex brownii, Desmodium varians, Gonocarpus tetragynus, Tricoryne elatior, Oxalis perennans, Geranium solanderi* var. *solanderi, Elymus scaber*, *Microlaena stipoides* var. *stipoides* and *Poa sieberiana*. A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 352 within the project footprint is shown in Figure 6-1.
How it meets the BC Act Determination	As outlined in Section 6.5.1 and Table 6-10 of the BDAR, PCT 352 in Very low, Low and Moderate condition aligns to the BC Act listed White Box Yellow Box Blakely's Red Gum Grassy Woodland and Derived Native Grassland.
How it meets the EPBC Act Determination	As outlined in Section 6.5.1 and Table 6-11 of the BDAR, PCT 352 in Moderate condition aligns to the EPBC Act listed White Box Yellow Box Blakely's Red Gum Grassy Woodland and Derived Native Grassland.

Number of plots sampled

Six plots were sampled within the Murrumbateman bioregion, including:

Very low condition:

- YG016E7C
- YG01407E
- YG016726

Low condition:

- YG014754

Moderate condition:

- YG014FF0
- YG013197

PCT 638 - Alpine Ash - Mountain Gum moist shrubby tall open forest of montane areas, southern South Eastern Highlands Bioregion and Australian Alps Bioregion	
Vegetation formation	Wet Sclerophyll Forests (Grassy sub-formation)
Vegetation class	Montane Wet Sclerophyll Forests
Conservation status	PCT 638 has no associated TEC.
% remaining in NSW	95
Extent	PCT 638 occurs in mountainous areas at high altitude mainly in the western and southern parts of Kosciuszko including the Bago-Maragle area.
Diagnostic canopy species for PCT 638	The canopy is dominated by *Eucalyptus delegatensis* subsp. *delegatensis* (Alpine Ash) and *Eucalyptus dalrympleana* subsp. *dalrympleana* (Mountain Gum).
Diagnostic midstorey species for PCT 638	The midstorey comprises species such as *Acacia obliquinervia* (Mountain Hickory), *Coprosma hirtella* (Coffee-berry), *Daviesia latifolia* (Bitter-pea), *Polyscias sambucifolia* (Elderberry Panax) and *Tasmannia xerophila*.
Diagnostic groundcover species for PCT 638	The groundcover is comprised of species such as *Acaena ovina* (Acaena), *Asperula conferta* (Common Woodruff), *Clematis aristata* (Old Man's Beard), *Polystichum proliferum* (Mother Shield Fern), *Stellaria pungens* (Prickly Starwort), *Veronica derwentiana* and *Viola betonicifolia* (Native Violet).
Condition and presence of weeds	PCT 638 is in the project footprint in High condition. Weeds are absent or have a low cover throughout most of PCT 638. The most common exotic species recorded was *Rubus anglocandicans* (Blackberry), which was typically found in dense patches, potentially in areas of past disturbance.
Justification of evidence used to identify the PCT	As mentioned above, PCT 638 is found in mountainous areas at high altitude mainly in the western and southern parts of Kosciuszko including the Bago-Maragle area. PCT 638 in the project footprint occurs between 1,049 - 1,213m asl. Diagnostic canopy species of PCT 638 include *Eucalyptus delegatensis* subsp. *delegatensis* and *Eucalyptus dalrympleana* subsp. *dalrympleana,* both of which were observed throughout this PCT. The midstorey is shrubby which is characteristic of PCT 638. Recorded diagnostic species include *Coprosma hirtella, Daviesia latifolia, Polyscias sambucifolia* and *Tasmannia* sp. Plots sampled confirm the presence of groundcover species diagnostic of PCT 638, including *Asperula conferta, Clematis aristata, Stellaria pungens, Veronica derwentiana* and *Viola betonicifolia.* A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 638 within the project footprint is shown in Figure 6-1.

PCT 638 - Alpine Ash - Mountain Gum moist shrubby tall open forest of montane areas, southern South Eastern Highlands Bioregion and Australian Alps Bioregion

Photos	 **Photo 65. High condition forest (photo taken at plot WM09498C)**
Number of plots sampled	Sixteen plots sampled within the Snowy Mountains bioregion, including: High condition: • WM0944D7 • WM094580 • WM094437 • WM09498C • WM094913 • WM094E96 • WM094A73 • WM094B46 • WM094613 • WM094F0B • WM094034 • WM094037 • WM094D85 • WM094BD0 • WM094C38 • WM0949C2

PCT 679 - Black Sallee - Snow Gum low woodland of montane valleys, South Eastern Highlands Bioregion and Australian Alps Bioregion	
Vegetation formation	Grassy Woodlands
Vegetation class	Subalpine Woodlands
Conservation status	PCT 679 aligns to Monaro Tableland Cool Temperate Grassy Woodland in the South Eastern Highlands Bioregion TEC listed as Critically Endangered under the BC Act. This TEC alignment only applies for PCT 679 mapped in the Crookwell IBRA Subregion (South Eastern Highland Bioregion).
% remaining in NSW	65
Extent	PCT 679 is found in frost hollow drainage lines in montane and tableland areas.
Diagnostic canopy species for PCT 679	The canopy is comprised of *Eucalyptus stellulata* (Black Sally), *Eucalyptus pauciflora* (White Sally), *Eucalyptus rubida* subsp. *rubida* (Candlebark), *Eucalyptus dalrympleana* subsp. *dalrympleana* (Mountain Gum) and *Eucalyptus aggregata* (Black Gum).
Diagnostic midstorey species for PCT 679	The midstorey comprises species such as *Baeckea utilis* (Mountain Baeckea), *Hakea microcarpa* (Small-fruited Hakea) and *Acrothamnus hookeri*.
Diagnostic groundcover species for PCT 679	The groundcover is comprised of grass and grass-like species such as *Carex appressa* (Tall Sedge), *Carex inversa* (Knob Sedge), *Empodisma minus, Poa labillardierei* var. *labillardierei* (Tussock), *Poa sieberiana* var. *sieberiana* (Snowgrass) and *Baloskion australe*. It includes forbs such as *Acaena novae-zelandiae* (Bidgee-widgee), *Asperula scoparia* (Prickly Woodruff) and *Hydrocotyle sibthorpioides*.
Condition and presence of weeds	PCT 679 occurs in the project footprint as three condition types: • Low • Moderate • High Exotic species are present throughout PCT 679, typically with higher covers recorded in the Low and Moderate condition zones. Wind dispersed species from the Asteraceae (daisy) and Poaceae (grass) families are the most commonly recorded species, such as *Holcus lanatus* (Yorkshire Fog) and *Hypochaeris radicata* (Catsear), however the cover of these species was low across the plots sampled. The climber *Rubus anglocandicans* (Blackberry) was recorded in several plots and observed as scattered but dense patches throughout the PCT.
Justification of evidence used to identify the PCT	As mentioned above, PCT 679 is found in frost hollow drainage lines in montane and tableland areas. Within the project footprint, PCT 679 is generally mapped along shallow drainage lines and depressions in montane areas. This is consistent with the landscape description for PCT 679. Diagnostic canopy species of PCT 679 include *Eucalyptus delegatensis* subsp. *delegatensis* and *Eucalyptus pauciflora* with *Eucalyptus dalrympleana* subsp. *dalrympleana*, all of which were observed throughout this PCT. No diagnostic midstorey species of PCT 679 were recorded in the plots sampled.

PCT 679 - Black Sallee - Snow Gum low woodland of montane valleys, South Eastern Highlands Bioregion and Australian Alps Bioregion	
	Plots sampled confirm the presence of groundcover species diagnostic of PCT 679, including *Carex appressa, Poa labillardierei* var. *labillardierei, Poa sieberiana* var. *sieberiana, Acaena novae-zelandiae* and *Asperula scoparia*. A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 679 within the project footprint is shown in Figure 6-1.
How it meets the BC Act Determination	As outlined in Section 6.5.4 and Table 6-14 of the BDAR, PCT 679 in Low, Moderate and High condition aligns to the BC Act listed Monaro Tableland Cool Temperate Grassy Woodland TEC.
Photos	 **Photo 66. Low condition woodland (photo taken at plot MA002091)**

	• BY044EBA Moderate condition: • BY044B95 High condition: • BY-049D • MA002A7B • BY096B08 • MA006A4D • WM114DA6

PCT 727 - Broad-leaved Peppermint - Brittle Gum - Red Stringybark dry open forest on the South Eastern Highlands Bioregion	
Vegetation formation	Dry Sclerophyll Forests (Shrubby sub-formation)
Vegetation class	Southern Tableland Dry Sclerophyll Forests
Conservation status	PCT 727 is associated with the Mt Canobolas Xanthoparmelia Lichen Community TEC listed as Endangered under the BC Act. However, given the TEC has a highly restricted distribution (Mt Canobolas in central-western New South Wales), PCT 727 in the project footprint is not considered to align to the TEC.
% remaining in NSW	50
Extent	PCT 727 is known to occur on undulating exposed and sheltered footslopes.
Diagnostic canopy species for PCT 727	The canopy is dominated by *Eucalyptus dives* (Broad-leaved Peppermint), *Eucalyptus mannifera* (Brittle Gum) and *Eucalyptus macrorhyncha* (Red Stringybark).
Diagnostic midstorey species for PCT 727	The midstorey comprises species such as *Acacia falciformis* (Broad-leaved Hickory), *Acacia gunnii* (Ploughshare Wattle), *Brachyloma daphnoides* (Daphne Heath) and *Daviesia leptophylla*.
Diagnostic groundcover species for PCT 727	The groundcover is comprised of species such as *Gonocarpus tetragynus* (Poverty Raspwort), *Hibbertia obtusifolia* (Hoary Guinea Flower), *Hovea linearis*, *Rytidosperma pallidum* (Redanther Wallaby Grass) and *Poa sieberiana* var. *sieberiana* (Snowgrass).
Condition and presence of weeds	PCT 727 occurs in the project footprint as three condition types: • Very low • Moderate • Very high Exotic species are present throughout PCT 727, typically with higher covers recorded in the Very low condition zone, with commonly recorded weeds including the forb species *Acetosella vulgaris* (Sheep Sorrel) and *Hypochaeris radicata* (Catsear), and the grass *Dactylis glomerata* (Cocksfoot).
Justification of evidence used to identify the PCT	As mentioned above, PCT 727 is found on undulating exposed and sheltered footslopes. PCT 727 in the project footprint predominantly occurs in the Rockley Plains Mitchell Landscape which is characterised by low rolling hills on a plateau surface. Diagnostic canopy species of PCT 727 include *Eucalyptus dives*, *Eucalyptus mannifera* and *Eucalyptus macrorhyncha*, all of which were observed throughout this PCT. Diagnostic species recorded in the midstorey include *Acacia gunnii* and *Brachyloma daphnoides*. Plots sampled confirm the presence of groundcover species diagnostic of PCT 727, including *Gonocarpus tetragynus, Rytidosperma pallidum* and *Poa sieberiana* var. *sieberiana*.

PCT 727 - Broad-leaved Peppermint - Brittle Gum - Red Stringybark dry open forest on the South Eastern Highlands Bioregion	
	A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 727 within the project footprint is shown in Figure 6-1.
Photos	 **Photo 69. Very low condition woodland (photo taken at plot BY045261)**

Photo 70. Moderate condition woodland (photo taken at plot BY0455B5)

Photo 71. Very high condition woodland (photo taken at plot BY-049C)

Number of plots sampled	Seven plots were sampled within the Crookwell bioregion: Very low condition:

PCT 727 - Broad-leaved Peppermint - Brittle Gum - Red Stringybark dry open forest on the South Eastern Highlands Bioregion	
	• BY045261 • BY045BFA Moderate condition: • BY-049B • BY0455B5 Very high condition: • BY-049C • BY-049A • BY-048A

PCT 731 - Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion	
Vegetation formation	Grassy Woodlands
Vegetation class	Southern Tableland Grassy Woodlands
Conservation status	PCT 731 has no associated TEC.
% remaining in NSW	20
Extent	PCT 731 occurs on undulating hills between 550 and 1100 m from the western Blue Mountains to near Braidwood.
Diagnostic canopy species for PCT 731	The canopy is dominated by *Eucalyptus dives* (Broad-leaved Peppermint), *Eucalyptus macrorhyncha* (Red Stringybark), *Eucalyptus mannifera* (Brittle Gum), *Eucalyptus dalrympleana* subsp. *dalrympleana* (Mountain Gum), *Eucalyptus rossii* (Inland Scribbly Gum) and *Eucalyptus cinerea* (Argyle Apple).
Diagnostic midstorey species for PCT 731	The midstorey is typically sparse and only has one diagnostic species *Melichrus urceolatus* (Urn Heath).
Diagnostic groundcover species for PCT 731	The groundcover is comprised of species such as *Rytidosperma racemosum* (Wallaby Grass), *Gonocarpus tetragynus* (Poverty Raspwort), *Goodenia hederacea* (Ivy Goodenia), *Hibbertia obtusifolia* (Hoary Guinea Flower), *Hydrocotyle laxiflora* (Stinking Pennywort), *Hypericum gramineum* (Small St John's Wort), *Lomandra filiformis* subsp. *coriacea* (Wattle Matt-rush), *Microlaena stipoides* var. *stipoides* (Weeping Grass) and *Oxalis perennans*.
Condition and presence of weeds	PCT 731 occurs in the project footprint as four condition types: • Very low • Low • Moderate • High A moderate to high cover of exotic species is present throughout PCT 731, with a large portion of species comprising grass species such as *Anthoxanthum odoratum* (Sweet Vernal Grass) and *Holcus lanatus* (Yorkshire Fog). Exotic forb species were also recorded throughout this PCT, with a low cover of *Hypochaeris radicata* (Catsear) present in all plots sampled and *Plantago lanceolata* (Lamb's Tongues) recorded with high coverage in several plots.
Justification of evidence used to identify the PCT	As mentioned above, PCT 731 is found on undulating hills between 550 and 1100 m from the western Blue Mountains to near Braidwood. The PCT in the project footprint predominantly occurs within 419-1048 m asl, and a small portion of it is mapped between 299-418 m asl. The PCT in the project footprint occurs across four Mitchell Landscapes Towrang Ranges, Dalton Hills, Gundary Plains and Crookwell Basalts and Sands.

PCT 731 - Broad-leaved Peppermint - Red Stringybark grassy open forest on undulating hills, South Eastern Highlands Bioregion	
	Diagnostic canopy species of PCT 731 include *Eucalyptus dives, Eucalyptus macrorhyncha, Eucalyptus dalrympleana* subsp. *dalrympleana* and *Eucalyptus cinerea*, all of which were observed throughout this PCT. Two canopy species that are not known to occur in PCT 731 (*Eucalyptus blakelyi* and *Eucalyptus sieberi)*, were both recorded in one plot each, however can most likely be attributed to ecotonal variations. The midstorey was typically sparse and species recorded often included the diagnostic *Melichrus urceolatus.* Plots sampled confirm the presence of groundcover species diagnostic of PCT 731, including *Rytidosperma racemosum, Gonocarpus tetragynus, Goodenia hederacea, Hydrocotyle laxiflora, Hypericum gramineum, Lomandra filiformis* subsp. *coriacea, Microlaena stipoides* var. *stipoides* and *Oxalis perennans.* A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 731 within the project footprint is shown in Figure 6-1.

	• BY03130D • BY034745 • BY0349F2 • BY034E63 Moderate condition: • BY035E53 • BY0348E7 • BY-032B • BY0340E3 • BY03470F High condition: • BY-032A • BY13011EC5 • BY13010FC9

PCT 870 - Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion	
Vegetation formation	Dry Sclerophyll Forests (Shrub/grass sub-formation)
Vegetation class	Central Gorge Dry Sclerophyll Forests
Conservation status	PCT 870 has no associated TEC.
% remaining in NSW	90
Extent	PCT 870 occurs on loams on dry slopes within rocky gorges of the Kowmung and Wollondilly Rivers between 100 and 750 m asl.
Diagnostic canopy species for PCT 870	The canopy typically includes *Eucalyptus punctata* (Grey Gum), *Eucalyptus eugenioides* (Thin-leaved Stringybark), *Eucalyptus tereticornis* (Forest Red Gum), *Eucalyptus cypellocarpa* (Monkey Gum) and *Eucalyptus elata* (River Peppermint).
Diagnostic midstorey species for PCT 870	The midstorey is typically comprised of *Acacia falciformis* (Broad-leaved Hickory), *Clematis aristata* (Old Man's Beard) and *Olearia viscidula* (Wallaby Weed).
Diagnostic groundcover species for PCT 870	The groundcover is comprised of grass and grass like species such as *Echinopogon ovatus* (Forest Hedgehog Grass), *Lomandra longifolia* (Spiny-headed Mat-rush) and *Lomandra multiflora* subsp. *multiflora* (Many-flowered Mat-rush). Diagnostic forbs include *Dichondra repens* (Kidney Weed), *Hypericum gramineum* (Small St John's Wort), *Poranthera microphylla* (Small Poranthera), *Lobelia purpurascens* (Whiteroot), *Veronica plebeia* (Trailing Speedwell) and *Wahlenbergia stricta* subsp. *stricta* (Tall Bluebell). The climbers *Desmodium gunnii* (Slender Tick-trefoil) and *Geitonoplesium cymosum* (Scrambling Lily), and the fern *Cheilanthes sieberi* subsp. *sieberi* (Rock Fern), may also be present.
Condition and presence of weeds	PCT 870 in the project footprint was only recorded in Very high condition. A low cover of wind dispersed exotic species predominantly from the Asteraceae (daisy) family are present throughout most of PCT 870.
Justification of evidence used to identify the PCT	PCT 870 occurs between 100 and 750 m asl on dry slopes and rocky gorges. The PCT in the project footprint occurs within 659-898m asl and is in the Wollondilly - Bindook Tablelands and Gorges Mitchell Landscape, which is characterised by gorges and scree slopes. *Eucalyptus punctata* and *Eucalyptus eugenioides* were the only canopy species recorded in this PCT and are both considered diagnostic species of PCT 870. The midstorey was sparse and species recorded included *Olearia* sp. Plots sampled confirm the presence of groundcover species diagnostic of PCT 870, including *Lomandra multiflora* subsp. *multiflora, Dichondra repens, Poranthera microphylla. Veronica plebeia, Wahlenbergia stricta* subsp. *stricta* and *Cheilanthes sieberi* subsp. *sieberi.* A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 870 within the project footprint is shown in Figure 6-1.

PCT 870 - Grey Gum - Thin-leaved Stringybark grassy woodland of the southern Blue Mountains gorges, Sydney Basin Bioregion	
Photos	 **Photo 75. Very high condition woodland (photo taken at plot BY008-F)**
Number of plots sampled	Three plots were sampled within the Bungonia bioregion, including: Very high condition: • BY008-F • BY008-G • BY008-H

PCT 939 - Montane wet heath and bog of the eastern tablelands, South Eastern Highlands Bioregion	
Vegetation formation	Freshwater Wetlands
Vegetation class	Montane Bogs and Fens
Conservation status	PCT 939 aligns to the Montane Peatlands and Swamps of the New England Tableland, NSW North Coast, Sydney Basin, South East Corner, South Eastern Highlands and Australian Alps bioregions TEC listed as Endangered under the BC Act. The PCT can also align to the Alpine Sphagnum Bogs and Associated Fens TEC listed as Endangered under the EPBC Act.
% remaining in NSW	50
Extent	PCT 939 is described as having a diverse open shrub stratum over 1 m tall dominated by species in the Myrtaceae and Epacridaceae families. The continuous groundcover is dominated by sedges with occasional grasses and a diverse range of herbs. The PCT typically occurs on waterlogged broad open flat gullies on alluvium derived from granitic or metasediments substrates above 800 m elevation on the eastern edge of the tablelands.
Diagnostic canopy species for PCT 939	Where present, the canopy typically includes species such as *Eucalyptus aquatica* (Broad-leaved Sally), *Eucalyptus parvula* (Small-leaved Gum), *Eucalyptus pauciflora* (White Sally) and *Eucalyptus stellulata* (Black Sally).
Diagnostic midstorey species for PCT 939	The midstorey is typically diverse and open and characterised by species such as *Baeckea utilis* (Mountain Baeckea), *Epacris breviflora, Epacris paludosa* (Swamp Heath), *Hakea microcarpa* (Small-fruited Hakea) and *Leptospermum myrtifolium*.
Diagnostic groundcover species for PCT 939	The groundcover is comprised a diverse range of forbs, sedges and occasional grasses including *Baloskion australe, Carex appressa* (Tall Sedge) *Empodisma minus*, *Phragmites australis* (Common Reed), *Acaena novae-zelandiae* (Bidgee-widgee), *Asperula gunnii* (Mountain Woodruff), *Centella asiatica* (Indian Pennywort), *Gonocarpus micranthus, Lobelia anceps, Persicaria decipiens* (Slender Knotweed), *Persicaria praetermissa* and *Ranunculus inundatus* (River Buttercup).
Condition and presence of weeds	PCT 939 occurs in the project footprint in Very high condition. Exotic species are present throughout PCT 939. Species recorded in the plots sampled include *Holcus lanatus* (Yorkshire Fog) and *Rubus anglocandicans* (Blackberry).
Justification of evidence used to identify the PCT	The PCT in the project footprint occurs entirely on the Tooma Granite Ranges Mitchell Landscape which is characterised by granite geology. Additionally, the PCT occurs above 800 m elevation (between 899-1213m asl) in boggy areas of impeded drainage near the headwaters of streams. PCT 939 within the project footprint is therefore consistent with the landscape description of PCT 939. Trees were absent or present in low abundance in this PCT and no diagnostic canopy species were recorded in the plots sampled. The midstorey was mid-dense to dense and species recorded were diagnostic of PCT 939 and include *Baeckea utilis, Epacris breviflora, Hakea microcarpa* and *Leptospermum myrtifolium*. Plots sampled confirm the presence of groundcover species diagnostic of PCT 939, forb species dominated the groundcover and diagnostic species include, *Gonocarpus micranthus, Asperula gunnii, Acaena novae-zelandiae, Centella asiatica* and *Ranunculus inundatus*.

PCT 939 - Montane wet heath and bog of the eastern tablelands, South Eastern Highlands Bioregion	
	Diagnostic grass and grass like species were also recorded and included *Carex appressa* and *Empodisma minus*. A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 939 within the project footprint is shown in Figure 6-1.
How it meets the BC Act Determination	As outlined in Section 6.5.5 and Table 6-15 of the BDAR, PCT 939 in Very high condition aligns to the BC Act listed Montane Peatlands and Swamps of the New England Tableland, NSW North Coast, Sydney Basin, South East Corner, South Eastern Highlands and Australian Alps bioregions TEC.
How it meets the EPBC Act Determination	As outlined in Section 6.5.5 and Table 6-16 of the BDAR, PCT 939 in Very high condition aligns to the EPBC Act listed Alpine Sphagnum Bogs and Associated Fens TEC.
Photos	 **Photo 76. Very high condition grassland (photo taken at plot WM094BOG2)**
Number of plots sampled	Two plots were sampled within the Snowy Mountains bioregion, including: Very high condition: • WM094E2 • WM094BOG2

PCT 952 - Mountain Gum - Narrow-leaved Peppermint - Snow Gum dry shrubby open forest on undulating tablelands, southern South Eastern Highlands Bioregion	
Vegetation formation	Grassy Woodlands
Vegetation class	Subalpine Woodlands
Conservation status	PCT 952 is associated with the Tableland Basalt Forest in the Sydney Basin and South Eastern Highlands Bioregions TEC listed as Endangered under the BC Act.
% remaining in NSW	50
Extent	PCT 952 typically occurs on gentle terrain on the tableland above 700 m elevation, on granitic or metasedimentary substrates.
Diagnostic canopy species for PCT 952	Diagnostic species in the canopy include *Eucalyptus dalrympleana* subsp. *dalrympleana* (Mountain Gum), *Eucalyptus radiata* subsp. *radiata* (Candlebark), *Eucalyptus pauciflora* (White Sally) and *Eucalyptus dives* (Broad-leaved Peppermint).
Diagnostic midstorey species for PCT 952	The midstorey is characterised by the presence of *Bossiaea foliosa* (Leafy Bossiaea), *Daviesia ulicifolia* (Gorse Bitter Pea), *Hibbertia obtusifolia* (Hoary Guinea Flower), *Hovea linearis, Leucopogon lanceolatus, Monotoca scoparia* and *Persoonia silvatica*.
Diagnostic groundcover species for PCT 952	The groundcover is comprised of species such as *Dianella tasmanica, Gonocarpus tetragynus* (Poverty Raspwort), *Lomandra longifolia* (Spiny-headed Mat-rush), *Microlaena stipoides* var. *stipoides* (Weeping Grass) and *Stylidium graminifolium* (Grass Triggerplant).
Condition and presence of weeds	PCT 952 occurs in the project footprint as three condition types: • Very low • Low • Moderate A moderate to high cover of exotic species are present throughout PCT 952. The most commonly recorded weeds are wind dispersed species from the Asteraceae (daisy) and Poaceae (grass) families. Common exotic species include *Hypochaeris radicata* (Catsear), *Cirsium vulgare* (Spear Thistle), *Holcus lanatus* (Yorkshire Fog), and *Phleum pratense* (Timothy).
Justification of evidence used to identify the PCT	As mentioned above, PCT 952 is found on gentle terrain on the tableland above 700 m elevation, on granitic or metasedimentary substrates. All of the PCT in the project footprint occurs about 700 m elevation (771 – 898 m asl.). Half of PCT 952 in the project footprint occurs on the Crookwell Basalts and Sands Mitchell Landscape which is characterised by moderately extensive flat topped tablelands and hills capped by Tertiary basalt. The other half of the PCT is mapped as occurring on the Towrang Ranges which is characterised as predominantly comprising sedimentary geology. Diagnostic canopy species of PCT 952 include *Eucalyptus pauciflora* and *Eucalyptus dives,* both of which were observed throughout this PCT.

PCT 952 - Mountain Gum - Narrow-leaved Peppermint - Snow Gum dry shrubby open forest on undulating tablelands, southern South Eastern Highlands Bioregion	
	The midstorey was typically sparse and no diagnostic species were recorded in the plots sampled. This could be attributed to the low condition of the vegetation in the project footprint. No High or Very high condition woodland was recorded in the project footprint. Plots sampled confirm the presence of groundcover species diagnostic of PCT 952, including *Dianella* sp., *Gonocarpus tetragynus* and *Microlaena stipoides* var. *stipoides*. A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 952 within the project footprint is shown in Figure 6-1.
How it meets the BC Act Determination	As outlined in Section 6.5.3 and Table 6-13 of the BDAR, PCT 952 in Very low, Low and Moderate condition aligns to the BC Act listed Tableland Basalt Forest.
Photos	 **Photo 77. Very low condition grassland (photo taken at plot BY-026A)**

Photo 78. Low condition grassland (photo taken at plot BY-029C)

Photo 79. Moderate condition woodland (photo taken at plot BY-029B)

PCT 952 - Mountain Gum - Narrow-leaved Peppermint - Snow Gum dry shrubby open forest on undulating tablelands, southern South Eastern Highlands Bioregion	
Number of plots sampled	Seven plots were sampled within the Crookwell bioregion: Very low condition: • BY-026A Low condition: • BY-029D • BY-029C • BY-029A Moderate condition: • BY-032D • BY-029B • BY-026B

PCT 953 - Mountain Gum - Snow Gum - Broad-leaved Peppermint shrubby open forest of montane ranges, South Eastern Highlands Bioregion and Australian Alps Bioregion	
Vegetation formation	Dry Sclerophyll Forests (Shrubby sub-formation)
Vegetation class	Southern Tableland Dry Sclerophyll Forests
Conservation status	PCT 953 aligns to Tableland Basalt Forest in the Sydney Basin and South Eastern Highlands Bioregions which is listed as an Endangered Ecological Community under the BC Act. This TEC alignment only applies for PCT 953 mapped in the Bondo IBRA Subregion (South Eastern Highland Bioregion).
% remaining in NSW	95
Extent	PCT 953 occurs in montane areas mainly in the northern Kosciuszko/Brindabella area and Tallaganda/Badja range.
Diagnostic canopy species for PCT 953	The canopy is characterised by the presence of by *Eucalyptus dalrympleana* subsp. *dalrympleana* (Mountain Gum), *Eucalyptus pauciflora* (White Sally), *Eucalyptus dives* (Broad-leaved Peppermint) and *Eucalyptus robertsonii* subsp. *robertsonii* (Robertson's Peppermint).
Diagnostic midstorey species for PCT 953	The midstorey is typically shrubby with characteristic species including *Acacia dealbata* (Silver Wattle), Acacia rubida (Red-stemmed Wattle), *Brachyloma daphnoides* (Daphne Heath), *Cassinia longifolia*, *Cassinia uncata* (Sticky Cassinia), *Daviesia latifolia* (Bitter-pea), *Exocarpos strictus* (Dwarf Cherry), *Olearia erubescens* (Pink-tip Daisy-bush), *Oxylobium ellipticum* (Common Shaggy Pea), *Platylobium formosum* and *Daviesia mimosoides* subsp. *mimosoides*.
Diagnostic groundcover species for PCT 953	The groundcover is comprised of species such as *Asperula scoparia* (Prickly Woodruff), *Glycine clandestina* (Twining glycine), *Lomandra longifolia* (Spiny-headed Mat-rush), *Persoonia chamaepitys* (Mountain Geebung), *Poa induta*, *Pteridium esculentum* (Bracken), *Senecio gunnii*, *Stackhousia monogyna* (Creamy Candles), *Stylidium graminifolium* (Grass Triggerplant) and *Viola betonicifolia* (Native Violet).
Condition and presence of weeds	PCT 953 occurs in the project footprint as three condition types: • Low • High • Very high Exotic species are present in throughout PCT 953, typically with higher covers recorded in the Low condition zones, with the most prolific weeds comprising forbs species such as *Hypericum perforatum* (St. Johns Wort), *Centaurium erythraea* (Common Centaury), *Hypochaeris radicata* (Catsear) and *Trifolium arvense* (Haresfoot Clover). The grass *Holcus lanatus* (Yorkshire Fog) was also recorded throughout this PCT.
Justification of evidence used to	As mentioned above, PCT 953 is found in montane areas mainly in the northern Kosciuszko/Brindabella area and Tallaganda/Badja range. The majority of the PCT in the project footprint is mapped in the Snowy Mountains IBRA subregion and is above 899 m asl.

PCT 953 - Mountain Gum - Snow Gum - Broad-leaved Peppermint shrubby open forest of montane ranges, South Eastern Highlands Bioregion and Australian Alps Bioregion	
identify the PCT	The diagnostic canopy species of PCT 953 *Eucalyptus dalrympleana* subsp. *dalrympleana*, *Eucalyptus pauciflora* and *Eucalyptus dives* were observed throughout this PCT. The midstorey was typically shrubby which is characteristic of PCT 953. Diagnostic species in the sampled plots include *Acacia dealbata, Daviesia latifolia, Exocarpos strictus, Olearia erubescens* and *Platylobium formosum*. Plots sampled confirm the presence of groundcover species diagnostic of PCT 953, including *Asperula scoparia, Glycine clandestina, Lomandra longifolia, Persoonia chamaepitys, Poa induta, Pteridium esculentum, Senecio gunnii*, *Stackhousia monogyna, Stylidium graminifolium* and *Viola betonicifolia.* A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 953 within the project footprint is shown in Figure 6-1.
How it meets the BC Act Determination	As outlined in Section 6.5.3 and Table 6-13 of the BDAR, PCT 953 in Low, High and Very high condition aligns to the BC Act listed Tableland Basalt Forest.
Photos	 **Photo 80. Low condition grassland (photo taken at plot WM094898)**

PCT 953 - Mountain Gum - Snow Gum - Broad-leaved Peppermint shrubby open forest of montane ranges, South Eastern Highlands Bioregion and Australian Alps Bioregion

Photo 81. High condition woodland (photo taken at plot MA014EB4)

Photo 82. Very high condition woodland (photo taken at plot MA0041AA)

PCT 953 - Mountain Gum - Snow Gum - Broad-leaved Peppermint shrubby open forest of montane ranges, South Eastern Highlands Bioregion and Australian Alps Bioregion	
Number of plots sampled	40 plots were sampled within the Snowy Mountains and Bondo IBRA subregions: Low condition: • MA094OUT5 • MA094E3 • MA094OUT1 • WM094898 • MA094OUT4 • WM094703 • MA094OUT3 • WM0944F1 High condition: • MA014C96 • MA013191 • MA014EB4 • MA013985 • MA013091 • MA0118CA • MA013E74 • MA013B4A Very high condition: • WM117798 • WM094E0E • WM114574 • WM114F2B • MA0041AA • WM0942C1 • WM1147C9 • WM094E52 • WM094971 • WM094953 • WM11404F • WM094203 • WM094284 • WM0945E2 • WM1140A2 • WM094503 • MA-009A • WM117287 • WM114976 • WM094A2B • WM094D78 • WM114C79 • WM11484B • WM117873

PCT 1093 – Red Stringybark – Brittle Gum – Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion	
Vegetation formation	Dry Sclerophyll Forests (Shrubby sub-formation)
Vegetation class	Southern Tableland Dry Sclerophyll Forests
Conservation status	PCT 1093 has no associated TEC.
% remaining in NSW	39
Extent	PCT 1093 occurs on ridges and slopes between 550 and 1150 m on the Southern and Central Tablelands, between Wallerawang and Captains Flat.
Diagnostic canopy species for PCT 1093	The canopy is dominated by *Eucalyptus macrorhyncha* (Red Stringybark), *Eucalyptus mannifera* (Brittle Gum), *Eucalyptus rossii* (Inland Scribbly Gum), *Eucalyptus dives* (Broad-leaved Peppermint) and *Eucalyptus goniocalyx* (Long-leaved Box).
Diagnostic midstorey species for PCT 1093	The midstorey is typically open with characteristic species including *Brachyloma daphnoides* (Daphne Heath), *Daviesia leptophylla* and *Hibbertia obtusifolia* (Hoary Guinea Flower).
Diagnostic groundcover species for PCT 1093	The groundcover is comprised of species such as *Dianella revoluta* var. *revoluta* (A Blue Flax Lily), *Gonocarpus tetragynus* (Poverty Raspwort), *Hovea linearis*, *Rytidosperma pallidum* (Silvertop Wallaby Grass) and *Lomandra filiformis* subsp. *coriacea* (Wattle Matt-rush).
Condition and presence of weeds	PCT 1093 occurs in the project footprint as five condition types: • Very low • Low • Moderate • High • Very high Exotic species are present throughout most of PCT 1093 in the project footprint, with an overall higher cover in the Very low and Low condition classes.
Justification of evidence used to identify the PCT	As mentioned above, PCT 1093 is found on ridges and slopes between 550 and 1150 m on the Southern and Central Tablelands, between Wallerawang and Captains Flat. The PCT in the project footprint occurs across six Mitchell Landscapes including Rockley Plains, Dalton Hills, Towrang Ranges, Crookwell Basalts and Sands, Gundary Plains and Gunning Hills, generally on ridges and slopes. Additionally, all of PCT 1093 in the project footprint occurs within 419-1048 m asl.

PCT 1093 – Red Stringybark – Brittle Gum – Inland Scribbly Gum dry open forest of the tablelands, South Eastern Highlands Bioregion	
	The canopy of PCT 1093 within the project footprint was dominated by *Eucalyptus macrorhyncha, Eucalyptus mannifera* and *Eucalyptus rossii.* The diagnostic canopy species *Eucalyptus dives* and *Eucalyptus goniocalyx* were also present to a lesser extent. The non-diagnostic canopy species *Eucalyptus bridgesiana, Eucalyptus melliodora*, *Eucalyptus sieberi* and *Eucalyptus viminalis* were also recorded in low abundance in this PCT. The presence of these species may be due to ecotonal variation. The midstorey was typically sparse to mid-dense. Species diagnostic of PCT 1093 that were recorded include *Brachyloma daphnoides* and *Hibbertia obtusifolia*. *Cassinia sifton* was recorded throughout this PCT, which can most likely be attributed to past and present land management practices. Plots sampled confirm the presence of groundcover species diagnostic of PCT 1093, including *Dianella revoluta* var. *revoluta, Gonocarpus tetragynus, Hovea linearis, Rytidosperma pallidum* and *Lomandra filiformis* subsp. *coriacea.* A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 1093 within the project footprint is shown in Figure 6-1.

PCT 1097 - Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion	
Vegetation formation	Wet Sclerophyll Forests (Grassy sub-formation)
Vegetation class	Southern Tableland Wet Sclerophyll Forests
Conservation status	PCT 1097 aligns to the Tableland Basalt Forest in the Sydney Basin and South Eastern Highlands Bioregions TEC listed as Endangered under the BC Act.
% remaining in NSW	5
Extent	PCT 1097 is typically found on undulating basalt tablelands between 600 and 1200 m, mainly between Oberon and Moss Vale.
Diagnostic canopy species for PCT 1097	The canopy is dominated by *Eucalyptus viminalis* (Ribbon Gum), *Eucalyptus radiata* subsp. *radiata* (Narrow-leaved peppermint) and *Acacia melanoxylon* (Blackwood).
Diagnostic midstorey species for PCT 1097	The midstorey is typically absent in this PCT.
Diagnostic groundcover species for PCT 1097	The groundcover is comprised of grass and grass like species such as *Austrostipa rudis, Echinopogon ovatus* (Forest Hedgehog Grass), *Microlaena stipoides* var. *stipoides* (Weeping Grass) and *Rytidosperma racemosum* (Wallaby Grass). Forb species such as *Acaena novae-zelandiae* (Bidgee-widgee), *Dichondra repens* (Kidney Weed), *Geranium solanderi* (Native Geranium), *Hydrocotyle laxiflora* (Stinking Pennywort), *Plantago varia*, *Stellaria pungens* (Prickly Starwort) and *Viola betonicifolia* (Native Violet). The climber *Desmodium varians* (Slender Tick-trefoil) and the fern *Pteridium esculentum* (Bracken) may also be present.
Condition and presence of weeds	PCT 1097 occurs in the project footprint in Very low condition. Weeds, predominantly grassy pasture weeds, are present throughout all of PCT 1097 in the project footprint.
Justification of evidence used to identify the PCT	As mentioned above, PCT 1097 is typically found on undulating basalt tablelands between 600 and 1200 m. Half of the PCT is in the project footprint occurs on the Crookwell Basalts and Sands Mitchell Landscape, and the other half occurs on the Rockley Plains and Wollondilly - Bindook Tablelands and Gorges Landscapes. Additionally, all of the PCT in the project footprint occurs between 659-898 m asl. Diagnostic the canopy species *Eucalyptus viminalis* and *Eucalyptus radiata subsp. radiata* were recorded as co-dominant species in the plots sampled. The midstorey was typically absent in the plots sampled which is characteristic of PCT 1097. Diagnostic species of PCT 1097 were not recorded in the plots sampled, this can be attributed to the Very low condition of PCT 1097 in the project footprint and the high cover of grassy pasture weeds in the understorey.

PCT 1097 - Ribbon Gum - Narrow-leaved Peppermint grassy open forest on basalt plateaux, Sydney Basin Bioregion and South Eastern Highlands Bioregion	
How it meets the BC Act Determination	As outlined in Section 6.5.3 and Table 6-13 of the BDAR, PCT 1097 in Very low condition aligns to the BC Act listed Tableland Basalt Forest.
Photos	 **Photo 88. Very low condition woodland (photo taken at plot BY020DBC)**
Number of plots sampled	Two plots were sampled within the Bungonia bioregion: Very low condition: • BY-020B • BY020DBC

PCT 1107 - River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion	
Vegetation formation	Wet Sclerophyll Forests (Shrubby sub-formation)
Vegetation class	Southern Escarpment Wet Sclerophyll Forests
Conservation status	PCT 1107 aligns to the Tableland Basalt Forest in the Sydney Basin and South Eastern Highlands Bioregions TEC listed as Endangered under the BC Act.
% remaining in NSW	90
Extent	PCT 1107 occurs on sheltered slopes on high ranges of the escarpment, mainly between 600 and 1100m, from the western Blue Mountains to Deua National Park.
Diagnostic canopy species for PCT 1107	The canopy is characterised by *Eucalyptus elata* (River Peppermint), *Eucalyptus radiata* subsp. *radiata* (Narrow-leaved Peppermint), *Eucalyptus fastigata* (Brown Barrel), *Eucalyptus cypellocarpa* (Monkey Gum), *Eucalyptus viminalis* (Ribbon Gum) and *Eucalyptus dalrympleana* subsp. *dalrympleana* (Mountain Gum).
Diagnostic midstorey species for PCT 1107	The midstorey is typically open and species that may be present include *Clematis aristata* (Old Man's Beard), *Leucopogon lanceolatus* and *Rubus parvifolius* (Native Raspberry).
Diagnostic groundcover species for PCT 1107	The groundcover is described as being moist, herbaceous and comprised of grass and grass like species such as *Echinopogon ovatus* (Forest Hedgehog Grass), *Lomandra longifolia* (Spiny-headed Mat-rush) and *Microlaena stipoides* var. *stipoides* (Weeping Grass). Diagnostic forb species include *Dianella caerulea* (Blue Flax-lily), *Dichondra repens* (Kidney Weed), *Plantago debilis* (Shade Plantain), *Poranthera microphylla* (Small Poranthera), *Stellaria pungens* (Prickly Starwort), *Veronica plebeia* (Trailing Speedwell) and *Viola hederacea* (Ivy-leaved Violet). The climbers *Desmodium varians* (Slender Tick-trefoil) and *Glycine clandestina* (Twining glycine) and the fern *Pteridium esculentum* (Bracken) may be present in this PCT.
Condition and presence of weeds	PCT 1107 in the project footprint is in High condition. A low cover of exotic species is present in PCT 1107 and mostly comprise wind dispersed Asteraceae (daisy) species.
Justification of evidence used to identify the PCT	PCT 1107 occurs predominantly between 600 and 1100 m asl. The PCT in the project footprint occurs within this range, at 659-770 m asl. Additionally, the canopy species *Eucalyptus radiata* subsp. *radiata* and *Eucalyptus viminalis* were recorded throughout this PCT and are diagnostic of PCT 1107. *Eucalyptus dives* was also recorded in this PCT, however this could be attributed to ecotonal variations and there is no other PCT in the BioNet Vegetation Classification System with all three canopy species present. Based on this, PCT 1107 is the best fit for the vegetation in the project footprint. The midstorey was typically open which is characteristic of PCT 1107. The diagnostic species *Clematis aristata* was recorded in the plots sampled.

PCT 1107 - River Peppermint - Narrow-leaved Peppermint open forest on sheltered escarpment slopes, Sydney Basin Bioregion and South East Corner Bioregion	
	Plots sampled confirm the presence of groundcover species diagnostic of PCT 1107, including, *Microlaena stipoides* var. *stipoides, Dichondra repens, Plantago debilis, Poranthera microphylla, Stellaria pungens, Veronica plebeia, Viola hederacea, Glycine* sp., and *Pteridium esculentum*. A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 638 within the project footprint is shown in Figure 6-1.
Photos	 **Photo 89. High condition woodland (photo taken at plot BY010012FA)**
Number of plots sampled	Two plots were sampled within the Bungonia bioregion: High condition: • BY010012FA • BY0109B6

PCT 1150 - Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion	
Vegetation formation	Dry Sclerophyll Forests (Shrubby sub-formation)
Vegetation class	South East Dry Sclerophyll Forests
Conservation status	PCT 1150 has no associated TEC.
% remaining in NSW	60
Extent	PCT 1150 occurs on sandy loams on ridges on the eastern margin of the tableland between 550 and 900m altitude.
Diagnostic canopy species for PCT 1150	The canopy is dominated by *Eucalyptus sieberi* (Silvertop Ash), *Eucalyptus agglomerata* (Blue-leaved Stringybark), *Eucalyptus globoidea* (White Stringybark) and *Eucalyptus mannifera* (Brittle Gum).
Diagnostic midstorey species for PCT 1150	The midstorey is typically open with characteristic species including *Allocasuarina littoralis* (Black She-Oak), *Hibbertia obtusifolia* (Hoary Guinea Flower) and *Persoonia linearis* (Narrow-leaved Geebung).
Diagnostic groundcover species for PCT 1150	The groundcover is comprised of species such as *Billardiera scandens* (Hairy Apple Berry), *Goodenia hederacea* (Ivy Goodenia), *Lomandra obliqua*, *Microlaena stipoides* var. *stipoides* (Weeping Grass), *Pomax umbellata* (Pomax) and *Stypandra glauca* (Nodding Blue Lily).
Condition and presence of weeds	PCT 1150 occurs in the project footprint as two condition types: • Moderate • High Exotic species are present throughout most of PCT 1150, however there is minimal weed cover in the High condition vegetation, comprising a low cover of small wind dispersed Asteraceae (daisy) species.
Justification of evidence used to identify the PCT	As mentioned above, PCT 1150 occurs on sandy loams on ridges on the eastern margin of the tableland between 550 and 900 m altitude. Majority of the PCT in the project footprint occurs on the Rockley Plains Mitchell Landscape which is described as low rolling hills on plateau surface some sandstone geology. Additionally, all of the PCT in the project footprint occurs between 659 – 898 m asl. PCT 1150 in the project footprint therefore aligns with the landscape description of PCT 1150. Diagnostic canopy species of PCT 1150 include *Eucalyptus sieberi* and *Eucalyptus globoidea*, both of which were recorded in the plots sampled in this PCT. The midstorey was typically open which is characteristic of PCT 1150. Diagnostic species midstorey species recorded include *Hibbertia obtusifolia* and *Persoonia linearis*. The non-diagnostic species,

PCT 1150 - Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion	
	Cassinia sifton was recorded in the Moderate condition vegetation ,which can most likely be attributed to disturbance factors as it is a known pioneer species of disturbed sites. Plots sampled confirm the presence of groundcover species diagnostic of PCT 1150, including *Billardiera scandens, Goodenia hederacea, Microlaena stipoides* var. *stipoides, Pomax umbellata* and *Stypandra glauca.* A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 1150 within the project footprint is shown in Figure 6-1.
Photos	 **Photo 90. Moderate condition woodland (photo taken at plot BY008-C)**

PCT 1150 - Silvertop Ash - Blue-leaved Stringybark shrubby open forest on ridges, north east South Eastern Highlands Bioregion

Photo 91. High condition woodland (photo taken at plot BY010F5E)

Number of plots sampled

Two plots were sampled within the Bungonia bioregion:

Moderate condition:

- BY008-C

High condition:

- BY010F5E

PCT 1191 - Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion	
Vegetation formation	Grassy Woodlands
Vegetation class	Subalpine Woodlands
Conservation status	PCT 1191 aligns to the Monaro Tableland Cool Temperate Grassy Woodland in the South Eastern Highlands Bioregion TEC which is listed as Critically Endangered under the BC Act. This TEC alignment only applies for PCT 1191 mapped in the Crookwell IBRA Subregion (South Eastern Highland Bioregion).
% remaining in NSW	5
Extent	PCT 1191 occurs on frost-hollow flats and footslopes in undulating tableland areas between 600 and 1100 m.
Diagnostic canopy species for PCT 1191	The canopy is dominated by *Eucalyptus pauciflora (*White Sally), *Eucalyptus rubida* subsp. *rubida* (Candlebark), *Eucalyptus stellulata* (Black Sally), *Eucalyptus viminalis* (Ribbon Gum), *Eucalyptus bridgesiana* (Apple Box) and *Eucalyptus aggregata* (Black Gum).
Diagnostic midstorey species for PCT 1191	The midstorey is typically sparse but may include species such as *Acacia dealbata* (Silver Wattle), *Acacia melanoxylon* (Blackwood) and *Lissanthe strigosa* (Peach Heath).
Diagnostic groundcover species for PCT 1191	The groundcover is typically dense and grassy and comprised of grass and grass like species such as *Elymus scaber* (Common Wheatgrass), *Microlaena stipoides* var. *stipoides* (Weeping Grass) and *Themeda triandra* (Kangaroo Grass). Forbs such as, *Chrysocephalum apiculatum* (Common Everlasting), *Gonocarpus tetragynus* (Poverty Raspwort), *Hydrocotyle laxiflora* (Stinking Pennywort) and *Hypericum gramineum* (Small St John's Wort).
Condition and presence of weeds	PCT 1191 occurs in the project footprint as two condition types: • Low • Moderate Exotic species are present throughout all of PCT 1191.
Justification of evidence used to identify the PCT	As mentioned above, PCT 1191 typically occurs on frost-hollow flats and footslopes in undulating tableland areas between 600 and 1100m. The PCT in the project footprint occurs predominantly on the Rockley Plains Mitchell Landscape which is characterised as low rolling hills on plateau. Additionally the PCT occurs between 419-898 m asl in the project footprint. The landscape position of PCT 1191 in the project footprint is therefore consistent with the landscape description of PCT 1191. The diagnostic canopy species of PCT 1191 *Eucalyptus pauciflora* and *Eucalyptus rubida* subsp. *rubida* were recorded throughout this PCT. The midstorey was typically sparse which is characteristic of PCT 1191.

PCT 1191 - Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion	
	Plots sampled confirm a dense and grassy groundcover which is characteristic of PCT 1191. Recorded diagnostic species include *Elymus scaber, Microlaena stipoides* var. *stipoides* and *Themeda triandra.* A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 1191 within the project footprint is shown in Figure 6-1.
How it meets the BC Act Determination	As outlined in Section 6.5.4 and Table 6-14 of the BDAR, PCT 1191 in Low and Moderate condition aligns to the BC Act listed Monaro Tableland Cool Temperate Grassy Woodland.
Photos	 **Photo 92. Low condition woodland (photo taken at plot BY066AC48)**

PCT 1191 - Snow Gum - Candle Bark woodland on broad valley flats of the tablelands and slopes, South Eastern Highlands Bioregion	
	 Photo 93. Moderate condition woodland (photo taken at plot 146MP009)
Number of plots sampled	Three plots were sampled within the Crookwell bioregion: Low condition: • BY06701F54 • BY066AC48 Moderate condition: • 146MP009

PCT 1196 - Snow Gum - Mountain Gum shrubby open forest of montane areas, South Eastern Highlands Bioregion and Australian Alps Bioregion	
Vegetation formation	Grassy Woodlands
Vegetation class	Subalpine Woodlands
Conservation status	PCT 1196 is associated with T*ableland Basalt Forest in the Sydney Basin and South Eastern Highlands Bioregions*. However, PCT 1196 is only mapped in the Snowy Mountains IBRA Subregion (Australian Alps Bioregion). Therefore PCT 1196 mapped in the project footprint does not align to this TEC.
% remaining in NSW	95
Extent	PCT 1196 is widespread on montane to sub alpine slopes and ridges.
Diagnostic canopy species for PCT 1196	The canopy is dominated by *Eucalyptus pauciflora* (White Sally), *Eucalyptus dalrympleana* subsp. *dalrympleana* (Mountain Gum), *Eucalyptus fastigata* (Brown Barrel), *Eucalyptus delegatensis* subsp. *delegatensis* (Alpine Ash) and occasionally *Eucalyptus robertsonii* subsp. *robertsonii* (Robertson's Peppermint).
Diagnostic midstorey species for PCT 1196	The midstorey is typically shrubby with characteristic species including *Acacia dealbata* (Silver Wattle), *Coprosma hirtella* (Coffee-berry), *Daviesia latifolia* (Bitter-pea), *Daviesia ulicifolia* (Gorse Bitter Pea), *Olearia erubescens* (Pink-tip Daisy-bush), *Olearia megalophylla* (Large-leaf Daisy-bush), *Oxylobium ellipticum* (Common Shaggy Pea), *Platylobium formosum* subsp. *formosum*, *Daviesia mimosoides* subsp. *mimosoides* and *Polyscias sambucifolia* (Elderberry Panax).
Diagnostic groundcover species for PCT 1196	The groundcover is typically grassy and comprised by species such as *Microlaena stipoides* var. *stipoides* (Weeping Grass), *Poa meionectes*, *Poa sieberiana* var. *sieberiana* (Snowgrass), *Acaena novae-zelandiae* (Bidgee-widgee), *Acaena ovina* (Acaena), *Asperula scoparia* (Prickly Woodruff), *Dianella tasmanica* (Tasman Flax-lily), *Geranium neglectum* (Crane's Bill), *Lomandra longifolia* (Spiny-headed Mat-rush), *Luzula flaccida* (Woodrush), *Persoonia chamaepitys* (Mountain Geebung), *Poranthera microphylla* (Small Poranthera), *Senecio gunnii*, *Stellaria pungens* (Prickly Starwort), *Stylidium graminifolium* (Grass Triggerplant), *Coronidium scorpioides* (Button Everlasting), *Brachyscome spathulata*, *Lagenifera stipitata* (Blue Bottle-daisy) and *Viola betonicifolia* (Native Violet).
Condition and presence of weeds	PCT 1196 occurs in the project footprint as two condition types: • Low • High Weeds are present throughout PCT 1196 with the most common weeds comprising wind dispersed species of the Poaceae (grass) and Asteraceae (daisy) families.
Justification of evidence used to identify the PCT	As mentioned above, PCT 1196 is widespread on montane to sub alpine slopes and ridges. Whilst the PCT is not characterised by a specific elevation range, the PCT in the project footprint occurs between 1,049 - 1,213 m asl. Diagnostic canopy species of PCT 1196 include *Eucalyptus pauciflora* and *Eucalyptus dalrympleana* subsp. *dalrympleana* both of which were recorded throughout this PCT.

PCT 1196 - Snow Gum - Mountain Gum shrubby open forest of montane areas, South Eastern Highlands Bioregion and Australian Alps Bioregion	
	The midstorey was typically shrubby which is characteristic of PCT 1196. Recorded diagnostic species include *Acacia dealbata, Daviesia latifolia, Daviesia ulicifolia* and *Olearia erubescens.* Plots sampled confirm the presence of groundcover species diagnostic of PCT 1196. Species include *Microlaena stipoides* var. *stipoides, Poa sieberiana* var. *sieberiana, Acaena novae-zelandiae, Asperula scoparia, Geranium neglectum, Lomandra longifolia, Poranthera microphylla, Senecio gunnii*, *Stellaria pungens, Lagenifera stipitata* and *Viola betonicifolia.* A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 1196 within the project footprint is shown in Figure 6-1.
Photos	 **Photo 94. Low condition woodland (photo taken at plot MA0023AE)**

PCT 1196 - Snow Gum - Mountain Gum shrubby open forest of montane areas, South Eastern Highlands Bioregion and Australian Alps Bioregion

Photo 95. High condition woodland (photo taken at plot MA002A30)

Number of plots sampled

Eight plots were sampled within the Snowy Mountains bioregion:

Low condition:

- MA0023AE

High condition:

- MA002A30
- MA0077B6
- MA002083
- MA002430
- WM094C4A
- WM094958
- WM0944CF

PCT 1224 - Sub-alpine dry grasslands and heathlands of valley slopes, southern South Eastern Highlands Bioregion and Australian Alps Bioregion	
Vegetation formation	Grasslands
Vegetation class	Temperate Montane Grasslands
Conservation status	PCT 1224 has no associated TEC.
% remaining in NSW	95
Extent	PCT 1224 occurs on broad, flat valley bottoms in montane to sub-alpine areas between 1200 and 1600 m.
Diagnostic canopy species for PCT 1224	An absent canopy layer is diagnostic of PCT 1224.
Diagnostic midstorey species for PCT 1224	The midstorey is typically shrubby with characteristic species including *Hakea microcarpa* (Small-fruited Hakea), *Pimelea linifolia subsp. caesia* and *Leucopogon hookeri.*
Diagnostic groundcover species for PCT 1224	The groundcover is typically mid-dense to dense with grasses and forbs such as *Aciphylla simplicifolia* (Mountain Aciphyll), *Asperula gunnii* (Mountain Woodruff), *Brachyscome decipiens* (Field Daisy), *Carex breviculmis*, *Luzula flaccida* (Woodrush), *Oreomyrrhis argentea* (Silvery Carraway), *Poa clivicola* (Fine-leaved Snowgrass), *Poa hiemata* (Soft Snowgrass), *Poa phillipsiana*, *Ranunculus graniticola* (Granite Buttercup) and *Trisetum spicatum* (Bristle Grass).
Condition and presence of weeds	PCT 1224 occurs in the project footprint in High condition. Exotic species are present in low abundance throughout PCT 1224. Exotic species present include *Trifolium subterraneum* (Subterraneum Clover), *Rumex acetosella* (Sorrel) and *Hypochaeris radicata* (Catsear).
Justification of evidence used to identify the PCT	As mentioned above, PCT 1224 is typically found on broad, flat valley bottoms in montane to sub-alpine areas between 1200 and 1600 m. Within the project footprint, PCT 1224 is situated on a broad flat with small drainage lines at an altitude of approximately 1150 m asl. It is therefore generally consistent with the landscape description of PCT 1224. A canopy was absent in PCT 1224 in the project footprint which is typical of the PCT. A midstorey was sparse in the plots sampled and included *Hakea microcarpa* which is a diagnostic species of PCT 1224 and *Epacris microphylla*. *Luzula flaccida* was the only diagnostic groundcover species recorded in the plots of PCT 1224. A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 1224 within the project footprint is shown in Figure 6-1.

PCT 1256 - Tableland swamp meadow on impeded drainage sites of the western Sydney Basin Bioregion and South Eastern Highlands Bioregion	
Vegetation formation	Freshwater Wetlands
Vegetation class	Montane Bogs and Fens
Conservation status	PCT 1256 aligns to the Montane Peatlands and Swamps of the New England Tableland, NSW North Coast, Sydney Basin, South East Corner, South Eastern Highlands and Australian Alps bioregions TEC listed as Endangered under the BC Act. PCT 1256 can also align to the Alpine Sphagnum Bogs and Associated Fens TEC listed as Endangered under the EPBC Act.
% remaining in NSW	15
Extent	PCT 1256 occurs on peats and humic loams in sediment-filled valleys up to 1000 m in the western Blue Mountains and Southern Tablelands.
Diagnostic canopy species for PCT 1256	An absent canopy layer is diagnostic of PCT 1256.
Diagnostic midstorey species for PCT 1256	The midstorey is typically shrubby with characteristic species including *Leptospermum juniperinum* (Prickly Tea-tree), *Leptospermum obovatum* and *Lythrum salicaria* (Purple Loosestrife).
Diagnostic groundcover species for PCT 1256	The groundcover is typically dense with sedges and forbs and comprises species such as *Baumea rubiginosa, Carex gaudichaudiana, Eleocharis sphacelata* (Tall Spike Rush), *Isachne globosa* (Swamp Millet), *Juncus usitatus, Phragmites australis* (Common Reed) and *Poa labillardierei* var. *labillardierei* (Tussock). Forb species include *Ranunculus inundatus* (River Buttercup) and *Hydrocotyle sibthorpioides*.
Condition and presence of weeds	PCT 1256 occurs in the project footprint in Low condition. PCT 1256 in the project footprint was mostly found in drainage channels in highly disturbed areas. Due to this, exotic species are present throughout PCT 1256, with a dominant species being *Phalaris aquatica* (Phalaris).
Justification of evidence used to identify the PCT	As mentioned above, PCT 1256 is typically found in sediment-filled valleys up to 1000 m. All of the PCT in the project footprint occurs between 419-898 m asl and was recorded in boggy areas of impeded drainage near the headwaters of streams. The PCT occurs across three Mitchell Landscapes in the project footprint; Boorowa Volcanics, Marilba Range and Rockley Plains. The Rockley Plains Mitchell landscape is associated with Silurian and Ordovician slate, phyllites, felspathic sandstones and interbedded volcanics. The Boorowa Volcanics Mitchell Landscape is associated with volcanic rocks varying in composition from felsic to intermediate and associated sedimentary rocks while the Marilba Range Mitchell landscape is also associated with steep dipping Devonian rhyolite, dacite, andesite, tuff and shale (DECC, 2002). The landscape position of PCT 1256 in the project footprint is therefore consistent with the landscape description of PCT 1256.While a midstorey was absent in the plots sampled, the plots sampled confirmed the presence of groundcover species diagnostic of PCT 1256, including *Carex gaudichaudiana, Juncus usitatus* and *Poa labillardierei* var. *labillardierei.*

PCT 1256 - Tableland swamp meadow on impeded drainage sites of the western Sydney Basin Bioregion and South Eastern Highlands Bioregion	
	A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 638 within the project footprint is shown in Figure 6-1.
How it meets the BC Act Determination	As outlined in Section 6.5.5 and Table 6-15 of the BDAR, PCT 1256 in Low condition aligns to the BC Act listed Montane Peatlands and Swamps.
Photos	 **Photo 97. Low condition (photo taken at plot BY-057C)**
Number of plots sampled	Two plots were sampled within the Crookwell bioregion: Low condition: • BY-057C • YG0202FD

PCT 1330 - Yellow Box - Blakelys Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion	
Vegetation formation	Grassy Woodlands
Vegetation class	Southern Tableland Grassy Woodlands
Conservation status	PCT 1330 aligns to the TEC White Box Yellow Box Blakely's Red Gum Grassy Woodland and Derived Native Grassland listed as a CEEC under the BC and EPBC Act.
% remaining in NSW	6
Extent	PCT 1330 occurs on loamy soils on undulating terrain between 500 and 900m on the tablelands.
Diagnostic canopy species for PCT 1330	The canopy can be diverse but is typically dominated by *Eucalyptus melliodora* (Yellow Box) and *Eucalyptus blakelyi* (Blakely's Red Gum). Other species present include *Eucalyptus bridgesiana* (Apple Box), *Eucalyptus dives* (Broad-leaved Peppermint), *Eucalyptus macrorhyncha* (Red Stringybark), *Eucalyptus rubida* subsp. *rubida* (Candlebark), *Eucalyptus pauciflora* (White Sally), *Eucalyptus mannifera* (Brittle Gum) and *Eucalyptus viminalis* (Ribbon Gum).
Diagnostic midstorey species for PCT 1330	The midstorey is typically sparse with diagnostic species such as *Lissanthe strigosa* (Peach Heath) and *Melichrus urceolatus* (Urn Heath) present.
Diagnostic groundcover species for PCT 1330	The groundcover is typically dense with grass species such as *Bothriochloa macra* (Red Grass), *Microlaena stipoides* var. *stipoides* (Weeping Grass) and *Themeda triandra* (Kangaroo Grass). Other diagnostic species include *Lomandra filiformis* subsp. *coriacea* (Wattle Matt-rush), *Gonocarpus tetragynus* (Poverty Raspwort), *Goodenia hederacea* (Ivy Goodenia) and *Hydrocotyle laxiflora* (Stinking Pennywort).
Condition and presence of weeds	PCT 1330 occurs in the project footprint as five condition types: • Very low • Low • Moderate • High • Very high Exotic species are present throughout all of PCT 1330 in the project footprint, and are particularly dominant in the Very low and Low condition vegetation where exotic pasture grass is prevalent.
Justification of evidence used to identify the PCT	As mentioned above, PCT 1330 occurs on loamy soils on undulating terrain between 500 and 900m on the tablelands. The majority of the PCT in the project footprint occurs between 419-898 m asl, however there are small portions that occur under 418 m and over 899 m asl. The PCT in the project footprint occurs across twelve Mitchell Landscapes most are described as hills and plains (Rockley Plains, Gundary Plains, Dalton Hills, Wollondilly - Bindook Tablelands and Gorges, Boorowa Volcanics, Oberon - Kialla Granites, Gunning Hills, Marilba Range, Burrinjuck Ridges, Crookwell Basalts and Sands, Upper Lachlan Channels and Floodplains and Towrang Ranges). The landscape position of PCT 1330 in the project footprint is therefore generally consistent with the landscape description of PCT 1330.

PCT 1330 - Yellow Box - Blakelys Red Gum grassy woodland on the tablelands, South Eastern Highlands Bioregion	
	Diagnostic canopy species of PCT 1330 include *Eucalyptus melliodora, Eucalyptus blakelyi, Eucalyptus bridgesiana, Eucalyptus dives, Eucalyptus macrorhyncha, Eucalyptus rubida* subsp. *rubida, Eucalyptus mannifera* and *Eucalyptus viminalis,* all of which were the most common canopy species recorded in the plots sampled. The midstorey is mostly sparse, which is characteristic of PCT 1330. The diagnostic species *Lissanthe strigosa* and *Melichrus urceolatus* were recorded in a low abundance throughout the PCT. *Cassinia sifton* was recorded throughout most of the PCT, however this can be attributed to past and present land management practices as the species is known to be a pioneer species in disturbed areas. Plots sampled confirm the presence of groundcover dominated by grasses and recorded diagnostic species include *Bothriochloa macra, Microlaena stipoides* var. *stipoides, Themeda triandra, Lomandra filiformis* subsp. *coriacea, Gonocarpus tetragynus, Goodenia hederacea* and *Hydrocotyle laxiflora*. A full species list for all surveyed plots is found in Appendix 5 and the extent of PCT 1330 within the project footprint is shown in Figure 6-1.
How it meets the BC Act Determination	As outlined in Section 6.5.1 and Table 6-10 of the BDAR, PCT 1330 in Very low, Low, Moderate, High and Very high condition aligns to the BC Act listed White Box Yellow Box Blakely's Red Gum Grassy Woodland and Derived Native Grassland.
How it meets the EPBC Act Determination	As outlined in Section 6.5.1 and Table 6-11 of the BDAR, PCT 1330 in Moderate, High and Very high condition aligns to the EPBC Act listed White Box Yellow Box Blakely's Red Gum Grassy Woodland and Derived Native Grassland.

Attachment 11. Planted native vegetation streamlined assessment module

Throughout the project footprint, there are approximately 48 hectares of mapped planted native vegetation. This vegetation is largely planted along the boundaries of paddocks, for the purposes of windbreaks within agricultural landscapes. Planted native vegetation occurs in five of the six IBRA subregions that comprise the project footprint:

- Inland slopes
- Bondo
- Crookwell
- Bungonia
- Murrumbateman.

Assessment against Appendix D1 of the BAM indicates planted native vegetation within the project footprint is consistent with Question 5 of the decision-making key (refer to Table A11- 1).

Planted native vegetation was assessed through a combination of ground truthing and aerial photo interpretation. For areas that were not ground-truthed (due to access limitations), planted native vegetation was identified through aerial photography, indicated by linear strips of vegetation of even age, often concentrated along paddock edges or as rectangular patches. Table A11- 2 provides an overview of planted native vegetation identified within the project footprint, the location of plantings in reference to Figure 4-1 and the level of field assessment undertaken at each location.

The planted Native Vegetation present within the project footprint consists predominantly of planted rows of Eucalypt, Casuarina and Acacia species, as well as exotic *Pinus* and *Cuppressus* species, occurring above an exotic groundcover. Where present, tree species were generally young and lacked hollows or other signs of fauna occupation (ie nests). No other key habitat features were present within the areas of planted native vegetation (ie rock outcrops, fallen timber, significant accumulations of leaf litter, aquatic environments). Field assessments undertaken indicate a general lack of habitat for candidate threatened species within the planted windbreaks. Furthermore, no incidental sightings or evidence (eg scats, stick nests) of candidate threatened species occupation was noted. Planted Native Vegetation not subject to field assessment is considered consistent with other planted vegetation occurring within the project footprint and is unlikely to support candidate threatened species or their habitats.

As no threatened species were observed, indicated or considered likely to use the planted native vegetation as habitat, the proposed clearing of planted vegetation within the project footprint does not need to address section 8.4 of the BAM (mitigate and manage impacts on biodiversity values). Furthermore, offsets for any ecosystem or species credits are not required.

Table A11- 1: Planted native vegetation streamlined assessment module decision-making key (DPIE, 2020)

Decision making key		Response
1	Does the planted native vegetation occur within an area that contains a mosaic of planted and remnant native vegetation and which can be reasonably assigned to a PCT known to occur in the same IBRA subregion as the proposal?	**No** The areas mapped as planted native vegetation generally occur as rows of Eucalyptus, Melaleuca, or Acacia, with limited structural complexity (often lacking a shrub layer), exotic understorey and limited natural resilience. Remnant vegetation was generally absent from areas mapped as planted Native Vegetation.
2	Is the planted native vegetation: a. planted for the purpose of environmental rehabilitation or restoration under an existing conservation obligation listed in BAM Section 11.9(2.), and b. the primary objective was to replace or regenerate a plant community type or a threatened plant species population or its habitat?	**No** From review of aerial photographs and ground truthing, areas mapped as planted Native Vegetation appear to be mostly acting as windbreaks within an agricultural landscape. The plantings were not likely to have been required for the purpose of environmental rehabilitation or restoration under an existing conservation agreement or to replace or regenerate a plant community type or a threatened plant species population or habitat.
3	Is the planted/translocated native vegetation individuals of a threatened species or other native species planted/translocated for the purpose of providing threatened species habitat under one of the following: a. a species recovery Project b. Saving our Species Project c. other types of government funded restoration Project d. condition of consent for a development approval that required those species to be planted or translocated for the purpose of providing threatened species habitat e. legal obligation as part of a condition or ruling of court. This includes regulatory directed or ordered remedial plantings (e.g. Remediation Order for clearing without consent issued under the BC Act or the Native Vegetation Act) f. ecological rehabilitation to re-establish a PCT or TEC that was, or is carried out under a mine operations plan, or g. approved vegetation management plan (e.g. as required as part of a Controlled Activity Approval for works on waterfront land under the NSW Water Management Act 2000)?	**No** The plantings are not likely to have been required for any of the above listed purposes. As stated above, it appears that the areas mapped as planted native vegetation appear to be mostly acting as windbreaks within an agricultural landscape.
4	Was the planted native vegetation (including individuals of a threatened flora species) undertaken voluntarily for revegetation, environmental rehabilitation or restoration without a legal obligation to secure or provide for management of the native vegetation?	**Unlikely** Given the location of the plantings, it is more likely that these planting were established for the purpose of a windbreak within an agricultural landscape, as detailed in question 5 below.
5	Is the native vegetation (including individuals of a threatened flora species) planted for functional, aesthetic, horticultural or plantation forestry purposes? This includes examples such as: windbreaks in agricultural landscapes, roadside plantings (including street trees, median strips, roadside batters), landscaping in parks, gardens and sport fields/complexes, macadamia plantations or teatree farms?	**Yes** The areas of planted native vegetation generally occur as linear strips of vegetation of even age, often concentrated along paddock edges. Presumably, the primary purpose of these areas is to act as a windbreak within an agricultural landscape.

Attachment 12: Threatened species habitat mapping and polygon development

This attachment documents the approach to species polygon development, White-bellied Sea-eagle waterway assessment, and threatened flora count estimates.

1. Species polygon development

Broadly, a three-step process was applied to produce final species polygons for candidate threatened flora and fauna species under BAM 2020 for the Humelink project. This comprised:

1. habitat mapping
2. review of targeted survey effort and results
3. finalisation of polygons.

1.1 Habitat mapping

Suitable habitats were mapped for candidate species using a stepwise process (as outlined below) and adopting the criteria outlined within Table A12- 3 and Table A12- 4 for each relevant species. An iterative mapping process was adopted. Initially, habitat maps were generated using publicly available datasets, such as State Vegetation Mapping, to inform priorities for targeted survey. As field data became available, habitat mapping was further refined to incorporate the ground-truthed site specific data. Supplementary mapping was also completed to support the identification of habitat constraints within inaccessible lands, using the methods outlined in Section 4.10.2 of the BDAR. The mapping approach applied is as follows:

- Vegetation zones constituting associated PCTs according to the TBDC were identified and non-associated PCTs excluded
- Geographic constraints as listed within the TBDC were determined spatially and relevant areas excluded
- Patch size was assigned to each vegetation polygon and areas excluded where vegetation polygons did not meet the patch size threshold for the candidate species, as per the TBDC
- A surrounding native woody vegetation cover score was calculated and the relevant category (<10%, 10-30%, 31-70%, >70%) assigned to each vegetation polygon based on woody vegetation mapped within 500 m of each polygon. Native vegetation cover was not applied as a filter to remove candidate species from the assessment (as per Section 5.2.1 Step 1 of the BAM). Rather, native vegetation cover was used to inform the extent of suitable habitat which species are likely to occupy. Vegetation polygons that did not meet the vegetation cover threshold for a species were considered degraded (in accordance with Section 5.2.3 Step 3 of the BAM and Section 4.4.3 of the BAM 2020 Ops Manual) and were removed from the species polygons. Species affected by this step are the 18 fauna species in section 4.2 with a native cover prescription of >10%.
- Habitat constraints as listed within the TBDC for relevant species were interpreted and applied using a mixture of field collected and other available data in consultation with the BCD where considered required for particular species. Habitat constraints that were applied as a filter for candidate species included:
    - waterbodies, riparian areas and drainage lines
    - cliffs
    - karst areas
    - rocky areas
    - hollow presence/ absence and associated hollow size class or other prescription (e.g. hollows greater than 20 centimetres diameter)

Where appropriate data was not available all potential habitat was retained (e.g. if trees were present as determined from aerial photography, but on-ground habitat mapping was not undertaken, then hollow trees of all size classes were assumed present

- Degraded habitats were defined and excluded where degradation resulted in necessary microhabitats for particular candidate species being absent. Where relevant, degraded habitats generally corresponded with:
    - low and very low condition PCTs subject to significant land use disturbance as a result of historical clearing, cropping and intensive grazing practices
    - vegetation that was under-scrubbed or lacking a native understorey
    - Category 1 lands and scattered trees completely enveloped by these lands.

1.2 Survey effort review

Following completion of the field survey program, a review of targeted survey effort, timing (seasonality) and results was undertaken for each species to further reduce the extent of mapped species polygons. This assessment did not apply to candidate species that were not subject to targeted survey or for which very limited survey was undertaken (refer to 2 and 3). Survey effort was reviewed for candidate flora and fauna species as outlined below.

- **Threatened flora**:
    - Flora grid searches (20m radius) and BAM plot locations were overlayed with mapped habitat (as described in Section 1.1) for each candidate flora species. The species was considered absent within that specific survey area where all of the below statements were true:
        - Surveys were undertaken within the appropriate season
        - The candidate species was targeted
        - A minimum survey effort of one flora survey per hectare of habitat was achieved
        - The target flora species was not directly recorded.
    - Buffered parallel transect polylines were then overlayed with remaining habitat areas and those areas excluded where targeted species were not recorded during the appropriate survey season. The extent of the buffer used for transects was informed by relevant survey guidelines based on the species lifeform and density of vegetation.
    - Mapped habitats for which the species was considered absent due to meeting the survey requirements were excluded from the species polygons.
    - Where a threatened flora species was recorded, a 30 metre buffer was applied to the point or polygon record. These areas were incorporated into the final species polygons.

Figure A12- 1: Examples of survey effort adequacy approach for threatened flora: areas inside of the green boxed areas (for survey points where concentration was > 1 point/ha) or blue shaded areas (for survey transects) were considered adequately surveyed depending on survey timing and target species

- **Threatened fauna**:
    - Survey effort was assessed across survey units established within mapped habitat (as described in Section 1.1) inside the project footprint.
    - The survey unit for most species including birds, bats (except Southern Myotis), mammals and reptiles, comprised a combination of Mitchell Landscape and vegetation formation. For example, one survey unit was: Dry Sclerophyll Forest (vegetation formation) within the Adelong Granite Ranges (Mitchell Landscape). Table A12 -1 outlines the survey unit applied for each target fauna group. An example of each unique fauna survey unit is shown below in Figure A12-1 and Figure A12- 2.
    - The survey unit for frogs and the Southern Myotis, comprised individual streams (2nd order and above since 1st order streams did not contain sufficient pools) with a buffer applied as per the TBDC (eg 200 metres for Southern Myotis).
    - The extent of suitable habitat within each survey unit was calculated in hectares to inform the total survey requirements according to relevant survey guidelines. For example, survey prescriptions for Southern Myotis include a minimum of 16 trap nights over 4 separate nights for every 2.5 kilometres of stream length (equivalent to 50 hectares when buffered by 200 metres). This was scaled appropriately (eg - where a survey unit supports 5 kilometres of stream, the survey requirement is multiplied by two). Table A12 -1 outlines the survey effort requirements applied to each survey unit for each fauna group.
    - Where survey requirements for targeted species were met for a survey unit, the species was considered absent unless directly recorded, in which case the entire survey unit was retained within the species polygon. Mapped habitats for which the species was considered absent based on meeting the survey requirement within a unit were excluded from the species polygons.
    - Mapped habitats occurring within 100m of a confirmed record where documented as recorded habitat within Section 7.3.3 of the BDAR.

Given survey access and seasonality constraints, the majority of mapped habitats have been retained for each candidate species. Survey units and requirements outlined in Table A12- 1 will be reviewed to further revise species polygons based on expert advice and additional surveys.

Figure A12- 2: Example of survey units for frogs and Southern Myotis

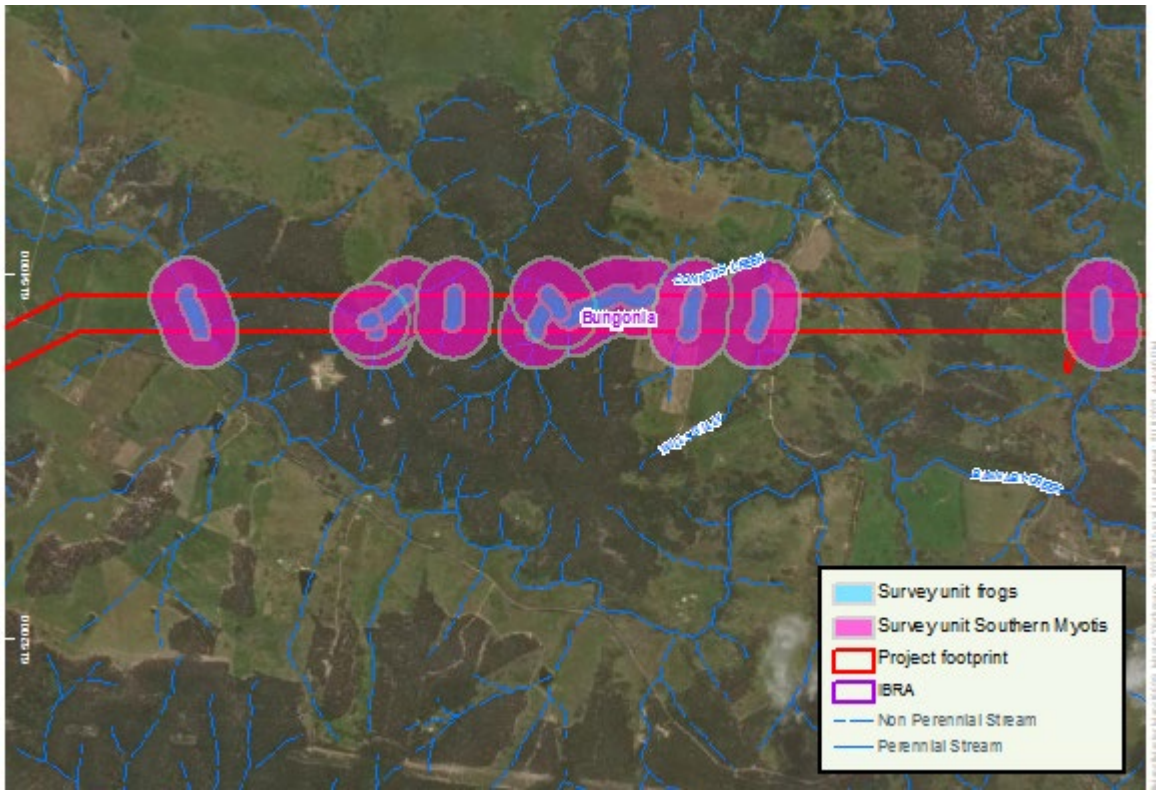

Figure A12- 3: Example of survey units for all other threatened fauna

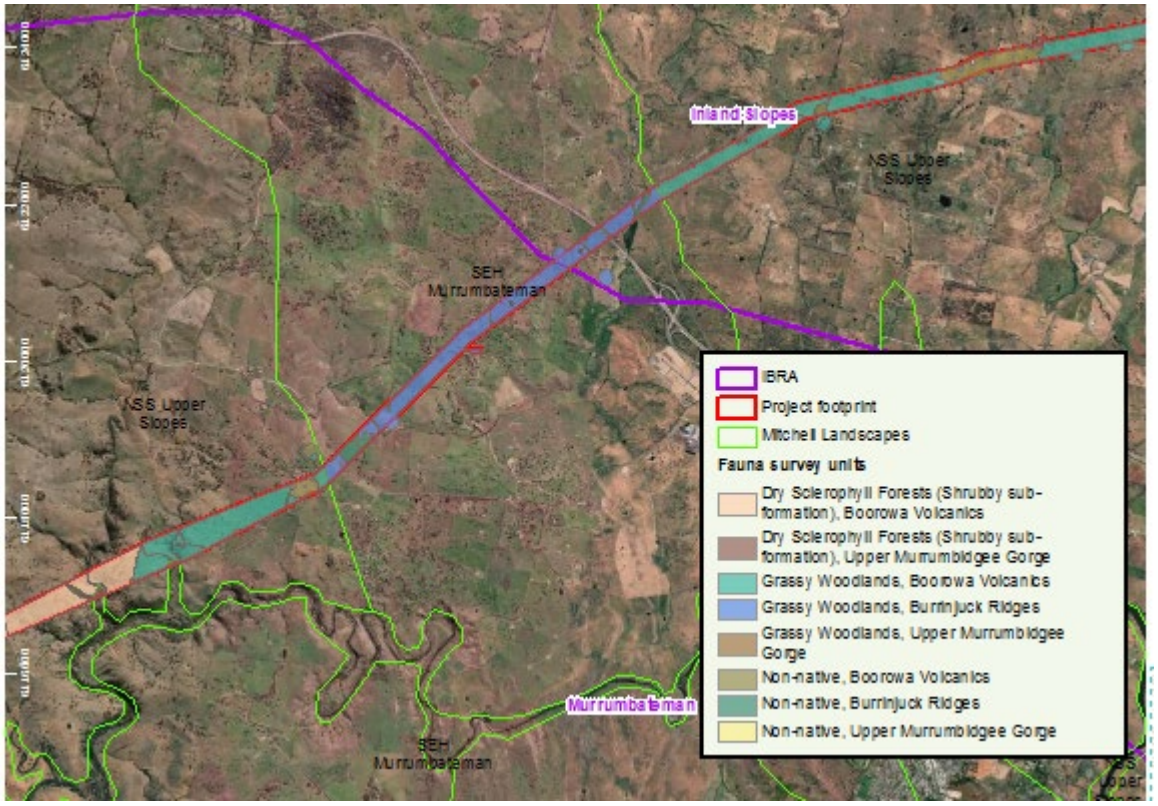

Table A12- 1: Fauna survey effort requirements

Scientific name	Common name	Survey unit	Survey method	Survey effort requirement per survey unit
Amphibians				
Crinia sloanei	Sloane's Froglet	Strahler 2nd order and above, 0.5km length, 50m Buffer	Frog census	Total 480 mins over at least 4 days
Litoria castanea	Yellow-spotted Tree Frog	Strahler 2nd order and above, 0.5km length, 50m Buffer	Frog census	Total 480 mins over at least 4 days
Mixophyes balbus	Stuttering Frog	Strahler 2nd order and above, 0.5km length, 50m Buffer	Frog census	Total 480 mins over at least 4 days
Pseudophryne corroboree	Southern Corroboree Frog	Strahler 2nd order and above, 0.5km length, 50m Buffer	Frog census	Total 480 mins, at least 4 survey points
Bats				
Chalinolobus dwyeri	Large-eared Pied Bat	Mitchell Landscape and Veg Formation	Bat recorder	At least 16 trap nights total per 50 ha
			Harp trap	At least 16 trap nights per 50 ha
Miniopterus orianae oceanensis	Large Bent-winged Bat	Mitchell Landscape and Veg Formation	Bat recorder	At least 16 trap nights total per 50 ha
			Harp trap	At least 16 trap nights per 50 ha
Myotis macropus	Southern Myotis	Strahler 2nd order and above, 2.5km length, 200m Buffer	Bat recorder	16 trap nights per 50 ha
			Harp trap	16 trap nights per 50 ha
Birds				
Burhinus grallarius	Bush Stone-curlew	Mitchell Landscape and Veg Formation	Call playback	At least 5 surveys per 200 ha
Callocephalon fimbriatum	Gang-gang Cockatoo	Mitchell Landscape and Veg Formation	Bird survey 2ha	Total 12 hours over at least four days per 50 ha
Calyptorhynchus lathami	Glossy Black-Cockatoo	Mitchell Landscape and Veg Formation	Bird survey 2ha	Total 12 hours over at least four days per 50 ha
Hieraaetus morphnoides	Little Eagle	Mitchell Landscape and Veg Formation	Bird survey 2ha	Total 12 hours over at least four days per 50 ha
Lophoictinia isura	Square-tailed Kite	Mitchell Landscape and Veg Formation	Bird survey 2ha	Total 12 hours over at least four days per 50 ha
Ninox connivens	Barking Owl	Mitchell Landscape and Veg Formation	Call playback	at least 5 surveys per 200 ha
Ninox strenua	Powerful Owl	Mitchell Landscape and Veg Formation	Call playback	at least 5 surveys per 200 ha
Petroica rodinogaster	Pink Robin	Mitchell Landscape and Veg Formation	Bird survey 2ha	Total 12 hours over at least four days per 50 ha
Polytelis swainsonii	Superb Parrot	Mitchell Landscape and Veg Formation	Bird survey 2ha	Total 12 hours over at least four days per 50 ha

Scientific name	Common name	Survey unit	Survey method	Survey effort requirement per survey unit
Tyto novaehollandiae	Masked Owl	Mitchell Landscape and Veg Formation	Call playback	at least 8 surveys per 200 ha
Tyto tenebricosa	Sooty Owl	Mitchell Landscape and Veg Formation	Call playback	at least 6 surveys per 200 ha
Marsupials				
Cercartetus nanus	Eastern Pygmy-possum	Mitchell Landscape and Veg Formation	Camera trap	100 nights for 50 ha (at least 8 cameras). The same effort for every additional 100 ha.
			Hair tube	20 tubes over at least four days per 50 ha
Petauroides volans	Greater Glider	Mitchell Landscape and Veg Formation	Elliot transect	100 trap nights per 50 ha
			Spotlighting	4 hours over at least two nights per 100 ha
Petaurus norfolcensis	Squirrel Glider	Mitchell Landscape and Veg Formation	Camera trap	100 nights for 50 ha (at least 8 cameras). The same effort for every additional 100 ha.
			Elliot transect	100 trap nights per 50 ha
			Hair tube	20 tubes over at least four days per 50 ha
			Spotlighting	5 hours over at least two nights per 100 ha
Petrogale penicillata	Brush-tailed Rock-wallaby	Mitchell Landscape and Veg Formation	Camera trap	100 nights for 50 ha (at least 8 cameras). The same effort for every additional 100 ha.
Phascolarctos cinereus	Koala	Mitchell Landscape and Veg Formation	Spotlighting	5 hours over at least two nights per 100 ha
Reptiles				
Aprasia parapulchella	Pink-tailed Legless Lizard	Mitchell Landscape and Veg Formation	Reptile search	Total 2 hours over at least 4 days per 50 ha
Cyclodomorphus praealtus	Alpine She-oak Skink	Mitchell Landscape and Veg Formation	Reptile search	Total 2 hours over at least 4 days per 50 ha
Rodents				
Mastacomys fuscus	Broad-toothed Rat	Mitchell Landscape and Veg Formation	Camera trap	100 nights for 50 ha (at least 8 cameras). The same effort for every additional 100 ha.
Pseudomys fumeus	Smoky Mouse	Mitchell Landscape and Veg Formation	Camera trap	100 nights for 50 ha (at least 8 cameras). The same effort for every additional 100 ha.

1.3 Impact assessment and final species polygon development

Remaining mapped habitat (after survey effort review described above) was clipped to the indicative disturbance area to provide the final species polygons.

2. White-bellied Sea-eagle waterway assessment

A desktop-based habitat assessment for the White-bellied Sea-eagle was undertaken to identify any large perennial streams or waterbodies that may support species across all IBRA subregions traversed by the project footprint.

A review of the species habitat and ecology was completed to determine key defining habitat characteristics, including information held in the TBDC, augmented by field observations by the Niche team of foraging/nesting activity by the species in inland waterways. This information was used to guide a desktop assessment of waterways and waterbodies intersected by the project footprint. This review utilised high-resolution aerial imagery, waterway and waterbody layers, Strahler stream order mapping, field-based aquatic habitat assessments and photo recording. Farm dams were excluded from the assessment, with major dams and water storages included in the assessment.

A total of 22 major waterways and waterbodies intersecting the project footprint were identified as having the potential to support the White-bellied Sea-eagle. These major waterways typically had a stream order greater than or equal to five, were perennial, with flowing reaches or elongated long pools with a high degree of longitudinal connectivity, generally with an average wetted stream width of approximately ten metres or greater. These features were used to inform selection where the assessment was limited by the resolution of aerial imagery or field assessment coverage. Major waterways and waterbodies intersecting with the project footprint that may support habitat for the White-bellied Sea-eagle are outlined below including stream orders to identify the relevant sections:

- Tarlo River (5)
- Middle Creek (5)
- Lachlan River (6)
- Jerrawa Creek (5)
- Derringullen Creek (5)
- Bowning Creek (5)
- Murrumbidgee Creek (9)
- Oak Creek (5)
- Adjungbilly Creek (6)
- Pejar Dam (-)
- Brungle Creek (5)
- Tumut River (8)
- Gocup Creek (4)
- Sandy Creek (5)
- Gilmore Creek (6)
- Adelong Creek (5)
- Yaven Creek (5)
- Tarcutta Creek (6)
- Umbango Creek

- Keajura Creek (6)
- Kyeamba Creek (7)
- O'Briens Creek (5).

3. Threatened flora count estimates

There are ten 'count species' recorded or assumed to be present within the project footprint. These species generate species credits based on the number of individuals recorded within areas of identified habitat. As per the Guideline for Surveying threatened plants and their habitats (DPIE 2020c), when a 'count of individual' species is assumed present, the number of individuals (single mature organisms as defined by BAM 2020) likely to be present within the project footprint will need to be estimated (eg based on reference sites). The approach to generate population estimates must be evidence-based and clearly documented in the BDAR.

Two 'count' threatened flora species were directly recorded within the project footprint: Ammobium craspedioides (Yass Daisy) and Leucochrysum albicans var. tricolor (Hoary Sunray). Survey data comprising counts of all individuals (ie not limited to consideration of mature versus immature individuals) within known habitat areas of the project footprint were applied to mapped potential habitat by means of the below methodology (Steps 1 to 4) to directly inform count estimates across areas not surveyed.

For other count threatened flora species for which presence has been assumed, the BCD provided advice on 8 March 2023 (via email) to inform count estimates. Given the estimates provided were based on population counts from within known sites only, it is reasoned that a provision for significant patches of unoccupied habitat in between areas of occupied habitat has not been made. In the context of the HumeLink project and other long linear developments, it is a certainty that large patches of non-occupied habitat between any known patches will be the dominant feature, which is reinforced by the number of surveys completed that did not result in the positive detection of relevant 'count' species target flora species. Step 1 of the below method accounts for inclusion of non-occupied habitat.

The methodology applied to obtain estimates for count threatened flora species directly impacted by the Humelink project incorporated four key steps, as detailed further below.

Step 1: Threatened flora strike rate: A threatened flora strike rate was calculated for each count flora species using the below formula. For threatened flora directly recorded, the total number of targeted surveys completed for each species (in accordance with guideline requirements) was reviewed to obtain the proportion of surveys (within mapped habitat) from which the target species was detected (ie a strike rate). For threatened flora that were not encountered during relevant targeted survey the strike rate was obtained by assuming a single positive detection occurred during all surveys performed.

$$Threatened\ flora\ strike\ rate = \frac{number\ of\ targeted\ surveys\ with\ positive\ detection}{total\ number\ of\ targeted\ surveys} \times 100$$

Step 2: Extent of occupied habitat: The threatened flora strike rate obtained for each count species was then multiplied by the total extent of potential habitat available for that species within the indicative disturbance footprint (ie subject to direct impacts). This was undertaken to obtain an estimate of the proportion of impacted habitat likely to be occupied by the species. The following equation was applied for each flora count species:

$$Occupied\ habitat\ (ha) = Potential\ habitat\ (ha) \times threatened\ flora\ strike\ rate$$

Step 3: Estimate count per hectare**:** A per hectare count estimate was obtained for two threatened flora species directly recorded within the project footprint using the below formula and survey data: *Ammobium craspedioides* (Yass Daisy) and *Leucochrysum albicans var. tricolor* (Hoary Sunray). For all other count flora species for which presence is assumed, a density estimate was obtained based on BCD advice provided.

$$Estimated\ count\ per\ hectare = \frac{average\ number\ of\ plants\ detected\ per\ positive\ survey}{occupied\ area\ (ha)}$$

Again, no allowance was made for the presence of immature individuals despite it being highly likely that these contributed towards count estimates provided by the BCD and are not required to be considered under BAM 2020.

Step 4: Final count estimate: The per hectare count estimate obtained for each species was multiplied by the total calculated extent of predicted habitat to provide a final count estimate for each count threatened flora species subject to direct impacts. The final count estimate obtained for each species formed the basis for the impact assessment and offset calculations for the project.

$$Final\ count\ = estimated\ count\ per\ hectare \times extent\ of\ predicted\ habitat$$

The following species had a total estimated count of one individual but suitable habitats included multiple vegetation zones:

- *Eucalyptus aggregata* (Black Gum)
- *Eucalyptus alligatrix subsp. alligatrix*
- *Eucalyptus cannonii* (Capertee Stringybark)
- *Eucalyptus robertsonii subsp. hemisphaerica* (Robertson's Peppermint)
- *Eucalyptus cannonii* (Capertee Stringybark).

With the exception of *Eucalyptus cannonii*, associated vegetation zones were generally less than 0.5 ha for each species. To avoid a significant overestimate of counts, a count of one individual was added to the largest vegetation zone only. For *Eucalyptus cannonii* (Capertee Stringybark), a count of one individual was conservatively assigned to all three vegetation zones for the species.

Table A12- 2 Final flora species count estimates

Scientific name	Common name	IBRA subregion	Step 1: Threatened flora strike rate (%)	Step 2: Extent of occupied habitat (ha)	Step 3: Estimated count/ ha	Step 4: Final count estimate	BCD advice
Acacia phasmoides	Phantom Wattle	Inland Slopes	1.43	0.01	123.5	1.48 (rounded to two individuals)	No advice was provided by the BCD for this species. In the absence of any guidance, the estimate of individuals per hectare for *Grevillea iaspicula* was assumed for this species.
Ammobium craspedioides	Yass Daisy	Crookwell, Murrumbateman, Inland Slopes, Bondo	0.98	2.35	801	1,168	The third equation above was used to generate the estimated number of individuals per hectare.
Eucalyptus aggregata	Black Gum	Crookwell, Murrumbateman, Inland Slopes	0.1	0.003	13	0.02 (rounded to 1 individual)	As per BCD's advice, Field (2008) recorded the largest population of *Eucalyptus aggregata* as 13 reproductive individuals per hectare. The definition of an individual within the BAM is: "Individual: in relation to organisms, a single, mature organism that is a threatened species, or any other threatened species listed under Part 13 of the EPBC Act." Given this, 13/ha has been applied.
Eucalyptus alligatrix subsp. *alligatrix*	-	Inland Slopes	0.24	0.005	30	0.08 (rounded to 1 individual)	The BCD provided a range of 10/ha – 30/ha depending on the vegetation condition (the higher the condition the higher the number of individuals). Whilst the potential habitat in the project footprint ranges in condition, a conservative approach has been applied and assumed 30 individuals per hectare.
Eucalyptus cannonii	Capertee Stringybark	Inland Slopes	0.24	0.03	30	0.34 (rounded to 1 individual)	The BCD provided a range of 10/ha – 30/ha depending on the vegetation condition (the higher the condition the higher the number of individuals). Whilst the potential habitat in the project footprint ranges in condition, a conservative approach has been applied and assumed 30 individuals per hectare.
Eucalyptus macarthurii	Paddy's River Box	Bungonia	1.05	0.17	170	18	The BCD provided an estimate of 170/ha, this number was applied in the calculations.

Scientific name	Common name	IBRA subregion	Step 1: Threatened flora strike rate (%)	Step 2: Extent of occupied habitat (ha)	Step 3: Estimated count/ ha	Step 4: Final count estimate	BCD advice
Eucalyptus robertsonii subsp. *hemisphaerica*	Robertson's Peppermint	Crookwell	0.48	0.01	20	0.03 (rounded to 1 individual)	The BCD provided a range of 10/ha – 20/ha depending on the vegetation condition (the higher the condition the higher the number of individuals). Whilst the potential habitat in the project footprint ranges in condition, a conservative approach has been applied and assumed 30 individuals per hectare.
Grevillea iaspicula	Wee Jasper Grevillea	Murrumbateman	0.25	0.12	123.5	9	The BCD provided an average estimate of 123.5/ha, this number was applied in the calculations.
Leucochrysum albicans var. *tricolor*	Hoary Sunray	Bungonia, Crookwell, Murrumbateman, Inland Slopes, Bondo, Snowy Mountains	1.28	3.90	31014.6	17,096	The BCD provided a range for this species of 37,500/ha - 103,000/ha. However, surveys within the project footprint recorded 184 locations with *Leucochrysum albicans* var. *tricolor*. Given this, it was assumed the recorded numbers within the project footprint would be more accurate than an estimate that may be based on stewardship and/or conservation sites.
Rutidosis leiolepis	Monaro Golden Daisy	Snowy Mountains	1.67	0.0025	84,052	350	The BCD provided an estimate of 84,052/ha, this number was applied in the calculations.

4. Habitat mapping criteria

4.1 Threatened flora

Table A12- 3: Habitat mapping criteria for candidate threatened flora

Scientific name	Common name	BC Act Status	EPBC Act Status	SAII	Associated PCTs within the project footprint	IBRA subregion	Geographic constraints	BioNet Habitat constraints (Incl. Breeding and Foraging)	Patch size	Vegetation cover	Habitat constraints applied	Degraded habitats removed
Acacia ausfeldii	Ausfeld's Wattle	V	-	-	PCT 266 and 276	Inland Slopes; Murrumbateman	None	Foot slopes and low rises on sandstone	N/A	N/A	None	Low and Very low condition
Acacia bynoeana	Bynoe's Wattle	E	V	-	PCT 1093	Bungonia; Crookwell	None	None	N/A	N/A	None	Low and Very low condition

4.2 Threatened fauna habitat mapping criteria

Table A12- 4: Habitat mapping criteria for candidate threatened fauna

Group	Scientific name	Common name	BC Act status	EPBC Act status	SAII	Associated PCTs within the project footprint	IBRA subregion	Geographic constraints	BioNet habitat constraints (Incl. Breeding and Foraging)	Patch size	Vegetation cover	Habitat constraints applied	Degraded habitats removed
Amphibians	*Crinia sloanei*	Sloane's Froglet	V	E	-	PCT 5, 9997 (waterbodies)	Inland Slopes	None	Semi-permanent/ephemeral wet areas; Containing relatively shallow sections with submergent and emergent vegetation, or within 500 m of wet area; Within 500 m of swamps or waterbodies	< 5 ha	<10 %	Within 50 m of waterbodies including natural waterways or drainage lines	PCT 0
Amphibians	*Litoria booroolongensis*	Booroolong Frog	E	E	-	PCT 280, 290, 1330, 9997 (Waterbodies)	Bondo; Crookwell; Inland Slopes	None	None	< 5 ha	<10 %	Within 50 m of waterbodies	None
Amphibians	*Litoria castanea*	Yellow-spotted Tree Frog	CE	E	Yes	PCT 335, 939, 1256, 9997 (Waterbodies)	Crookwell; Murrumbateman; Snowy Mountains	None	None	< 5 ha	<10 %	None	None

Group	Scientific name	Common name	BC Act status	EPBC Act status	SAII	Associated PCTs within the project footprint	IBRA subregion	Geographic constraints	BioNet habitat constraints (Incl. Breeding and Foraging)	Patch size	Vegetation cover	Habitat constraints applied	Degraded habitats removed
Amphibians	*Mixophyes balbus*	Stuttering Frog	E	V	Yes	PCT 870, 1097, 1107, 1150	Bungonia	None	None	5 - <25 ha	31- <70 %	None	Very low condition
Amphibians	*Pseudophryne corroboree*	Southern Corroboree Frog	CE	CE	Yes	PCT 679 and 1196	Snowy Mountains	Above 1000 m altitude	Within 200 m of high montane and sub-alpine bog or ephemeral pool environments (ie swamps)	< 5 ha	>70 %	Waterbodies including natural waterways and drainage lines	None
Birds	*Burhinus grallarius*	Bush Stone-curlew	E	-	-	PCT 5, 266, 277, 280, 287, 290, 343, 352 and 1330	Bondo; Inland Slopes; Murrumbateman	None	Fallen/standing dead timber including logs	< 5 ha	11- <30 %	None	PCTs 0 and 9998; Low and Very low condition
Birds	*Callocephalon fimbriatum*	Gang-gang Cockatoo	V	E	-	PCT 5, 266, 268, 277, 278, 280, 283, 287, 290, 294, 294, 299, 300, 314, 316, 322, 343, 349, 351, 352, 638, 679, 727, 731, 870, 52, 953, 1093, 1097, 1107, 1150, 1151, 1191, 1196 and 1330	Bondo; Bungonia; Crookwell; Inland Slopes; Murrumbateman; Snowy Mountains	None	Breeding: Eucalypt tree species with hollows greater than 9 cm diameter	< 5 ha	11- <30 %	Hollow bearing trees with hollows >6 cm	PCTs 0 and 9998; Non-woody vegetation; Very low condition; Category 1 Land
Birds	*Haliaeetus leucogaster*	White-bellied Sea Eagle	V	-	-	PCT 5, 85, 266 277, 280, 283, 278, 287, 290, 299, 314, 316, 352, 679, 953, 1191 and 1330	Crookwell; Murrumbateman; Inland Slopes	None	Foraging: Within 1 km of a rivers, lakes, large dams or creeks, wetlands and coastlines; Breeding: Living or dead mature trees within suitable vegetation within	< 5 ha	<10 %	500 m buffer (250 m for peri-urban/urban areas) to suitable waterways	Non-woody vegetation; Very low condition; Category 1 Land

Group	Scientific name	Common name	BC Act status	EPBC Act status	SAII	Associated PCTs within the project footprint	IBRA subregion	Geographic constraints	BioNet habitat constraints (Incl. Breeding and Foraging)	Patch size	Vegetation cover	Habitat constraints applied	Degraded habitats removed
									1 km of a rivers, lakes, large dams or creeks, wetlands and coastlines			(Refer to Section 3.1)	
Birds	*Hieraaetus morphnoides*	Little Eagle	V	-	-	PCT 5, 266, 268, 277, 278, 280, 283, 285, 287, 290, 294, 295, 296, 297, 299, 300, 301, 306, 314, 316, 322, 335, 343, 349, 351, 352, 638, 679, 727, 731, 870, 939, 952, 953, 1093, 1097, 1107, 1150, 1191, 1196 and 1330	Bondo; Bungonia; Crookwell; Inland Slopes; Murrumbateman; Snowy Mountains	None	Breeding: Nest trees - live (occasionally dead) large old trees within vegetation.	< 5 ha	11- <30 %	None	PCT 0; Non-woody vegetation; Very low condition; Category 1 Land
Birds	*Lophoictinia isura*	Square-tailed Kite	V	-	-	PCT 5, 266, 268, 277, 278, 280, 283, 287, 290, 294, 322, 352, 731, 953 and 1093	Bondo; Inland Slopes; Murrumbateman	None	Breeding: Nest trees	< 5 ha	11- <30 %	None	Non-woody vegetation; Very low condition; Category 1 Land
Birds	*Ninox connivens*	Barking Owl	V	-	-	PCT 5, 266, 268, 277, 278, 280, 283, 290, 295, 314, 343, 638, 870, 953, 1093, 1097, 1107, 1150, 1191 and 1330	Bondo; Bungonia; Inland Slopes; Murrumbateman; Snowy Mountains	None	Breeding: Living or dead trees with hollows greater than 20 cm diameter and greater than 4 m above the ground.	< 5 ha	11- <30 %	Hollow bearing trees with hollows >20 cm present	PCT 0; Non-woody vegetation; Very low condition; Category 1 Land

Group	Scientific name	Common name	BC Act status	EPBC Act status	SAII	Associated PCTs within the project footprint	IBRA subregion	Geographic constraints	BioNet habitat constraints (Incl. Breeding and Foraging)	Patch size	Vegetation cover	Habitat constraints applied	Degraded habitats removed
Birds	*Ninox strenua*	Powerful Owl	V	-	-	PCT 5, 283, 287, 290, 295, 300, 314, 351, 352, 638, 727, 731, 870, 953, 1093, 1097, 1107, 1150, 1151, 1191 and 1330	Bondo; Bungonia; Crookwell; Inland Slopes; Murrumbateman; Snowy Mountains	None	Breeding: Living or dead trees with hollow greater than 20 cm diameter	< 5 ha	11- <30 %	Hollow bearing trees with hollows >20 cm present	Non-woody vegetation; Very low condition; Category 1 Land
Birds	*Petroica rodinogaster*	Pink Robin	V	-	-	PCT 299, 300, 638, 679, 953, 1097, 1107, 1150, 1191 and 1196	Bondo; Bungonia; Inland Slopes; Snowy Mountains	None	None	< 5 ha	11- <30 %	None	No woody vegetation; Very low condition; Category 1 Land
Birds	*Tyto novaehollandiae*	Masked Owl	V	-	-	PCT 266, 277, 280, 290, 294, 638, 870, 953, 1093, 1097, 1107, 1150, 1191 and 1330	Bondo; Bungonia; Inland Slopes; Snowy Mountains	None	Breeding: Living or dead trees with hollows greater than 20 cm diameter.	< 5 ha	11- <30 %	Hollow bearing trees with hollows >20 cm present	Non-woody vegetation; Very low condition; Category 1 Land
Birds	*Tyto tenebricosa*	Sooty Owl	V	-	Yes	PCT 638	Snowy Mountains	None	Breeding: Caves or clifflines/ledges; Living or dead trees with hollows greater than 20 cm diameter.	>= 100 ha	>70 %	Hollow bearing trees with hollows >20 cm present; Potential cliffs (ie supplementary cliffline mapping)	None
Invertebrate	*Paralucia spinifera*	Purple Copper Butterfly	E	V	-	PCT 135, 731, 1191 and 1330	Murrumbateman	None	Bursaria spinosa or within 40 m of Bursaria spinosa	< 5 ha	<10 %	None	None

Group	Scientific name	Common name	BC Act status	EPBC Act status	SAII	Associated PCTs within the project footprint	IBRA subregion	Geographic constraints	BioNet habitat constraints (Incl. Breeding and Foraging)	Patch size	Vegetation cover	Habitat constraints applied	Degraded habitats removed
Invertebrate	*Keyacris scurra*	Key's Matchstick Grasshopper	E	E	-	PCT 266, 277, 278, 283 and 1330	Bungonia; Crookwell; Inland Slopes; Murrumbateman	None	None	< 5 ha	<10 %	None	None
Invertebrate	*Synemon plana*	Golden Sun Moth	V	V	-	PCT 266, 277, 352 and 1330	Inland Slopes; Murrumbateman	None	Wallaby grass (*Rytidosperma sp*), Chilean needlegrass (*Nassella nessiana*) or Serrated Tussock (*Nassella trichotoma*)	< 5 ha	<10 %	None	Woody vegetation
Mammals	*Chalinolobus dwyeri*	Large-eared Pied Bat	V	V	Yes	PCT 1093 and 1330	Bungonia	None	Within 2 km of rocky areas containing caves, overhangs, escarpments, outcrops, or crevices, or within two kilometres of old mines or tunnels.	< 5 ha	11- <30 %	None	Non-woody vegetation; Very low condition; Category 1 Land
Mammals	*Miniopterus orianae oceanensis*	Large Bent-winged Bat	V	-	Yes	PCT 1290, 351, 1093 and 1330	Bungonia; Inland Slopes; Murrumbateman	None	Breeding: Cave, tunnel, mine, culvert or other structure known or suspected to be used for breeding including species records with microhabitat code "IC - in cave;" observation type code "E nest-roost;" with numbers of individuals >500	< 5 ha	<10 %	Within 100 m of moderate to high potential karst	Non-woody vegetation; Very low condition; Category 1 Land
Mammals	*Myotis macropus*	Southern Myotis	V	-	-	PCT5, 299, 349, 352, 870, 1107, 191 and 1330	Bondo; Bungonia; Inland Slopes; Murrumbateman; Snowy Mountains	None	Hollow bearing trees; Bridges, caves or artificial structures within 200 m of riparian zone; Waterbodies including	< 5 ha	<10 %	Anthropogenic habitat (culverts/ bridges) present; Within 200 m	PCT 0 and 9998; Non-woody vegetation; Very low condition;

Group	Scientific name	Common name	BC Act status	EPBC Act status	SAII	Associated PCTs within the project footprint	IBRA subregion	Geographic constraints	BioNet habitat constraints (Incl. Breeding and Foraging)	Patch size	Vegetation cover	Habitat constraints applied	Degraded habitats removed
									rivers, creeks, billabongs, lagoons, dams and other waterbodies on or within 200 m of the site			of Strahler 2nd order streams	Category 1 Land
Mammals	*Cercartetus nanus*	Eastern Pygmy-possum	V	-	-	PCT 268, 277, 280, 283, 285, 287, 290, 294, 295, 97, 299, 300, 314, 349, 352, 638, 727, 731, 952, 1093, 1097, 1107, 1150, 1151, 1191, 1196 and 1330	Bondo; Bungonia; Crookwell; Inland Slopes; Murrumbateman; Snowy Mountains	None	None	< 5 ha	11- <30 %	Midstorey present	Non-woody vegetation; Very low condition; Category 1 Land
Mammals	*Petauroides volans*	Greater Glider	-	V	-	PCT 299, 300, 316, 351, 638, 727, 870, 952, 953, 1093, 1097, 1107, 1150, 1151, 1191, 1196 and 1330	Bondo; Bungonia; Crookwell; Inland Slopes; Murrumbateman; Snowy Mountains	None	Hollow bearing trees	5 - <25 ha	31- <70 %	Hollow bearing trees with hollows >10 cm	Non-woody vegetation; Very low condition
Mammals	*Petaurus norfolcensis*	Squirrel Glider	V	-	-	PCT 5, 266, 268, 277, 278, 280, 283, 287, 290, 294, 314, 316, 322, 343, 349, 351, 352, 731, 870, 953, 1093, 1150, 1151 and 1330	Bondo; Bungonia; Crookwell; Inland Slopes; Murrumbateman; Snowy Mountains	None	None	< 5 ha	<10 %	Hollow bearing trees with hollows > 5 cm	Non-woody vegetation; Very low condition

Group	Scientific name	Common name	BC Act status	EPBC Act status	SAII	Associated PCTs within the project footprint	IBRA subregion	Geographic constraints	BioNet habitat constraints (Incl. Breeding and Foraging)	Patch size	Vegetation cover	Habitat constraints applied	Degraded habitats removed
Mammals	*Petrogale penicillata*	Brush-tailed Rock-wallaby	E	V	Yes	PCT 283, 870, 1093, 1107, 1150 and 1330	Bungonia	None	Land within 1 km of rocky escarpments, gorges, steep slopes, boulder piles, rock outcrops or clifflines	5 - <25 ha	11- <30 %	Within 100 m of moderate to high potential karst; Rocky outcrops present; Caves overhangs present	Non-woody vegetation; Very low condition; Category 1 Land
Mammals	*Phascogale tapoatafa*	Brush-tailed Phascogale	V	-	-	PCT 638 and 953	Bondo; Snowy Mountains	None	None	< 5 ha	<10 %	Hollow bearing trees with hollows > 5 cm	Non-woody vegetation; Very low condition; Category 1 Land
Mammals	*Phascolarctos cinereus*	Koala	E	E	-	PCT 5, 266, 268, 277, 278, 280, 283, 285, 287, 290, 294, 295, 296, 297, 299, 300, 301, 306, 314, 316, 322, 335, 343, 349, 351, 352, 638, 679, 727, 731, 870, 939, 953, 1093, 1097, 1107, 1150, 1151, 1191, 1196 and 1330	Bondo; Bungonia; Crookwell; Inland Slopes; Murrumbateman; Snowy Mountains	None	Breeding: Areas identified via survey as important habitat	< 5 ha	<10 %	None	Non-woody vegetation; Very low condition; Category 1 Land
Mammals	*Mastacomys fuscus*	Broad-toothed Rat	V	V	-	PCT 679	Snowy Mountains	None	None	5 - <25 ha	31- <70 %	None	Non-woody vegetation; Very low

Group	Scientific name	Common name	BC Act status	EPBC Act status	SAII	Associated PCTs within the project footprint	IBRA subregion	Geographic constraints	BioNet habitat constraints (Incl. Breeding and Foraging)	Patch size	Vegetation cover	Habitat constraints applied	Degraded habitats removed
													condition; Category 1 Land
Mammals	*Pseudomys fumeus*	Smoky Mouse	CE	E	Yes	PCT 638, 953 and 1196	Bondo; Snowy Mountains	None	None	>= 100 ha	>70 %	None	Non-woody vegetation; Very low condition; Category 1 Land
Reptiles	*Aprasia parapulchella*	Pink-tailed Legless Lizard	V	V	-	PCT 266, 277, 278, 280, 283, 290, 294, 319, 322, 351, 731, 1191 and 1330	Bondo; Bungonia; Crookwell; Inland Slopes; Murrumbateman	South of Grabben Gullen; West of Dalton	Rocky areas or within 50 m of rocky areas	< 5 ha	<10 %	Within 50 m of Rock features	None
Reptiles	*Cyclodomorphus praealtus*	Alpine She-oak Skink	E	E	-	PCT 679 and 1196	Snowy Mountains	None	None	< 5 ha	31- <70 %	None	Very low condition; Category 1 Land
Reptiles	*Delma impar*	Striped Legless Lizard	V	V	-	PCT 277, 1330 and Non-native	Bungonia; Crookwell; Inland Slopes; Murrumbateman	None	None	< 5 ha	<10 %	None	None

Attachment 13. Serious and irreversible impacts

1. Introduction

This attachment presents additional information to assist the determining authority with evaluating the extent and severity of project impacts to candidate SAII entities recorded or assumed present within the project footprint (Table A13- 1). Data and information presented within was obtained from BCD (date of BCD data packages requested and received detailed in Table A13- 1 for each SAII entity), and available online resources. Reference sources utilised beyond BCD data packages are detailed in each SAII assessment.

Table A13- 1 below provides the rationale for conducting an SAII assessment for each candidate SAII entity considered. Sections 2 and 3 of this attachment provide detailed information to support SAII assessments for species likely to be impacted by the project and those with a limited potential for impacts respectively.

Table A13- 1: SAII entities recorded or assumed present categorised by likelihood of impacts (likely versus limited potential)

Scientific Name	Common Name	SAII	SAII Breeding	SAII Assessment required?	Information sources
Threatened biodiversity SAII candidates likely to be impacted Species have been included in this section of the table where some level of impact for the species is considered at least moderately likely.					
TECs					
White Box-Yellow Box-Blakely's Red Gum Grassy Box Woodland and Derived Native Grassland	-	True	-	Yes. This TEC was recorded in the project footprint and is likely to be impacted by the project. SAII assessment required.	Requested data package from BOS Help Desk on 24 March 2022, data package received 28 March 2022
Tableland Basalt Forest in the Sydney Basin and South-Eastern Highlands Bioregions	-	True	-	Yes. This TEC was recorded in the project footprint and is likely to be impacted by the project. SAII assessment required.	Requested data package from BOS Help Desk on 24 March 2022, data package received 28 March 2022
Coolac-Tumut Serpentinite Shrubby Woodland in the NSW South-Western Slopes and South-Eastern Highlands Bioregions	-	True	-	Yes. This TEC was recorded in the project footprint and is likely to be impacted by the project. SAII assessment required.	Requested data package from BOS Help Desk on 24 March 2022, data package received 28 March 2022
Monaro Tableland Cool Temperate Grassy Woodland in the South-Eastern Highlands Bioregion	-	True	-	Yes. This TEC was recorded in the project footprint and is likely to be impacted by the project. SAII assessment required.	Requested data package from BOS Help Desk on 24 March 2022, data package received 28 March 2022

Scientific Name	Common Name	SAII	SAII Breeding	SAII Assessment required?	Information sources
Threatened flora					
Prasophyllum bagoense	Bago Leek Orchid	True	-	*Prasophyllum bagoense* was not recorded in the project footprint, however the species has been assumed present over a portion of the project footprint due to survey limitations. A population has been previously recorded 130 m to the west of the project footprint in Bago State Forest. Potential habitat for the species would be impacted by the project at this location. SAII assessment required.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. No data was provided for this species specifically to conduct the SAII assessment.
Prasophyllum innubum	Brandy Marys Leek-orchid	True	-	*Prasophyllum innubum* was not recorded in the project footprint, however the species has been assumed present over a portion of the project footprint due to survey limitations. Potential habitat for the species would be impacted by the project. SAII assessment required.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. No data was provided for this species specifically to conduct the SAII assessment.
Prasophyllum keltonii	Kelton's Leek Orchid	True	-	*Prasophyllum keltonii* was not recorded in the project footprint, however the species has been assumed present over a portion of the project footprint due to survey limitations. A population was recorded 750 m to the west of the project footprint in Bago State Forest during field surveys carried out for the project. Potential habitat for the species would be impacted by the project at this location. SAII assessment required.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. No data was provided for this species specifically to conduct the SAII assessment.
Pterostylis oreophila	Blue-tongued Greenhood	True	-	*Pterostylis oreophila* was not recorded in the project footprint, however the species has been assumed present over a portion of the project footprint due to survey limitations. Potential habitat for the species would be impacted by the project. SAII assessment required.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. No data was provided for this species.

Scientific Name	Common Name	SAII	SAII Breeding	SAII Assessment required?	Information sources
Solanum armourense	-	True	-	*Solanum armourense* was not recorded in the project footprint, however the species has been assumed present over a portion of the project footprint due to survey limitations. Potential habitat for the species would be impacted by the project. SAII assessment required.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. No data was provided for this species.
Threatened fauna					
Litoria castanea	Yellow-spotted Tree Frog	True	-	Yellow-spotted Tree Frog was not recorded in the project footprint. The species has a moderate likelihood of occurrence within the Murrumbateman IBRA subregion where suitable permanent streams occur and historic records are known. No habitats within Murrumbateman would be impacted. Species presence has been assumed within some IBRA subregions predicted by the BAM-C due to survey limitations. A limited area of potential habitat would be impacted within Crookwell and the Snowy Mountains. As such, an SAII assessment is required.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. No data was provided for this species.
Pseudomys fumeus	Smoky Mouse	True	-	Smoky Mouse was not recorded in the project footprint, however the species has been assumed present over a portion of the project footprint due to survey limitations. Potential habitat for the species would be impacted by the project. An SAII assessment is required for the species.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. No data was provided for this species.
Tyto tenebricosas	Sooty Owl	-	True	Sooty Owl was not recorded in the project footprint, however the species has been assumed present over a portion of the project footprint due to survey limitations and potential habitat for the species within the Snowy Mountains IBRA subregion. An SAII assessment is required for the species.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023.No data was provided for this species.

Scientific Name	Common Name	SAII	SAII Breeding	SAII Assessment required?	Information sources
Threatened biodiversity SAII candidates with limited potential to be impacted Species have been included in this section of the table where there is incomplete information to be able to exclude them from SAII assessment despite a limited likelihood of potential impacts and/or occurrence within the disturbance footprint, for example: The species/entity was not found during field surveys of comparable habitat, however the survey coverage was incomplete or surveys were not conducted during the required season and the species is known or predicted from the broader IBRA sub-region.					
Threatened flora					
Acacia phasmoides	Phantom Wattle	True	-	Habitat for *Acacia phasmoides* was not recorded in the project footprint, however the species has been assumed present over a portion of the project footprint due to survey limitations. Despite this, the species is considered unlikely to occur within the project footprint given it is only known from one location in NSW: Woomagarma National Park in Greater Hume Shire (nearest known location is approximately 27 km from the project footprint). A SAII assessment has been undertaken on a precautionary basis.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. Data received 3 March 2023.
Bossiaea fragrans	-	True	-	*Bossiaea fragrans* was not recorded in the project footprint, however the species has been assumed present over a portion of the project footprint due to survey limitations. The species is only known from the Abercrombie Karst Conservation Reserve (nearest known location is approximately 75 km from the project footprint) and within the adjacent Travelling Stock Reserve, south of Bathurst on the NSW central tablelands. It has a highly restricted distribution, with only a small number of discrete known sub-populations. Given this, the species is considered unlikely to occur within the project footprint. A SAII assessment has been undertaken on a precautionary basis.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. No data was provided for this species.

Scientific Name	Common Name	SAII	SAII Breeding	SAII Assessment required?	Information sources
Caladenia concolor	Crimson Spider Orchid	True	-	*Caladenia concolor* was not recorded in the project footprint, however the species has been assumed present over a portion of the project footprint due to survey limitations. The species has a low likelihood of occurrence. Known populations are limited to a property near Bethungra and within Burrinjuck Nature Reserve (nearest known location is approximately 4 km from the project footprint). Requires woodland with a high diversity of plant species. A SAII assessment has been undertaken on a precautionary basis.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. No data was provided for this species.
Caladenia tessellata	Thick Lip Spider Orchid	True	-	*Caladenia tessellata* was not recorded in the project footprint, however the species has been assumed present over a portion of the project footprint due to survey limitations. No known populations occur within proximity to the project footprint (nearest known location is approximately 55 km from the project footprint) and the species likelihood of occurrence is considered low. A SAII assessment has been undertaken on a precautionary basis.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. Data received 3 March 2023.
Calotis glandulosa	Mauve Burr-daisy	True	-	*Calotis glandulosa* was not recorded in the project footprint, however the species has been assumed present over a portion of the project footprint due to survey limitations. The species is known from three sites in the upper Shoalhaven catchment (approximately 20 km from the project footprint). Whilst it is a coloniser of disturbed lands it does not tolerate heavy grazing. The species has a low likelihood of occurring within the project footprint. A SAII assessment has been undertaken on a precautionary basis.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. Data received 3 March 2023.

Scientific Name	Common Name	SAII	SAII Breeding	SAII Assessment required?	Information sources
Diuris ochroma	Pale Golden Moths	True	-	*Diuris ochroma* was not recorded in the project footprint, however the species has been assumed present over a portion of the project footprint due to survey limitations. Known populations of the species are limited to Kosciuszko National Park and the Kybean area in NSW (approximately 27 km from the project footprint). The species has a low likelihood of occurring within the project footprint. A SAII assessment has been undertaken on a precautionary basis.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. Data received 3 March 2023.
Eucalyptus alligatrix subsp. *alligatrix*	-	True	-	*Eucalyptus alligatrix subsp. alligatrix* was not recorded in the project footprint, however the species has been assumed present over a portion of the project footprint due to survey limitations. The species is only known from a single population south-west of Rylstone (approximately 174 km from the project footprint). The species has a low likelihood of occurring within the project footprint. A SAII assessment has been undertaken on a precautionary basis.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. Data received 3 March 2023.
Eucalyptus robertsonii subsp. *hemisphaerica*	Robertson's Peppermint	True	-	*Eucalyptus robertsonii subsp. hemisphaerica* was not recorded in the project footprint, however the species has been assumed present over a portion of the project footprint due to survey limitations. The species is known only from the central tablelands of NSW north of Orange to Burraga (approximately 64 km from the project footprint). The species has a low likelihood of occurring within the project footprint. A SAII assessment has been undertaken on a precautionary basis.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. No data was provided for this species
Euphrasia arguta	-	True	-	*Euphrasia arguta* was not recorded in the project footprint, however the species has been assumed present over a portion of the project footprint due to	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. Data received 3 March 2023.

Scientific Name	Common Name	SAII	SAII Breeding	SAII Assessment required?	Information sources
				survey limitations. Only known population of the species occurs in the Nundle area of NSW (approximately 195 km from the project footprint). The species has a low likelihood of occurring within the project footprint. A SAII assessment has been undertaken on a precautionary basis.	
Euphrasia scabra	Rough Eyebright	True	-	*Euphrasia scabra* was not recorded in the project footprint, however the species has been assumed present over a portion of the project footprint due to survey limitations. There are three known populations of the species in NSW: Bondi State Forest, South East Forests National Park and near Nunnock Swamp (nearest known location is approximately 14 km from the project footprint). The species has a low likelihood of occurring within the project footprint. A SAII assessment has been undertaken on a precautionary basis.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. Data received 3 March 2023.
Genoplesium superbum	Superb Midge Orchid	True	-	Suitable habitat for *Genoplesium superbum* was detected within the project footprint within the Bungonia IBRA Subregion. Targeted flora surveys within the project footprint did not locate the species. Where survey effort was not adequate, species presence has been assumed within suitable habitat. The species is only known from two locations near Nerriga and Morton National Park in NSW (nearest known location is approximately 71 km from the project footprint). The species has a low likelihood of occurring within the project footprint. A SAII assessment has been undertaken on a precautionary basis.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. Data received 3 March 2023.

Scientific Name	Common Name	SAII	SAII Breeding	SAII Assessment required?	Information sources
Glycine latrobeana	Clover Glycine	True	-	*Glycine latrobeana* was not recorded in the project footprint, however the species has been assumed present over a portion of the project footprint due to survey limitations. The closest known population is within Kosciuszko National Park (approximately 30 km from the project footprint). The species has a low likelihood of occurring within the project footprint. A SAII assessment has been undertaken on a precautionary basis.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. Data received 3 March 2023.
Grevillea iaspicula	Wee Jasper Grevillea	True	-	*Grevillea iaspicula* was not recorded in the project footprint, however the species has been assumed present over a portion of the project footprint due to survey limitations. The species is only known to occur on the shores of Lake Burrinjuck (approximately 11 km from the project footprint). The species has a low likelihood of occurring within the project footprint. A SAII assessment has been undertaken on a precautionary basis.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. Data received 3 March 2023.
Grevillea wilkinsonii	Tumut Grevillea	True	-	*Grevillea wilkinsonii* was not recorded in the project footprint, however the species has been assumed present over a portion of the project footprint due to survey limitations. The species is only known from two locations in NSW: Goobarragandra River and overlapping two properties at Gundagai (nearest known location is approximately 14 km from the project footprint). The species has a low likelihood of occurring within the project footprint. A SAII assessment has been undertaken on a precautionary basis.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. Data received 3 March 2023.
Irenepharsus magicus	Elusive Cress	True	-	Habitat for Elusive Cress was detected within the project footprint in the Snowy Mountains IBRA Subregion. Targeted flora surveys within the project footprint did not locate the species, however certain	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. Data received 3 March 2023].

Scientific Name	Common Name	SAII	SAII Breeding	SAII Assessment required?	Information sources
				areas of potential suitable habitat within the project footprint were inaccessible for surveys, therefore the species has been assumed present in these areas. Despite this, the species is considered to have a low likelihood of occurring within the project footprint. The only known records from Geehi Dam within Kosciuszko National Park (nearest known location is approximately 56 km from the project footprint). A SAII assessment has been undertaken on a precautionary basis.	
Pomaderris delicata	Delicate Pomaderris	True	-	*Pomaderris delicata* was not recorded in the project footprint, however the species has been assumed present over a portion of the project footprint due to survey limitations. Known from only two sites: between Goulburn and Bungonia and south of Windellama (nearest known location is approximately 32 km from the project footprint). The species has a low likelihood of occurring within the project footprint. A SAII assessment has been undertaken on a precautionary basis.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. No data was provided for this species.
Pomaderris pallida	Pale Pomaderris	True	-	*Pomaderris pallida* was not recorded in the project footprint, however the species has been assumed present over a portion of the project footprint due to survey limitations. There are no known records of the species within 20 km of the project footprint (nearest known location is approximately 38 km from the project footprint). The species is considered to have a low likelihood of occurring within the project footprint. A SAII assessment has been undertaken on a precautionary basis.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. No data was provided for this species.

Scientific Name	Common Name	SAII	SAII Breeding	SAII Assessment required?	Information sources
Zieria obcordata	Granite Zieria	True	-	*Zieria obcordata* was not recorded in the project footprint, however the species has been assumed present over a portion of the project footprint due to survey limitations. The species is only known from two sites in NSW: one in the Wuuluman area near Wellington and the other at Crackerjack Rock/ Rock Forests area north-west of Bathurst (nearest known location is approximately 224 km from the project footprint). The species has a low likelihood of occurring within the project footprint. A SAII assessment has been undertaken on a precautionary basis.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. No data was provided for this species.
Threatened fauna					
Miniopterus orianae oceanensis	Large Bent-winged Bat	-	True	Large Bent-winged Bat was recorded in the project footprint and foraging habitat would be impacted by the project, however the SAII component for this species is confined to breeding habitat. Potential breeding habitat for the species has not been recorded however a singly rocky gully situated in the Murrumbateman IBRA subregion has been identified as potential habitat. This potential breeding habitat would not be impacted by the project, however a small area (i.e. 0.11 ha) would be cleared within 100 m of the potential roost site. No ground disturbance is proposed in this location. A SAII assessment has been undertaken on a precautionary basis.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. No data was provided for this species.
Mixophyes balbus	Stuttering Frog	True	-	Stuttering Frog was not recorded in the project footprint. Suitable wet sclerophyll forest habitat and permanent streams occur within the Bungonia IBRA subregion however the closest historic records are within the Blue Mountains (about 40 km north). The	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. No data was provided for this species.

Scientific Name	Common Name	SAII	SAII Breeding	SAII Assessment required?	Information sources
				species has been assumed present over a portion of the project footprint due to survey limitations. A SAII assessment has been undertaken on a precautionary basis.	
Petrogale penicillata	Brush-tailed Rock-wallaby	True	-	Brush-tailed Rock Wallaby was not recorded in the project footprint. The closest known record (1997) is about 8 km north of the project at Wombeyan Caves. There is potential for habitat to occur immediately north of Tarlo River National Park within a large patch of remnant vegetation. The species has been assumed present within this area due to survey limitations. However, further refinement of the species polygon is required as many lands are unlikely to support suitable rocky habitats. A SAII assessment has been undertaken on a precautionary basis.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. No data was provided for this species.
Chalinolobus dwyeri	Large-eared Pied Bat	True	-	Large-eared Pied Bat was not recorded in or adjacent to the project footprint. Species presence has been assumed within 2 km of mapped potential karst and cliff lines, due to survey limitations. About 7.7 ha of potential foraging habitat for the species would be impacted by the project. The project would not interfere with habitat occurring within 100 m of mapped potential karst and cliff lines. A SAII assessment has been undertaken on a precautionary basis.	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. No data was provided for this species.
Pseudophryne corroboree	Southern Corroboree Frog	True	-	Southern Corroboree Frog was not recorded in the project footprint. Some patches of suitable sphagnum bog habitats occur within the Snowy Mountains IBRA subregion. The species has been assumed present within these areas due to survey limitations. However, the known range of the species is limited to Kosciuszko National Park (nearest known	Data requested from BOS Help desk in March 2022 and again on 3 February 2023. No data was provided for this species

Scientific Name	Common Name	SAII	SAII Breeding	SAII Assessment required?	Information sources
				location is approximately 12 km from the project footprint) and the species is considered unlikely to occur within the project footprint. A SAII assessment has been undertaken on a precautionary basis.	

Official

2. Threatened biodiversity SAII candidates likely to be impacted

2.1 Threatened ecological communities

2.1.1 Box-Gum Woodland and Tableland Basalt Forest

Additional impact assessment provisions for TEC at risk of SAII (Section 9.1.1 of the BAM)	*White Box-Yellow Box-Blakely's Red Gum Grassy Box Woodland and Derived Native Grassland*	*Tableland Basalt Forest in the Sydney Basin and South Eastern Highlands Bioregions*
Impact summary	The project would result in direct impacts to a total of 311.78 ha of White Box-Yellow Box-Blakely's Red Gum Grassy Box Woodland and Derived Native Grassland. This area constitutes all condition classes including low and very low condition classes which make up 75% (233 ha) of the stated impact area. It is noted that statistics relating to clearing and the remaining extent of this community typically equate historic clearing with clearing of woody vegetation (canopy and midstorey elements) and provide statistics on remaining areas of the community based on condition thresholds that exceed condition thresholds employed under the current BAM method (eg *Austin et al. (2000)* calculation of 1% of the community remaining). Definitions of native vegetation have broadened under the BAM and therefore much of the area (those comprising areas with limited woody vegetation cover and/or less than 50% native vegetation ground cover) apportioned to this community under the current assessment may be within areas considered as cleared areas to inform statistics. In addition, lands that would be considered Category 1 lands if not part of a critically endangered PCT have been included within the stated areas to be cleared. Accordingly, it is useful to consider the area of moderate to high condition vegetation proposed to be cleared rather than any/all vegetation classed as the community under the BAM and this assessment. This consideration is particularly pertinent given that limited loss of condition is expected for	The project would result in direct impacts to a total of 37.42 ha of Tableland Basalt Forest in the Sydney Basin Bioregion and South Eastern Highlands Bioregions. This area constitutes all condition classes including low and very low condition classes, however excludes areas mapped as Category 1 lands. The majority (76%) of impacted areas are high or very high condition areas, however a large proportion of the impacts (22%) are within the Hazard Tree Zone where limited VI (condition) loss is expected. Potential indirect impacts to the TEC include: • Inadvertent impacts on adjacent vegetation. • Transport of weeds and pathogens from the site to adjacent vegetation. • Changed fire regimes. Prescribed impacts to the TEC include: • Impacts to habitat connectivity • Impacts on water quality, waterways, and hydrological processes.

Official

Additional impact assessment provisions for TEC at risk of SAII (Section 9.1.1 of the BAM)	*White Box-Yellow Box-Blakely's Red Gum Grassy Box Woodland and Derived Native Grassland*	*Tableland Basalt Forest in the Sydney Basin and South Eastern Highlands Bioregions*
	areas that are already in low condition in this assessment where clearing is for the ECZ or HTZ zones which comprise a significant proportion of the proposed clearing. Potential indirect impacts to the TEC include: • Inadvertent impacts on adjacent vegetation. • Transport of weeds and pathogens from the site to adjacent vegetation. • Changed fire regimes. Potential prescribed impacts to the TEC include: • Impacts on water quality, waterways, and hydrological processes.	
1. The assessor is required to provide further information in the BDAR or BCAR regarding the impacts on each TEC at risk of an SAII. This must include the action and measures taken to avoid the direct and indirect impact on the TEC at risk of an SAII. Where these have been addressed elsewhere the assessor can refer to the relevant sections of the BDAR and BCAR.	Eight PCTs within the project footprint aligned with the White Box-Yellow Box-Blakely's Red Gum Grassy Box Woodland and Derived Native Grassland (Box Gum Woodland) TEC. The TEC occurred in varying condition states across all IBRA subregions intersecting the project footprint. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to TECs include: • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1). • Further avoidance and minimisation of TEC impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying TEC remnants and their existing condition, habitat features and important connectivity corridors. • Establishment of biodiversity exclusion zones in retained vegetation to demarcate high condition TEC	Tableland Basalt Forest in the Sydney Basin and South Eastern highland Bioregion TEC aligns with five PCTs within the project footprint: PCTs 952, 953, 1196, 1097 and 1107. The TEC occurs within the Crookwell, Bungonia and Bondo IBRA subregion. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to TECs include: • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1). • Further avoidance and minimisation of TEC impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying TEC remnants and their existing condition, habitat features and important connectivity corridors. • Establishment of biodiversity exclusion zones in retained vegetation to demarcate high condition TEC remnants as no-go zones during the construction phase (EMM B23).

Additional impact assessment provisions for TEC at risk of SAII (Section 9.1.1 of the BAM)	*White Box-Yellow Box-Blakely's Red Gum Grassy Box Woodland and Derived Native Grassland*	*Tableland Basalt Forest in the Sydney Basin and South Eastern Highlands Bioregions*
	remnants as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of TECs within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with pathogens, pests and weeds (EMM B19).	• Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of TECs within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20).
2. The assessor must consult the TBDC and/or other sources to report on the current status of the TEC including:		
• evidence of reduction in geographic distribution (Principle 1, clause 6.7(2)(a) BC Regulation) as the current total geographic extent of the TEC in NSW AND the estimated reduction in geographic extent of the TEC since 1970 (not including impacts of the proposal)	***Principle 1 SAII = Yes*** *Meets reduction in geographic extent of ≥90% since 1750 or ≥80% since 1970.* *Final Determination: Austin et al. (2000) found the community had been reduced to less than 1% of its pre-European extent in the Central Lachlan region. Comparable degrees of reduction have been documented for NSW south-western slopes and southern Tablelands (estimated <4% remaining, Thomas et. al. 2000), and for the Holbrook area (estimated <7% remaining, Gibbons and Boak (2000).*	**Information provided by EES (07/04/2022)** ***Principle 1 SAII = Yes*** *Meets reduction in geographic extent of ≥90% since 1750 or ≥80% since 1970.* *Final Determination = The area of the community remaining in the Sydney - South Coast region is estimated to represent approximately 5-20% of its projected occurrence there at the time of European settlement.* Principle 1 applies to this TEC. An estimated 5-20% of the original distribution of this TEC prior to European settlement remains (DPE 2011, Tozer *et. al.* 2010),

Additional impact assessment provisions for TEC at risk of SAII (Section 9.1.1 of the BAM)	***White Box-Yellow Box-Blakely's Red Gum Grassy Box Woodland and Derived Native Grassland***	***Tableland Basalt Forest in the Sydney Basin and South Eastern Highlands Bioregions***
	In 2010 it was estimated that only 405,000 ha of *White Box – Yellow Box – Blakely's Red Gum Grassy Woodland and Derived Native Grassland* in various condition states remained (DECCW 2010). Thomas *et al.* (2000) estimated that approximately 59,468 hectares remained in south-eastern NSW as of the year 2000, which is less than 4% of its original extent. There is circumstantial evidence which suggests that clearing of White Box – Yellow Box – Blakely's Red Gum Grassy Woodland and Derived Native Grassland is ongoing and has increased in recent years, at least in NSW which accounts for three quarters of the distribution of the Ecological Community (Tozer & Simpson 2020).	and therefore meets the criterion for reduction in geographic extent of ≥90% since 1750. TEC distribution data from 1970 is not available and therefore the estimated reduction in geographic extent of the TEC since 1970 has not been estimated.
• extent of reduction in ecological function for the TEC using evidence that describes the degree of environmental degradation or disruption to biotic processes (Principle 2, clause 6.7(2)(b) BC Regulation) indicated by: ▪ change in community structure ▪ change in species composition ▪ disruption of ecological processes ▪ invasion and establishment of exotic species ▪ degradation of habitat, and ▪ fragmentation of habitat	***Principle 2 SAII = Yes*** *Meets reduction in ecological function of ≥90% since 1750 or ≥80% since 1970* *Final Determination = White Box Yellow Box Blakely's Red Gum Woodland has been drastically reduced in area and highly fragmented because of clearance for cropping and pasture improvement. Austin et al. (2000) found the community had been reduced to less than 1% of its pre-European extent in the Central Lachlan region. Comparable degrees of reduction have been documented for NSW south-western slopes and southern Tablelands (estimated <4% remaining, Thomas et. al. 2000), and for the Holbrook area (estimated <7% remaining, Gibbons and Boak (2000). Gibbons and Boak (2000) found remnants of woodlands dominated by Eucalyptus albens, E. melliodora and E. blakelyi were severely fragmented." "These threats include: further clearing (for cropping, pasture improvement or other development); deterioration of remnant condition (caused by firewood cutting, increased livestock grazing, weed invasion, inappropriate fire regimes, soil disturbance and increased nutrient loads); degradation of the landscape in which*	**Information provided by EES (11/04/2022)** ***Principle 2 SAII = Yes*** *Meets reduction in ecological function of ≥90% since 1750 or ≥80% since 1970* *Final Determination = The area of the community remaining in the Sydney - South Coast region is estimated to represent approximately 5-20% of its projected occurrence there at the time of European settlement." "Extensive clearing of Tableland Basalt Forest has resulted in fragmentation and loss of ecological connectivity. The remaining area of the community is severely fragmented, with more than 70% of mapped extant patches estimated to be less than 10 ha." "The integrity and survival of small, isolated stands are impaired by the small population size of many species, enhanced risks from environmental stochasticity, disruption to pollination and dispersal of fruits or seeds, and likely reduction in the genetic diversity of isolated populations." "Fragmentation of habitat and disruption of these ecological processes contribute to a large reduction in the ecological function of the community.* Principle 2 applies to this TEC.

Additional impact assessment provisions for TEC at risk of SAII (Section 9.1.1 of the BAM)	*White Box-Yellow Box-Blakely's Red Gum Grassy Box Woodland and Derived Native Grassland*	*Tableland Basalt Forest in the Sydney Basin and South Eastern Highlands Bioregions*
	remnants occur (including soil acidification, salinity, and loss of connectivity between remnants). Change in community structure*:* The Box Gum Woodland that existed prior to European settlement now exists as remnants in three different states. The three states are: • An overstorey of eucalypt trees exists, but there is no substantial native understorey. • A native understorey exists, but the trees have been cleared. • Both a native understorey and an overstorey of eucalypts exist in conjunction. • Change in species composition: Grazing, pasture improvement and changed fire regimes has had a significant impact on the species composition of remaining remnants. Grazing has been shown to lead to a reduction in understorey species diversity and richness due to the suppression or loss of native species that are both highly palatable and intolerant of grazing by domestic stock (Tozer and Simpson 2020). • The disruption of biotic processes and interactions caused by the implementation of management for agricultural production is very severe and the impacts are estimated to apply over more than 90% of the pre-1750 distribution of Box Gum Woodland. The ecological community continues to be degraded at both the patch and landscape scale. This ongoing modification, while not necessarily leading to the total destruction of all elements of the ecological community, threatens it with extinction (Tozer and Simpson 2020). • Invasion and establishment of exotic species: The reduction of native plant cover by grazing presents opportunities for the invasion by exotic plant	Change in community structure: Undisturbed stands are an open forest or woodland structure with an open canopy of eucalypts, sparse small trees and shrubs and a dense and largely continuous ground cover of herbs and grasses. Community structure varies depending on historic and current disturbance, particularly clearing and grazing and disturbed stands may lack the tree and/or shrub strata. The community includes derived native grasslands where the tree and shrub strata have been removed, however, contain ground cover species characteristic of the community. After total or partial clearing, the tree stratum may remain sparse or may regrow to form dense stands of saplings and small trees. These dense stands, which are typically associated with a ground layer with reduced cover and species diversity (DECCW 2010, NSWSC 2011). Change in species composition: This TEC has been subject to significant changes in the floristic composition of the community through the loss of large trees resulting in the loss of fauna habitat and overgrazing of palatable species resulting in loss of flora species characteristic of the community (DECCW 2010, NSWSC 2011). Disruption of ecological processes: Fragmentation of habitat leading to the loss of connectivity and resulting in the disruption of ecological processes (e.g. pollination, the dispersal of propagules), the invasion and establishment of exotic species, habitat degradation associated with overgrazing and erosion and reduced fire frequency contributes to a reduction in the ecological function of this TEC (DECCW 2010, NSWSC 2011). Invasion and establishment of exotic species: Invasion of exotic species poses a significant threat to this TEC. Several of the common exotic species (particularly grasses such as *Holcus lanatus* and *Lolium perenne*) form a dense ground layer that is

Additional impact assessment provisions for TEC at risk of SAII (Section 9.1.1 of the BAM)	*White Box-Yellow Box-Blakely's Red Gum Grassy Box Woodland and Derived Native Grassland*	*Tableland Basalt Forest in the Sydney Basin and South Eastern Highlands Bioregions*
	species. Of the remaining area, a large proportion of it has been modified and occurs as trees over a predominantly exotic understorey (Tozer and Simpson 2020). • Degradation of habitat, and fragmentation of habitat: This ecological community is subject to ongoing threats across its range, including further clearing, deterioration of remnant condition and degradation of the landscape in which remnants occur. Degradation and fragmentation of this ecological community involves the loss of suites of species, such as woodland birds, understorey plant species and soil crusts. It is known that these woodlands and grasslands are losing suites of functionally important species, and that these losses are detrimentally impacting upon this ecological community (Tozer and Simpson 2020).	capable of smothering native plants, reducing their reproduction and survival (NSWSC 2011). Degradation of habitat: Moderate to heavy grazing of this TEC by domestic livestock and rabbits has resulted in the decline and disappearance of palatable shrub and herb species and compaction and erosion of topsoil, making it difficult for a diverse native understorey to re-establish at times when total grazing pressure is reduced. The effects of such overgrazing may be exacerbated under drought conditions (NSWSC 2011). Fragmentation of habitat: Extensive clearing of this TEC has resulted in fragmentation and loss of ecological connectivity (NSWSC 2011).
• evidence of restricted geographic distribution (Principle 3, clause 6.7(2)(c) BC Regulation), based on the TEC's geographic range in NSW according to the: ▪ extent of occurrence ▪ area of occupancy, and ▪ number of threat-defined locations	***Principle 3 SAII = No*** *Number of locations = Unknown* *Estimated AOO = Unknown* *Estimated EOO = 263,778 km^2* *Estimated total current extent = Unknown* The geographic distribution of Box Gum Woodland is not restricted. The extent of occurrence of this ecological community is very large, notwithstanding that it has undergone a severe decline in area of occupancy due to both clearing and degradation. The best estimate of the extent of occurrence is 263,778 km^2 (DPE 2022). The best estimate of the area of occupancy is 151,100 km^2 (Tozer and Simpson 2020). While this ecological community is subject to demonstrable, ongoing threats, there are insufficient data to determine the current degree of these threats across the dispersed remnants	**Information provided by EES (07/04/2022)** ***Principle 3 SAII = No*** *Number of locations = Unknown* *Estimated AOO = 11,200 km^2* *Estimated EOO = 21,841 km^2* *Estimated total current extent = 38,388 ha* Principle 3 does not apply to this TEC, however: The estimated extent of occurrence of this TEC is 21,841 km^2. The estimated area of occupancy of this TEC is 11,200 km^2. Data on the number of threat-defined locations for this TEC is not recorded. The TEC is known or predicted within 10 IBRA Subregions of the South Eastern Highlands Bioregion with no geographic restrictions within any subregion (OEH 2022). The estimated total current extent of this TEC is 38,388 ha. Approximately 280 ha of this TEC protected in conservation

	of this ecological community. There are also insufficient data to accurately determine its current area (Tozer and Simpson 2020).	reserves which represents <2% of the original extent of this TEC prior to European settlement (Tozer *et al.* 2010).
• evidence that the TEC is unlikely to respond to management (Principle 4, clause 6.7(2)(d) BC Regulation). • known reproductive characteristics severely limit the ability to increase the existing population on, or occupy new habitat (e.g. species is clonal) on, a biodiversity stewardship site • the species is reliant on abiotic habitats which cannot be restored or replaced (eg karst systems) on a biodiversity stewardship site, or • life history traits and/or ecology is known but the ability to control key threatening processes at a biodiversity stewardship site is currently negligible (eg frogs severely impacted by chytrid fungus).	Principle 4 does not currently apply to TEC's (DPE 2022), however: • There are no known reproductive characteristics that severely limit the ability to increase the existing population on or occupy new habitat on a biodiversity stewardship site. • The TEC is not reliant on abiotic habitats which cannot be restored or replaced on a biodiversity stewardship site. However, the success is likely to be dependent on the location of the site. • The ecology is known, KTPs can reasonably be controlled within a biodiversity stewardship site and the TEC is expected to be responsive to management.	Principle 4 does not currently apply to TEC's (DPE 2022), however: • There are no known reproductive characteristics that severely limit the ability to increase the existing population on or occupy new habitat on a biodiversity stewardship site. • The TEC is not reliant on abiotic habitats which cannot be restored or replaced on a biodiversity stewardship site. However, the success is likely to be dependent on the location of the site. • The ecology is known, KTPs can reasonably be controlled within a biodiversity stewardship site and the TEC is expected to be responsive to management.
3. Where the TBDC indicates data is 'unknown' or 'data deficient' for a TEC for a criterion listed in Subsection 9.1.1(2.), the assessor must record this in the BDAR or BCAR.	Tozer and Simpson (2020) note that the following data components for Box Gum Woodland are data deficient: Environmental degradation in the last 50 years, in the next 50 years and since 1750. Quantitative analysis - No quantitative analysis of ecosystem collapse has been carried out for Box Gum Woodland. An unknown area of Box Gum Woodland has been subjected to clearing of understorey species, probably in addition to the sowing of exotic pasture, or the clearing of Eucalypt regrowth in derived grassland. The rates of clearing or modification of areas of derived grassland are also unknown and difficult to measure.	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this TEC for a criterion listed in Subsection 9.1.1(2.).
4. In relation to the impacts from the proposal on the TEC at risk of an SAII, the assessor must include data and information on:		

Additional impact assessment provisions for TEC at risk of SAII (Section 9.1.1 of the BAM)	*White Box-Yellow Box-Blakely's Red Gum Grassy Box Woodland and Derived Native Grassland*	*Tableland Basalt Forest in the Sydney Basin and South Eastern Highlands Bioregions*
• the impact on the geographic extent of the TEC (Principles 1 and 3) by estimating the total area of the TEC to be impacted by the proposal: ▪ in hectares, and ▪ as a percentage of the current geographic extent of the TEC in NSW. Data and information should include direct impacts (i.e. from clearing) and indirect impacts where partial loss of the TEC is likely as a result of the proposal. The assessor should consider for example, changes to fire regime (frequency, severity), hydrology, pollutants, species interactions (increased competition, changes to pollinators or dispersal), fragmentation, increased edge effects and disease, pathogens and parasites, which are likely to contribute to the loss of flora and/or fauna species characteristic of the TEC.	Approximately 3,137 ha of *White Box-Yellow Box-Blakely's Red Gum Grassy Box Woodland and Derived Native Grassland* TEC (BC Act) occurs in the project footprint (Figure 6-1). The majority (80%) of this TEC in the project footprint is in a low to very low condition, 8% is in moderate condition and 11% is in high to very high condition. A total of 311.78 ha would be directly impacted by the project. Of the area that is likely to be directly impacted, 16% (49.35 ha) is in high to very high condition, and the majority is in low to very low condition. The best estimate of the extent of occurrence for this TEC is 263,778 km^2 (DPE 2022). Given this, less than 0.01% of this TEC's estimated extent of occurrence would be directly impacted by the project. Potential indirect impacts would include edge effects and potential for increased weed invasion adjacent to the easement, potential changes to fire regimes in surrounding vegetation as a result of management for asset protection, potential for introduction of weeds, diseases and pathogens in the construction phase and operation phase by use of designated access tracks by unclean vehicles.	Approximately 176.85 ha of Tableland Basalt Forest in the Sydney Basin and South Eastern Highlands Bioregions TEC occurs in the project footprint (Figure 6-1). The majority (60%) of this TEC in the project footprint is in high to very high condition, 5% is in moderate condition and 35% is in a low to very low condition. Of that, a total of 37.42 ha is likely to be directly impacted by the project. The estimated extent of occurrence of this TEC is 21,841 km^2. and area of occurrence 11,200 km^2. Given that, approximately 0.002% and 0.003% of this TEC's estimated extent of occurrence and area of occurrence respectively would be directly impacted by the project. The estimated total current extent of this TEC is 38,388 ha, of which 0.1% is likely to be directly impacted by the project. Potential indirect impacts would include edge effects and potential for increased weed invasion adjacent to the easement, potential changes to fire regimes in surrounding vegetation as a result of management for asset protection, potential for introduction of weeds, diseases and pathogens in the construction phase and operation phase by use of designated access tracks by unclean vehicles.
• the extent that the proposed impacts are likely to contribute to further environmental degradation or the disruption of biotic processes (Principle 2) of the TEC by: • estimating the size of any remaining, but now isolated, areas of the TEC; including areas of the TEC within 500 m of the development footprint or equivalent area for other types of proposals • describing the impacts on connectivity and fragmentation of the remaining areas of TEC measured by: • distance between isolated areas of the TEC, presented as the average distance if the remnant is	The TEC is comprised of PCTs 266, 268, 277, 278, 280, 283, 352 and 1330 within the project footprint along the 360 km generally linear project footprint. These PCTs are mapped variably on either side of the proposed easement. The project would impact on 10% of the total area of TEC within the project footprint, and as such would retain some connectivity between adjacent patches. The distance between existing isolated areas of the TEC within the project footprint averages 48 m. If removed, the distance between isolated areas of the TEC within the project footprint averages 67 m.	The TEC is comprised of PCTs 952, 953, 1097, 1107 and 1196 within the project footprint along the 360 km linear project footprint. These PCTs are mapped variably on either side of the indicative disturbance area. The project would directly impact on 21% of the total area of this TEC within the project footprint, and as such would retain some connectivity between adjacent patches. The distance between existing isolated areas of the TEC within the project footprint averages 10.8 m. If removed, the distance between isolated areas of the TEC within the project footprint averages 163.4 m.

Additional impact assessment provisions for TEC at risk of SAII (Section 9.1.1 of the BAM)	*White Box-Yellow Box-Blakely's Red Gum Grassy Box Woodland and Derived Native Grassland*	*Tableland Basalt Forest in the Sydney Basin and South Eastern Highlands Bioregions*
retained AND the average distance if the remnant is removed as proposed, and • estimated maximum dispersal distance for native flora species characteristic of the TEC, and • other information relevant to describing the impact on connectivity and fragmentation, such as the area to perimeter ratio for remaining areas of the TEC as a result of the development • describing the condition of the TEC according to the vegetation integrity score for the relevant vegetation zone(s) (Section 4.3). The assessor must also include the relevant composition, structure and function condition scores for each vegetation zone.	The area to perimeter ratio of existing areas of the TEC within the project footprint averages 0.3. If removed, the area to perimeter ratio of the TEC within the project footprint averages 0.8. The Community has been extensively cleared throughout its range and remnants typically are small, isolated, highly fragmented, occur in predominantly cleared landscapes and exhibit highly modified understoreys (TSSC 2020). Many overstorey trees characteristic of this TEC are very old and there is a general lack of regeneration of overstorey trees, dying trees are not being adequately replaced across the range of the ecological community (Reid & Landsberg 2000 as cited in TSSC 2020). Including associated PCT's within 500 m of the project footprint, the average patch size of the TEC is 4.6 ha (range <1 sqm to 495.3 ha). The project may alter the current connectivity or increase fragmentation of the remaining areas of the TEC, due to direct impacts of clearing and long-term impacts to vegetation condition are likely. The project is likely to directly impact 311.78 ha of the TEC, the current VI scores average 17.2 and ranges from 0.6 – 75.8. Future VI scores for each impact zone are shown in the table below: Disturbance area zone / Min VI / Max VI / Mean VI TCZ / 0.00 / 0.00 / 0.00 ECZ / 0.50 / 34.40 / 12.59 HTZ / 1.00 / 74.1 / 31.39 All / 0.00 / 74.1 / 13.07	The area to perimeter ratio of existing areas of the TEC within the project footprint averages 0.1. If removed, the area to perimeter ratio of the TEC within the project footprint averages 0.5. Including associated PCT's within 500 m of the project footprint, the average patch size of the TEC is 3.2 ha (range <1 sqm to 64.4 ha). Fragmentation of habitat and disruption of ecological processes contribute to a large reduction in the ecological function of this TEC (Clarke 2000). The project may alter the current connectivity or increase fragmentation of the remaining areas of the TEC, due to direct impacts of clearing and long-term impacts to vegetation condition are likely. Given the project would directly impact 37.42 ha of the TEC, the current VI scores average 18.2 and ranges from 5.6 – 34.5. Future VI scores for each impact zone are shown in the table below: Disturbance area zone / Min / Max / Mean TCZ / 0.00 / 0.00 / 0.00 ECZ / 2.10 / 20.70 / 8.58 HTZ / 5.60 / 66.40 / 40.14 All / 0.00 / 66.40 / 13.10 TEC areas broken up by condition are given in the table below: Vegetation condition / Total impacted area (ha) / Impacted condition zone as proportion of TEC extent (%)

<tr><td></td><td>TEC areas broken up by condition are given in the table below:<table><tr><th>Vegetation condition</th><th>Total impacted area (ha)</th><th>Impacted condition zone as proportion of TEC extent (%)</th></tr><tr><td>Very high</td><td>4.66</td><td>1.49%</td></tr><tr><td>High</td><td>44.69</td><td>14.33%</td></tr><tr><td>Moderate</td><td>29.32</td><td>9.41%</td></tr><tr><td>Low</td><td>95.13</td><td>30.51%</td></tr><tr><td>Very low</td><td>137.97</td><td>44.25%</td></tr><tr><td>Total</td><td>311.78</td><td>100%</td></tr></table></td><td><table><tr><td>Very high</td><td>0.26</td><td>0.69%</td></tr><tr><td>High</td><td>28.42</td><td>75.95%</td></tr><tr><td>Moderate</td><td>0.42</td><td>1.12%</td></tr><tr><td>Low</td><td>2.72</td><td>7.27%</td></tr><tr><td>Very low</td><td>5.6</td><td>14.97%</td></tr><tr><td>Total</td><td>37.42</td><td>100%</td></tr></table></td></tr>
<tr><td>5. The assessor may also provide new information that demonstrates that the principle identifying that the TEC is at risk of an SAII is not accurate.</td><td>Not applicable.</td><td>Not applicable.</td></tr>
<tr><td>Likely SAII assessment outcome against relevant principles.</td><td>Due to the proposed clearing of better condition areas of the community, the project would add to the reduction in ecological function experienced by this community historically. The project would contribute to a further decline of the species or ecological community that is currently observed, estimated, inferred or reasonably suspected to be in a rapid rate of decline.
However, there are extensive areas of this community that remain and if impacts were substantially limited to lower condition remnants this might result in a 'non-significant risk' of extinction determination. This would be due to the relatively large expanses of the community which remain and restriction of most impacts to lower condition areas.</td><td>It is noted that 8.1 ha of impacts for this community would occur within the HTZ zone where a limited VI loss is predicted. If TCZ and ECZ clearing within higher condition areas can be further limited, it should significantly reduce the risk of an SAII conclusion.

However, without additional mitigation, the project is likely to be deemed a significant risk to the ecological community becoming extinct because it will cause a further decline of the ecological community that is currently observed, estimated, inferred or reasonably suspected to be in a rapid rate of decline. In addition, primarily for better condition areas of the community subject to ECZ clearing, the project would add to the reduction in ecological function experienced by this community historically.</td></tr>
</table>

2.1.2 Coolac-Tumut Serpentinite Shrubby Woodland and Monaro Tableland Temperate Grassy Woodland

Additional impact assessment provisions for TEC at risk of SAII (Section 9.1.1 of the BAM)	***Coolac-Tumut Serpentinite Shrubby Woodland in the NSW South Western Slopes and South Eastern Highlands Bioregions***	***Monaro Tableland Cool Temperate Grassy Woodland in the South Eastern Highlands Bioregion***
Impact summary	The project would result in direct impacts to a total of 1.42 ha of *Coolac-Tumut Serpentinite Shrubby Woodland in the NSW South Western Slopes and South Eastern Highlands Bioregions.* This area constitutes a relatively even mix of high moderate and low condition classes and excludes areas mapped as Category 1 lands. All impacts (100%) are within the Total Clearing Zone where total VI loss is accounted for. Potential indirect impacts to the TEC include: • Inadvertent impacts on adjacent vegetation. • Transport of weeds and pathogens from the site to adjacent vegetation. • Changed fire regimes. Prescribed impacts to the TEC include: • Impacts to habitat connectivity.	The project would result in direct impacts to a total of 1.7 ha of *Monaro Tableland Cool Temperate Grassy Woodland in the South Eastern Highlands Bioregion.* This area constitutes all condition classes including very low and low condition class which make up 90% of the stated impact area. Potential indirect impacts to the TEC include: • Inadvertent impacts on adjacent vegetation. • Transport of weeds and pathogens from the site to adjacent vegetation. • Changed fire regimes. Potential prescribed impacts to the TEC include: • Impacts to habitat connectivity. • Impacts on water quality, waterways, and hydrological processes.
1. The assessor is required to provide further information in the BDAR or BCAR regarding the impacts on each TEC at risk of an SAII. This must include the action and measures taken to avoid the direct and indirect impact on the TEC at risk of an SAII. Where these have been addressed elsewhere the assessor can refer to the relevant sections of the BDAR and BCAR.	Coolac-Tumut Serpentinite Shrubby Woodland in the NSW South Western Slopes and South Eastern Highlands Bioregions TEC aligns with PCT 301 within the Inland Slopes IBRA subregion. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to TECs include: • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1). • Further avoidance and minimisation of TEC impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying TEC remnants and their existing condition, habitat features and important connectivity corridors.	Two PCTs (PCTs 679 and 1191) within the project footprint align with the Monaro Tableland Cool Temperate Grassy Woodland TEC. The TEC occurs within the Crookwell IBRA subregion. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to TECs include: • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1). • Further avoidance and minimisation of TEC impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying TEC remnants and their existing condition, habitat features and important connectivity corridors.

	• Establishment of biodiversity exclusion zones in retained vegetation to demarcate high condition TEC remnants as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of TECs within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20).	• Establishment of biodiversity exclusion zones in retained vegetation to demarcate high condition TEC remnants as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of TECs within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with pathogens, pests and weeds (EMM B19).
2. The assessor must consult the TBDC and/or other sources to report on the current status of the TEC including:		
• evidence of reduction in geographic distribution (Principle 1, clause 6.7(2)(a) BC Regulation) as the current total geographic extent of the TEC in NSW AND the estimated reduction in geographic extent of the TEC since 1970 (not including impacts of the proposal)	**Information provided by EES (28/03/2022)** ***Principle 1 SAII = No*** *Does not meet reduction in geographic extent of ≥90% since 1750 or ≥80% since 1970.* Principle 1 does not apply to this TEC. Associated with soils derived from serpentinite geology (Benson *et al.* 2010, Armstrong *et al.* 2013, NSWSC 2015), the geographic extent of this TEC is highly restricted. Based on serpentinite mapped in the Coolac/Gundagai/Tumut area in the NSW Statewide Geological Database Geology 250k (2001) layer as a surrogate for the distribution of this TEC, the upper bound for Area of Occupancy (AOO) is estimated at 460 km^2/46,000 ha (NSWSC 2015). It is estimated that less than 6,320 ha of this TEC remains,	***Principle 1 SAII = Yes*** *Meets reduction in geographic extent of ≥90% since 1750 or ≥80% since 1970* *Final Determination: Monaro Tableland Cool Temperate Grassy Woodland has undergone a very large reduction in distribution. Based on an analysis of maps produced by Gellie (2005) and Keith and Bedward (1999), together with maps depicting more recent vegetation clearing (Danaher 2011) the NSW Threatened Species Scientific Committee estimates that less than 15,660 ha of Monaro Tableland Cool Temperate Grassy Woodland remain, approximately 5% of its estimated pre-1750 distribution of 295,500 ha.*

Additional impact assessment provisions for TEC at risk of SAII (Section 9.1.1 of the BAM)	*Coolac-Tumut Serpentinite Shrubby Woodland in the NSW South Western Slopes and South Eastern Highlands Bioregions*	*Monaro Tableland Cool Temperate Grassy Woodland in the South Eastern Highlands Bioregion*
	which represents approximately 14% of its estimated pre-1750 distribution of 46,000 ha (NSWSC 2019) and therefore does not the criterion for reduction in geographic extent of ≥90% since 1750. TEC distribution data from 1970 is not available and therefore the estimated reduction in geographic extent of the TEC since 1970 has not been estimated.	Based on an analysis of mapping (produced by Keith and Bedward 1999, Gellie 2005 and Danaher 2011 (cited in NSWSC 2019) It is estimated that less than 15,660 ha of this TEC remain, which represents approximately 5% of its estimated pre-1750 distribution of 295,500 ha (NSWSC 2019) which therefore meets the criterion for reduction in geographic extent of ≥90% since 1750. Moreover, ongoing threats to this TEC are likely to cause continuing declines in geographic distribution (NSWSC 2019). TEC distribution data from 1970 is not available and therefore the estimated reduction in geographic extent of the TEC since 1970 has not been estimated.
• extent of reduction in ecological function for the TEC using evidence that describes the degree of environmental degradation or disruption to biotic processes (Principle 2, clause 6.7(2)(b) BC Regulation) indicated by: ▪ change in community structure ▪ change in species composition ▪ disruption of ecological processes ▪ invasion and establishment of exotic species ▪ degradation of habitat, and ▪ fragmentation of habitat	**Information provided by EES (28/03/2022)** ***Principle 2 SAII = Yes*** *Meets reduction in ecological function of ≥90% since 1750 or ≥80% since 1970* *Final Determination = Collectively, these threats indicate a large reduction in ecological function [changes in community structure and composition, degradation and fragmentation of habitat, and invasion and establishment of exotic species].* Principle 2 applies to this TEC. Change in community structure: The structure of this TEC varies between tall open heath and low sparse woodland and is usually dominated by scattered taller trees, small trees, shrubs and grasstrees (NSWSC 2015). The ground is generally rocky and the vegetative ground cover is sparse on exposed slopes and dense in creek lines (NSWSC 2015). Larger trees, a range of shrub species and dense to mid-dense ground cover can be found where the soil is deeper in protected gullies and foot slopes (Benson *et al.* 2010). This TEC has been extensively cleared and heavily impacted by weed invasion and grazing which has led to changes in community structure (NSWSC 2015). Change in species composition: The species composition of this TEC has also changed as a result of clearing, weed invasion as well as grazing by domestic	***Principle 2 SAII = Yes*** *Meets reduction in ecological function of ≥90% since 1750 or ≥80% since 1970* *Final Determination: Remnants are typically small and fragmented and are thus susceptible to attrition via clearing for routine land management practices. The threats to Monaro Tableland Cool Temperate Grassy Woodland listed above [changes in rainfall and temperature, grazing, weed invasion, vegetation clearing] are ongoing and likely to cause continuing declines in geographic distribution and disruption of biotic processes or interactions.* Change in community structure: The structure of this TEC varies from woodland to low open woodland and is characterised by a sparse to very sparse tree stratum and a continuous herbaceous ground stratum is usually present (NSWSC 2019). The tree stratum becomes shorter and sparser with reduced moisture availability or increasing waterlogging of soil (NSWSC 2019). Trees may be absent as a result of clearing for agriculture and failure to regenerate as a result of excessive by exotic herbivores domestic stock (NSWSC 2019). Similarly, the continuous herbaceous ground stratum is highly variable in cover as a function of grazing pressure from native and exotic herbivores and domestic

Additional impact assessment provisions for TEC at risk of SAII (Section 9.1.1 of the BAM)	***Coolac-Tumut Serpentinite Shrubby Woodland in the NSW South Western Slopes and South Eastern Highlands Bioregions***	***Monaro Tableland Cool Temperate Grassy Woodland in the South Eastern Highlands Bioregion***
	livestock and exotic pest animals (Benson *et al.* 2010, Armstrong *et al.* 2013, NSWSC 2015). Disruption of ecological processes: This has led to changes in community structure and composition, degradation and fragmentation of habitat, and invasion and establishment of exotic species. Collectively, these threats indicate a substantial reduction in ecological function (NSWSC 2015). Invasion and establishment of exotic species: This TEC is heavily affected by the invasion and establishment of high threat weeds particularly in heavily grazed locations and gullies (Benson *et al.* 2010) and a range of exotic forbs commonly occur within this TEC (Armstrong *et al.* 2013). Degradation of habitat: The adverse effects of grazing by domestic livestock and exotic pest animals such as rabbits, hares, horses, deer, pigs and goats on the structure and floristic composition of plant communities in the upper Murrumbidgee catchment in general have been noted (Armstrong *et al.* 2013). Fragmentation of habitat: Serpentinite rock outcrops and surrounding landscapes have been extensively cleared for grazing and agriculture. Consequently, this TEC is highly fragmented and most remaining stands are small and with high edge to area ratios (NSWSC 2015).	livestock (NSWSC 2019). This TEC may develop a shrub or bracken thickets as a result of extensive disturbance to the ground stratum following excessive grazing (NSWSC 2019). Change in species composition: The loss of trees as a result of clearing for agriculture and grazing by domestic livestock, in cases where the development of a shrub and bracken thickets has developed has plainly altered species composition of this TEC. Similarly, grazing pressure has resulted in the partial or complete replacement of native tussock forming grass, herb and sub-shrub species (Costin 1954 as cited in NSWSC 2019) and a highly variable species composition of the ground stratum (NSWSC 2019). Disruption of ecological processes: Given that this TEC has undergone a very large reduction in geographic distribution and experienced a very large degree of environmental degradation it follows that this TEC has also experienced a very large disruption to ecological processes (NSWSC 2019). Moreover, ongoing threats to this TEC are likely to cause continuing disruption to ecological processes (NSWSC 2019). Invasion and establishment of exotic species: Remnants of this TEC are subject to invasion and establishment of an extensive range of exotic grass, herb and shrub species (NSWSC 2019) that include a range of high threat weeds. Degradation of habitat: This TEC has been impacted by the grazing by domestic livestock since the 1820s and is subject to ongoing grazing pressure from native and exotic herbivores as well as domestic livestock (NSWSC 2019). Degradation of the ground stratum in this TEC has been associated with well-documented impacts of grazing including the erosion, compaction and nutrient enrichment of the topsoil (NSWSC 2019). Fragmentation of habitat: Remnants of this TEC are typically small and fragmented and are thus susceptible to continued clearing for routine agricultural land management practices (NSWSC 2019).

Additional impact assessment provisions for TEC at risk of SAII (Section 9.1.1 of the BAM)	*Coolac-Tumut Serpentinite Shrubby Woodland in the NSW South Western Slopes and South Eastern Highlands Bioregions*	*Monaro Tableland Cool Temperate Grassy Woodland in the South Eastern Highlands Bioregion*
• evidence of restricted geographic distribution (Principle 3, clause 6.7(2)I BC Regulation), based on the TEC's geographic range in NSW according to the: ▪ extent of occurrence ▪ area of occupancy, and ▪ number of threat-defined locations	**Information provided by EES (28/03/2022)** ***Principle 3 SAII = Yes*** *Number of locations = Unknown* *Estimated AOO = 460 km^2* *Estimated EOO = 1,721 km^2* *Estimated total current extent = 6,320 ha* Principle 3 applies to this TEC. This TEC is associated with soils derived from serpentinite geology (Benson *et al.* 2010, Armstrong *et al.* 2013, NSWSC 2015). As a result, the geographic distribution of this TEC is highly restricted (NSWSC 2015). There has been major alteration to the geographic distribution of this TEC due to weed invasion, grazing and clearing Benson *et al.* (2010). The estimated extent of occurrence of this TEC is 1,721 km^2. The estimated area of occupancy of this TEC is 460 km^2. However, due to extensive clearing throughout the range of this TEC the area of occupancy of is much less that this figure but is unlikely to be <10 km^2. Data on the number of threat-defined locations for this TEC is not recorded. The estimated total current extent of this TEC is 6,320 ha. This TEC is not protected within any conservation reserve (NSWSC 2015).	***Principle 3 SAII = No*** *Number of locations = Unknown* *Estimated AOO = 5,300 km^2* *Estimated EOO = 13,780 km^2* *Estimated total current extent = 15,660 ha* The estimated extent of occurrence of this TEC is 13,780 km^2. The estimated area of occupancy of this TEC is 5,300 km^2. Data on the number of threat-defined locations for this TEC is not recorded. The TEC is known or predicted within 11 IBRA Subregions of the South Eastern Highlands Bioregion with no geographic restrictions within any subregion (OEH 2022). The estimated total current extent of this TEC is 15,660 ha. Approximately 1,293 ha of this TEC protected in conservation reserves, 85 ha is preserved in perpetuity under conservation agreements and 147 ha occurs in Crown Reserves representing 1,525 ha under reservation. which represents <1% of the pre-1750 extent of this TEC (NSWSC 2019).
• evidence that the TEC is unlikely to respond to management (Principle 4, clause 6.7(2)(d) BC Regulation). • known reproductive characteristics severely limit the ability to increase the existing population on, or occupy new habitat (eg species is clonal) on, a biodiversity stewardship site	Principle 4 does not currently apply to TEC's (DPE 2022), however: • There are no known reproductive characteristics that severely limit the ability to increase the existing population on or occupy new habitat on a biodiversity stewardship site. • The TEC is reliant on abiotic habitats which cannot be restored or replaced on a biodiversity stewardship site (ie soils derived from serpentinite geology formations (Benson *et al.* 2010, Armstrong *et al.* 2013, NSWSC 2015)), therefore the success is likely to be dependent on the location of the site. However, the TEC is expected to be responsive to management. • Notwithstanding the reliance of this TEC on abiotic habitats above, the ecology for this TEC is known, Key Threatening Processes can reasonably be controlled within a biodiversity stewardship site (ie	Principle 4 does not currently apply to TEC's (DPE 2022), however: • There are no known reproductive characteristics that severely limit the ability to increase the existing population or occupy new habitat on a biodiversity stewardship site. • The TEC is not reliant on abiotic habitats which cannot be restored or replaced on a biodiversity stewardship site. However, the success is likely to be dependent on the location of the site. • The ecology is known, Key Threatening Processes can reasonably be controlled within a biodiversity stewardship site and the TEC is expected to be responsive to management.

Additional impact assessment provisions for TEC at risk of SAII (Section 9.1.1 of the BAM)	*Coolac-Tumut Serpentinite Shrubby Woodland in the NSW South Western Slopes and South Eastern Highlands Bioregions*	*Monaro Tableland Cool Temperate Grassy Woodland in the South Eastern Highlands Bioregion*
• the species is reliant on abiotic habitats which cannot be restored or replaced (eg karst systems) on a biodiversity stewardship site, or • life history traits and/or ecology is known but the ability to control key threatening processes at a biodiversity stewardship site is currently negligible (eg frogs severely impacted by chytrid fungus).	'Clearing of native vegetation', 'Invasion of native plant communities by exotic perennial grasses', 'Competition and grazing by the feral European rabbit', 'Competition and habitat degradation by Feral Goats, *Capra hircus* Linnaeus 1758', 'Habitat degradation and loss by Feral Horses (brumbies, wild horses), *Equus caballus* Linnaeus 1758', 'Herbivory and environmental degradation caused by feral deer', 'Predation and hybridisation by Feral Dogs, *Canis lupus familiaris'*, 'Predation by feral cats', 'Predation by the European Red Fox', 'Predation, habitat degradation, competition and disease transmission by Feral Pigs (*Sus scrofa*) ', 'Ecological consequences of high frequency fires', 'Loss of Hollow-bearing Trees', 'Removal of dead wood and dead trees') and the TEC is expected to be responsive to management.	
3. Where the TBDC indicates data is 'unknown' or 'data deficient' for a TEC for a criterion listed in Subsection 9.1.1(2.), the assessor must record this in the BDAR or BCAR.	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this TEC for a criterion listed in Subsection 9.1.1(2.).	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this TEC for a criterion listed in Subsection 9.1.1(2.).
4. In relation to the impacts from the proposal on the TEC at risk of an SAII, the assessor must include data and information on:		
• the impact on the geographic extent of the TEC (Principles 1 and 3) by estimating the total area of the TEC to be impacted by the proposal: ▪ in hectares, and ▪ as a percentage of the current geographic extent of the TEC in NSW. Data and	Approximately 33.10 ha of Coolac-Tumut Serpentinite Shrubby Woodland in the NSW South Western Slopes and South Eastern Highlands Bioregions TEC occurs in the project footprint (Figure 6-1). The majority (40%) of this TEC in the project footprint is in a low condition, 23% is in a moderate condition and 37% is in high condition. No other condition classes were recorded. Of that, a total of 1.42 ha is likely to be directly impacted by the project. The best estimate of the extent of occurrence for this TEC is 1,721 km^2 (NSWSC 2015) and area of occurrence 460 km^2. Given that, approximately 0.0008% and 0.003% of this TEC's estimated extent of occurrence and area of occurrence respectively is likely to be directly impacted by the project. The	Approximately 23.32 ha of *Monaro Tableland Cool Temperate Grassy Woodland in the South Eastern Highlands Bioregion* CEEC occurs in the project footprint (Figure 6-1). The majority (58%) of this CEEC in the project footprint is in Low condition, 10% is in moderate condition and 32% is in High to Very high condition. Of that, a total of 1.7 ha is likely to be directly impacted by the project. The best estimate of the extent of occurrence for this TEC is 13,780 km^2 and area of occupancy is 5,300 km^2. Given that, approximately 0.0001% and 0.0003% of this TEC's estimated extent of occurrence and area of occurrence respectively is likely to be directly impacted by the project.

Additional impact assessment provisions for TEC at risk of SAII (Section 9.1.1 of the BAM)	*Coolac-Tumut Serpentinite Shrubby Woodland in the NSW South Western Slopes and South Eastern Highlands Bioregions*	*Monaro Tableland Cool Temperate Grassy Woodland in the South Eastern Highlands Bioregion*
information should include direct impacts (ie from clearing) and indirect impacts where partial loss of the TEC is likely as a result of the proposal. The assessor should consider for example, changes to fire regime (frequency, severity), hydrology, pollutants, species interactions (increased competition, changes to pollinators or dispersal), fragmentation, increased edge effects and disease, pathogens and parasites, which are likely to contribute to the loss of flora and/or fauna species characteristic of the TEC.	estimated total current extent of this TEC is 6,320 ha, of which 0.02% is likely to be directly impacted by the project. Potential indirect impacts would include edge effects and potential for increased weed invasion adjacent to the easement, potential changes to fire regimes in surrounding vegetation as a result of management for asset protection, potential for introduction of weeds, diseases and pathogens in the construction phase and operation phase by use of designated access tracks by unclean vehicles.	The estimated total current extent of this TEC is 15,660 ha, of which less than 0.01% would be directly impacted by the project. Potential indirect impacts would include edge effects and potential for increased weed invasion adjacent to the easement, potential changes to fire regimes in surrounding vegetation as a result of management for asset protection, potential for introduction of weeds, diseases and pathogens in the construction phase and operation phase by use of designated access tracks by unclean vehicles.
• the extent that the proposed impacts are likely to contribute to further environmental degradation or the disruption of biotic processes (Principle 2) of the TEC by: • estimating the size of any remaining, but now isolated, areas of the TEC; including	The TEC is comprised of PCT 301, predominantly situated adjacent to Red Hill State Forest within the project footprint. The project would directly impact on 4% of the TEC within the project footprint. Given the variable terrain at this location, transmission lines would span across large sections of this TEC without the need for clearing. As such the project would have a negligible impact on connectivity between adjacent patches. The distance between existing isolated areas of the TEC within the project footprint averages 4,322 m. If removed, the distance between isolated areas of the TEC within the project footprint averages 4,863 m.	The TEC is comprised of PCTs 679 and 1191 within the project footprint along the 360 km generally linear project footprint. These PCTs are mapped variably on either side of the proposed easement. The project would directly impact 7.2% of the total area of this TEC within the project footprint, and as such would have negligible impact on connectivity between adjacent patches. The average distance between existing isolated areas of the TEC within the project footprint averages 727.8 m and is unlikely to change. In general, the evidence available indicates that the most likely potential dispersal rate for Eucalypts is equivalent to about 1–2 m per year. Over

Additional impact assessment provisions for TEC at risk of SAII (Section 9.1.1 of the BAM)	*Coolac-Tumut Serpentinite Shrubby Woodland in the NSW South Western Slopes and South Eastern Highlands Bioregions*	*Monaro Tableland Cool Temperate Grassy Woodland in the South Eastern Highlands Bioregion*
areas of the TEC within 500 m of the development footprint or equivalent area for other types of proposals • describing the impacts on connectivity and fragmentation of the remaining areas of TEC measured by: • distance between isolated areas of the TEC, presented as the average distance if the remnant is retained AND the average distance if the remnant is removed as proposed, and • estimated maximum dispersal distance for native flora species characteristic of the TEC, and • other information relevant to describing the impact on connectivity and fragmentation, such as the area to perimeter ratio for remaining areas of the TEC as a result of the development • describing the condition of the TEC according to the vegetation integrity score for the relevant vegetation zone(s) (Section 4.3). The assessor must also include the relevant composition,	The area to perimeter ratio of existing areas of the TEC within the project footprint averages 0.1. If removed, the area to perimeter ratio of the TEC within the project footprint averages 0.4. Including associated PCT's within 500 m of the project footprint, the average patch size of the TEC is 34.3 ha (range 4.6 sqm to 259.9 ha). The project is unlikely to alter the current connectivity or increase fragmentation of the remaining areas of the TEC, due to the small scale nature of the direct impacts of clearing and long-term impacts to vegetation condition. Given the project would directly impact 1.42 ha of the TEC, the current VI score is 46.1. Future VI scores for each impact zone are shown in the table below: Disturbance area zone | Min | Max | Mean TCZ | 0.00 | 0.00 | 0.00 ECZ | N/A | N/A | N/A HTZ | N/A | N/A | N/A TEC areas broken up by condition are given in the table below: Vegetation condition | Total impacted area (ha) | Impacted condition zone as proportion of TEC extent (%) Very high | 0 | 0% High | 0.37 | 26.06% Moderate | 0.42 | 29.58% Low | 0.63 | 44.37% Very low | 0 | 0%	decades, this is likely to occur as a series of stepwise events, associated with disturbances such as bushfires (Booth 2017). The area to perimeter ratio of existing areas of the TEC within the project footprint averages 0.2. If removed, the area to perimeter ratio of the TEC within the project footprint averages 0.3. Including associated PCT's within 500 m of the project footprint, the average patch size of the TEC is 1.2 ha (range 3.8 sqm to 5.4 ha). The project is unlikely to alter the current connectivity or increase fragmentation of the remaining areas of the TEC, due to the small-scale nature of the direct impacts of clearing and long-term impacts to vegetation condition. The project is likely to directly impact 1.7 ha of the TEC, the current VI scores average 31.2 and ranges from 5.5 – 48.2. Future VI scores for each impact zone are shown in the table below: Disturbance area zone | Min VI | Max VI | Mean VI TCZ | 0.00 | 0.00 | 0.00 ECZ | 0.40 | 32.80 | 16.86 HTZ | 32.30 | 51.10 | 43.03 All | 0.00 | 51.10 | 18.31 TEC areas broken up by condition are given in the table below: Vegetation condition | Total impacted area (ha) | Impacted condition zone as proportion of TEC extent (%) Very high | 0 | 0%

structure and function condition scores for each vegetation zone.	Total 1.42 100%	High 0.07 4.11% Moderate 0.10 5.88% Low 1.52 89% Very low 0 0% Total 1.7 100%
5. The assessor may also provide new information that demonstrates that the principle identifying that the TEC is at risk of an SAII is not accurate.	Not applicable.	Not applicable.
Likely SAII assessment outcome against relevant principles.	Given the limited and sporadic extent of impacts it is considered very unlikely that the project would be considered as contributing significantly towards the risk of extinction to the community. The project is not expected to reduce the extent of occurrence or area of occupation of this community (the relevant SAII principle for assessment) under scales used for their calculation.	Given the limited extent of impacts and the retention of some values in areas to be cleared (no areas expected to be totally cleared) it is considered unlikely that the project would be considered as contributing significantly towards the risk of extinction to the community. Additional avoidance of better condition areas would reduce the likelihood of an SAII even further.

2.2 Threatened flora

2.2.1 *Prasophyllum bagoense* and *Prasophyllum innubum*

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	***Prasophyllum bagoense* Bago Leek Orchid**	***Prasophyllum innubum* Brandy Marys Leek-Orchid**
Impact summary	The project would result in direct impacts to a total of 31.9 ha of potential habitat for Bago Leek Orchid, the vast majority of which is assumed presence. Potential indirect impacts to the species include: • Transport of weeds and pathogens from the site to adjacent vegetation. • Trampling of threatened flora species. • Changed fire regimes.	The project would result in direct impacts to a total of 0.25 ha of Brandy Marys Leek-Orchid habitat in high condition, all of which is assumed presence. Potential indirect impacts to the species include: • Transport of weeds and pathogens from the site to adjacent vegetation. • Trampling of threatened flora species. • Changed fire regimes.
1. The assessor is required to provide further information in the BDAR or BCAR for any species at risk of an SAII, including the action and measures taken to avoid the direct and indirect impact on the species at risk of an SAII. Where these have been addressed elsewhere the assessor can refer to the relevant sections of the BDAR or BCAR.	*Prasophyllum bagoense* is a tuberous ground orchid *f*ound in grassy, low heathland dominated by *Poa clivicola, Epacris gunnii* and *E. celata* on a subalpine plain bordered by Snow Gum and Mountain Gum According to the DPE (2014), there is a single population of at least 2,300 individuals in the Tumbarumba area (DPIE 2021). The species was recorded during field surveys within the Bago State Forest approximately 130 metres from the project footprint. Six individuals were recorded by NSW Forestry Corporation in 2016 within the project footprint in Bago State Forest. Suitable habitat for the species is situated within the project footprint and species presence has been assumed within these habitats including within habitats that are treed and may be less heathy in some areas (potentially sub-optimal habitat). Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened flora include: • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1).	*Prasophyllum innubum* occurs in Bago State Forest and apparently also on adjacent Crown forestry lease and private freehold, it is not known to occur in any conservation reserves (DPE 2008). The species is known only from a highly restricted habitat on the treeless McPhersons Plain in Bago State Forest, an area that includes sub-alpine grassland, sphagnum bogs, and open heathland, at an elevation of 1,100 m. The species has a preference for grassland with moderately boggy ground, though not sphagnum-dominated areas. The species is assumed present within potential habitats within the project footprint but has not been directly recorded. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened flora include: • Design refinements to avoid impacts where practicable (B32) • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1).

	• Further avoidance and minimisation of impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying the extent of habitats, their existing condition and certainty levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed threatened flora habitats as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of temporarily disturbed areas within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with pathogens, pests and weeds (EMM B19).	• Further avoidance and minimisation of impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying the extent of habitats, their existing condition and certainty levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed threatened flora habitat as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of temporarily disturbed areas within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with pathogens, pests and weeds (EMM B19).
2. The assessor must consult the TBDC and/or other sources to report on the current population of the species including:		
• evidence of rapid decline (Principle 1, clause 6.7(2)(a) BC Regulation) presented by an estimate of the:	***Principle 1 SAII = No*** According to the DPE (2014), there is a single population of 400 – 600 individuals in the Tumbarumba area on land covered by	***Principle 1 SAII = No*** There is insufficient data available in publicly available resources and accessible peer reviewed articles to estimate a

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Prasophyllum bagoense* Bago Leek Orchid	*Prasophyllum innubum* Brandy Marys Leek-Orchid
▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer), or ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer) as indicated by: an index of abundance appropriate to the species; decline in geographic distribution and/or habitat quality; exploitation; effect of introduced species, hybridisation, pathogens, pollutants, competitors or parasites	a Crown Lease on State Forest on the Southern Tablelands of NSW. A comprehensive survey was conducted in 2016 of the treeless plains near historic records of this species and around 600 individual plants were located; a large increase on the 50 plants known at the time of listing as threatened (DPE 2021). In 2020, more detailed surveys in the same area showed the population to number at least 2,300 individuals (DPE 2021a), indicating a possible increase or fluctuation in population. However, there is no conclusive evidence that the species is stable or declining (DPE 2014). Key threats (DPIE 2022) to the species, which are likely to have contributed to its low population are: • Pest animals: Feral grazing animals and trampling (horses and pigs) • Weed invasion: *Hypericum perforatum (*St John's Wort) • Demographic Threats: Small population size • Overgrazing: Domestic stock • Land management practices: Uncertainty of future land management practices.	decline in population of the species in NSW in the past 10 years or three generations. Population size of this species fluctuates between 0 and 200 visible plants in eight small populations, with one population now thought to be extinct. The population has declined from around 400 plants since 2004 (TSSC 2014). There is insufficient data to determine whether the reduction is very severe, severe or substantial over the given time period (TSSC 2014). Surveys have shown a decline in mature plants over the last five years due to effects of grazing, changes to hydrology and drought conditions. It is expected that continued decline is likely due to ongoing and potential threats. Climate change is also expected to hasten this decline (TSSC, 2014). The geographic distribution of this species is precarious due to the threats currently impacting on the species, as well as potential threats (TSSC 2014a). Key threats (TSSC 2014) to the species, which are likely to have contributed to its low population are: • Logging, mining and mineral fossicking • Hydrological changes due to dam construction. • Grazing by domestic stock and feral horses (*Equus caballus*). • Soil disturbance by feral pigs (*Sus scrofa*) • Weed invasion by *Rubus fruticosus* and *Holcus lanatus*. • Inappropriate land management practices.
• evidence of small population size (Principle 2, clause 6.7(2)(b) BC Regulation) presented by: ▪ an estimate of the species' current population size in NSW, and ▪ an estimate of the decline in the species' population size in NSW in three years or one generation (whichever is longer), and	***Principle 2 SAII = No*** According to the DPE (2014), there is a single population in the Tumbarumba area. The number of mature individuals is estimated to be low between 400- 600 individuals (DPE, 2014; DPIE, 2022). In 2020, detailed surveys recorded a population of at least 2,300 individuals (DPE 2021). However, due to fluctuating numbers of aboveground material over seasons it is	***Principle 2 SAII = No*** In NSW this species is known from a single population comprising about seven small colonies. Its population size now fluctuates between 0 and 200 visible plants (TSSC 2014). The species occurs in Bago State Forest and apparently also on adjacent Crown forestry lease and private freehold, it is not known to occur in any conservation reserves (DPE 2008).

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Prasophyllum bagoense* Bago Leek Orchid	*Prasophyllum innubum* Brandy Marys Leek-Orchid
▪ where such data is available, an estimate of the number of mature individuals in each subpopulation, or the percentage of mature individuals in each subpopulation, or whether the species is likely to undergo extreme fluctuations	difficult to determine if the population is stable or declining (TSSC 2014). There is no conclusive evidence that the species is stable or declining, given the fluctuation of aboveground material possibly being dependent on seasons (DPE 2014). The species information available in BioNet and other reliable/peer reviewed information about the species is limited. BioNet record data contains 399 records of the species (DPE 2022). Of these records, the most recent record is from 2021, with most records surveyed in 2016. None of these records have had their location displayed, and thus it is difficult to confidently identify a decline in the population over the last decade (DPE 2022). According to the DPE (2014), there is a single population of at least 2,300 individuals in the Tumbarumba area (DPIE 2021). The NSW Scientific Committee (TSSC 2014) describes the above ground material as fluctuating from season to season. The species is insect-pollinated and not known to reproduce vegetatively thus the species fluctuates relying on seed germination for recruitment (DPE 2014)	Although, DPE (2022) describes how the species is more common than current records suggest, and it has been misidentified as *Prasophyllum alpestre* (Mauve Leek Orchid). Population size of this species fluctuates between 0 and 200 visible plants. The population has declined from around 400 plants since 2004 (TSSC 2014). No estimates are available on the number of mature individuals for each sub population. Between 0 and 200 individuals were recorded in all seven known colonies (TSSC 2014). The number of mature individuals is not given.
• evidence of limited geographic range for the threatened species (Principle 3, clause 6.7(2)(c) BC Regulation) presented by: ▪ extent of occurrence ▪ area of occupancy ▪ number of threat-defined locations (geographically or ecologically distinct areas in which a single threatening event may rapidly affect all species occurrences), and ▪ whether the species' population is likely to undergo extreme fluctuations	***Principle 3 SAII = Yes*** *Area of Occupancy (ha) = < 10 km^2* *Extent of Occurrence (ha) = < 100 km^2* *No. Threat-defined locations = <= 3 locations* *Extreme fluctuations in number = No information* The size and area inhabited by the existing population of this species is limited in geographic range. According to DPE (2014), the single known population in NSW is 4 ha in area. The extent of occurrence and area of occupancy are estimated to be approximately 4 km^2.	***Principle 3 SAII = Yes*** *Extent of Occurrence (ha) = < 100 km^2* *Area of Occupancy (ha) = < 10 km^2* *No. Threat-defined locations = <= 3 locations* Extent of occurrence is listed as 4 km^2 (TSSC, 2014). Area of occupancy is 1.5 ha (0.015 km^2) (TSSC, 2014). The distribution of this species is associated with the Alpine Sphagnum Bogs and Associated Fens EPBC Act-listed threatened ecological community. The species has no Threat Defined Locations (TSSC 2014).

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	***Prasophyllum bagoense* Bago Leek Orchid**	***Prasophyllum innubum* Brandy Marys Leek-Orchid**
	Vegetation associations at known sites are typically sub-alpine grassy plain and wetland at an elevation of about 1,100 m (DPE 2014). The current distribution of this species is known, further identification of threat-defined locations is unlikely to occur. However, any potentially suitable habitat ought to be considered a threat defined location within proximity to the known population. The numbers of aboveground *Prasophyllum bagoense* fluctuate, possibly dependent on season (TSSC 2012 cited in TSSC 2014).	There has been an observed decline in the number of mature individuals, from 400 to fluctuations of visible plants between 0 and 200 plants, over the five years leading up to 2014 (TSSC 2014).
• evidence that the species is unlikely to respond to management (Principle 4, clause 6.7(2)(d) BC Regulation) because: • known reproductive characteristics severely limit the ability to increase the existing population on, or occupy new habitat (eg species is clonal) on, a biodiversity stewardship site • the species is reliant on abiotic habitats which cannot be restored or replaced (eg karst systems) on a biodiversity stewardship site, or • life history traits and/or ecology is known but the ability to control key threatening processes at a biodiversity stewardship site is currently negligible (eg frogs severely impacted by chytrid fungus).	***Principle 4 SAII = No*** The species is known to have reproductive characteristics that could severely limit the ability to increase the existing population. It is understood that *Prasophyllum bagoense* is insect-pollinated, relying on seed germination for recruitment (TSSC 2014). BioNet states that the species has a moderate sensitivity to gain dependent on the effectiveness of management to control threats (DPIE 2022). There is no known critical habitat for this species. This species is threatened by a number of KTPs listed under the *Biodiversity Conservation Act 2016*, including changing hydrology, disturbance by domestic and feral animals and weed invasion (TSSC 2014).	***Principle 4 SAII = No*** This species has been assigned to the Data-deficient species management stream under the Saving our Species (SoS) program (OEH 2022a). A priority action under this program is to conduct genetic research to confirm whether morphologically similar species *Prasophyllum innubum* and *P. alpestri* are actually distinct species (OEH 2022a). The species has no known reproductive characteristics that could severely limit the ability to increase the existing population. BioNet states that the species has a moderate sensitivity to gain dependent on the effectiveness of management to control threats (DPE 2022). There is no known critical habitat for this species although this species is associated with the Alpine Sphagnum Bogs and Associated Fens EPBC Act-listed threatened ecological community (DPE 2022b; TSSC 2014). The life history traits of this species are not well known.
3. Where the TBDC indicates data is 'unknown' or 'data deficient' for a species for a criterion listed in Subsection 9.1.2(2.), the assessor must record this in the BDAR or BCAR.	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this species for a criterion listed in Subsection 9.1.1(2.). Some responses in this consideration of SAII cannot be completed comprehensively due to the following:	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this species for a criterion listed in Subsection 9.1.1(2.). Some responses in this consideration of SAII cannot be completed comprehensively due to the following:

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Prasophyllum bagoense* Bago Leek Orchid	*Prasophyllum innubum* Brandy Marys Leek-Orchid
	• The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited. • A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. • As such, we have noted the knowledge gaps in the TBDC and provided responses using information from the limited available sources.	• The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited. • A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. • As such, we have noted the knowledge gaps in the TBDC and provided responses using information from the limited available sources.
4. In relation to the impacts from the proposal on the species at risk of an SAII, the assessor must include data and information on:		
• the impact on the species' population (Principles 1 and 2) presented by: ▪ an estimate of the number of individuals (mature and immature) present in the subpopulation on the subject land (the site may intersect or encompass the subpopulation) and as a percentage of the total NSW population, and ▪ an estimate of the number of individuals (mature and immature) to be impacted by the proposal and as a percentage of the total NSW population, or ▪ if the species' unit of measure is area, provide data on the number of individuals on the site, and the estimated number that will be impacted, along with the area of habitat to be impacted by the proposal	It is not possible to determine how many individuals comprise the sub-population on the site from the available data. Suitable habitat for *Prasophyllum bagoense* was detected within the project footprint within the Snowy Mountains IBRA subregion. There are 421 historic records of *Prasophyllum bagoense* (645 estimated individuals) within and adjacent to the project footprint (NSW Forestry Corporation 2020). Six historic (2016) records of the species occur within the project footprint within Bago State Forest. Field surveys undertaken within suitable habitats recorded individuals 130 m west of the project footprint but not within it. Despite this, the species is considered likely or potentially to occur within suitable habitats located within the project footprint given the presence of historic records and suitable habitats. The species has been assumed present within these habitats. Given species presence is assumed within suitable habitats, and the limited information available on the total population size, it is not possible to determine the number of individuals (mature and immature) to be impacted by the project and as a percentage of the total NSW population. The species unit of measure is area. There are six historic (2016) records of the species within the project footprint.	It is not possible to determine how many individuals comprise the sub-population on the site from the available data. Suitable habitat for Brandy Marys Leek-orchid was detected within the project footprint within the Snowy Mountains IBRA subregion. Targeted flora surveys within the project footprint did not locate the species. Where survey effort was not adequate, species presence has been assumed within potential habitat. As such a percentage present in the subpopulation of the total population cannot be attained. However, it is assumed to have a high likelihood of occurrence due to presence of suitable habitat and there are four nearby records of the Brandy Marys Leek-orchid, with the closest record only 600 m outside the project footprint (DPE 2022). All records are located in proximity to the southern extent of the project footprint in PCT 1124 paddocks (DPE 2022). Given the species was not recorded and is only assumed present, and the limited information available on the total population of the species, it is not possible to determine the number of individuals (mature and immature) to be impacted by the project and as a percentage of the total NSW population.

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Prasophyllum bagoense* Bago Leek Orchid	*Prasophyllum innubum* Brandy Marys Leek-Orchid
	Species presence has been assumed within suitable predicted habitat within the project footprint. The total extent of suitable habitat to be directly impacted by the project is 31.9 ha. Suitable habitat in the surrounding landscape containing numerous records of Bago Leek Orchid individuals would be retained (DPE 2022).	The species unit of measure is area. The species was not located within the project footprint despite targeted surveys in accessible land. Species presence has been assumed within potential habitat. The total area of this species suitable habitat to be directly impacted by the project is 0.25 ha.
• impact on geographic range (Principles 1 and 3) presented by: ▪ the area of the species' geographic range to be impacted by the proposal in hectares, and a percentage of the total area of occupancy or extent of occupancy within NSW ▪ the impact on the subpopulation as either: all individuals will be impacted (subpopulation eliminated); OR impact will affect some individuals and habitat; OR impact will affect some habitat, but no individuals of the species will be directly impacted ▪ to determine if the persisting subpopulation that is fragmented will remain viable, estimate (based on published and unpublished sources such as scientific publications, technical reports, databases or documented field observations) the habitat area required to support the remaining population, and habitat available within dispersal distance, and distance over which genetic exchange can occur (eg seed dispersal) and pollination distance for the species ▪ To determine changes in threats affecting remaining subpopulations and habitat if the proposed impact proceeds, estimate changes in environmental factors including changes to fire regimes (frequency, severity); hydrology, pollutants; species interactions (increased	The project footprint contains 101.61 ha of suitable habitat, of this the project would impact on 31.9 ha (31%), 98% of which is high condition. The extent of occurrence and area of occupancy of the single known population in NSW is estimated to be approximately 4 km^2 (DPE 2014) however it is not known whether all of the area of potential impact occurs within this area. Therefore, the project could impact an estimated 8% of this species' extent of occurrence. The project would result in the direct impact to 31.9 ha of potentially suitable habitat for this species within the project footprint. There are six historic (2016) records of the species within the project footprint. However, these records do not occur within the clearing footprint. Despite this, the project would impact on potential habitat with potential to support the species. As species presence has been assumed, the total number of individuals that may be impacted cannot be accurately quantified. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. Therefore, if the species is present, the project would not create a barrier to dispersal of the species. The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence. If the species is present, individuals in the project footprint may be affected by increased threats such as infestation of weeds - St John's wort and *Potentilla recta*, land management practices that do not support conservation,	The species is known from a single population comprising about seven small colonies, totalling about 400 individuals (TSSC 2014). The project footprint contains 8.83 ha of potential habitat, 0.25 ha (3%) of this would be impacted by the project, all of which is in high condition. The extent of occurrence for this species was estimated at 4 km^2 (TSSC 2014), however it is not known whether all of the area of potential impact occurs within this area. Therefore, the project could impact an estimated 0.06% of this species' extent of occurrence. The project would impact 0.25 ha of potential habitat for this species. No individuals of the species are likely to be directly impacted in areas where targeted surveys were undertaken as the species was not detected. In areas that comprise the species polygon, species presence has been assumed. As such, the number of individuals cannot be quantified. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. Therefore, if the species is present, the project would not create a barrier to dispersal of the species. The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence. If the species is present, individuals in the project footprint may be affected by changes to fire regimes, increased edge effects, this species is associated with Alpine Sphagnum Bogs TEC and may be affected by modified hydrology of drainage lines within the project footprint and/or changes in use and management of adjacent land, off-road

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Prasophyllum bagoense* Bago Leek Orchid	*Prasophyllum innubum* Brandy Marys Leek-Orchid
competition and effects on pollinators or dispersal); fragmentation, increased edge effects, likelihood of disturbance; and disease, pathogens and parasites. Where these factors have been considered elsewhere in relation to the target species, the assessor may refer to the relevant sections of the BDAR or BCAR.	increased edge effects, altered hydrology due to drainage lines within the project footprint, off-road vehicle activities (access tracks), disturbance from vegetation removal and maintenance activities within the clearing footprint.	vehicle activities (access tracks), disturbance from vegetation removal and maintenance within the clearing footprint.
5. The assessor may also provide new information that can be used to demonstrate that the principle identifying the species as at risk of an SAII, is inaccurate.	Not applicable.	Not applicable.
Likely SAII assessment outcome against relevant principles.	Confirmation of habitat status through survey and/or further expert advice may remove the likelihood of an SAII finding. Presently, given the project will impact on 31.9 ha of potential habitat, which may equate with up to 8% of the species known range, the project is likely to be deemed a significant risk to the species becoming extinct because it is an impact on the habitat of a species that is currently observed, estimated, inferred or reasonably suspected to have a very limited geographic distribution.	Given the project impact would be limited to 0.25 ha of high condition habitat, which equates to approximately 3% of the species known range, the project is unlikely to be deemed a significant risk to the species becoming extinct because it is an impact on the habitat of a species that is currently observed, estimated, inferred or reasonably suspected to have a very limited geographic distribution. Within the project footprint, 8.58 ha of habitat for this species would remain and if impacts were further avoided and minimised through route refinement (EMM B1) this would likely result in a non-significant risk determination.

2.2.2 *Prasophyllum keltonii* and *Pterostylis oreophila*

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	***Prasophyllum keltonii* Kelton's Leek Orchid**	***Pterostylis oreophila* Blue-tongued Greenhood**
Impact summary	The project would result in direct impacts to a total of 31.70 ha of potential habitat for Kelton's Leek Orchid, the vast majority of which is assumed presence. Potential indirect impacts to the species include: • Transport of weeds and pathogens from the site to adjacent vegetation. • Trampling of threatened flora species. • Changed fire regimes.	The project would result in direct impacts to a total of 0.56 ha of Blue-tongued Greenhood habitat, all of which is assumed presence. Potential indirect impacts to the species include: • Transport of weeds and pathogens from the site to adjacent vegetation. • Trampling of threatened flora species. • Changed fire regimes.
1. The assessor is required to provide further information in the BDAR or BCAR for any species at risk of an SAII, including the action and measures taken to avoid the direct and indirect impact on the species at risk of an SAII. Where these have been addressed elsewhere the assessor can refer to the relevant sections of the BDAR or BCAR.	*Prasopyllum keltonii* is known from a single population, occurring in a small area on the McPhersons Plain in Bago State Forest (DPE 2008c). The species grows on tussock grassland plain, in moisture retentive brown loam at approximately 1,200 m above sea level (Jones 2007). The species was recorded during field surveys within the Bago State Forest approximately 750 metres from the project footprint. Three individuals were recorded by NSW Forestry Corporation in 2016 within the project footprint in Bago State Forest. Suitable habitat for the species is situated within the project footprint and species presence has been assumed within these habitats, including within habitats that are treed and may be less grassy in some areas (potentially sub-optimal habitat). Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened flora include: • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1). • Further avoidance and minimisation of impacts to be prioritised through detailed design and micro-	*Pterostylis oreophila* is known from a few small populations within Kosciuszko National Park and a population in Bago State Forest and adjoining Crown Leases south of Tumut. The species habitat is restricted to areas beside small montane and subalpine streams under tall dense thickets of *Leptospermum grandiflorum* (Mountain Tea Tree), in black oozing mud or less commonly in peaty soils and sphagnum mounds (Jones, 2006, p. 308 cited in TSSC 2012a). This type of habitat occurs throughout much of the upper areas of Kosciuszko National Park. According to TSSC (2014c), this species occurs in the Kiandra and Bago areas in NSW consisting of approximately 90 individuals in total. The species is assumed present within potential habitats within the project footprint but has not been directly recorded. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened flora include: • Design refinements to avoid impacts where practicable (B32) • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1).

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Prasophyllum keltonii* Kelton's Leek Orchid	*Pterostylis oreophila* Blue-tongued Greenhood
	siting (EMM B1). This process would be supported by detailed constraints mapping identifying the extent of habitats, their existing condition and certainty levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed threatened flora habitats as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of temporarily disturbed areas within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with pathogens, pests and weeds (EMM B19).	• Further avoidance and minimisation of impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying the extent of habitats, their existing condition and certainty levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed threatened flora habitats as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of temporarily disturbed areas within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with pathogens, pests and weeds (EMM B19).
2. The assessor must consult the TBDC and/or other sources to report on the current population of the species including:		

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Prasophyllum keltonii* Kelton's Leek Orchid	*Pterostylis oreophila* Blue-tongued Greenhood
• evidence of rapid decline (Principle 1, clause 6.7(2)(a) BC Regulation) presented by an estimate of the: ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer), or ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer) as indicated by: an index of abundance appropriate to the species; decline in geographic distribution and/or habitat quality; exploitation; effect of introduced species, hybridisation, pathogens, pollutants, competitors or parasites	***Principle 1 SAII = No*** In NSW this species is known from a single population, occurring in a small area known as McPhersons Plain in Bago State Forest (DPE 2008c). Its population size was thought to fluctuate between 10 and 250 individuals which is a decline from an estimated 400 plants in 2004 (TSSC 2014b). A comprehensive survey was conducted in 2016 near historic records of this species (DPIE 2021a). Around 300 plants were located; a large increase compared to the 50 plants known at the time of listing as threatened (DPIE 2021a). In 2020, more detailed surveys in the same area showed the population to number at least 1,000 individuals (DPIE 2021a), representing an increase. This species grows on tussock grassland plain, in moisture retentive brown loam at approximately 1,200 m above sea level (Jones 2007). Key threats (TSSC 2014b) to the species, which are likely to have contributed to its low population are: • Grazing: Domestic stock and feral horses (*Equus caballus*) • Pest animals: grazing and trampling by feral animals (mainly horses and pigs). • Soil disturbance: rooting by feral pigs. • Weed invasion: *Holcus lanatus* (Yorkshire Fog) and *Hypericum perforatum* (St John's Wort). • Hydrological changes due to dam construction • Demographic Threats: small population size and confined geography • Logging and forestry activities • Land management practices: Uncertainty of future land management practices.	***Principle 1 SAII = No*** There is insufficient data available in publicly available resources and accessible peer reviewed articles to estimate a decline in population of the species in NSW in the past 10 years or three generations. However, TSSC (2012a) describes how considering the current threats impacting on the species, it is likely that the number of plants would decline in the future. This species habitat is restricted to areas beside small montane and subalpine streams under tall dense thickets of *Leptospermum grandiflorum* (Mountain Tea Tree), in black oozing mud or less commonly in peaty soils and sphagnum mounds (Jones, 2006, p. 308 cited in TSSC 2012a). This type of habitat occurs throughout much of the upper areas of Kosciuszko National Park. The main identified threats to the species, as listed in TSSC (2012a), which are likely to have contributed to its low population are: • Feral species: grazing and trampling by cattle and feral horses, soil disturbance by feral pigs. • Altered hydrology: impacts from forestry, bushfires and controlled burning on sedimentation rates. • Impacts of grazing: Domestic stock • Adjacent land uses: logging • Recreational activities: Horse trail riding trampling; mineral fossicking at the Bago area site • Weed invasion: Mainly by *Rubus fruticosus* (Blackberry) in the Bago area • Inappropriate land management: inappropriate fire regimes and mismanagement of controlled burns • Several of these threats could have a disproportionate impact on the narrow ecological niche favoured by this species (NSWSC 2008 cited

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Prasophyllum keltonii* Kelton's Leek Orchid	*Pterostylis oreophila* Blue-tongued Greenhood
		in TSSC 2012a). For example, a hazard reduction burn in sphagnum mounds in Bago State Forest is reported to have destroyed a subpopulation during unusually dry conditions in 2006 (NSWSC 2008 in TSSC 2012).
• evidence of small population size (Principle 2, clause 6.7(2)(b) BC Regulation) presented by: ▪ an estimate of the species' current population size in NSW, and ▪ an estimate of the decline in the species' population size in NSW in three years or one generation (whichever is longer), and ▪ where such data is available, an estimate of the number of mature individuals in each subpopulation, or the percentage of mature individuals in each subpopulation, or whether the species is likely to undergo extreme fluctuations	***Principle 2 SAII = No*** According to the TSSC (2014b), this species population fluctuates between 10 and 250 individuals, although more recent surveys have estimated that 1,000 individuals may be present in the known populations (DPIE 2021a). The species has not been found to be in decline. DPIE (2021a) states the species trajectory as "fluctuating". Species numbers are also convoluted by the dry years between 2017 and 2019 when fewer plants emerged (DPIE 2021a). The species was estimated to number 10-250 individuals in 2014 (TSSC 2014b) but recent surveys estimate the population to be 1,000 individuals (DPIE 2021a). Emergent numbers of individuals are only indicative of a population as there are always dormant plants so estimates can be highly uncertain (DPIE 2021a). This species has a very low number of mature individuals (TSSC 2014b). DPIE (2021a) states the species trajectory as "fluctuating". This fluctuation may be associated with climatic or rainfall effects with DIPE (2021a) noting that population numbers are highly uncertain due to the dry years between 2017 and 2019.	***Principle 2 SAII = Yes*** As of 2014, the estimated number of mature individuals is 240, in ACT, NSW and Victoria (TSSC 2012a). According to TSSC (2014c), this species occurs in the Kiandra and Bago areas in NSW consisting of approximately 90 individuals in total. The overall number of subpopulations has increased over the past 30 years nationwide, although there is no quantitative data available on whether the species has undergone a reduction in numbers (TSSC, 2012a). However, TSSC (2014a) states that it is likely to undergo a reduction in total population size but there is insufficient data to judge how severe this reduction would be. In NSW, one subpopulation has been recorded from the Kiandra area of Kosciuszko National Park with an approximate 50 individuals, two subpopulations (one thought to be extinct) from the Bago State Forest numbering 12 individuals and one subpopulation from the neighbouring Brandy Marys Bago State Forest Crown Leases numbering an approximate 30 individuals (DPE 2008a). This species is restricted to areas beside small montane and subalpine streams under tall dense thickets of *L. grandiflorum*, in black oozing mud or less commonly in peaty soils and sphagnum mounds (Jones, 2006, p. 308 cited in TSSC 2012). This type of habitat occurs throughout much of the upper areas of Kosciuszko National Park (TSSC 2012a).

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Prasophyllum keltonii* Kelton's Leek Orchid	*Pterostylis oreophila* Blue-tongued Greenhood
• evidence of limited geographic range for the threatened species (Principle 3, clause 6.7(2)(c) BC Regulation) presented by: ▪ extent of occurrence ▪ area of occupancy ▪ number of threat-defined locations (geographically or ecologically distinct areas in which a single threatening event may rapidly affect all species occurrences), and ▪ whether the species' population is likely to undergo extreme fluctuations	***Principle 3 SAII = Yes*** *Extent of Occurrence (ha) = < 100 km²* *Area of Occupancy (ha) = < 10 km²* *No. Threat-defined locations = <= 3 locations* This species has an extent of occurrence of approximately 12 ha (0.12 km²) (TSSC 2014b). This species grows on a tussock grassland plain, in moisture retentive brown loam at approximately 1,200 m above sea level (Jones 2007). This species occurs within the Australian Alps Bioregion and the Murrumbidgee Natural Resource Management Region. The distribution of this species is associated with the 'Alpine Sphagnum Bogs and Associated Fens' EPBC listed ecological community. This species has an area of occupancy of less than 1 ha (0.01 km²) (TSSC 2014b). This species is known from less than 3 locations (DPE 2022). DPIE (2021a) describes the species trajectory as "fluctuating". The species was estimated to number a large range of between 10-250 individuals in 2014 (TSSC 2014b) but recent surveys estimate the population to be 1,000 individuals (DPIE 2021).	***Principle 3 SAII = Yes*** *Extent of Occurrence (ha) = < 100 km²* *Area of Occupancy (ha) = < 10 km²* *No. Threat-defined locations = <= 3 locations* The species extent of occurrence is unknown (TSSC 2012a). However due to the low number of mature individuals and severe fragmentation it is likely that the species has a very restricted geographic distribution (TSSC 2012a). This species area of occupancy is unknown (TSSC 2012a). As a small population was found in Bago State Forest and in the adjoining Brandy Marys Crown Leases, the extent of occurrence of the species has been adjusted to include parts of the Snowy River, Tumbarumba and possibly Tumut LGA (now Snowy Valleys Council) (DPE 2008a). The species has no Threat Defined Locations. The distribution of this species is associated with the Alpine Sphagnum Bogs and Associated Fens EPBC Act-listed threatened ecological community (TSSC 2012a). There is insufficient data to determine whether the species population size would be likely to undergo extreme natural fluctuations. Although, demographic stochasticity is listed as a threat to this species due to the narrow areas of occupancy, small population sizes, and dispersed distribution of populations (DPE 2008a).
• evidence that the species is unlikely to respond to management (Principle 4, clause 6.7(2)(d) BC Regulation) because: ▪ known reproductive characteristics severely limit the ability to increase the existing population on, or occupy new habitat (eg species is clonal) on, a biodiversity stewardship site	***Principle 4 SAII = No*** Climatic and rainfall factors have been suggested to affect the emergence of some individuals with DPE, (2021) noting that the dry years between 2017 and 2019 may have resulted in less emergent numbers of individuals. Other than this, the species has no known reproductive	***Principle 4 SAII = No*** The species flowers from November to January and is pollinated by small gnats or mosquitos (Jones, 2006). The species produces seed and is also suspected to reproduce vegetatively as it has been found to grow in small colonies. However, vegetative reproduction appears to be limited to good seasons and this species does not form large clonal

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Prasophyllum keltonii* Kelton's Leek Orchid	*Pterostylis oreophila* Blue-tongued Greenhood
▪ the species is reliant on abiotic habitats which cannot be restored or replaced (eg karst systems) on a biodiversity stewardship site, or ▪ life history traits and/or ecology is known but the ability to control key threatening processes at a biodiversity stewardship site is currently negligible (eg frogs severely impacted by chytrid fungus).	characteristics that could severely limit the ability to increase the existing population. This species occurs within the Australian Alps Bioregion and the Murrumbidgee Natural Resource Management Region. The distribution of this species is associated with the 'Alpine Sphagnum Bogs and Associated Fens' EPBC listed ecological community. This associated vegetation community may be hard to replace or restore on a Biodiversity Stewardship Site. The species has a moderate sensitivity to gain, this is dependent on the species response to, and effectiveness of, controlling threats (DPE 2022). The life-history traits and ecology of this species is moderately well known (TSSC 2014b). Actions to control the threat from grazing by feral and domestic animals has recently been undertaken and the species has responded well, with numbers increasing to an estimated 1,000 individuals (DPIE 2021). The main threats to this species as described above can reasonably be controlled within a biodiversity stewardship site (eg logging, hydrological changes due to dam construction, grazing, soil disturbance by feral pigs (*Sus scrofa*), mineral fossicking, weed invasion and inappropriate land management), therefore this species is expected to be responsive to management. There are no specified KTPs for this species.	colonies like other members of this genus. A single plant found in 2003, and observed again in 2010, had not shown any vegetative reproduction. It is possible that reproduction may only occur from seed (P.Branwhite, pers. comm., 2010 as cited in DPE 2008). The species has no known reproductive characteristics that could severely limit the ability to increase the existing population, however, it is believed to be insect pollinated. Ecology and response to management is poorly known. BioNet states that the species has a high sensitivity to gain. There is no known critical habitat for this species. The life-history traits and ecology of the species is not well known. This species is listed as a data deficient species by the Saving our Species program OEH 2022b).
3. Where the TBDC indicates data is 'unknown' or 'data deficient' for a species for a criterion listed in Subsection 9.1.2(2.), the assessor must record this in the BDAR or BCAR.	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this species for a criterion listed in Subsection 9.1.1(2.). Some responses in this consideration of SAII cannot be completed comprehensively due to the following: The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited.	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this species for a criterion listed in Subsection 9.1.1(2.). Some responses in this consideration of SAII cannot be completed comprehensively due to the following: The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited.

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Prasophyllum keltonii* Kelton's Leek Orchid	*Pterostylis oreophila* Blue-tongued Greenhood
	A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. As such, we have noted the knowledge gaps in the TBDC and provided responses using information from the limited available sources.	A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. As such, we have noted the knowledge gaps in the TBDC and provided responses using information from the limited available sources.
4. In relation to the impacts from the proposal on the species at risk of an SAII, the assessor must include data and information on:		
• the impact on the species' population (Principles 1 and 2) presented by: ▪ an estimate of the number of individuals (mature and immature) present in the subpopulation on the subject land (the site may intersect or encompass the subpopulation) and as a percentage of the total NSW population, and ▪ an estimate of the number of individuals (mature and immature) to be impacted by the proposal and as a percentage of the total NSW population, or ▪ if the species' unit of measure is area, provide data on the number of individuals on the site, and the estimated number that will be impacted, along with the area of habitat to be impacted by the proposal	It is not possible to determine how many individuals comprise the sub-population on the site from the available data. Suitable habitat for *Prasophyllum keltonii* was detected within the project footprint in the Snowy Mountains IBRA Subregion. Field surveys completed for the project recorded 14 individuals adjacent to (ie within 750 m) the project footprint. 330 individuals have been historically recorded by the NSW Forestry Corporation (all during 2016) within the vicinity of the project footprint. Three of these historic records directly intersected the project footprint.). Species records are situated within the southern extent of the project footprint in the PCT 1224 paddocks. *Pterostylis oreophila* and *Prasophyllum innubum* have also been historically recorded within this habitat (DPE 2022). Potentially suitable habitat for the species is situated within the project footprint and species presence has been assumed within these habitats. Given the limited information available on the total population of the species, it is not possible to determine the number of individuals (mature and immature) that would be impacted by the project and as a percentage of the total NSW population.	It is not possible to determine how many individuals comprise the sub-population on the site from the available data. Suitable habitat for Blue-tongued Greenhood was detected within the project footprint within Snowy Mountains IBRA Subregion. Targeted flora surveys within the project footprint did not locate the species. Where survey effort was not adequate, species presence has been assumed within potential habitat. There are 5 nearby records of the Blue-tongued Greenhood, with the closest record 300 m from the project footprint boundary (DPE 2022). All BioNet records were focused southern extent of the project footprint (DPE 2022). It is known to occur within the Snowy Mountains IBRA Subregion. Given the species was not recorded and is only assumed present, and the limited information available on the total population of the species, it is not possible to determine the number of individuals (mature and immature) that would be impacted by the project and as a percentage of the total NSW population. The species unit of measure is area. The species was not located within the project footprint despite targeted surveys in accessible land. Targeted flora surveys within the project footprint did not locate the species. Where survey effort was not adequate, species presence has been

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Prasophyllum keltonii* Kelton's Leek Orchid	*Pterostylis oreophila* Blue-tongued Greenhood
	The species unit of measure is area. The species was not located within the project footprint despite targeted surveys in accessible land. Species presence has been assumed within potential habitat. The total area of this species potential habitat that would be directly impacted by the project is 31.67 ha. Suitable habitat in the surrounding landscape containing numerous records of Kelton's Leek Orchid would not be directly impacted by the project (DPE 2022).	assumed within potential habitat. The project would result in the direct impact to 0.56 ha of potential habitat for Blue-tongued Greenhood in the project footprint.
• impact on geographic range (Principles 1 and 3) presented by: ▪ the area of the species' geographic range to be impacted by the proposal in hectares, and a percentage of the total area of occupancy or extent of occupancy within NSW ▪ the impact on the subpopulation as either: all individuals will be impacted (subpopulation eliminated); OR impact will affect some individuals and habitat; OR impact will affect some habitat, but no individuals of the species will be directly impacted ▪ to determine if the persisting subpopulation that is fragmented will remain viable, estimate (based on published and unpublished sources such as scientific publications, technical reports, databases or documented field observations) the habitat area required to support the remaining population, and habitat available within dispersal distance, and distance over which genetic exchange can occur (eg seed dispersal) and pollination distance for the species	The project footprint contains 92.78 ha of suitable habitat for the species, 31.70 ha (34%) of this would be impacted by the project, mostly (98%) high condition. However, percentages of extents and areas of occupancy and percentages cannot be accurately determined as there is insufficient or inconsistent data available for this species. The project would impact 31.70 ha of potential habitat for this species, within the project footprint. The project would impact some habitat, but no individuals of the species is likely to be directly impacted in areas where targeted surveys were undertaken as the species was not detected. In areas that comprise the species polygon, species presence has been assumed. As such, the number of individuals cannot be quantified. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. Therefore, if the species is present, the project would not create a barrier to dispersal of the species. The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence. If the species is present, individuals in the project footprint may be affected by increased threats such as infestation of weeds (Sweet Vernal grass and Sulphur cinquefoil) and potential (ox-eye daisy), off-road	The project footprint comprises 2.95 ha of suitable habitat in the form of a species habitat polygon, of this the project would impact on 0.56 ha (19%), all of which is in very high condition. However, percentages of extents and areas of occupancy and percentages cannot be accurately determined as there is insufficient or inconsistent data available for this species. The project would impact on 0.56 ha (19%) of the 2.95 ha of suitable habitat for the species within the project footprint. The project would impact some habitat, but no individuals of the species is likely to be directly impacted in areas where targeted surveys were undertaken as the species was not detected. In areas that comprise the species polygon that could not be adequately surveyed, species presence has been assumed. As such, the number of individuals cannot be quantified. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. Therefore, if the species is present, the project would not create a barrier to dispersal of the species. The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence in inaccessible suitable habitat. If the species is present, individuals in the project footprint may

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Prasophyllum keltonii* Kelton's Leek Orchid	*Pterostylis oreophila* Blue-tongued Greenhood
▪ To determine changes in threats affecting remaining subpopulations and habitat if the proposed impact proceeds, estimate changes in environmental factors including changes to fire regimes (frequency, severity); hydrology, pollutants; species interactions (increased competition and effects on pollinators or dispersal); fragmentation, increased edge effects, likelihood of disturbance; and disease, pathogens and parasites. Where these factors have been considered elsewhere in relation to the target species, the assessor may refer to the relevant sections of the BDAR or BCAR.	vehicle activities (access tracks), disturbance from vegetation removal and maintenance within the clearing footprint, increased edge effects, altered hydrology due to drainage lines within the project footprint. This species is associated with 'Alpine Sphagnum Bogs and Associated Fens' EPBC listed ecological community and may be affected by modified hydrology of drainage lines within the project footprint and/or changes in use and management of adjacent land.	be affected by changes to fire regimes in surrounding vegetation as a result of management for asset protection, increased edge effects, altered hydrology due to drainage lines within the project footprint, off-road vehicle activities (access tracks), disturbance from vegetation removal and maintenance within the clearing footprint.
5. The assessor may also provide new information that can be used to demonstrate that the principle identifying the species as at risk of an SAII, is inaccurate.	Not applicable.	Not applicable.
Likely SAII assessment outcome against relevant principles.	Confirmation of habitat status through survey and/or further expert advice may remove the likelihood of an SAII finding. Given the project will impact on 31.70 ha of majority (98%) high condition habitat, the project is likely to be deemed a significant risk to the species becoming extinct because it is an impact on the habitat of the species that is currently observed, estimated, inferred or reasonably suspected to have a very limited geographic distribution.	Principle 2: Given the limited available data for the current population size of the species, and the fact that the species presence is assumed due to limited survey effort, the project may be deemed a significant risk to the species becoming extinct as it may further reduce the population size of the species or ecological community that is currently observed, estimated, inferred or reasonably suspected to have a very small population size (precautionary finding due to limited data available). Principle 3: Given the project would impact 0.56 ha of very high condition habitat, the project may be deemed a significant risk to the species becoming extinct because it is an impact on the habitat of the species that is currently observed, estimated, inferred or reasonably suspected to have a very limited geographic distribution (precautionary finding due to limited data available on known extent).

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Prasophyllum keltonii* Kelton's Leek Orchid	*Pterostylis oreophila* Blue-tongued Greenhood
		If impacts were further avoided and minimised through route refinement (EMM B1) this would likely result in a non-significant risk determination. This should be achievable given the limited predicted area of impact.

2.2.3 *Solanum armourense*

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	***Solanum armourense***
Impact summary	The project would result in direct impacts to a total of 0.51 ha of *Solanum armourense* habitat all of which is assumed presence. Potential indirect impacts to the species include: • Transport of weeds and pathogens from the site to adjacent vegetation. • Trampling of threatened flora species. • Changed fire regimes.
1. The assessor is required to provide further information in the BDAR or BCAR for any species at risk of an SAII, including the action and measures taken to avoid the direct and indirect impact on the species at risk of an SAII. Where these have been addressed elsewhere the assessor can refer to the relevant sections of the BDAR or BCAR.	*Solanum armourense* is a NSW endemic known to occur at only four locations, three are within Blue Mountains National Park (DPE 2003b). The species grows amongst other shrubs in eucalypt woodland, on steep rocky hillsides with shallow soil. The species is assumed present within potential habitats within the project footprint but has not been directly recorded. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened flora include: • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1). • Further avoidance and minimisation of impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying the extent of habitats, their existing condition and certainty levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed threatened flora habitats as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of temporarily disturbed areas within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with pathogens, pests and weeds (EMM B19).

Official

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	***Solanum armourense***
2. The assessor must consult the TBDC and/or other sources to report on the current population of the species including:	
• evidence of rapid decline (Principle 1, clause 6.7(2)(a) BC Regulation) presented by an estimate of the: ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer), or ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer) as indicated by: an index of abundance appropriate to the species; decline in geographic distribution and/or habitat quality; exploitation; effect of introduced species, hybridisation, pathogens, pollutants, competitors or parasites	***Principle 1 SAII = Yes*** This species has undergone a population decline of over 80% in 10 years or three generations (DPE 2022). There is insufficient data available in publicly available resources and accessible peer reviewed articles to estimate a decline in population of the species in NSW in the past 10 years or three generations. The species is known from only four locations where it grows amongst other shrubs in eucalypt woodland, on steep rocky hillsides with shallow soil. Long term population data is not available for this species in NSW. However, as outlined in BioNet (DPE 2022), key threats to the species, which are likely to have contributed to its low population are: • Demographic threats: small population size. Given extremely small population size and restricted distribution this species is threatened by extinction due to environmental and demographic uncertainty. • Habitat loss/disturbance: Vegetation clearing for agricultural purposes and urban development. Species under threat also from roads or tracks where potential damage from maintenance activities or fire management is a threat. • Fire: Inappropriate fire regime, particularly frequent fire. • Weed Invasion: Potential for invasion of habitat by *Nassella trichotoma* (Serrated tussock) and *Pittosporum undulatum* (Sweet Pittosporum). • Disease: Potentially threatened with infestation by the Tomato Red Spider Mite (*Tetranychus evansi*). The Murphys Crossing population has been identified as hosting a small beetle that impacts foliage and appears to reduce reproductive fitness. • Pest animals: Occasionally impacted by rutting and digging by feral pigs.
• evidence of small population size (Principle 2, clause 6.7(2)(b) BC Regulation) presented by: ▪ an estimate of the species' current population size in NSW, and ▪ an estimate of the decline in the species' population size in NSW in three years or one generation (whichever is longer), and ▪ where such data is available, an estimate of the number of mature individuals in each subpopulation, or the percentage of mature individuals in each subpopulation, or whether the species is likely to undergo extreme fluctuations	***Principle 2 SAII = Yes*** *Solanum armourense* is a NSW endemic known to occur at only four locations, three are within Blue Mountains National Park (DPE 2003b). A recent survey at three of the locations found only 2 mature individuals at a single location, although the species may be present in the soil seed bank at these and other sites (DPE 2003b). BioNet states that there are <50 individuals or <250 individuals where threats are known (DPE 2022). There is insufficient data to determine an estimate of a decline in the population over the last three years or one generation. BioNet Atlas (DPE 2022a) contains 157 records of this species. Of these records, none are within the last ten years, offering a poor indication of current decline. BioNet record

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Solanum armourense*
	data does not contain enough records to confidently identify a decline in the population over the last three years (DPE 2022a). According to the NSW Scientific Committee (DPE 2003b), a recent survey at three of the known locations found only two mature individuals at a single location, although the species may be present in the soil seed bank at these and other sites. There is little evidence to suggest whether the species is likely to undergo extreme fluctuation. However, this species is possibly susceptible to fire which could cause its population to fluctuate given its isolated and restricted populations (DPE 2003b).
• evidence of limited geographic range for the threatened species (Principle 3, clause 6.7(2)(c) BC Regulation) presented by: ▪ extent of occurrence ▪ area of occupancy ▪ number of threat-defined locations (geographically or ecologically distinct areas in which a single threatening event may rapidly affect all species occurrences), and ▪ whether the species' population is likely to undergo extreme fluctuations	***Principle 3 SAII = No*** *Area of Occupancy (ha) = no data* *Extent of Occurrence (ha) = no data* *No. Threat-defined locations = no data* A quantified extent of occurrence for this species is not provided in BioNet (2022). The species is confined to a relatively small area south-west of Sydney, from Mt Armour within Blue Mountains National Park south to the Wombeyan area (DPE 2003b). A quantified area of occupancy for this species is not provided in BioNet (2022). The species is known from only four locations where it grows amongst other shrubs in eucalypt woodland, on steep rocky hillsides with shallow soil. Three of the four locations occur within Blue Mountains National Park (DPE 2003b). The number of threat defined locations for this species is not provided, however the species is known from only four locations (BioNet 2022). Occurrences of this species seem to reflect the presence of soils derived from limestone or with a high proportion of calcite sediments (OEH 2022). It's suggested that this species is susceptible to fire which could threaten populations given their isolated locations and small population size (DPE 2003b). There is insufficient data to determine whether the species population size would be likely to undergo extreme natural fluctuations. However, this species is fire sensitive and an obligate seeder (ie loses the entire adult population in a fire and relies on the seedbank to regenerate) (DPE 2022).
• evidence that the species is unlikely to respond to management (Principle 4, clause 6.7(2)(d) BC Regulation) because: ▪ known reproductive characteristics severely limit the ability to increase the existing population on, or occupy new habitat (eg species is clonal) on, a biodiversity stewardship site	***Principle 4 SAII = No*** The reproductive traits of this species are not well known with limited information available. This species is known to flower August to May, peaking in warmer months (DPE 2022). This species does not appear to have any reproductive characteristics that could severely limit the ability to increase the existing population.

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Solanum armourense*
▪ the species is reliant on abiotic habitats which cannot be restored or replaced (eg karst systems) on a biodiversity stewardship site, or ▪ life history traits and/or ecology is known but the ability to control key threatening processes at a biodiversity stewardship site is currently negligible (eg frogs severely impacted by chytrid fungus).	BioNet (DPE 2022) states that the species has a high sensitivity to gain, however this is dependant on the effectiveness of management in controlling threats. This species ecology and response to management is poorly known. There is no known critical habitat for this species. The life-history traits and ecology of this species is not well known. There are no specified key threatening processes for this species.
3. Where the TBDC indicates data is 'unknown' or 'data deficient' for a species for a criterion listed in Subsection 9.1.2(2.), the assessor must record this in the BDAR or BCAR.	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this species for a criterion listed in Subsection 9.1.1(2.). Some responses in this consideration of SAII cannot be completed comprehensively due to the following: • The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited. • A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. • As such, we have noted the knowledge gaps in the TBDC and provided responses using information from the limited available sources.
4. In relation to the impacts from the proposal on the species at risk of an SAII, the assessor must include data and information on:	
• the impact on the species' population (Principles 1 and 2) presented by: ▪ an estimate of the number of individuals (mature and immature) present in the subpopulation on the subject land (the site may intersect or encompass the subpopulation) and as a percentage of the total NSW population, and ▪ an estimate of the number of individuals (mature and immature) to be impacted by the proposal and as a percentage of the total NSW population, or ▪ if the species' unit of measure is area, provide data on the number of individuals on the site, and the estimated number that will be impacted, along with the area of habitat to be impacted by the proposal	It is not possible to determine how many individuals comprise the sub-population on the site from the available data. Potentially suitable habitat for *Solanum armourense* was detected within the project footprint within the Bungonia IBRA Subregion. Targeted flora surveys within the project footprint did not locate the species. Where survey effort was not adequate, species presence has been assumed within suitable habitat. There are two nearby records of *Solanum armourense,* with the closest record 6.5 km from the project footprint boundary (DPE 2022). BioNet records were focused on the eastern extent of the project footprint (DPE 2022). It is known to occur within the Bungonia IBRA Subregion. Given the species was not recorded and is only assumed present, and the limited information available on the total population of the species, it is not possible to determine the number of individuals (mature and immature) that would be impacted by the project and as a percentage of the total NSW population. The species unit of measure is area. The species was not located within the project footprint despite targeted surveys in accessible land. Where survey effort was not adequate, species presence has been assumed within potential habitat. The total extent of potential habitat for the species that would be directly impacted by the project is 0.51 ha. However, given that this species was not recorded on the

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Solanum armourense*
	site during targeted surveys, there are no BioNet records within the project footprint and individuals recorded in the surrounding landscape would be retained, it is unlikely that the project would impact the local population for this species.
• impact on geographic range (Principles 1 and 3) presented by: ▪ the area of the species' geographic range to be impacted by the proposal in hectares, and a percentage of the total area of occupancy or extent of occupancy within NSW ▪ the impact on the subpopulation as either: all individuals will be impacted (subpopulation eliminated); OR impact will affect some individuals and habitat; OR impact will affect some habitat, but no individuals of the species will be directly impacted ▪ to determine if the persisting subpopulation that is fragmented will remain viable, estimate (based on published and unpublished sources such as scientific publications, technical reports, databases or documented field observations) the habitat area required to support the remaining population, and habitat available within dispersal distance, and distance over which genetic exchange can occur (eg seed dispersal) and pollination distance for the species ▪ To determine changes in threats affecting remaining subpopulations and habitat if the proposed impact proceeds, estimate changes in environmental factors including changes to fire regimes (frequency, severity); hydrology, pollutants; species interactions (increased competition and effects on pollinators or dispersal); fragmentation, increased edge effects, likelihood of disturbance; and disease, pathogens and parasites. Where these factors have been considered elsewhere in relation to the target species, the assessor may refer to the relevant sections of the BDAR or BCAR.	The project footprint comprises 7.17 ha of potential habitat for the species, 0.51 ha (6.6%) of this habitat would be impacted by the project, 98% of which is in moderate to high condition. However, percentages of extents and areas of occupancy and percentages cannot be accurately determined as there is insufficient or inconsistent data available for this species. The project would impact on 0.51 ha (7%) of the 7.17 ha of potential habitat for the species within the project footprint. The project would impact some potentially suitable habitat, but no individuals of the species is likely to be directly impacted in areas where targeted surveys were undertaken as the species was not detected. In areas that comprise the species polygon that were not adequately surveyed, species presence has been assumed. As such, the number of individuals cannot be quantified. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. Therefore, if the species is present, the project would not create a barrier to dispersal of the species. The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence. If the species is present, individuals in the project footprint may be affected by changes to fire regimes, increased edge effects, altered hydrology due to drainage lines within the project footprint, off-road vehicle activities (access tracks), disturbance from vegetation removal and maintenance within the clearing footprint.
5. The assessor may also provide new information that can be used to demonstrate that the principle identifying the species as at risk of an SAII, is inaccurate.	Not applicable.
Likely SAII assessment outcome against relevant principles.	Principle 1: Given the project would impact 0.51 ha of moderate to high condition habitat and the species presence is assumed, the project may be deemed a significant risk to the species becoming extinct as it may cause a further decline of the species that is currently observed, estimated, inferred or reasonably suspected to be in a rapid rate of decline (precautionary finding due to limited data available on rate of decline).

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Solanum armourense*
	Principle 2: Given the limited available data for the current population size of the species, and the fact that the species presence is assumed due to limited survey effort, the project may be deemed a significant risk to the species becoming extinct as it may further reduce the population size of the species that is currently observed, estimated, inferred or reasonably suspected to have a very small population size (precautionary finding due to limited data available). If impacts were further avoided and minimised through route refinement (EMM B1) or if further survey confirmed absence of the species within areas of assumed presence this would likely result in a non-significant risk determination.

2.3 Threatened fauna

2.3.1 Yellow-spotted Tree Frog and Smoky Mouse

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	***Litoria castanea* Yellow-spotted Tree Frog**	***Pseudomys fumeus* Smoky Mouse**
Impact summary	The project would result in direct impacts to a total of 1.36 ha of Yellow-spotted Tree Frog potential habitat, typically constituting trees fringing farm dams or other waterbodies with limited habitat potential. No breeding habitat is expected to be directly impacted for the species. Potential indirect impacts to the species includes: • Reduced viability of adjacent habitat due to noise, dust, or light spill. • Increased risk of starvation or exposure, and loss of shade or shelter. • Increase in pest animal populations and predation of native fauna. • Changed fire regimes. Prescribed impacts to the species includes: • Impacts on habitat connectivity. • Impacts to water quality, waterbodies and hydrological processes.	The project would result in direct impacts to a total of 132.66 ha of Smoky Mouse habitat. Potential indirect impacts to the species include: • Reduced viability of adjacent habitat due to noise, dust, or light spill. • Increased risk of starvation or exposure, and loss of shade or shelter. • Removal and disturbance of rocks, including bush rock. • Increase in pest animal populations and predation of native fauna. • Changed fire regimes.
1. The assessor is required to provide further information in the BDAR or BCAR for any species at risk of an SAII, including the action and measures taken to avoid the direct and indirect impact on the species at risk of an SAII. Where these have been addressed elsewhere the assessor can refer to the relevant sections of the BDAR or BCAR.	Yellow-spotted Tree Frog require large permanent ponds or slow flowing 'chain-of-ponds' streams with abundant emergent vegetation such as bulrushes and aquatic vegetation. The species is assumed present within potential habitats within the project footprint but has not been directly recorded. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened frogs include: • Avoiding and minimising impacts by spanning over waterways and rerouting access tracks to avoid waterway habitats wherever possible (EMM B1).	The Smoky Mouse occurs in a range of habitat from heath on ridge tops, slopes in sclerophyll forest, heathland, open forest and occasionally wetter gullies (DPE 2022). Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to Smoky Mouse include: • Avoiding and minimising impacts by route refinement, over-spanning and rerouting access tracks to avoid potential habitats wherever possible (EMM B1). • Additional targeted surveys undertaken prior to commencement of construction to further delineate

Official

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Litoria castanea* Yellow-spotted Tree Frog	*Pseudomys fumeus* Smoky Mouse
	• Additional targeted surveys undertaken prior to commencement of construction to delineate the extent of habitats within inaccessible lands (EMM B2). • Further design avoidance and impact minimisation to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying threatened frog habitats, their existing condition, important connectivity corridors and certainty levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed habitat areas as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, fauna handling, fauna habitat management measures, including construction connectivity strategy to maintain habitat linkages during the construction period and post-construction rehabilitation of temporarily disturbed habitats where relevant (EMM B18). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with Chytrid Fungus (EMM B19). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20).	the extent of habitats within the project footprint (EMM B2). • Further design avoidance and impact minimisation to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying Smoky Mouse habitats, their existing condition, important connectivity corridors and certainty levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey). • Development of a Connectivity Strategy to ensure essential habitat linkages for the species are retained within the landscape (EMM B16). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed habitat areas as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, fauna handling, fauna habitat management measures, including construction connectivity strategy to maintain habitat linkages during the construction period and post-construction rehabilitation of temporarily disturbed habitats where relevant (EMM B18). • Use of directional lighting for all permanent lighting (i.e. substations). Artificial lighting required during construction would be directed towards work sites to minimise light spill as much as practicable (EMM B31).

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Litoria castanea* Yellow-spotted Tree Frog	*Pseudomys fumeus* Smoky Mouse
	• Use of directional lighting for all permanent lighting (i.e. substations). Artificial lighting required during construction would be directed towards work sites to minimise light spill as much as practicable (EMM B31).	
2. The assessor must consult the TBDC and/or other sources to report on the current population of the species including:		
• evidence of rapid decline (Principle 1, clause 6.7(2)(a) BC Regulation) presented by an estimate of the: ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer), or ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer) as indicated by: an index of abundance appropriate to the species; decline in geographic distribution and/or habitat quality; exploitation; effect of introduced species, hybridisation, pathogens, pollutants, competitors or parasites	***Principle 1 SAII = Yes*** DPE have determined that this species is at risk of SAII due to Principle 1 – rapid decline (DPE 2022). There are no data available to evaluate the population trend over any three-generation period (TSSC 2019). Generation length is not known with certainty but is estimated to be four to five years based on two similar *Litoria* species found in similar habitats, *L. aurea* (Green and Golden Bell Frog) and *L. raniformis* (TSSC 2019). Consequently, the appropriate time scale for this criterion is likely to be between 12 to 15 years (TSSC 2019). While the amphibian chytrid fungus caused a substantial decline in the population of *Litoria castanea* (Yellow-spotted Tree Frog), this occurred predominantly in the late 1980s and early 1990s and is therefore outside the relevant time period for this criterion (TSSC 2019). There are no data available to evaluate the population trend over any three-generation period (TSSC 2019). Threats to the species are principally related to disease and habitat degradation (TSSC 2019). Key threats to the species (DPE 2022), which are likely to have contributed to its decline in NSW over the last 10 years are: • Habitat loss: Loss/modification of wetlands, swamps and slow-running creeks and adjacent vegetation. Changes to hydrology and water quality. Removal of fallen timber, rocks and debris used as shelter by this species.	***Principle 1 SAII = Yes*** DPE have determined that this species is at risk of SAII due to Principle 1 – rapid decline (DPE 2022). Population size of *Pseudomys fumeus* is difficult to estimate due to its ephemeral nature, in a spatial and temporal sense (DPE 2010b). DPIE (2021f) lists the species population trajectory as declining. However, the number of sites occupied in 2020 was the same as in 2008 may indicate the beginning of an increasing trend (DPIE 2021f). The species is limited to a small number of locations in NSW's south-east; with an estimated population of less than 100 individuals (DPIE 2021f). The species population was found to be declining across many sites after repeat survey efforts, as reported in Menkhorst and Broom (2008). The species is listed in BioNet as having a population decline of > 80% within three generations (DPE 2022). Key threats to the species (DPIE 2021f), which are likely to have contributed to its decline are: • Habitat loss/fragmentation: Loss of habitat, primarily through timber harvesting and road construction along ridges. • Fire and inappropriate fire regimes: Too frequent burning (ie hazard reduction burns every 4-7 years) removes foraging habitat in the shrub layer and affects hypogeal fungi that forms a large part of the species diet (Menkhorst and Broome 2008). Conversely too long a period without fire can lead to

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Litoria castanea* Yellow-spotted Tree Frog	*Pseudomys fumeus* Smoky Mouse
	• Disease: Amphibian Chytrid Fungus which causes the disease Chytridiomycosis. Infection by myxosporean parasites is also a potential threat (TSSC 2019). • Disturbance to habitat: Damage to breeding habitat through forestry activities. • Chemical pollution: herbicide and pesticide application in or adjacent to habitat • Weed and native grass encroachment: invasion of habitat by weeds such as Ulex europaeus (Gorse). • Feral species: Predation by foxes and cats. Egg predation by introduced fish species such as *Cyprinus carpio* (European Carp), *Perca fluviatilis* (European Perch, Redfin) and *Gambusia holbrooki* (Gambusia, Eastern Mosquitofish) • Reduced distribution: Restricted in distribution as well as population size.	the senescence of understorey vegetation on long unburnt sites. • Feral animals: Predation from feral cats and foxes. Feral herbivore browsing/grazing reducing food resources and depleting shrub cover. Predation from domestic cats and dogs from adjacent land holdings. • Disease: *Phytophthora cinnamomi* dieback. Many of the heath plants in this species foraging habitat are affected. • Demographic threats/small population size: The small population size can lead to the loss of site occupancy through demographic and/or gender driven metapopulation collapse. • Lack of knowledge: Insufficient understanding of this species distribution and abundance. Uncertainty about the species' density and distribution throughout its EOO. According to BioNet, there are many nearby records of this species within 10 km of the project footprint. The majority of records within the locality are to the south east of the project footprint north of Cabramurra.
• evidence of small population size (Principle 2, clause 6.7(2)(b) BC Regulation) presented by: ▪ an estimate of the species' current population size in NSW, and ▪ an estimate of the decline in the species' population size in NSW in three years or one generation (whichever is longer), and ▪ where such data is available, an estimate of the number of mature individuals in each subpopulation, or the percentage of mature individuals in each subpopulation, or whether the species is likely to undergo extreme fluctuations	***Principle 2 SAII = Yes*** DPE have determined that this species is at risk of SAII due to Principle 2 – small population size (DPE 2022). There is no known extant population of *L castanea* (NSW National Parks and Wildlife Service 2001 cited in TSSC 2019). In 2004, the IUCN Red List of Threatened Species estimated that the population contains fewer than 50 mature individuals (Hero et al., 2004 cited in TSSC 2019). *L castanea* may be extinct in the wild, however, they may have remained undetected as a result of insufficient survey effort (NSW National Parks and Wildlife Service 2001; Hero et al. 2006 cited in TSSC 2019).	***Principle 2 SAII = Yes*** DPE have determined that this species is at risk of SAII due to Principle 2 – small population size (DPE 2022). DPE (2010b) estimated that the population in NSW may be less than 50 individuals. More recent reports have estimations of <100 individuals (DPIE 2021f). This species displays both long-term population decline as well as shorter term "boom and bust" population dynamics. DPIE (2021f) lists the species population trajectory as declining. The species was found to be in decline at most of the sites surveyed (Menkhorst and Broome 2008).

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Litoria castanea* Yellow-spotted Tree Frog	*Pseudomys fumeus* Smoky Mouse
	There are no data available to evaluate the population trend over any three-generation period (TSSC 2019). See above for more detail. Given that there are no records of the species since 1980, the total population is likely to include fewer than 50 mature individuals and may already be extinct (TSSC 2019).	Extremely little is known about the population number and composition of the Smoky Mouse (Menkhorst and Broome 2008). This species displays both long-term population decline as well as shorter term "boom and bust" population dynamics (DoE 2019). True variation in population density and composition may also be complicated by variability in capture/detectability, making it hard to recognise when an actual decline or range contraction has occurred or gain a real insight into the population composition in any given area (DoE 2019). Quantitative data on the age structure of the population species is not readily available.
• evidence of limited geographic range for the threatened species (Principle 3, clause 6.7(2)(c) BC Regulation) presented by: ▪ extent of occurrence ▪ area of occupancy ▪ number of threat-defined locations (geographically or ecologically distinct areas in which a single threatening event may rapidly affect all species occurrences), and ▪ whether the species' population is likely to undergo extreme fluctuations	***Principle 3 SAII = Yes*** DPE have determined that this species is at risk of SAII due to Principle 3 – limited geographic range (DPE 2022). The calculated extent of occurrence (EOO) is 4 km^2. The current geographic distribution of the species could be highly restricted or very highly restricted, depending on persistence of populations in unsurveyed habitat (TSSC 2019). The area of occupancy (AOO) for this species is estimated to also be 4 km^2 (TSSC 2019). At present, no critical habitat has been identified or declared for *L castanea* (NPWS 2001b). NPWS (2001b) proposes consideration of declaration of critical habitat under the TSC Act for this species in the event that an extant population is found in NSW (NPWS 2001b). This species has not been located in many years, despite significant effort (TSSC 2019). If there are remaining populations, they can also be inferred to be severely fragmented (NSWSC 2008a). There is no information/evidence of this species experiencing extreme fluctuations in population size or habitat (NSWSC 2008a).	***Principle 3 SAII = No*** DPE have determined that this species is not at risk of SAII due to Principle 3 – limited geographic range (DPE 2022). The extent of occurrence for this species is estimated at 102,498 km^2. There are known populations this species in the Eden/Nullica region of south eastern NSW (DoE 2019). There are also intermittent detections in the Snowy Mountains from Kosciuszko National Park through to the Brindabellas near Canberra (DoE 2019). The area of occupancy of this species is estimated to be 256km^2. The NSW Scientific Committee considers the species area of occupancy to be restricted (DPE 2010). The ephemeral nature of populations makes a robust estimate of AOO difficult (DoE, 2019). It is thought that this species inhabits a range of vegetation communities including coastal and subalpine heath, *Eucalyptus pauciflora* (Snow Gum) woodland in subalpine regions, and dry forest dominated by eucalypts such as *E. dives* (Broad-leaved Peppermint), E. *mannifera* (Brittle Gum*), E. dalrympleana* (Mountain Gum) or *E. delegatensis* (Alpine Ash) (DPIE 2021f). Some populations of this species (Grampians, Vic) has shown resilience post disturbance (fires, drought and invasive feral

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Litoria castanea* Yellow-spotted Tree Frog	*Pseudomys fumeus* Smoky Mouse
		predators), This species is thought to have been more common, with sub-fossil remains being found in far western Victoria and south eastern NSW at Jenolan Caves (DPIE 2021f). This species displays both long-term population decline as well as shorter term "boom and bust" population dynamics (DoE 2019). This species is known to undergo large annual fluctuations in abundance, with a rapid decline in numbers leading up to breeding season (Cockburn 1981). The young are forced to vacate their birth territory during autumn as food resources dwindle, which can cause death from not finding adequate habitat/food resources or predation with only those finding high quality food likely to survive the winter (Cockburn 1981). Consequently, the decline in abundance principally affects individuals resident in non-preferred habitats (Cockburn 1981). The ephemeral nature of this species life history may also be complicated by variability in capture/detectability, making it hard to recognise true population effects (DoE 2019).
• evidence that the species is unlikely to respond to management (Principle 4, clause 6.7(2)(d) BC Regulation) because: ▪ known reproductive characteristics severely limit the ability to increase the existing population on, or occupy new habitat (eg species is clonal) on, a biodiversity stewardship site ▪ the species is reliant on abiotic habitats which cannot be restored or replaced (eg karst systems) on a biodiversity stewardship site, or ▪ life history traits and/or ecology is known but the ability to control key threatening processes at a biodiversity stewardship site is currently negligible (eg frogs severely impacted by chytrid fungus).	***Principle 4 SAII = Yes*** DPE have determined that this species is at risk of SAII due to Principle 4 – unlikely to respond to management (DPE 2022). Little is known about the reproductive process of *L castanea*, however, it is likely to be similar to that of *L. aurea* and *L. raniformis* (NSW SC 2008a). This species has no known characteristics that could severely limit its ability to increase on a biodiversity stewardship site. The habitat of *L castanea* comprises ponds, wetlands and slowly moving streams with abundant marginal growth of bulrushes and other vegetation NPWS 2001b). At present, no critical habitat has been identified or declared (NPWS 2001b). The ability to control key threats at a biodiversity stewardship site is thought to be possible. The removal of feral animals through fencing and control programs	***Principle 4 SAII = Yes*** DPE have determined that this species is at risk of SAII due to Principle 4 – unlikely to respond to management (DPE 2022). BioNet states that this species has a high sensitivity to gain, dependant on the effectiveness of management actions controlling threats to the species. There are no known reproductive characteristics that could severely limit the ability to increase the existing population on a biodiversity stewardship site. The species is not reliant on abiotic habitats which cannot be restored, replicated or replaced on a biodiversity stewardship site. Adequate ground cover (low heath, grass tussocks, logs, rocks or leaf-litter) and soil conditions conducive to growth of hypogeal fungi (a major component of the diet) are deemed to be critical habitat elements (Menkhorst & Broome 2008). The

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Litoria castanea* Yellow-spotted Tree Frog	*Pseudomys fumeus* Smoky Mouse
	is achievable. To mitigate the threat of Amphibian Chytrid Fungus, a strict hygiene protocol would be able to be enforced on a biodiversity stewardship site in alignment with DEE (2016).	species is known to inhabit disturbed habitat, with a population being found in an artificial boulderfield in Kosciuszko National Park showing that this species does not have many limiting habitat preferences. This species would benefit from the removal/control of feral cats and foxes which are a key threatening process. This threat can be mitigated through adequate fencing and control programs on a biodiversity stewardship site. The opportunity to control fire regimes more closely on a biodiversity stewardship site would also remove another key threatening process for this species. *Phytophthora cinnamomi* (Cinnamon Fungus) is a threat that may be difficult to control at a biodiversity stewardship site. Many plant families and genera that make up this species habitat are susceptible to the fungus. Habitat for this species has been removed in some areas of infestation in NSW (eg Nullica) (Menkhorst & Broome 2008). Cinnamon Fungus has the potential to have a large detrimental impact to this species on a biodiversity stewardship site.
3. Where the TBDC indicates data is 'unknown' or 'data deficient' for a species for a criterion listed in Subsection 9.1.2(2.), the assessor must record this in the BDAR or BCAR.	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this species for a criterion listed in Subsection 9.1.1(2.). Some responses in this consideration of SAII cannot be completed comprehensively due to the following: • The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited • A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. As such, we have noted the knowledge gaps in the TBDC and provided responses using information from the limited available sources.	Some of the questions in this consideration of SAII cannot be assessed at this time because: • The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited • A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. • As such, we have noted the knowledge gaps in the TBDC and provided responses using information we have been able to source.

Official

4. In relation to the impacts from the proposal on the species at risk of an SAII, the assessor must include data and information on:		
• the impact on the species' population (Principles 1 and 2) presented by: ▪ an estimate of the number of individuals (mature and immature) present in the subpopulation on the subject land (the site may intersect or encompass the subpopulation) and as a percentage of the total NSW population, and ▪ an estimate of the number of individuals (mature and immature) to be impacted by the proposal and as a percentage of the total NSW population, or ▪ if the species' unit of measure is area, provide data on the number of individuals on the site, and the estimated number that will be impacted, along with the area of habitat to be impacted by the proposal	Suitable habitat for Yellow-spotted Tree Frog was detected within the project footprint within PCTs 335, 939, 1256, 9997 in the Crookwell, Murrumbateman and Snowy Mountains IBRA subregion. It is not possible to determine how many individuals comprise the sub-population from the available data. Given that there are no records of the species since 1980, the total population is likely to include fewer than 50 mature individuals and may already be extinct (TSSC 2019). However, they may have remained undetected as a result of insufficient survey effort (TSSC 2019). The total population in NSW is unknown, as such a percentage to be impacted of the total population cannot be attained. The species was not recorded in the project footprint during targeted surveys and is assumed present. There are 2 nearby records of the Yellow-spotted Tree Frog (400 estimated individuals) (DPE 2022). All records are outside the project footprint, with the closest record 9 km from the project footprint. Records are focused around the western extent of the project footprint. It is known as historically present in Crookwell and Murrumbateman IBRA Subregions. As above, the total population in NSW is unknown, as such a percentage to be impacted of the total population cannot be determined. The project would result in the direct impact to 1.36 ha of potential habitat for Yellow-spotted Tree Frog. Given that only limited suitable habitat would be impacted, and similar habitat in the surrounding landscape would be retained, it is unlikely that the project would substantially impact the local population for this highly mobile species. The species unit of measure is area, with the species polygon mapped as per the requirements in the NSW Survey Guide for	Suitable habitat for *Pseudomys fumeus* was detected within the project footprint within PCTs 638, 953 and 1196 in the Bondo and Snowy Mountains IBRA subregions. Targeted fauna surveys within the project footprint did not locate the species. Where survey effort was not adequate, species presence has been assumed within suitable habitat. There are no records within 20 km of the project (DPE 2022). As such, a percentage of the total population present in the subpopulation on the project footprint cannot be attained. Given the species was not recorded and is only assumed present, and the limited information available on the total population of the species, it is not possible to determine the number of individuals (mature and immature) that would be impacted by the project and as a percentage of the total NSW population. As above, the total population in NSW is unknown, as such a percentage to be impacted of the total population cannot be determined. The project would result in the direct impact to 132.66 ha (0.06 ha and 132.6 ha in Bondo and Snowy Mountains IBRA subregions, respectively) of potential habitat for Smoky Mouse. The species unit of measure is area. The species was not located within the project footprint despite targeted surveys in accessible land. Where survey effort was not adequate, species presence has been assumed within suitable habitat. The total area of this species habitat that would be impacted by the project is 132.66 ha (0.06 ha and 132.6 ha in Bondo and Snowy Mountains IBRA subregions, respectively).

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Litoria castanea* Yellow-spotted Tree Frog	*Pseudomys fumeus* Smoky Mouse
	Threatened Frogs (DPIE 2020d) (Figure 13-3). Up to 1.36 ha of potential habitat would be directly impacted as a result of the project, however similar habitat in the surrounding landscape would be retained. Therefore, whilst there would be an impact on 1.36 ha of suitable habitat in the project footprint, it is considered to be of negligible consequence to the species on a regional scale. This species requires large permanent ponds or slow flowing 'chain-of-ponds' streams with abundant emergent vegetation such as bulrushes and aquatic vegetation (DPE 2022). The project has the potential to impact on water quality, water bodies and hydrological processes. A total of 1,139 streams are located within the project footprint (of various types and condition). There are several major waterbodies that intersect the project footprint. However, construction work would mostly be limited to above-ground transmission line construction and installation, which would avoid direct impacts to waterways, especially major waterways, with appropriate water management measures to be implemented. Work within proximity of aquatic ecosystems would require stringent erosion and sediment controls to avoid increased run-off and pollutant loads. Once operational, such impacts are considered to be negligible on an ongoing basis.	
• impact on geographic range (Principles 1 and 3) presented by: ▪ the area of the species' geographic range to be impacted by the proposal in hectares, and a percentage of the total area of occupancy or extent of occupancy within NSW ▪ the impact on the subpopulation as either: all individuals will be impacted (subpopulation eliminated); OR impact will affect some individuals and habitat; OR impact will affect	The extent of occurrence and area of occupancy for this species was estimated to be 4 km^2 (TSSC 2019). Therefore, the project would impact 0.5% of the Yellow-spotted Tree Frog range. However, the habitat impacted only provides opportunistic forage and the species has a high dispersal across its range. As such, it is unlikely that the geographic range or area/extent of occupancy of this highly mobile species would be substantially impacted by the project. This species was not recorded in the project footprint and there were two records (400 estimated individuals) near the	The project footprint includes 132.66 ha (0.06 ha and 132.6 ha in Bondo and Snowy Mountains IBRA subregions respectively) of potential habitat for the species, 132.66 ha (0.06 ha (0.05%) and 132.60 ha (99.95%) in Bondo and Snowy Mountains IBRA subregions, respectively) of which would be impacted by the project. The extent of occurrence and area of occupancy for this species was estimated to be 102,498 km^2 and 256 km^2, respectively (TSSC, 2021). Therefore, the project could potentially impact 0.5% of the Smoky Mouse range.

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Litoria castanea* Yellow-spotted Tree Frog	*Pseudomys fumeus* Smoky Mouse
some habitat, but no individuals of the species will be directly impacted ▪ to determine if the persisting subpopulation that is fragmented will remain viable, estimate (based on published and unpublished sources such as scientific publications, technical reports, databases or documented field observations) the habitat area required to support the remaining population, and habitat available within dispersal distance, and distance over which genetic exchange can occur (eg seed dispersal) and pollination distance for the species ▪ to determine changes in threats affecting remaining subpopulations and habitat if the proposed impact proceeds, estimate changes in environmental factors including changes to fire regimes (frequency, severity); hydrology, pollutants; species interactions (increased competition and effects on pollinators or dispersal); fragmentation, increased edge effects, likelihood of disturbance; and disease, pathogens and parasites. Where these factors have been considered elsewhere in relation to the target species, the assessor may refer to the relevant sections of the BDAR or BCAR.	project footprint, with the closest record 9 km from the project footprint. Therefore, it is likely that the project would affect some suitable habitat, but no individuals of the species is likely to be directly impacted within the area surveys, as none were recorded. In areas that comprise the species polygon that could not be adequately surveyed, species presence has been assumed. As such, the number of individuals cannot be quantified. The project would result in the development of highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. This species is likely to be able to traverse the long, linear nature of the area to be cleared. Any impacts on species connectivity are likely to reduce over time as biodiversity acclimatises to the presence of the transmission lines (and structures), further a connectivity strategy is to be developed after the design refinement stage to minimise the extent of connectivity impacts, which may include retaining of corridors adjacent to easement to facilitate fauna movement. The consequence of the impacts would be minor and non-significant. It is therefore unlikely that a population of the species would be fragmented by the project. Therefore, the project is not likely to reduce the habitat area required to support a population of the species. The impact on the sub-population(s) cannot be quantified, as the Yellow-spotted Tree Frog was not recorded and the species polygon has been calculated based on assumed presence in suitable habitat. The project would impact 1.36 ha of suitable habitat for this species. If the species is present, individuals in the project footprint may be affected by changes to water quality, habitat loss, disturbance from access tracks, chemical pollution, vegetation removal and maintenance within the clearing footprint. Yellow-spotted Tree Frog is also threatened by Amphibian Chytrid Fungus which causes the disease	The project would impact on 132.66 ha (0.06 ha (0.05%) and 132.60 ha (99.95%) in Bondo and Snowy Mountains IBRA subregions, respectively) of the 132.66 ha (0.06 ha and 132.6 ha in Bondo and Snowy Mountains IBRA subregions, respectively) of potential habitat for the species within the project footprint. In areas that comprise the species polygon that could not be adequately surveyed, species presence has been assumed. As such, the number of individuals cannot be quantified. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. This species is likely to be able to traverse the long, linear nature of the area to be cleared. Any impacts on species connectivity are likely to reduce over time as biodiversity acclimatises to the presence of the transmission lines (and structures), further a connectivity strategy is to be developed after the design refinement stage to minimise the extent of connectivity impacts, which may include retaining of corridors adjacent to easement to facilitate fauna movement. The project is not likely to not create a barrier to dispersal of the species. The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence. If the species is present, individuals in the project footprint may be affected by changes to fire regimes in surrounding vegetation as a result of management for asset protection, habitat loss, increased edge effects, introduction or spread of pathogens, altered hydrology due to drainage lines within the project footprint, and off-road vehicle activities (access tracks).

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Litoria castanea* Yellow-spotted Tree Frog	*Pseudomys fumeus* Smoky Mouse
	Chytridiomycosis. Infection by *myxosporean* parasites is also a potential threat (TSSC 2019). There is the potential for the introduction or spread of pathogens by means of imported materials, machinery movements and increased foot traffic during the construction phase. No evidence of pathogens such as Chytrid Fungus was recorded within the project footprint. However, these have potential to occur. Given the likelihood of Chytrid Fungus occurring on the site is low, mitigation can be implemented via hygiene protocols.	
5. The assessor may also provide new information that can be used to demonstrate that the principle identifying the species as at risk of an SAII, is inaccurate.	Not applicable	Not applicable.
Likely SAII assessment outcome against relevant principles.	The project would have direct impacts on 1.36 ha of potential habitat for Yellow-spotted Tree Frog typically constituting trees or other woody vegetation fringing farm dams or other waterbodies with limited habitat potential. No breeding habitat is expected to be directly impacted for the species. About 1.09 ha (80%) of the potential habitat occurs within the TCZ and would be subject to permanent loss. The remaining habitat areas occur within the ECZ and HTZ and would be subject to partial clearing. A low likelihood of direct impacts to potential breeding habitat and the limited extent of impact on surrounding foraging habitats mean an SAII outcome is considered unlikely for this species, particularly given stated measures to avoid and mitigate impacts to waterbodies. Additional measures to reduce clearing within potential habitat would strengthen this conclusion.	The project would impact on 132.66 ha of high or very high condition potential habitat, 59.43 ha (45%) of this habitat would be subject to some selective thinning of large trees only (i.e. HTZ). Given this, microhabitat features are expected to be retained within these areas. Impacts to 132.66 ha of habitat potentially equates to 0.5% of the species known range. It is considered that the impacts from the project may be deemed a sufficiently high risk to be an SAII depending on the likelihood of the species being present. Additional survey and/or expert advice is likely to assist in confirmation of the species presence/ absence within the project footprint and therefore the considered level of risk for an SAII to occur.

2.3.2 Sooty Owl

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	***Tyto tenebricosa* Sooty Owl**
Impact summary	The project would result in direct impacts to a total of 21.2 ha of Sooty Owl habitat. Potential indirect impacts to the species include: • Reduced viability of adjacent habitat due to noise, dust, or light spill. • Increased risk of starvation or exposure, and loss of shade or shelter. • Increase in pest animal populations and predation of native fauna. • Changed fire regimes. • Fauna collision, electrocution with transmission lines. Prescribed impacts for the species include: • Impacts to karst, caves, crevices, cliffs, rocks and other geological features, including 6.23 ha of steep cliffline habitat within the project footprint that may be considered potential cave – nesting habitat for Sooty Owl. • Fauna injury and/or mortality from transmission line collision, entanglement, or electrocution.
1. The assessor is required to provide further information in the BDAR or BCAR for any species at risk of an SAII, including the action and measures taken to avoid the direct and indirect impact on the species at risk of an SAII. Where these have been addressed elsewhere the assessor can refer to the relevant sections of the BDAR or BCAR.	The Sooty Owl occurs in rainforest, including dry rainforest, subtropical and warm temperate rainforest, as well as moist eucalypt forests. Roosts by day in the hollow of a tall forest tree or in heavy vegetation; hunts by night for small ground mammals or tree-dwelling mammals such as the Common Ringtail Possum (*Pseudocheirus peregrinus*) or Sugar Glider (*Petaurus breviceps*). The species nests in very large tree-hollows (OEH 2017). Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to Sooty Owl include: • Avoiding and minimising impacts by route refinement, over-spanning and rerouting access tracks to avoid potential habitats wherever possible (EMM B1). • Additional targeted surveys undertaken prior to commencement of construction to further delineate the extent of habitats and potential roost locations within the project footprint (EMM B2). • Further design avoidance and impact minimisation to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying Sooty Owl habitats, their existing condition, important connectivity corridors and certainty levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey). • Development of a Connectivity Strategy to ensure essential habitat linkages for the species are retained within the landscape (EMM B16).

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Tyto tenebricosa* Sooty Owl
	• Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed habitat areas as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, fauna handling, fauna habitat management measures, including construction connectivity strategy to maintain habitat linkages during the construction period and post-construction rehabilitation of temporarily disturbed habitats where relevant (EMM B18). • Habitat supplementation measures, including nest boxes and hollow re-use/ creation, to be implemented wherever practicable (EMM B21). This would be documented within a Supplementary Hollow and Nest Strategy. • Use of directional lighting for all permanent lighting (i.e. substations). Artificial lighting required during construction would be directed towards work sites to minimise light spill as much as practicable (EMM B31).
2. The assessor must consult the TBDC and/or other sources to report on the current population of the species including:	
• evidence of rapid decline (Principle 1, clause 6.7(2)(a) BC Regulation) presented by an estimate of the: ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer), or ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer) as indicated by: an index of abundance appropriate to the species; decline in geographic distribution and/or habitat quality; exploitation; effect of introduced species, hybridisation, pathogens, pollutants, competitors or parasites	***Principle 1 SAII = No*** DPE have determined that this species is not at risk of SAII due to Principle 1 – rapid decline (DPE 2022). This species is inferred to have declined as a result of clearing of forest (DEC 2006). However, there is no evidence that the species is continuing to decline in public forest lands (DEC 2006), and it is believed that populations in NSW may now be stable, albeit with medium reliability (Garnett & Crowley 2000). In NSW, the distribution of the species has remained almost the same over the 20 years between 1977-1981 and 1998-2002, although not enough records are available to identify any state or national trend in reporting rate (Barrett et al. 2003, 2007). Most populations in NSW are now located in State forests and NSW National Parks, and the baseline for its historical decline is uncertain (NSWSC 2008). Key threats to the species (DPE 2022), which are likely to have contributed to its decline in NSW over the last 10 years are: Habitat loss, fragmentation and degradation: Loss of hollow bearing trees and changes to forest and woodland structure. Clearing of habitat for agriculture, grazing forestry or other pursuits. Poisoning: Secondary poisoning from rodenticides. Overgrazing and fire: A combination of grazing and too frequent fire can lead to the depletion of ground cover for small mammal prey.

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Tyto tenebricosa* Sooty Owl
• evidence of small population size (Principle 2, clause 6.7(2)(b) BC Regulation) presented by: ▪ an estimate of the species' current population size in NSW, and ▪ an estimate of the decline in the species' population size in NSW in three years or one generation (whichever is longer), and ▪ where such data is available, an estimate of the number of mature individuals in each subpopulation, or the percentage of mature individuals in each subpopulation, or whether the species is likely to undergo extreme fluctuations	***Principle 2 SAII = No*** DPE have determined that this species is not at risk of SAII due to Principle 2 – small population size (DPE 2022). The number of individuals has been estimated as 10,000, of which more than half would occur in NSW on the assumption of geographic range; or more than 5,000 birds (Garnett & Crowley 2000). This estimate is assigned with a low level of reliability (Garnett & Crowley 2000). The NSW population was estimated as a minimum of 2,000 pairs or 10,000 birds (DEC 2006). This species is inferred to have declined as a result of clearing of forest (DEC 2006). However, there is no evidence that the species is continuing to decline in public forest lands (DEC 2006), and it is believed that populations in NSW may now be stable, albeit with medium reliability (Garnett & Crowley 2000). There is no data available in the literature to give an estimation of the number of mature individuals.
• evidence of limited geographic range for the threatened species (Principle 3, clause 6.7(2)(c) BC Regulation) presented by: ▪ extent of occurrence ▪ area of occupancy ▪ number of threat-defined locations (geographically or ecologically distinct areas in which a single threatening event may rapidly affect all species occurrences), and ▪ whether the species' population is likely to undergo extreme fluctuations	***Principle 3 SAII = No*** DPE have determined that this species is not at risk of SAII due to Principle 3 – limited geographic range (DPE 2022). This species' extent of occurrence is estimated to be 230,000km^2 (NSWSC 2008). This species area of occurrence is estimated at 50,000km^2 (NSWSC 2008). This species inhabits subtropical and warm temperate rainforest, and moist eucalypt forest with a well-developed mid-storey of trees or shrubs (NSWSC 2008). The species is capable of dispersal over ranges up to 50km^2 including across disturbed areas (NSWSC 2008) so is unlikely to be threatened by a single event. The cleared Hunter Valley is assumed to have broken connectivity between the northern and southern distribution of the species in NSW. NSWSC (2008) states that there is no evidence of extreme population fluctuations in the population size or habitat of this species.
• evidence that the species is unlikely to respond to management (Principle 4, clause 6.7(2)(d) BC Regulation) because: ▪ known reproductive characteristics severely limit the ability to increase the existing population on, or occupy new habitat (eg species is clonal) on, a biodiversity stewardship site ▪ the species is reliant on abiotic habitats which cannot be restored or replaced (eg karst systems) on a biodiversity stewardship site, or	***Principle 4 SAII = Yes*** DPE have determined that this species is at risk of SAII due to Principle 4 – unlikely to respond to management (DPE 2022). Sooty Owls nest in large tree hollows more than 30 cm wide and up to 10 m deep in big, old trees (usually alive but sometimes dead) (NSWSC (2008). This species is highly dependent on the availability of tree hollows for breeding. This species ability to be increase in population on a biodiversity stewardship site would be highly dependent on the presence of large, hollow bearing trees on the site.

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Tyto tenebricosa* Sooty Owl
▪ life history traits and/or ecology is known but the ability to control key threatening processes at a biodiversity stewardship site is currently negligible (eg frogs severely impacted by chytrid fungus).	This species preference for nesting in large, hollow bearing trees may be a limiting factor on a biodiversity stewardship site lacking this feature. Key threatening processes can be reasonably controlled within a biodiversity stewardship site, therefore this species is expected to be responsive to management.
3. Where the TBDC indicates data is 'unknown' or 'data deficient' for a species for a criterion listed in Subsection 9.1.2(2.), the assessor must record this in the BDAR or BCAR.	Some of the questions in this consideration of SAII cannot be assessed at this time because: • The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited • A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. • As such, we have noted the knowledge gaps in the TBDC and provided responses using information we have been able to source.
4. In relation to the impacts from the proposal on the species at risk of an SAII, the assessor must include data and information on:	
• the impact on the species' population (Principles 1 and 2) presented by: ▪ an estimate of the number of individuals (mature and immature) present in the subpopulation on the subject land (the site may intersect or encompass the subpopulation) and as a percentage of the total NSW population, and ▪ an estimate of the number of individuals (mature and immature) to be impacted by the proposal and as a percentage of the total NSW population, or ▪ if the species' unit of measure is area, provide data on the number of individuals on the site, and the estimated number that will be impacted, along with the area of habitat to be impacted by the proposal	It is not possible to determine how many individuals comprise the sub-population on the site from the available data. The number of individuals in NSW has been estimated as 10,000 birds (DEC 2006). However, no individuals or nesting habitat (caves or hollow bearing trees) was identified within the project footprint during targeted survey efforts, as such a percentage to be impacted of the total population cannot be attained. There are nine nearby records (10 estimated individuals) on BioNet (DPE 2022). All records are outside the project footprint, with the closest record 650 m from the project footprint. Records are focused around the southern extent of the project footprint. It is known to occur in Bondo, Bungonia and the Snowy Mountains IBRA Subregions. Associated PCTs and habitat occurs within the project footprint. This species may utilise habitats within the project footprint for foraging and breeding where suitable hollows are present. The project intersects 160 ha of steep sandstone geologies within the project footprint, however no cave environments were identified during field campaigns. Furthermore, no deep excavation or drilling is required within rocky areas or steep slopes that intersect the project footprint and spanning of structures across steep gullies and outcropping would occur. Suitable caves and breeding sites have not been detected in the project footprint. As above, this species was not recorded on the site, as such a percentage to be impacted of the total population cannot be determined. The species unit of measure is area. The species polygon for this species should be formed where a hollow bearing tree has been identified as a breeding site. As breeding sites were not recorded during field survey, the species polygon has been conservatively mapped based on associated PCTs (638) with a condition sufficient to

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Tyto tenebricosa* Sooty Owl
	support potential breeding and foraging opportunities (i.e. high condition). The total extent of potential habitat that would be impacted by the project is 21.20 ha. However, it should be noted that this is likely to be an over estimate of any actual impacts given hollow bearing trees were only recorded within 57% of plots completed within the relevant vegetation zone associated with this species (ie PCT 638 High). 11.80 ha (56%) of impacted habitat is situated within the HTZ and would be subject to selective clearing of large trees only.
• impact on geographic range (Principles 1 and 3) presented by: ▪ the area of the species' geographic range to be impacted by the proposal in hectares, and a percentage of the total area of occupancy or extent of occupancy within NSW ▪ the impact on the subpopulation as either: all individuals will be impacted (subpopulation eliminated); OR impact will affect some individuals and habitat; OR impact will affect some habitat, but no individuals of the species will be directly impacted ▪ to determine if the persisting subpopulation that is fragmented will remain viable, estimate (based on published and unpublished sources such as scientific publications, technical reports, databases or documented field observations) the habitat area required to support the remaining population, and habitat available within dispersal distance, and distance over which genetic exchange can occur (eg seed dispersal) and pollination distance for the species ▪ to determine changes in threats affecting remaining subpopulations and habitat if the proposed impact proceeds, estimate changes in environmental factors including changes to fire regimes (frequency, severity); hydrology, pollutants; species interactions (increased competition and effects on pollinators or dispersal); fragmentation, increased edge effects, likelihood of disturbance; and disease, pathogens and parasites. Where these factors have been considered elsewhere in relation to the target species, the assessor may refer to the relevant sections of the BDAR or BCAR.	This species extent of occurrence is estimated to be 230,000km^2 and area of occurrence is estimated at 50,000km^2 (NSWSC 2008). Therefore, the project would impact 0.0004% of the Sooty Owl's area of occurrence. The impact on the sub-population(s) cannot be quantified, as the species (or any or active nesting habitat) was not recorded within the project footprint during targeted survey efforts. There were several records of the species outside the project footprint, with the closest record 650 m from the project footprint. This mobile species is likely to be able to traverse the linear nature of the area to be cleared. It is therefore unlikely that a population of the species would be fragmented by the project. Therefore, the project is not likely to reduce the habitat area required to support a population of the species. The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence in suitable habitat. The project would impact 21.20 ha of potential habitat for this species. If the species is present, individuals in the project footprint may be affected by an increase in habitat loss, changes to fire regimes, increased edge effects, disturbance from vegetation removal and maintenance within the clearing footprint.
5. The assessor may also provide new information that can be used to demonstrate that the principle identifying the species as at risk of an SAII, is inaccurate.	Not applicable.
Likely SAII assessment outcome against relevant principles.	The project would impact on 21.20 ha of potential habitat for Sooty Owl. However, based on the review of available plot and hollow bearing tree data, it is likely that a moderate proportion of this habitat does not support suitable hollows and could be removed from the species polygon

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Tyto tenebricosa* Sooty Owl
	altogether. Additional constraints mapping and survey during breeding season is recommended to confirm where breeding habitats are present/ absent. More than half (11.80 ha) of impacted habitats are situated within the HTZ. Where active roosts are recorded within this zone, it is likely that these could be avoided through design measures such as increased transmission line structure heights and micro-siting. Given impacts to breeding habitats are likely to be limited in extent, the project is deemed unlikely to pose a significant risk to the species becoming extinct.

3. Threatened biodiversity SAII candidates with limited potential to be impacted

3.1 Threatened flora

3.1.1 Acacia phasmoides and Bossiaea fragrans

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	***Acacia phasmoides* Phantom Wattle**	***Bossiaea fragrans***
Impact summary	The project would result in direct impacts to a total of 2.00 ha of Phantom Wattle habitat (assumed presence), all of which is in moderate condition. Potential indirect impacts to the species include: • Transport of weeds and pathogens from the site to adjacent vegetation. • Trampling of threatened flora species. • Changed fire regimes.	The project would result in direct impacts to a total of 6 ha of *Bossiaea fragrans* habitat (assumed presence), 0.68 ha (11%) of which is in moderate to high condition. Potential indirect impacts to the species include: • Transport of weeds and pathogens from the site to adjacent vegetation. • Trampling of threatened flora species. • Changed fire regimes.
1. The assessor is required to provide further information in the BDAR or BCAR for any species at risk of an SAII, including the action and measures taken to avoid the direct and indirect impact on the species at risk of an SAII. Where these have been addressed elsewhere the assessor can refer to the relevant sections of the BDAR or BCAR.	In NSW *Acacia phasmoides* occurs on seasonally damp granite-derived soils in very close proximity (typically less than 8 m; DPIE 2021) to ephemeral creeks and their tributaries (Harden 1991; DECCW pers. comm. in Sutter 2010), from 220–390 m altitude (DAWE 2021). The species is assumed present within potential habitats within the project footprint but has not been directly recorded. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened flora include: • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1). • Further avoidance and minimisation of impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying the extent of habitats, their existing condition and certainty levels regarding species occurrence where assumed	*Bossiaea fragrans* is currently only known from the Abercrombie Karst Conservation Reserve and within the adjacent Travelling Stock Reserve, south of Bathurst on the NSW central tablelands. It has a highly restricted distribution, with only a small number of discrete known sub-populations. The species occurs on spilite, rhyolite or slate and volcanic substrates and is often associated with Red Stringybark (*Eucalyptus macrorhyncha*) - Red Box (*Eucalyptus polyanthemos*) woodland +/- White Box (*Eucalyptus albens*). The species is assumed present within potential habitats within the project footprint but has not been directly recorded. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened flora include: • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1).

Official

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Acacia phasmoides* Phantom Wattle	*Bossiaea fragrans*
	present (ie likely/ unlikely to occur subject to further survey). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed threatened flora habitats as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of temporarily disturbed areas within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with pathogens, pests and weeds (EMM B19).	• Further avoidance and minimisation of impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying the extent of habitats, their existing condition and certainty levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed threatened flora habitats as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of temporarily disturbed areas within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with pathogens, pests and weeds (EMM B19).
2. The assessor must consult the TBDC and/or other sources to report on the current population of the species including:		
• evidence of rapid decline (Principle 1, clause 6.7(2)(a) BC Regulation) presented by an estimate of the:	*Principle 1 SAII = No* There is insufficient data on decline in population to assess *Acacia phasmoides* against this criteria.	*Principle 1 SAII = No* There is insufficient data on decline in population to assess *Bossiaea fragrans* against this criterion (TSSC 2018).

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Acacia phasmoides* Phantom Wattle	*Bossiaea fragrans*
▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer), or ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer) as indicated by: an index of abundance appropriate to the species; decline in geographic distribution and/or habitat quality; exploitation; effect of introduced species, hybridisation, pathogens, pollutants, competitors or parasites	There is insufficient data on decline in population to assess *Acacia phasmoides* against this criteria. Nothing is known of the previous abundance of the NSW population (Sutter 2010). The major threats to *Acacia phasmoides* are herbivory from feral herbivores (browsing by feral mammals including goats and deer) particularly during the post-fire recovery stage and the genetic consequences of small subpopulations. *Acacia phasmoides* is threatened by several fire-related threats, including high frequency fire, fire-drought interactions and fire promoted weed invasion (DAWE 2021c). The 2019–20 bushfires burnt approximately 51% of the modelled range of *Acacia phasmoides* (Gallagher 2020), including nearly the entire Victorian subpopulation and approximately one third of the plants in the known NSW subpopulation (DAWE 2021c).	Continuing decline has been observed for number of mature individuals because of ongoing impacts from goats (*Capra hircus*) and pigs (*Sus scrofa*) (TSSC 2018). *Bossiaea fragrans* is threatened by grazing and competition from weeds. Goats are common in the Abercrombie Caves area and it is thought that they may be grazing on *Bossiaea fragrans* seedlings (McDougall pers. comm. Cited in NSW Scientific Committee 2009). The grass *Nassella trichotoma (*Serrated Tussock) is also in the area and may be a threat to recruitment of seedlings (McDougall 2009 cited in NSW Scientific Committee 2009). A potential contributor to future decline in *Bossiaea fragrans* is the loss of seed to predation by insects. Observations in 2011 suggested seed predation was significant (in the order of 50%; R. Johnston pers comm, January 2017 cited in NSW Scientific Committee 2009).
• evidence of small population size (Principle 2, clause 6.7(2)(b) BC Regulation) presented by: ▪ an estimate of the species' current population size in NSW, and ▪ an estimate of the decline in the species' population size in NSW in three years or one generation (whichever is longer), and ▪ where such data is available, an estimate of the number of mature individuals in each subpopulation, or the percentage of mature individuals in each subpopulation, or whether the species is likely to undergo extreme fluctuations	<u>*Principle 2 SAII = No*</u> In New South Wales, there is a single subpopulation of about 2000 plants east of Holbrook (NSW NPWS 2020 cited in DAWE 2021), with most of the plants occurring in Woomargama National Park and a few plants growing on adjoining private property to the south of the park (although these were not relocated during surveys in 2012; DPIE 2021 cited in DAWE 2021c). *Acacia phasmoides* is known only from the two areas in which it currently occurs, and there are no records to suggest there has been any decline in distribution since European settlement of Australia. Nothing is known of the previous abundance of the NSW population (Sutter 2010). *Acacia phasmoides* is restricted to two subpopulations in small areas of north-eastern Victoria and south-eastern New South Wales (ALA 2020 cited in DAWE 2021c). In New South Wales, there is a single subpopulation of about 2000 plants east of Holbrook (NSW NPWS 2020 cited in DAWE 2021c), with most	<u>*Principle 2 SAII = Yes*</u> *Bossiaea fragrans* has a total population of only 400 plants (TSSC 2018). Currently only known from the Abercrombie Karst Conservation Reserve and within the adjacent Travelling Stock Reserve, south of Bathurst on the NSW central tablelands. It has a highly restricted distribution, with only a small number of discrete known sub-populations (OEH 2022f). According to Jowett (2015) 'Following targeted searches over 3 years from 2011 to 2014, the known population has increased to over 400 plants' (TSSC 2018). The number of mature individuals of *Bossiaea fragrans* is extremely low. A total of 13 plants were located within the two extant populations (12 plants at one site, and only one plant at the second site) (NSW Scientific Committee 2009). Additional individuals were discovered during surveys from 2011 to 2014 that identified 400 plants at 21 sites, a considerable increase on the 13 plants at two sites previously recorded. The species is still considered to be highly geographically restricted (Jowett

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Acacia phasmoides* Phantom Wattle	*Bossiaea fragrans*
	of the plants occurring in Woomargama National Park and a few plants growing on adjoining private property to the south of the park (although these were not relocated during surveys in 2012; DPIE 2021 cited in DAWE 2021c). In Victoria, there is a single subpopulation in Burrowa-Pine Mountain National Park near Corryong, where the species occurs in four documented areas to the west and south of Pine Mountain summit, with a total of about 500 plants (DELWP 2016 cited in DAWE 2021c).	2015 cited in TSSC 2018). The range of the species is approximately 1 km^2 and all sites are considered to be part of the one population. Currently there is no available data to assess the likelihood of extreme fluctuations in *Bossiaea fragrans* (TSSC 2018).
• evidence of limited geographic range for the threatened species (Principle 3, clause 6.7(2)(c) BC Regulation) presented by: ▪ extent of occurrence ▪ area of occupancy ▪ number of threat-defined locations (geographically or ecologically distinct areas in which a single threatening event may rapidly affect all species occurrences), and ▪ whether the species' population is likely to undergo extreme fluctuations	<u>*Principle 3 SAII = Yes*</u> Extent of Occurrence (ha) = 18.676 km^2 Area of Occupancy (ha) = 32 km^2 No. Threat-defined locations = <= 3 locations. *Acacia phasmoides* has a highly restricted range and small population size (DAWE 2021c). Many small, isolated subpopulations are subject to the effects of low genetic diversity (Frankham et al. 2014 cited in DAWE 2021c) and stochastic events. It is possible that *Acacia phasmoides* has low genetic diversity (DAWE 2021c). Data deficient –there is currently no documented evidence of extreme fluctuations for *Acacia phasmoides*. Nothing is known of the previous abundance of the NSW population (Sutter 2010).	<u>*Principle 3 SAII = Yes:*</u> *Area of Occupancy (ha) = < 10 km^2* *Extent of Occurrence (ha) = < 100 km^2* *No. Threat-defined locations = <= 3 locations* The species has a very highly restricted geographic range with extent of occurrence (EOO) and area of occupancy (AOO) estimated to be 4-8 km^2 (NSW Scientific Committee 2009). As above. *Bossiaea fragrans* is found at only one location. This species is threatened by environmental and demographic stochasticity due to its very highly restricted distribution and small population size. As a result of the above-mentioned threats*, B. fragrans* is at risk of a projected decline in abundance, geographic distribution or habitat quality (NSW Scientific Committee 2009). Currently there is no available data to assess the likelihood of extreme fluctuations in *Bossiaea fragrans* (TSSC 2018).
• evidence that the species is unlikely to respond to management (Principle 4, clause 6.7(2)(d) BC Regulation) because: ▪ known reproductive characteristics severely limit the ability to increase the existing population on, or occupy new habitat (eg species is clonal) on, a biodiversity stewardship site	<u>*Principle 4 SAII = Yes*</u> The species has no known reproductive characteristics that could severely limit the ability to increase the existing population. However, Wattle species are mostly pollinated by insects, particularly bees. Little is known about longevity or generation length of the *Acacia phasmoides* (DAWE 2021c).	<u>Principle 4 SAII = No</u> The species has no known reproductive characteristics that could severely limit the ability to increase the existing population, however, *Bossiaea* species typically have a long-lived seedbank that responds to fire (Auld pers. Comm. May 2008). There are thought to have been no fires in the area since 1939 (McDougall pers. Comm.) and recent observations

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Acacia phasmoides* Phantom Wattle	*Bossiaea fragrans*
▪ the species is reliant on abiotic habitats which cannot be restored or replaced (eg karst systems) on a biodiversity stewardship site, or ▪ life history traits and/or ecology is known but the ability to control key threatening processes at a biodiversity stewardship site is currently negligible (eg frogs severely impacted by chytrid fungus).	This species has a moderate sensitivity to gain dependent on the effectiveness of management to control threats (DPE 2022). Due to the species eligibility for listing (highly restricted range and small population size), all habitat is considered critical to the survival of the species (DAWE 2021c). No Critical Habitat as defined under section 207A of the EPBC Act has been identified or included in the Register of Critical Habitat (DAWE 2021c). The few plants in the NSW subpopulation that grow on private land are affected by invasion of annual grasses (Sutter 2010 cited in DAWE 2021c). The invasion of native plant communities by exotic perennial grasses is listed as a KTP under the Biodiversity Conservation Act in NSW (NSW Scientific Committee 2003). The main threats to this species as described above can reasonably be controlled within a biodiversity stewardship site. This species requires the application of ecological fire management (DPE 2022).	suggest that seed predation (grazing) is significant. The seedbank may therefore be of limited size and viability. Seedling recruitment in the interfire intervals is likely to be limited (Auld pers. Comm. May 2008 cited in NSW Scientific Committee 2009). BioNet states that the species has a high sensitivity to gain dependent on the effectiveness of management to control threats (DPE 2022). There is no known critical habitat for this species. The life-history traits and ecology of *Bossiaea fragrans* is known. This species requires the application of ecological fire management (DPE 2022). The main threats to this species as described above can reasonably be controlled within a biodiversity stewardship site eg grazing by goats (*Capra hircus*) and pigs (*Sus scrofa*) and competition from weeds, therefore this species is expected to be responsive to management. 'Competition and habitat degradation by Feral Goats, *Capra hircus* is listed as a KTP under the *Biodiversity Conservation Act 2016*. 'Invasion of native plant communities by exotic perennial grasses' is listed as a KTP under the *Biodiversity Conservation Act 2016* (NSW Scientific Committee 2009).
3. Where the TBDC indicates data is 'unknown' or 'data deficient' for a species for a criterion listed in Subsection 9.1.2(2.), the assessor must record this in the BDAR or BCAR.	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this species for a criterion listed in Subsection 9.1.1(2.). Some responses in this consideration of SAII cannot be completed comprehensively due to the following: The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited. A lot of the information is not covered by scientific papers, and there are significant knowledge gaps.	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this species for a criterion listed in Subsection 9.1.1(2.). Some responses in this consideration of SAII cannot be completed comprehensively due to the following: The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited. A lot of the information is not covered by scientific papers, and there are significant knowledge gaps.

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Acacia phasmoides* Phantom Wattle	*Bossiaea fragrans*
	As such, we have noted the knowledge gaps in the TBDC and provided responses using information from the limited available sources.	As such, we have noted the knowledge gaps in the TBDC and provided responses using information from the limited available sources.
4. In relation to the impacts from the proposal on the species at risk of an SAII, the assessor must include data and information on:		
• the impact on the species' population (Principles 1 and 2) presented by: ▪ an estimate of the number of individuals (mature and immature) present in the subpopulation on the subject land (the site may intersect or encompass the subpopulation) and as a percentage of the total NSW population, and ▪ an estimate of the number of individuals (mature and immature) to be impacted by the proposal and as a percentage of the total NSW population, or ▪ if the species' unit of measure is area, provide data on the number of individuals on the site, and the estimated number that will be impacted, along with the area of habitat to be impacted by the proposal	Potential habitat for *Acacia phasmoides* was detected within the project footprint within the Inland Slopes IBRA Subregion, however the species was not directly recorded during targeted surveys. Where survey effort was not adequate, species presence has been assumed within suitable habitat. The species has not been recorded within 20 km of the project footprint and is only known from one location in NSW: Woomargama National Park in Greater Hume Shire, approximately 60 km south-west of the project footprint. Given the species was not recorded in the project footprint and is only assumed present, and the limited information available on the total population of the species, it is not possible to determine the number of individuals (mature and immature) that would be impacted by the project and as a percentage of the total NSW population. The species' unit of measure is area. The species was not recorded within the project footprint. Where survey effort was not adequate, species presence has been assumed within suitable habitat. The total area of this species suitable habitat that would be directly impacted by the project is 2.00 ha.	It is not possible to determine how many individuals comprise the sub-population within the project footprint from the available data. Potentially suitable habitat for *Bossiaea fragrans* occurs within the project footprint within PCT 268 in the Inland Slopes Subregion. Targeted flora surveys within the project footprint did not locate the species. Where survey effort was not adequate, species presence has been assumed within suitable habitat. There are no records within 20 km of the project (DPE 2022). Given the species was not recorded and is only assumed present, and the limited information available on the total population of the species, it is not possible to determine the number of individuals (mature and immature) that would be impacted by the project and as a percentage of the total NSW population. The species unit of measure is area. The species was not located within the project footprint despite targeted surveys in accessible land. Where survey effort was not adequate, species presence has been assumed within suitable habitat. The total extent of potential habitat that would be directly impacted by the project is 6.1 ha.
• impact on geographic range (Principles 1 and 3) presented by: ▪ the area of the species' geographic range to be impacted by the proposal in hectares, and a percentage of the total area of occupancy or extent of occupancy within NSW	The project footprint contains 49.05 ha of suitable habitat in the form of a species habitat polygon, of this the project would impact on 2.00 ha (4%). The extent of occurrence (EOO) was estimated to be 18.676 km^2 (1,867.6 ha) (BCD data package). Therefore, the project would impact less than 0.01% of this species' extent of occurrence. The area of occupancy (AOO)	The project footprint contains 102.93 ha of potential habitat for the species, 6.1 ha (6%) would be impacted by the project. The extent of occurrence and area of occupancy for this species was estimated to be 4-8 km^2 (NSW Scientific Committee 2009). Therefore, the project may impact up to 2-4% of the species' extent of occurrence (as it is not known if

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Acacia phasmoides* Phantom Wattle	*Bossiaea fragrans*
▪ the impact on the subpopulation as either: all individuals will be impacted (subpopulation eliminated); OR impact will affect some individuals and habitat; OR impact will affect some habitat, but no individuals of the species will be directly impacted ▪ to determine if the persisting subpopulation that is fragmented will remain viable, estimate (based on published and unpublished sources such as scientific publications, technical reports, databases or documented field observations) the habitat area required to support the remaining population, and habitat available within dispersal distance, and distance over which genetic exchange can occur (eg seed dispersal) and pollination distance for the species ▪ to determine changes in threats affecting remaining subpopulations and habitat if the proposed impact proceeds, estimate changes in environmental factors including changes to fire regimes (frequency, severity); hydrology, pollutants; species interactions (increased competition and effects on pollinators or dispersal); fragmentation, increased edge effects, likelihood of disturbance; and disease, pathogens and parasites. Where these factors have been considered elsewhere in relation to the target species, the assessor may refer to the relevant sections of the BDAR or BCAR.	was estimated to be 32 km^2 (3,200 ha) (BCD data package). Therefore, the project would impact less than 0.01% of this species' area of occupancy. It is not known whether all of the area of potential impact occurs within the known AOO or EOO. The project would impact on 2.00 ha (4%) of the 49.05 ha of suitable habitat for the species within the project footprint. The project would impact some habitat, but no individuals of the species is likely to be directly impacted in areas where targeted surveys were undertaken as the species was not detected. In areas that comprise the species polygon that could not be adequately surveyed, species presence has been assumed. As such, the number of individuals cannot be quantified. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. Therefore, if the species is present, the project would not create a barrier to dispersal of the species. The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence in suitable habitat. If the species is present, individuals in the project footprint may be affected by changes to fire regimes in surrounding vegetation as a result of management for asset protection, increased edge effects, altered hydrology due to drainage lines within the project footprint, off-road vehicle activities (access tracks).	the project footprint intersects with the known EOO or AOO for the species). The project would impact on 6.1 ha (6%) of the 102.93 ha of potential habitat for the species within the project footprint. The project would impact some habitat, but no individuals of the species is likely to be directly impacted in areas where targeted surveys were undertaken as the species was not detected. In areas that comprise the species polygon that were not adequately surveyed, species presence has been assumed. As such, the number of individuals cannot be quantified. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. Therefore, if the species is present, the project would not create a barrier to dispersal of the species. The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence. If the species is present, individuals in the project footprint may be affected by changes to fire regimes in surrounding vegetation as a result of management for asset protection, increased edge effects, altered hydrology due to drainage lines within the project footprint, off-road vehicle activities (access tracks).
5. The assessor may also provide new information that can be used to demonstrate that the principle identifying the species as at risk of an SAII, is inaccurate.	Not applicable.	Not applicable.
Likely SAII assessment outcome against relevant principles.	The species has been assumed present within the project footprint due to survey limitations. Despite this, the species is considered unlikely to occur within the project footprint given	*Bossiaea fragrans* has been assumed present within the project footprint due to survey limitations. The species is only known from the Abercrombie Karst Conservation Reserve and

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Acacia phasmoides* Phantom Wattle	*Bossiaea fragrans*
	it is only known from one location in NSW: Woomagarma National Park in Greater Hume Shire. Therefore, the project is unlikely to be deemed a significant risk to the species becoming extinct due to either an impact on the habitat of the species that is currently observed, estimated, inferred or reasonably suspected to have a very limited geographic distribution, or; the impacted species being unlikely to respond to measures to improve its habitat and vegetation integrity and therefore its members are not replaceable.	within the adjacent Travelling Stock Reserve, south of Bathurst on the NSW central tablelands. It has a highly restricted distribution, with only a small number of discrete known sub-populations. Given this, the species is considered unlikely to occur within the project footprint. Therefore, the project is unlikely to be deemed a significant risk to the species becoming extinct due to either a reduction in the population size of the species that is currently observed, estimated, inferred or reasonably suspected to have a very small population size, or due to an impact on the habitat of the species that is currently observed, estimated, inferred or reasonably suspected to have a very limited geographic distribution.

3.1.2 Caladenia concolor and Caladenia tesselata

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	***Caladenia concolor***	***Caladenia tessellata* Thick Lip Spider Orchid**
Impact summary	The project would result in direct impacts to a total of 34.10 ha of *Caladenia concolor* habitat, all of which is in moderate to high condition. Potential indirect impacts to the species include: • Transport of weeds and pathogens from the site to adjacent vegetation. • Trampling of threatened flora species. • Changed fire regimes.	The project would result in direct impacts to a total of 16.00 ha of Thick Lip Spider Orchid habitat (assumed present), all of which is in moderate to very high condition. Potential indirect impacts to the species include: • Transport of weeds and pathogens from the site to adjacent vegetation. • Trampling of threatened flora species. • Changed fire regimes.
1. The assessor is required to provide further information in the BDAR or BCAR for any species at risk of an SAII, including the action and measures taken to avoid the direct and indirect impact on the species at risk of an SAII. Where these have been addressed elsewhere the assessor can refer to the relevant sections of the BDAR or BCAR.	*Caladenia concolor* is currently known from only 3 populations in the vicinity of Cootamundra, Lake Burrinjuck and Albury. Habitat for the species comprises regrowth woodland on granite ridge country that has retained a high diversity of plant species, including other orchids. The species is assumed present within potential habitats within the project footprint but has not been directly recorded. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened flora include: • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1). • Further avoidance and minimisation of impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying the extent of habitats, their existing condition and certainty levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey).	*Caladenia tessellata* is known from the Sydney area (old records), Wyong, Ulladulla and Braidwood in NSW. Generally found in grassy sclerophyll woodland on clay loam or sandy soils, though the population near Braidwood is in low woodland with stony soil. The species is assumed present within potential habitats within the project footprint but has not been directly recorded. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened flora include: • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1). • Further avoidance and minimisation of impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying the extent of habitats, their existing condition and certainty levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Caladenia concolor*	*Caladenia tessellata* Thick Lip Spider Orchid
	• Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed threatened flora habitats as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of temporarily disturbed areas within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with pathogens, pests and weeds (EMM B19).	threatened flora habitats as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of temporarily disturbed areas within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). Implementation of biosecurity protocols during construction to manage any potential risks associated with pathogens, pests and weeds (EMM B19).
2. The assessor must consult the TBDC and/or other sources to report on the current population of the species including:		
• evidence of rapid decline (Principle 1, clause 6.7(2)(a) BC Regulation) presented by an estimate of the: ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer), or ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer) as indicated by: an index of abundance appropriate to the species; decline in geographic distribution and/or habitat quality; exploitation; effect of	***Principle 1 SAII = Yes*** There is insufficient data to show a meaningful trend yet. However, numbers have declined from 2017 despite there being no threatening processes (such as browsing or human disturbance) in Benambra National Park (DPIE 2021h). The main factors that are the cause of the species being eligible for listing in the Endangered category are its restricted area or occupancy and fragmentation and continuing decline in habitat (TSSC 2016b). *Caladenia concolor* is threatened by habitat loss and fragmentation, altered moisture regimes,	***Principle 1 SAII = Yes:*** Long term population data for this species in NSW is not available and generation length is unknown. Therefore, the decline in population of the species in NSW in the past 10 years or three generations has not been estimated. However, there have been continuing declines in the number of populations and individuals within NSW. At least two populations have become extinct since the 1980's and at least 14 populations from the Sydney and South Coast regions have not been recorded since the 1950s (NSWSC 2002). The

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Caladenia concolor*	*Caladenia tessellata* Thick Lip Spider Orchid
introduced species, hybridisation, pathogens, pollutants, competitors or parasites	invasive species and too frequent fire (TSSC 2016b). The main threats facing this orchid relate to its small population size and lack of recruitment, so propagation and reintroduction to bolster the existing wild population are key to its long-term survival (DPIE 2021h).	apparent loss of some subpopulations has resulted in a decrease in the number of subpopulations and individuals within NSW (DAWE 2021). The decline in the population of the species in NSW in the last 10 years cannot be assessed at this time because the species information available in BioNet and other reliable/peer reviewed information about the species is limited and does not address this aspect. The decline in population of the species in NSW in the past 10 years or three generations based on the listed threats has not been estimated. Decline in habitat quality is likely to be a factor for this species as a result of altered fire intervals since European settlement, disturbance from exotic pest animals such as pigs and possibly vegetation competition (DPIE 2021e).
• evidence of small population size (Principle 2, clause 6.7(2)(b) BC Regulation) presented by: ▪ an estimate of the species' current population size in NSW, and ▪ an estimate of the decline in the species' population size in NSW in three years or one generation (whichever is longer), and ▪ where such data is available, an estimate of the number of mature individuals in each subpopulation, or the percentage of mature individuals in each subpopulation, or whether the species is likely to undergo extreme fluctuations	***Principle 2 SAII = No*** Only two populations, totalling around 600 individuals occur in New South Wales: one on hills near Albury, and the other in Benambra National Park (DPIE 2021h). There is insufficient data to show a meaningful trend yet. However, numbers have declined from 2017 despite there being no threatening processes (such as browsing or human disturbance) in Benambra National Park (DPIE 2021h). The current NSW Scientific Committee listing incorporates two populations which have each been described as separate species by D.L. Jones. One of these populations comprises a few hundred plants on private property near Bethungra and the other of about 100 plants occurs in Burrinjuck Nature reserve. The other occurrences of *Caladenia concolor* in NSW are from the Nail Can Hill Crown Reserve near Albury. The species also occurs at two localities in Victoria near Beechworth and Chiltern (DPE 2022). Currently there is no available data to assess the likelihood of extreme fluctuations in *Caladenia concolor*.	***Principle 2 SAII = No:*** The most recent estimate total population size for this species from three subpopulations in NSW was 1,041 plants (DAWE 2021). However, population numbers are likely to be underestimates due to the suppression of flowering in the absence of recent fire. Approximately 100 flowering plants were known at the Morton National Park subpopulation as at 2019 (Coutts-McClelland 2021 pers. comm. 17 Sept cited in DAWE 2021) but over 1000 flowering individuals were counted in September 2020 following the 2019-20 bushfires which burnt the area (Phillips 2021 pers. comm. 17 September cited in DAWE 2021). There are no long term survey data, therefore it is not possible to directly estimate the rate of population decline (DAWE 2021). Annual monitoring and targeted surveys of two priority management sites, one in Morton National Park and the other in the Braidwood areas were conducted from 2016 to 2020 (DPIE 2021e). The population at the Morton National Park site is considered to be stable and possibly increasing with approximately 25 individuals recorded in permanent plots in

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Caladenia concolor*	*Caladenia tessellata* Thick Lip Spider Orchid
		2016 and approximately 60 individuals recorded in 2020. However, the total number of flowering plants observed outside of the permanent plots in 2020 was far higher (DPIE 2021e). The Braidwood population appears to be slowly declining with 10 individuals recorded in permanent plots in 2016 and approximately 6 recorded in 2020 (DPIE 2021e). While there are few regular surveys there are insufficient data to characterise trends in extant subpopulations (DPIE 2021e). Therefore, the decline in population of the species in NSW in the past 10 years or three generations has not been estimated. The decline in the population of the species in NSW in the last 10 years cannot be assessed at this time because the species information available in BioNet and other reliable/peer reviewed information about the species is limited and does not address this aspect. The total number of mature individuals of this species is low (DAWE 2021). In NSW, no estimates are available on the number of mature individuals. Approximately 1,014 individual plants were recorded in the Moreton subpopulation in 2020, <10 were recorded at a private property in Braidwood in 2021 and 17 individuals were recorded in the Nadgee Nature Reserve in 2020 (DAWE 2021). The species is not subject to extreme fluctuations in population size as plants are long-lived and capable of persisting in a dormant or non-flowering state (DAWE 2021).
• evidence of limited geographic range for the threatened species (Principle 3, clause 6.7(2)(c) BC Regulation) presented by: ▪ extent of occurrence ▪ area of occupancy ▪ number of threat-defined locations (geographically or ecologically distinct areas in which a single threatening event may rapidly affect all species occurrences), and	***Principle 3 SAII = Yes*** • *Area of Occupancy (ha) = 72 km²* • *Extent of Occurrence (ha) = 12,339.516 km²* • *No. Threat-defined locations = <= 3 locations* Extent of Occurrence: 12,339.516 km² (BCD data package) Area of Occupancy: 72 km² (BCD data package) Number of threat-defined locations: There is insufficient data	***Principle 3 SAII = Yes:*** *Extent of Occurrence (ha) = 1,137.411 km²* *Area of Occupancy (ha) = 124.000 km²* Extent of occurrence: The data package provided by BCD lists the extent of occurrence of this species in NSW as 1,137 km² . Area of Occupancy: The data package provided by BCD lists the Area of Occupancy for this species is approximately 124 km².

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Caladenia concolor*	*Caladenia tessellata* Thick Lip Spider Orchid
▪ whether the species' population is likely to undergo extreme fluctuations	to determine the number of threat-defined locations for this species. The species is currently known from only 3 populations in the vicinity of Cootamundra, Lake Burrinjuck and Albury. This species could be threatened by environmental and demographic stochasticity due to its very highly restricted distribution and small population size. Extreme fluctuations: There is insufficient data to determine whether the species population size would be likely to undergo extreme natural fluctuations.	This includes the two known subpopulations at Morton National Park and near Braidwood and a third in Nadgee Nature Reserve (DAWE 2021). Number of threat-defined locations: <= 3 locations. The species is widespread but occurrence is patchy (DAWE 2021). The current distribution of this species is known, further identification of threat-defined locations is unlikely to occur. However, any potentially suitable habitat ought to be considered a threat defined location within proximity to the known population. Extreme fluctuations in number: The species is not subject to extreme fluctuations in population size as plants are long-lived and capable of persisting in a dormant or non-flowering state (DAWE 2021). Threats to these populations is from habitat destruction and degradation, inappropriate fire regimes, grazing and trampling by invasive and native herbivores and increased frequency of droughts due to climate change (DAWE 2021).
• evidence that the species is unlikely to respond to management (Principle 4, clause 6.7(2)(d) BC Regulation) because: ▪ known reproductive characteristics severely limit the ability to increase the existing population on, or occupy new habitat (eg species is clonal) on, a biodiversity stewardship site ▪ the species is reliant on abiotic habitats which cannot be restored or replaced (eg karst systems) on a biodiversity stewardship site, or ▪ life history traits and/or ecology is known but the ability to control key threatening processes at a biodiversity stewardship site is currently negligible (eg frogs severely impacted by chytrid fungus).	***Principle 4 SAII = No*** There is very little known about the ecology of *Caladenia concolor* (NSW NPWS 2003 cited in TSSC 2016b). The species has no known reproductive characteristics that could severely limit the ability to increase the existing population, however, most terrestrial orchids have evolved under conditions of hot summer fires, generally when the plants have been dormant (Backhouse & Jeanes 1995 cited in TSSC 2016b). Some *Caladenia* species flower vigorously following hot summer fires (Backhouse & Jeanes 1995; Todd 2000 cited in TSSC 2016b). However, this may be as much the result of the removal of surrounding vegetation and reduced competition as any chemical effect of the fire (Backhouse & Jeanes 1995 cited in TSSC 2016b). The timing of fire for orchids is important, with the best time during late summer or early autumn, after seed	***Principle 4 SAII = No:*** The species has no known reproductive characteristics that could severely limit the ability to increase the existing population (DAWE 2021). The species has a moderate sensitivity to gain dependent on the effectiveness of management to control threats (DPE 2022). The long-term persistence of suitable mycorrhizal fungi is critical for ongoing recruitment however, there is no known critical habitat for this species (DAWE 2021). Key threatening processes can reasonably be controlled within a biodiversity stewardship site (eg habitat degradation/loss by development, trampling and grazing by domestic stock or feral pest species and population loss by feral pigs), therefore this species is expected to be responsive to management.

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Caladenia concolor*	*Caladenia tessellata* Thick Lip Spider Orchid
	dispersal but prior to new plant emergence (TSSC 2016b). BioNet states that the species has a moderate sensitivity to gain dependent on the effectiveness of management to control threats (DPE 2022). There is no known critical habitat for this species (DPE 2022). There is very little known about the ecology of *Caladenia concolor* (NSW NPWS 2003 cited in TSSC 216b). This species requires the application of ecological fire management (DPE 2022). The main threats to this species as described above can reasonably be controlled within a biodiversity stewardship site.	
3. Where the TBDC indicates data is 'unknown' or 'data deficient' for a species for a criterion listed in Subsection 9.1.2(2.), the assessor must record this in the BDAR or BCAR.	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this species for a criterion listed in Subsection 9.1.1(2.). Some responses in this consideration of SAII cannot be completed comprehensively due to the following: • The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited • A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. • As such, we have noted the knowledge gaps in the TBDC and provided responses using information from the limited available sources.	Some of the questions in this consideration of SAII cannot be assessed at this time because: • The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited • A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. • As such, we have noted the knowledge gaps in the TBDC and provided responses using information we have readily available.
4. In relation to the impacts from the proposal on the species at risk of an SAII, the assessor must include data and information on:		
• the impact on the species' population (Principles 1 and 2) presented by: ▪ an estimate of the number of individuals (mature and immature) present in the subpopulation on the subject land (the site may intersect or encompass the subpopulation) and	Potential habitat for *Caladenia concolor* was detected within the project footprint within PCTs 268, 280 and 290 in the Murrumbateman and Inland Slopes Subregions. Targeted flora surveys within the project footprint did not locate the species. Where survey effort was not adequate, species presence has been assumed within suitable habitat. There are 7 records near the project (43 individuals), and the closest is 4 km from the	It is not possible to determine how many individuals comprise the sub-population on the site from the available data. Suitable habitat for *Caladenia tessellata* was detected within the project footprint within the Bungonia IBRA Subregion. Targeted flora surveys within the project footprint did not locate the species. Where survey effort was not adequate,

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Caladenia concolor*	*Caladenia tessellata* Thick Lip Spider Orchid
as a percentage of the total NSW population, and ▪ an estimate of the number of individuals (mature and immature) to be impacted by the proposal and as a percentage of the total NSW population, or ▪ if the species' unit of measure is area, provide data on the number of individuals on the site, and the estimated number that will be impacted, along with the area of habitat to be impacted by the proposal	project footprint (DPE 2022).Given the species was not recorded and is only assumed present, and the limited information available on the total population of the species, it is not possible to determine the number of individuals (mature and immature) that would be impacted by the project and as a percentage of the total NSW population. The species unit of measure is area. The species was not located within the project footprint despite targeted surveys in accessible land. Where survey effort was not adequate, species presence has been assumed within suitable habitat. The project would result in the direct impact to 34.10 ha of potential habitat for Crimson Spider Orchid in the project footprint.	species presence has been assumed within suitable habitat. There are no records within 20 km of the project (DPE 2022). Given the species was not recorded and is only assumed present within potential habitat, and the limited information available on the total population of the species, it is not possible to determine the number of individuals (mature and immature) to be impacted by the project and as a percentage of the total NSW population. The species unit of measure is area. The species was not located within the project footprint despite targeted surveys in accessible land. Where survey effort was not adequate, species presence has been assumed within potential habitat The total area of this species habitat to be directly impacted by the project is 16.00 ha. However, given that this species was not recorded on the site during targeted surveys, there are no nearby records within 20 km of the site and similar habitat in the surrounding landscape would be retained, it is unlikely that the project would impact the local population for this species.
• impact on geographic range (Principles 1 and 3) presented by: ▪ the area of the species' geographic range to be impacted by the proposal in hectares, and a percentage of the total area of occupancy or extent of occupancy within NSW ▪ the impact on the subpopulation as either: all individuals will be impacted (subpopulation eliminated); OR impact will affect some individuals and habitat; OR impact will affect some habitat, but no individuals of the species will be directly impacted ▪ to determine if the persisting subpopulation that is fragmented will remain viable, estimate (based on published and unpublished sources such as scientific publications, technical reports,	The project footprint contains 103.32 ha of suitable habitat in the form of a species habitat polygon, of this the project would impact on 34.10 ha (33%). The extent of occurrence (EOO) was estimated to be 12,339.516 km^2 (1,233,951.5 ha) BCD data package). Therefore, the project may impact up to 0.002% of this species' extent of occurrence. The area of occupancy (AOO) was estimated to be 72 km^2 (7,200 ha) (BCD data package). Therefore, the project may impact up to 0.48% of this species' extent of occurrence. The project would impact on 34.10 ha (33%) of the 103.32 ha of potential habitat for the species within the project footprint. The project would impact some habitat, but no individuals of the species is likely to be directly impacted in areas where targeted surveys were undertaken as the species was not detected. In areas that comprise the species polygon that were	The project footprint comprises 297.52 ha of suitable habitat, 16.00 ha (5%) of this would be impacted by the project. The extent of occurrence (EOO) was estimated to be 1,137 km^2 (113,700 ha) (BCD data package). Therefore, the project may impact less than 0.02% of the species' extent of occurrence, as it is unknown if the potential habitat intersects with the known EOO for the species. The area of occupancy (AOO) was estimated to be 124 $km^{2,}$ (12,400 ha) therefore the project may impact up to 0.14 % of the AOO for the species, as it is unknown if the potential habitat intersects with the known AOO for the species. The project would impact on 16.00 ha (5%) of the 297.52 ha of potential habitat for the species within the project footprint. The project would impact some habitat, but no individuals of the species is likely to be directly impacted in areas where

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Caladenia concolor*	*Caladenia tessellata* Thick Lip Spider Orchid
databases or documented field observations) the habitat area required to support the remaining population, and habitat available within dispersal distance, and distance over which genetic exchange can occur (eg seed dispersal) and pollination distance for the species ▪ to determine changes in threats affecting remaining subpopulations and habitat if the proposed impact proceeds, estimate changes in environmental factors including changes to fire regimes (frequency, severity); hydrology, pollutants; species interactions (increased competition and effects on pollinators or dispersal); fragmentation, increased edge effects, likelihood of disturbance; and disease, pathogens and parasites. Where these factors have been considered elsewhere in relation to the target species, the assessor may refer to the relevant sections of the BDAR or BCAR.	not adequately surveyed, species presence has been assumed. As such, the number of individuals cannot be quantified. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. Therefore, if the species is present, the project would not create a barrier to dispersal of the species. The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence. If the species is present, individuals in the project footprint may be affected by changes to fire regimes in surrounding vegetation as a result of management for asset protection, increased edge effects, altered hydrology due to drainage lines within the project footprint, off-road vehicle activities (access tracks).	targeted surveys were undertaken as the species was not detected. In areas that comprise the species polygon that were not adequately surveyed, species presence has been assumed. As such, the number of individuals cannot be quantified. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. Therefore, if the species is present the project would not create a barrier to dispersal of the species. The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence in inaccessible suitable habitat. If the species is present, individuals in the project footprint may be affected by changes to fire regimes in surrounding vegetation as a result of management for asset protection, increased edge effects, altered hydrology due to drainage lines within the project footprint, off-road vehicle activities (access tracks).
5. The assessor may also provide new information that can be used to demonstrate that the principle identifying the species as at risk of an SAII, is inaccurate.	Not applicable.	Not applicable.
Likely SAII assessment outcome against relevant principles.	*Caladenia concolor* has been assumed present over a portion of the project footprint due to survey limitations. The species has a low likelihood of occurrence. Known populations are limited to a property near Bethungra and within Burrinjuck Nature Reserve. Requires woodland with a high diversity of plant species. Therefore, the project is unlikely to be deemed a significant risk to the species becoming extinct due to either causing a further decline of the species that is currently observed, estimated, inferred or reasonably suspected to be in a rapid rate of decline or due to an impact on the habitat of the	*Caladenia tessellata* has been assumed present over a portion of the project footprint due to survey limitations. No known populations occur within proximity to the project footprint and the species likelihood of occurrence is considered low. Therefore, the project is unlikely to be deemed a significant risk to the species becoming extinct due to either causing a further decline of the species that is currently observed, estimated, inferred or reasonably suspected to be in a rapid rate of decline or due to an impact on the habitat of the species that is currently observed, estimated, inferred or

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Caladenia concolor*	*Caladenia tessellata* Thick Lip Spider Orchid
	species that is currently observed, estimated, inferred or reasonably suspected to have a very limited geographic distribution.	reasonably suspected to have a very limited geographic distribution.

3.1.3 Calotis glandulosa and Diuris ochroma

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	***Calotis glandulosa* Mauve Burr-daisy**	***Diuris ochroma* Pale Golden Moths**
Impact summary	The project would result in direct impacts to a total of 16.00 ha of Mauve Burr-daisy habitat (assumed presence), the majority (99%) of which is in high condition. Potential indirect impacts to the species include: • Transport of weeds and pathogens from the site to adjacent vegetation. • Trampling of threatened flora species. • Changed fire regimes.	The project would result in direct impacts to a total of 0.25 ha of Pale Golden Moths habitat (assumed presence), in high condition. Potential indirect impacts to the species include: • Transport of weeds and pathogens from the site to adjacent vegetation. • Trampling of threatened flora species. • Changed fire regimes.
1. The assessor is required to provide further information in the BDAR or BCAR for any species at risk of an SAII, including the action and measures taken to avoid the direct and indirect impact on the species at risk of an SAII. Where these have been addressed elsewhere the assessor can refer to the relevant sections of the BDAR or BCAR.	*Calotis glandulosa* is found in montane and subalpine grasslands in the Australian Alps. The species is known to occur at three sites in the upper Shoalhaven catchment. The species is assumed present within potential habitats within the project footprint but has not been directly recorded. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened flora include: • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1). • Further avoidance and minimisation of impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying the extent of habitats, their existing condition and certainty levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed threatened flora habitats as no-go zones during the construction phase (EMM B23).	*Diuris Ochroma* is occurs in south-eastern NSW on the sub-alpine plains of Kosciuszko National Park and the Kybean area. The species is found in grassland and sub-alpine open woodland above 900 m in altitude, on brown loam over shale, with scattered trees of *Eucalyptus pauciflora* (Snow Gum) and *Eucalyptus viminalis* (Manna Gum) (DPE 2005). The species is assumed present within potential habitats within the project footprint but has not been directly recorded. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened flora include: • Design refinements to avoid impacts where practicable (B32) • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1). • Further avoidance and minimisation of impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying the extent of habitats, their existing condition and certainty levels regarding species occurrence where assumed

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Calotis glandulosa* Mauve Burr-daisy	*Diuris ochroma* Pale Golden Moths
	• Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of temporarily disturbed areas within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with pathogens, pests and weeds (EMM B19).	present (ie likely/ unlikely to occur subject to further survey). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed threatened flora habitats as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of temporarily disturbed areas within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with pathogens, pests and weeds (EMM B19).
2. The assessor must consult the TBDC and/or other sources to report on the current population of the species including:		
• evidence of rapid decline (Principle 1, clause 6.7(2)(a) BC Regulation) presented by an estimate of the: ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer), or ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer) as indicated by: an index of abundance appropriate to the species;	***Principle 1 SAII = Yes*** Long term population data for this species in NSW is not available. *Calotis glandulosa* are ascending or erect branched perennials (Davis 1952), however generation length is unknown. Therefore, the decline in population of the species in NSW in the past 10 years or three generations has not been estimated. The decline in the population of the species in NSW in the last 10 years cannot be assessed at this time because the species information available in BioNet and other reliable/peer	***Principle 1 SAII = No:*** In NSW, this species is restricted to a single population in the Kybeyan area, Monaro Tableland (DPE 2005). Approximately 70 mature individuals were recorded at the site during targeted surveys of the Kybeyan area in December 2003 (Miles & McPherson 2004 cited in DPE 2005). In 2008, this population contained an estimated 130 mature individuals (TSSC 2016). However, searches of other two previously known reliable locations in Kosciuszko National Park, as well as suitable

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Calotis glandulosa* Mauve Burr-daisy	*Diuris ochroma* Pale Golden Moths
decline in geographic distribution and/or habitat quality; exploitation; effect of introduced species, hybridisation, pathogens, pollutants, competitors or parasites	reviewed information about the species is limited and does not address this aspect. The decline in population of the species in NSW in the past 10 years or three generations based on the listed threats has not been estimated. However, this species faces many threats which are likely to have contributed to its low population, including habitat degradation by development and agriculture, invasion of exotic weeds, and grazing by domestic stock and population loss by feral pigs (TSSC 2008, DPIE 2021d).	habitat elsewhere within the district were not successful in 30 years as of 2008, indicating a declining population of the species in NSW over that period (NSW Scientific Committee 2005, 2008 as cited in TSSC 2016). Populations of this species have reduced and occur in severely fragmented ecosystems (Coates et al., 2002). The *Diuris ochroma* is a herbaceous perennial geophyte that dies back annually to one or two oblong underground tubers (TSSC 2016), however the generation length is not stated. The decline in the population of the species in NSW in the last 10 years cannot be assessed at this time because there is insufficient long term population data for this species in NSW and generation length is unknown. The decline in population of the species in NSW in the past 10 years or three generations based on the listed threats has not been estimated. Decline in geographic distribution and/or habitat quality is likely to be a factor for this species as a result the threats of grazing and trampling (pigs), weed invasion, habitat loss and degradation (vegetation clearing for agricultural purposes, development, road/track works), restricted distribution (only known in one location in NSW) and poor recruitment (TSSC 2016).
• Evidence of small population size (Principle 2, clause 6.7(2)(b) BC Regulation) presented by: ▪ an estimate of the species' current population size in NSW, and ▪ an estimate of the decline in the species' population size in NSW in three years or one generation (whichever is longer), and ▪ where such data is available, an estimate of the number of mature individuals in each subpopulation, or the percentage of mature individuals in each subpopulation, or whether the species is likely to undergo extreme fluctuations	***Principle 2 SAII = No*** Population data for this species is available from four key sites NSW. In 2020-21 the number of individuals was; <1,500 at Back Creek Travelling Stock Reserve (TSR), <2,000 at Bibbenluke Common, approximately 300 at Nungar Plain and approximately 500 at Lake Eucumbene sites (DPIE 2021d). Population data for this species is available from four key sites in NSW from 2017-18 to 2020-21. Management actions, as well as higher than average winter rainfall in 2020, have helped this species recover at three priority management sites (DPIE 2021d). The number of individuals recorded is as follows:	***Principle 2 SAII = Yes*** In NSW, this species is confined to a single population containing 130 plants in the Kybeyan area (TSSC 2016). This suggests the species fragility. The most recent population records are from 2003 and 2008. Therefore, there is insufficient data to estimate the decline in the species' population size in NSW in three years or one generation. In NSW, no estimates are available on the number of mature individuals. Approximately 130 individuals were recorded in the single Kybeyan area population. The amount of mature individuals is not given.

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Calotis glandulosa* Mauve Burr-daisy	*Diuris ochroma* Pale Golden Moths
	Increased from <500 in 2017-18 to <1,500 in 2020-21 at Back Creek TSR (DPIE 2021d). Increased from approximately 200 in 2018-19 to <2,000 in 2020-21 at Bibbenluke Common (DPIE 2021d). Increased from approximately 300 in 2018-19 to approximately 200 in 2020-21. The Nungar Plain site was burnt by the 2019–20 fires, but the population has recovered to almost pre-fire levels (DPIE 2021d). Increased from approximately 200 in 2018-19 to approximately 500 in 2020-21 at Lake Eucumbene sites (DPIE 2021d). This species is endemic to NSW and is generally known from montane and subalpine grasslands in the Monaro and Kosciuszko regions (TSSC 2008). In NSW, no estimates are currently available on the number of mature individuals. Therefore, estimates of the number of mature individuals in each subpopulation have not been provided. There is insufficient data to determine whether the species population size would be likely to undergo extreme fluctuations.	
• evidence of limited geographic range for the threatened species (Principle 3, clause 6.7(2)(c) BC Regulation) presented by: ▪ extent of occurrence ▪ area of occupancy ▪ number of threat-defined locations (geographically or ecologically distinct areas in which a single threatening event may rapidly affect all species occurrences), and ▪ whether the species' population is likely to undergo extreme fluctuations	***Principle 3 SAII = No:*** Extent of Occurrence:73,935.733 km^2 (BCD data package) Area of Occupancy: 440 km^2 (BCD data package) Number of threat-defined locations: There is insufficient data to determine the number of threat-defined locations for this species. This species is generally known from subalpine grassland and montane or natural temperate grassland dominated by *Themeda australis (*Kangaroo Grass) and *Eucalyptus pauciflora (Snow Gum*) Woodlands on the Monaro and Shoalhaven area (TSSC 2008). This species faces many threats and does not persist in heavily-grazed pastures of the Monaro or the Shoalhaven area, suggesting that grazing may have led to a decline in abundance throughout its range (Benson 1994 cited in TSSC 2008).	***Principle 3 SAII = Yes:*** Extent of Occurrence (ha) = 55,361.495 km^2 Area of Occupancy (ha) = 60.000 km^2 Extent of occurrence: The data package provided by BCD lists the extent of occurrence of this species in NSW is 55,361.495 km^2 .The size and area inhabited by the existing population of *Diuris ochroma* is limited in geographic range. The single known population in NSW is in an area of less than 4 km^2 in size (NSW Scientific Committee 2008 as cited in TSSC 2016). Area of Occupancy: The data package provided by BCD lists the Area of Occupancy for this species is approximately 60 km^2. No Threat-defined locations = <= 3 locations. Vegetation associations at known sites are typically subalpine open

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Calotis glandulosa* Mauve Burr-daisy	*Diuris ochroma* Pale Golden Moths
	Extreme fluctuations: There is insufficient data to determine whether the species population size would be likely to undergo extreme natural fluctuations.	woodland above 900m in altitude (TSSC, 2016). The current distribution of this species is known, further identification of threat-defined locations is unlikely to occur. However, any potentially suitable habitat ought to be considered a threat defined location within proximity to the known population. There is insufficient data to determine whether the species population size would be likely to undergo extreme natural fluctuations. Demographic stochasticity is likely to be a factor for this species due to its small population size (Miles & McPherson 2004 as cited in TSSC 2016).
• evidence that the species is unlikely to respond to management (Principle 4, clause 6.7(2)(d) BC Regulation) because: ▪ known reproductive characteristics severely limit the ability to increase the existing population on, or occupy new habitat (eg species is clonal) on, a biodiversity stewardship site ▪ the species is reliant on abiotic habitats which cannot be restored or replaced (eg karst systems) on a biodiversity stewardship site, or ▪ life history traits and/or ecology is known but the ability to control key threatening processes at a biodiversity stewardship site is currently negligible (eg frogs severely impacted by chytrid fungus).	***Principle 4 SAII = No:*** This species has no known reproductive characteristics that could severely limit the ability to occupy new habitat on a biodiversity stewardship site (TSSC 2008). This species is generally known from montane and subalpine grasslands in the Monaro and Kosciuszko regions as well as the Shoalhaven catchment (TSSC 2008). The species does not appear to be reliant on abiotic habitats which cannot be restored or replaced on a biodiversity stewardship site. More precise information on ecological requirements is a research priority (TSSC 2008) and, presumably, information on life history. The species has a moderate sensitivity to gain dependent on the effectiveness of management to control threats (DPE 2022). Key threatening processes can be reasonably controlled within a biodiversity stewardship site (eg habitat degradation/loss by development, trampling and grazing by domestic stock or feral pest species and population loss by feral pigs), therefore this species is expected to be responsive to management.	***Principle 4 SAII = No:*** The species has no known reproductive characteristics that could severely limit the ability to increase the existing population. The species may require open herbaceous vegetation maintained by regular burning (DSE 2003 cited in TSSC, 2016). Pollination of *Diuris* spp. is mainly by small native bees attracted to the bright floral colours. Variations in seasonal climatic conditions, most notably rainfall and temperature influence flowering, which in turn could influence pollination (TSSC 2016). The species has a moderate sensitivity to gain dependent on the effectiveness of management to control threats. There is no known critical habitat for this species (DPIE 2022). The life-history traits and ecology of *Diurus ochroma* is known. Key threatening processes can reasonably be controlled within a biodiversity stewardship site (eg habitat degradation/loss by development, trampling and grazing by domestic stock or feral pest species, population loss by feral pigs), therefore this species is expected to be responsive to management.
3. Where the TBDC indicates data is 'unknown' or 'data deficient' for a species for a criterion listed in Subsection 9.1.2(2.), the assessor must record this in the BDAR or BCAR.	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this species for a criterion listed in Subsection 9.1.1(2.).	Some of the questions in this consideration of SAII cannot be assessed at this time because:

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Calotis glandulosa* Mauve Burr-daisy	*Diuris ochroma* Pale Golden Moths
	Some responses in this consideration of SAII cannot be completed comprehensively due to the following: • The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited • A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. • As such, we have noted the knowledge gaps in the TBDC and provided responses using information from the limited available sources.	• The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited • A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. • As such, we have noted the knowledge gaps in the TBDC and provided responses using information we have readily available.
4. In relation to the impacts from the proposal on the species at risk of an SAII, the assessor must include data and information on:		
• the impact on the species' population (Principles 1 and 2) presented by: ▪ an estimate of the number of individuals (mature and immature) present in the subpopulation on the subject land (the site may intersect or encompass the subpopulation) and as a percentage of the total NSW population, and ▪ an estimate of the number of individuals (mature and immature) to be impacted by the proposal and as a percentage of the total NSW population, or ▪ if the species' unit of measure is area, provide data on the number of individuals on the site, and the estimated number that will be impacted, along with the area of habitat to be impacted by the proposal	It is not possible to determine how many individuals comprise the sub-population on the site from the available data. Suitable habitat for *Calotis glandulosa* was detected within the project footprint within the Bondo and Snowy Mountains IBRA Subregions. Targeted flora surveys undertaken in areas of suitable habitat within the project footprint did not locate the species. Where survey effort was not adequate, species presence has been assumed within suitable habitat. There are no BioNet records within 20 km of the project footprint (DPE 2022). As such, a percentage of the total population present in the subpopulation on the project footprint cannot be attained. Given the species was not recorded and is only assumed present in inaccessible areas, and the limited information available on the total population of the species, it is not possible to determine the number of individuals (mature and immature) to be impacted by the project and as a percentage of the total NSW population. The species unit of measure is area. The species was not recorded within the project footprint despite targeted surveys in accessible land. Some areas of potential suitable habitat	It is not possible to determine how many individuals comprise the sub-population on the site from the available data. Suitable habitat for *Diuris ochroma* was detected within the project footprint within the Snowy Mountains IBRA Subregion. Targeted flora surveys undertaken in areas of suitable habitat within the project footprint did not locate the species, as such a percentage present in the subpopulation of the total population cannot be attained. There are no BioNet records within 20 km of the project footprint (DPE 2022). Where survey effort was not adequate, species presence has been assumed within potential habitat based on associated PCTs and other available desktop data including vegetation condition. In NSW, this species is confined to a single population, in 2008, this population contained an estimated 130 mature individuals in the Kybeyan area (TSSC 2016). Given the species was not recorded and is only assumed present in inaccessible areas, and the limited information available on the total population of the species, it is not possible to determine the number of individuals (mature and

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Calotis glandulosa* Mauve Burr-daisy	*Diuris ochroma* Pale Golden Moths
	within the project footprint was inaccessible for surveys, therefore the species has been assumed present in these areas. The total area of this species habitat to be directly impacted by the project is 16.00 ha. However, given that this species was not recorded on the site during targeted surveys, there are no nearby records within 20 km of the site and similar habitat in the surrounding landscape would be retained, it is unlikely that the project would impact the local population for this species.	immature) to be impacted by the project and as a percentage of the total NSW population. The species unit of measure is area. The species was not located within the project footprint despite targeted surveys in accessible land. Where survey effort was not adequate, species presence has been assumed within potential habitat. The total area of this species habitat to be directly impacted by the project is 0.25 ha.
• impact on geographic range (Principles 1 and 3) presented by: ▪ the area of the species' geographic range to be impacted by the proposal in hectares, and a percentage of the total area of occupancy or extent of occupancy within NSW ▪ the impact on the subpopulation as either: all individuals will be impacted (subpopulation eliminated); OR impact will affect some individuals and habitat; OR impact will affect some habitat, but no individuals of the species will be directly impacted ▪ to determine if the persisting subpopulation that is fragmented will remain viable, estimate (based on published and unpublished sources such as scientific publications, technical reports, databases or documented field observations) the habitat area required to support the remaining population, and habitat available within dispersal distance, and distance over which genetic exchange can occur (eg seed dispersal) and pollination distance for the species ▪ to determine changes in threats affecting remaining subpopulations and habitat if the proposed impact proceeds, estimate changes in	The project footprint comprises 104.34 ha of suitable habitat, of this the project would impact on 16.00 ha (15%). The extent of occurrence (EOO) was estimated to be 73,935.733 km^2 (7,393,573.3 ha). Therefore, the project may impact less than 0.0004% of the species' extent of occurrence. The area of occupancy (AOO) was estimated to be 440 $km^{2,}$ (44,000 ha) therefore the project may impact up to 0.06 % of the AOO for the species. The project would impact 16.00 ha of suitable habitat for this species within the project footprint. The project would impact some habitat, but no individuals of the species is likely to be directly impacted in areas where targeted surveys were undertaken as the species was not detected. In areas that comprise the species polygon for which adequate survey effort was not achieved, species presence has been assumed. As such, the number of individuals cannot be quantified. Given that the species was not recorded on the site and there are no nearby records within 20 km of the site, the species is not likely to be fragmented by the project. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. Therefore, if the species is present the project would not create a barrier to dispersal of the species.	The project footprint comprises 8.83 ha of potential habitat, 0.25 ha (3%) of this would be impacted by the project. The extent of occurrence (EOO) was estimated to be 55,361.495 km^2 (5,536,149.5 ha) (BCD data package). Therefore, the project would impact 0.000005% of this species' extent of occurrence. The area of occupancy (AOO) was estimated to be 60 $km^{2,}$ (6,000 ha) therefore the project would impact 0.004 % of the AOO for the species. The project would impact on 0.25 ha (3%) of the 8.83 ha of potential habitat for the species within the project footprint. The project would impact some habitat, but no individuals of the species is likely to be directly impacted in areas where targeted surveys were undertaken as the species was not detected. In areas that comprise the species polygon that were not adequately surveyed, species presence has been assumed. As such, the number of individuals cannot be quantified. If the species is present, individuals in the project footprint may be affected by changes to fire regimes, increased edge effects, disturbance from vegetation removal and maintenance within the clearing footprint. The project would impact on 0.25 ha of potential habitat for the species in the form of associated PCTs within the project footprint. However, the species was not recorded on the site and there are no nearby records within 20 km of the site,

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Calotis glandulosa* Mauve Burr-daisy	*Diuris ochroma* Pale Golden Moths
environmental factors including changes to fire regimes (frequency, severity); hydrology, pollutants; species interactions (increased competition and effects on pollinators or dispersal); fragmentation, increased edge effects, likelihood of disturbance; and disease, pathogens and parasites. Where these factors have been considered elsewhere in relation to the target species, the assessor may refer to the relevant sections of the BDAR or BCAR.	The project is not likely to increase any of the above listed threats to the species because there are no nearby records of this species within 20 km of the project footprint. The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence in inaccessible suitable habitat. If the species is present, individuals in the project footprint may be affected by changes to fire regimes, increased edge effects, disturbance from vegetation removal and maintenance within the clearing footprint.	therefore the species is not likely to be fragmented by the project. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. Therefore, the project would not create a barrier to dispersal of the species.
5. The assessor may also provide new information that can be used to demonstrate that the principle identifying the species as at risk of an SAII, is inaccurate.	Not applicable.	Not applicable.
Likely SAII assessment outcome against relevant principles.	*Calotis glandulosa* has been assumed present over 16.00 ha of the project footprint due to survey limitations. The species is known from three sites in the upper Shoalhaven catchment. Whilst it is a coloniser of disturbed lands it does not tolerate heavy grazing. The species has a low likelihood of occurring within the project footprint. Therefore, the project is unlikely to be deemed a significant risk to the species becoming extinct due to causing a further decline of the species that is currently observed, estimated, inferred or reasonably suspected to be in a rapid rate of decline.	*Diuris ochroma* has been assumed present over 0.25 ha of the project footprint due to survey limitations. Known populations of the species are limited to Kosciuszko National Park and the Kybean area in NSW. The species has a low likelihood of occurring within the project footprint. Therefore, the project is unlikely to be deemed a significant risk to the species becoming extinct due to either further reducing the population size of the species that is currently observed, estimated, inferred or reasonably suspected to have a very small population size, or due to an impact on the habitat of the species that is currently observed, estimated, inferred or reasonably suspected to have a very limited geographic distribution.

3.1.4 Eucalyptus alligatrix subsp. alligatrix and Eucalyptus robertsonii subsp. hemisphaerica

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	***Eucalyptus alligatrix subsp. alligatrix***	***Eucalyptus robertsonii subsp. hemisphaerica* Robertson's Peppermint**
Impact summary	The project would result in direct impacts to a total of 1.14 ha of *Eucalyptus alligatrix* subsp. *alligatrix* habitat (assumed presence), all of which is in moderate to high condition. Potential indirect impacts to the species include: • Transport of weeds and pathogens from the site to adjacent vegetation. • Trampling of threatened flora species. • Changed fire regimes.	The project would result in direct impacts to a total of 0.29 ha of Robertson's Peppermint habitat (assumed presence), all of which is in moderate condition. Potential indirect impacts to the species include: • Transport of weeds and pathogens from the site to adjacent vegetation. • Trampling of threatened flora species. • Changed fire regimes.
1. The assessor is required to provide further information in the BDAR or BCAR for any species at risk of an SAII, including the action and measures taken to avoid the direct and indirect impact on the species at risk of an SAII. Where these have been addressed elsewhere the assessor can refer to the relevant sections of the BDAR or BCAR.	*Eucalyptus alligatrix* subsp. *alligatrix* has been identified in NSW as a single population in Rylstone in Mid-Western Regional LGA (DPE 2015b). The species' habitat comprises of dry sclerophyll woodland on shallow relatively infertile soils (grey brown loam with ironstone). The species is assumed present within potential habitats within the project footprint but has not been directly recorded. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened flora include: • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1). • Further avoidance and minimisation of impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying the extent of habitats, their existing condition and certainty levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed threatened flora habitats as no-go zones during the construction phase (EMM B23).	*Eucalyptus robertsonii* subsp. *hemisphaerica* is known only from the central tablelands of NSW, at small disjunct localities from north of Orange to Burraga. The species' habitat is found in closed grassy woodland in locally sheltered sites. Is found on lighter soils, often on granite or quartzite, with low to medium nutrients (TSSC 2012b). The species is assumed present within potential habitats within the project footprint but has not been directly recorded. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened flora include: • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1). • Further avoidance and minimisation of impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying the extent of habitats, their existing condition and certainty levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed threatened flora habitats as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing,

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Eucalyptus alligatrix subsp. alligatrix*	*Eucalyptus robertsonii subsp. hemisphaerica* Robertson's Peppermint
	• Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of temporarily disturbed areas within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with pathogens, pests and weeds (EMM B19).	construction management and post-construction rehabilitation of temporarily disturbed areas within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with pathogens, pests and weeds (EMM B19).
2. The assessor must consult the TBDC and/or other sources to report on the current population of the species including:		
• evidence of rapid decline (Principle 1, clause 6.7(2)(a) BC Regulation) presented by an estimate of the: ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer), or ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer) as indicated by: an index of abundance appropriate to the species; decline in geographic	***Principle 1 SAII = No*** DPE has not determined that this species is at risk of SAII due to Principle 1 – rapid decline (DPE 2022). There is no data available on the decline in population of the species in the past 10 years or three generations. There is no data available on the decline in population of the species in the past 10 years or three generations as indicated by: an index of abundance appropriate to the species; decline in geographic distribution and/or habitat quality; exploitation; effect of introduced species, hybridisation, pathogens, pollutants, competitors or parasites. Key threats to the species (DPE 2022) include:	***Principle 1 SAII = No*** DPE has not determined that this species is at risk of SAII due to Principle 1 – rapid decline (DPE 2022). There is no data available on the decline in population of the species in the past 10 years or three generations. There is no data available on the decline in population of the species in the past 10 years or three generations as indicated by: an index of abundance appropriate to the species; decline in geographic distribution and/or habitat quality; exploitation; effect of introduced species, hybridisation, pathogens, pollutants, competitors or parasites. Key threats to the species (DPE 2022) include:

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Eucalyptus alligatrix subsp. alligatrix*	*Eucalyptus robertsonii subsp. hemisphaerica* Robertson's Peppermint
distribution and/or habitat quality; exploitation; effect of introduced species, hybridisation, pathogens, pollutants, competitors or parasites	• Habitat loss: Vegetation clearing for agricultural purposes: Historic clearing and modification for land use • Overgrazing: domestic stock may affect regeneration • Demographic threats: Restricted distribution; small population size • Land management practices: uncertainty of future land management practices: potential for change in land use such as coal mining, subdivision or changed grazing practices • Pest animal: Rabbits: Suppression of regeneration.	• Land management practices: Uncertainty of future land management practices: Clearing and land use related impacts, including forestry, grazing and road maintenance activities • Demographic threats: Poor recruitment: Senescence and lack of regeneration, especially as older even-aged stands die off with no recruitment of juveniles in presence of other threats; Restricted distribution: Restricted distribution and low abundance of local populations render the species vulnerable to extinction from stochastic events • Lack of knowledge: Insufficient understanding of species' phylogeny; Insufficient understanding of distribution and/or abundance; Insufficient understanding of threatening process
• evidence of small population size (Principle 2, clause 6.7(2)(b) BC Regulation) presented by: ▪ an estimate of the species' current population size in NSW, and ▪ an estimate of the decline in the species' population size in NSW in three years or one generation (whichever is longer), and ▪ where such data is available, an estimate of the number of mature individuals in each subpopulation, or the percentage of mature individuals in each subpopulation, or whether the species is likely to undergo extreme fluctuations	***Principle 2 SAII = No*** DPE have not determined that this species is at risk of SAII due to Principle 2 – small population size (DPE 2022). DPE (2015b) estimates the current population size as < 1000 individuals. An annual report from Save Our Species indicates that over a four-year period, the population was relatively stable with 100% juvenile survival, however, several mature trees were lost to drought (DPE 2015b). There is no data available on the estimate of mature individuals in the population.	***Principle 2 SAII = Yes*** DPE have determined that this species is at risk of SAII due to Principle 2 – small population size (DPE 2022). DPE (2022) estimates current population in NSW as < 50 or <250 individuals. TSSC (2012b) indicates there are 15 known point records. There is insufficient data to determine an estimate of a decline in the population over the last three years or one generation. There is no data available on the estimate of mature individuals in the population.
• evidence of limited geographic range for the threatened species	***Principle 3 SAII = Yes*** *Extent of Occurrence (ha) = 0.069 km^2*	***Principle 3 SAII = Yes***

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Eucalyptus alligatrix subsp. alligatrix*	*Eucalyptus robertsonii subsp. hemisphaerica* Robertson's Peppermint
(Principle 3, clause 6.7(2)I BC Regulation) presented by: ▪ extent of occurrence ▪ area of occupancy ▪ number of threat-defined locations (geographically or ecologically distinct areas in which a single threatening event may rapidly affect all species occurrences), and ▪ whether the species' population is likely to undergo extreme fluctuations	*Area of Occupancy (ha) = 4.000 km^2* DPE have determined that this species is at risk of SAII due to Principle 3 – limited geographic range (DPE 2022). Extent of occurrence: The data package provided by BCD lists the extent of occurrence of this species in NSW as 0.069 km^2 . The species has been identified in NSW as a single population in Rylstone in Mid-Western Regional LGA (DPE 2015b) and is limited in geographic range. Area of Occupancy: The data package provided by BCD lists the Area of Occupancy for this species is approximately 4 km^2.The species population in Rylstone covers an area of approximately 266 ha (DPE 2015b). There is a single threat-defined location in Rylstone, NSW. A single threatening event may rapidly affect all species occurrence (DPE 2015b). There is no information/evidence of this species experiencing extreme fluctuations in population size or habitat.	DPE have determined that this species is at risk of SAII due to Principle 3 – limited geographic range (DPE 2022). There is no data available on the calculated extent of occurrence (EOO). There is no data available on the calculated Area of occurrence (AOO). The species distribution exists at a limited location and is projected to decline in area of occupancy and number of mature individuals as a result of clearing (TSSC 2012b). There is no information/evidence of this species experiencing extreme fluctuations in population size or habitat.
• evidence that the species is unlikely to respond to management (Principle 4, clause 6.7(2)(d) BC Regulation) because: ▪ known reproductive characteristics severely limit the ability to increase the existing population on, or occupy new habitat (eg species is clonal) on, a biodiversity stewardship site ▪ the species is reliant on abiotic habitats which cannot be restored or replaced (eg karst	***Principle 4 SAII = No*** DPE have not determined that this species is at risk of SAII due to Principle 4 – unlikely to respond to management (DPE 2022). This species has no known characteristics that could severely limit its ability to increase on a biodiversity stewardship site. The habitat for *E. alligatrix* subsp. *alligatrix* comprises of dry sclerophyll woodland on shallow relatively infertile soils (grey-brown loam with ironstone). At present, no critical habitat has been identified or declared. The ability to control key threats at a biodiversity stewardship site is thought to be possible. The species has a high sensitivity to gain (DPE 2022). The removal of feral animals through fencing and control	***Principle 4 SAII = No*** DPE have not determined that this species is at risk of SAII due to Principle 4 – unlikely to respond to management (DPE 2022). This species has no known characteristics that could severely limit its ability to increase on a biodiversity stewardship site. The habitat for *E.robertsonii* subsp. *hemisphaerica* is found in closed grassy woodland in locally sheltered sites. is found on lighter soils, often on granite or quartzite, with low to medium nutrients (TSSC 2012b). At present, no critical habitat has been identified or declared. The ability to control key threats at a biodiversity stewardship site is thought to be possible. The species has a high sensitivity to gain (DPE 2022). To mitigate habitat loss and poor land management would be fulfilled by conserving a stewardship site.

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Eucalyptus alligatrix subsp. alligatrix*	*Eucalyptus robertsonii subsp. hemisphaerica* Robertson's Peppermint
systems) on a biodiversity stewardship site, or ▪ life history traits and/or ecology is known but the ability to control key threatening processes at a biodiversity stewardship site is currently negligible (eg frogs severely impacted by chytrid fungus).	programs is achievable. To mitigate habitat loss and poor land management would be fulfilled by conserving a stewardship site.	
3. Where the TBDC indicates data is 'unknown' or 'data deficient' for a species for a criterion listed in Subsection 9.1.2(2.), the assessor must record this in the BDAR or BCAR.	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this species for a criterion listed in Subsection 9.1.1(2.). Some responses in this consideration of SAII cannot be completed comprehensively due to the following: The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited. A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. As such, we have noted the knowledge gaps in the TBDC and provided responses using information from the limited available sources.	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this species for a criterion listed in Subsection 9.1.1(2.). Some responses in this consideration of SAII cannot be completed comprehensively due to the following: The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited. A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. As such, we have noted the knowledge gaps in the TBDC and provided responses using information from the limited available sources.
4. In relation to the impacts from the proposal on the species at risk of an SAII, the assessor must include data and information on:		
• the impact on the species' population (Principles 1 and 2) presented by: ▪ an estimate of the number of individuals (mature and immature) present in the subpopulation on the subject land (the site may intersect or encompass the subpopulation)	Suitable habitat for *Eucalyptus alligatrix subsp. alligatrix* was detected within the project footprint within PCTs 287 and 290 in the Inland Slopes IBRA subregion. Targeted flora surveys within the project footprint did not locate the species. Where survey effort was not adequate, species presence has been assumed within suitable habitat. There are no records within 20 km of the project (DPE 2022). As such, a percentage of the total population present in the subpopulation on the project footprint cannot be attained. Given the species was not recorded and is only assumed present, and the	Suitable habitat for *Eucalyptus robertsonii subsp. hemispharica* was detected within the project footprint within PCTs 352 and 727 in the Crookwell and Inland Slopes IBRA subregions. Targeted flora surveys within the project footprint did not locate the species. Where survey effort was not adequate, species presence has been assumed within suitable habitat. There are no records within 20 km of the project (DPE 2022). As such, a percentage of the total population present in the subpopulation on the project footprint cannot be attained. Given the species was not recorded and is only assumed present, and the limited

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Eucalyptus alligatrix subsp. alligatrix*	*Eucalyptus robertsonii subsp. hemisphaerica* Robertson's Peppermint
and as a percentage of the total NSW population, and ▪ an estimate of the number of individuals (mature and immature) to be impacted by the proposal and as a percentage of the total NSW population, or ▪ if the species' unit of measure is area, provide data on the number of individuals on the site, and the estimated number that will be impacted, along with the area of habitat to be impacted by the proposal	limited information available on the total population of the species, it is not possible to determine the number of individuals (mature and immature) that would be impacted by the project and as a percentage of the total NSW population. As above, the total population in NSW is unknown, as such a percentage to be impacted of the total population cannot be determined. The project would result in the direct impact to 1.14 ha of potential habitat for *Eucalyptus alligatrix subsp. alligatrix*. The species unit of measure is count. The species was not located within the project footprint despite targeted surveys in accessible land. Where survey effort was not adequate, species presence has been assumed within suitable habitat. The total area of this species habitat that would be impacted by the project is 1.14 ha.	information available on the total population of the species, it is not possible to determine the number of individuals (mature and immature) that would be impacted by the project and as a percentage of the total NSW population. As above, the total population in NSW is unknown, as such a percentage to be impacted of the total population cannot be determined. The project would result in the direct impact to 0.29 ha of potential habitat for *Eucalyptus robertsonii subsp. Hemispharica* in the Crookwell IBRA subregion. The species unit of measure is count. The species was not located within the project footprint despite targeted surveys in accessible land. Where survey effort was not adequate, species presence has been assumed within suitable habitat. The total area of this species habitat that would be impacted by the project is 0.29 ha in the Crookwell IBRA region.
• impact on geographic range (Principles 1 and 3) presented by: ▪ the area of the species' geographic range to be impacted by the proposal in hectares, and a percentage of the total area of occupancy or extent of occupancy within NSW ▪ the impact on the subpopulation as either: all individuals will be impacted (subpopulation eliminated); OR impact will affect some individuals and habitat; OR impact will affect some habitat, but no individuals of the species will be directly impacted	The project footprint comprises of 52.86 ha of potential habitat for the species, 1.14 ha (2%) of which would be impacted by the project. The extent of occurrence (EOO) was estimated to be 0.069 km^2 (69 ha). Therefore, the project would impact less than 2.8% of the species' extent of occurrence. The area of occupancy (AOO) was estimated to be 4 $km^{2,}$ (400 ha), therefore the project would impact 0.5 % of the AOO for the species. The project would impact on 1.14 ha (2%) of the 52.86 ha of potential habitat for the species within the project footprint. The project would impact some habitat, but no individuals of the species is likely to be directly impacted in areas where targeted surveys were undertaken as the species was not detected. In areas that comprise the species polygon that could not be adequately surveyed, species presence has been assumed. As such, the number of individuals cannot be quantified. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely	The project footprint comprises of 12.96 ha (5.87 ha in Crookwell and 7.09 ha in Inland Slopes) of potential habitat for the species, 0.29 ha (2%) of which would be impacted by the project, wholly within the Crookwell IBRA subregion. However, percentages of extents and areas of occupancy and percentages cannot be accurately determined as there is insufficient or inconsistent data available for this species. The project would impact on 0.29 ha (2%) of the 12.96 ha of potential habitat for the species within the project footprint. The project would impact some habitat, but no individuals of the species is likely to be directly impacted in areas where targeted surveys were undertaken as the species was not detected. In areas that comprise the species polygon that could not be adequately surveyed, species presence has been assumed. As such, the number of individuals cannot be quantified. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. Therefore, the project would not create a barrier to dispersal of the species. The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence. If the species is

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Eucalyptus alligatrix subsp. alligatrix*	*Eucalyptus robertsonii subsp. hemisphaerica* Robertson's Peppermint
▪ to determine if the persisting subpopulation that is fragmented will remain viable, estimate (based on published and unpublished sources such as scientific publications, technical reports, databases or documented field observations) the habitat area required to support the remaining population, and habitat available within dispersal distance, and distance over which genetic exchange can occur (eg seed dispersal) and pollination distance for the species ▪ To determine changes in threats affecting remaining subpopulations and habitat if the proposed impact proceeds, estimate changes in environmental factors including changes to fire regimes (frequency, severity); hydrology, pollutants; species interactions (increased competition and effects on pollinators or dispersal); fragmentation, increased edge effects, likelihood of disturbance; and disease, pathogens and parasites. Where these factors have been considered elsewhere in relation to the target species,	unaffected. Therefore, the project would not create a barrier to dispersal of the species. The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence. If the species is present, individuals in the project footprint may be affected by changes to fire regimes in surrounding vegetation as a result of management for asset protection, increased edge effects, altered hydrology due to drainage lines within the project footprint, off-road vehicle activities (access tracks).	present, individuals in the project footprint may be affected by changes to fire regimes in surrounding vegetation as a result of management for asset protection, increased edge effects, altered hydrology due to drainage lines within the project footprint, off-road vehicle activities (access tracks).

the assessor may refer to the relevant sections of the BDAR or BCAR.		
5. The assessor may also provide new information that can be used to demonstrate that the principle identifying the species as at risk of an SAII, is inaccurate.	Not applicable.	Not applicable.
Likely SAII assessment outcome against relevant principles.	*Eucalyptus alligatrix subsp. alligatrix* has been assumed present over a portion of the project footprint due to survey limitations. The species is only known from a single population south-west of Rylstone. The species has a low likelihood of occurring within the project footprint. Therefore, the project is unlikely to be deemed a significant risk to the species becoming extinct due to an impact on the habitat of the species that is currently observed, estimated, inferred or reasonably suspected to have a very limited geographic distribution.	*Eucalyptus robertsonii subsp. hemisphaerica* has been assumed present over a portion of the project footprint due to survey limitations. The species is known only from the central tablelands of NSW north of Orange to Burraga. The species has a low likelihood of occurring within the project footprint. Therefore, the project is unlikely to be deemed a significant risk to the species becoming extinct due to either further reducing the population size of the species that is currently observed, estimated, inferred or reasonably suspected to have a very small population size, or due to an impact on the habitat of the species that is currently observed, estimated, inferred or reasonably suspected to have a very limited geographic distribution.

3.1.5 Euphrasia arguta and Euphrasia scabra

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Euphrasia arguta*	*Euphrasia scabra* Rough Eyebright
Impact summary	The project would result in direct impacts to a total of 92.90 ha of *Euphrasia arguta* habitat, 15% of which is in moderate to high condition. Potential indirect impacts to the species include: • Transport of weeds and pathogens from the site to adjacent vegetation. • Trampling of threatened flora species. • Changed fire regimes.	The project would result in direct impacts to a total of 1.90 ha of Rough Eyebright habitat (assumed presence), 94 % of which is in high to very high condition. Potential indirect impacts to the species include: • Transport of weeds and pathogens from the site to adjacent vegetation. • Trampling of threatened flora species. • Changed fire regimes.

Official

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	***Euphrasia arguta***	***Euphrasia scabra* Rough Eyebright**
1. The assessor is required to provide further information in the BDAR or BCAR for any species at risk of an SAII, including the action and measures taken to avoid the direct and indirect impact on the species at risk of an SAII. Where these have been addressed elsewhere the assessor can refer to the relevant sections of the BDAR or BCAR.	*Euphrasia arguta* was rediscovered in the Nundle area of the NSW north western slopes and tablelands in 2008. Prior to this, it had not been collected for 100 years. Historically, *Euphrasia arguta* has only been recorded from relatively few places within an area extending from Sydney to Bathurst and north to Walcha. The Royal Botanic Gardens Specimen Register records an additional location reported and vouchered in 2002 from near the Hastings River; and E*uphrasia arguta* was also recorded from the Barrington Tops in 2012. The species occurs in the open forest country around Bathurst in sub humid places', 'on the grassy country near Bathurst', and 'in meadows near rivers'. The species is assumed present within potential habitats within the project footprint but has not been directly recorded. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened flora include: • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1). • Further avoidance and minimisation of impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying the extent of habitats, their existing condition and certainty levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed threatened flora habitats as no-go zones during the construction phase (EMM B23).	There are three extant populations of *Euphrasia scabra* in NSW: Bondi State Forest, South East Forests National Park and near Nunnock Swamp. Total NSW population is between 250 and 500 plants. This number varies with season with few plants appearing in some years. The species occurs in or at the margins of swampy grassland or in sphagnum bogs, often in wet, peaty soil. The species is assumed present within potential habitats within the project footprint but has not been directly recorded. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened flora include: • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1). • Further avoidance and minimisation of impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying the extent of habitats, their existing condition and certainty levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed threatened flora habitats as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of temporarily disturbed areas within the project footprint (EMM B18).

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Euphrasia arguta*	*Euphrasia scabra* Rough Eyebright
	• Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of temporarily disturbed areas within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with pathogens, pests and weeds (EMM B19).	• Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with pathogens, pests and weeds (EMM B19).
2. The assessor must consult the TBDC and/or other sources to report on the current population of the species including:		
• evidence of rapid decline (Principle 1, clause 6.7(2)(a) BC Regulation) presented by an estimate of the: ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer), or ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer) as indicated by: an index of abundance appropriate to the species; decline in geographic distribution and/or habitat quality; exploitation; effect of introduced species, hybridisation, pathogens, pollutants, competitors or parasites	***Principle 1 SAII = No*** *Euphrasia arguta* had not been seen for over 100 years prior to its rediscovery in 2008. Subsequently, plants have been found at six sites spanning up to 25 km apart, with one population of over 15 000 plants and others ranging from 20–1000 plants. In 2009, the total population was estimated to be more than 16 000 individuals. There are no data on the species' abundance for the intervening period (TSSC 2011). The decline in the population of the species in NSW in the last 10 years cannot be assessed at this time because the species information available in BioNet and other reliable/peer reviewed information about the species is limited and does not address this aspect. The most abundant population has declined due to repeated clearing and could continue to decline in the absence of an	***Principle 1 SAII = No*** Long term population data is not available for this annual species in NSW. Therefore, population estimates cannot be accurately determined. The species is known from only eight New South Wales populations (DPE 1999). Until 1999, the most recent is dated 1899 from the Jenolan Caves area. Other collections were made in the late 1800's from Port Jackson, Bathurst Plains, Lake George, Jindabyne, Yarrangobilly Caves and Tumbarumba. The species has been found in 1999 and 2014 in Bondi State Forest with a population estimated at 300 plants (DPE 1999), as well as in the Glenbog State Forest (DPE 2022a).

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Euphrasia arguta*	*Euphrasia scabra* Rough Eyebright
	appropriate management regime. As this population represents greater than 90% of the known individuals of the species this suggests that the species' distribution is precarious for its survival (TSSC 2011).	Long term population data is not available for this species in NSW. However, key threats to the species, which are likely to have contributed to its low population are: Habitat disturbance: grazing Weed Invasion: Mixed weeds causing loss/ and degradation of habitat and inhibit recruitment Habitat loss/fragmentation: Loss of key habitat. Demographic threats: Small population size (DPE 1999).
• evidence of small population size (Principle 2, clause 6.7(2)(b) BC Regulation) presented by: ▪ an estimate of the species' current population size in NSW, and ▪ an estimate of the decline in the species' population size in NSW in three years or one generation (whichever is longer), and ▪ where such data is available, an estimate of the number of mature individuals in each subpopulation, or the percentage of mature individuals in each subpopulation, or whether the species is likely to undergo extreme fluctuations	***Principle 2 SAII = No*** In 2009 the total population size of *Euphrasia arguta* was estimated to be 16 000 individuals. There are no data on the species' abundance for the intervening period (TSSC 2011). There is insufficient data to determine an estimate of a decline in the population over the last three years or one generation. However, as noted above, the most abundant population has declined due to repeated clearing and could continue to decline in the absence of an appropriate management regime (TSSC 2011). As of 2009, plants have been found at six sites spanning up to 25 km apart, with one population of over 15 000 plants and others ranging from 20–1000 plants. In 2009 the total population size of *Euphrasia arguta* was estimated to be 16 000 individuals. While the species' reproductive biology is poorly known, the fact that fruits produce "many seeds" (Benson and McDougall, 2001, cited in TSSC 2011) suggests the potential for rapid population growth under good conditions. However, clearing occurred in the area of the largest population December 2009 and the current number of mature individuals is unknown (TSSC 2011).	***Principle 2 SAII = No*** There are three extant populations in NSW: Bondi State Forest, South East Forests National Park and near Nunnock Swamp with a total population between 250 and 500 plants (OEH 2018). This number varies with season with few plants appearing in some years (OEH 2018). The population found in Bondi State Forest which numbered approximately 300 plants in 1999 (DPE 1999). BioNet record data shows an additional population was found in the Glenbog State Forest in 2014 however, the population size is not provided (DPE 2022a). There is insufficient data to determine an estimate of a decline in the population over the last three years or one generation. There is insufficient data to determine an estimate of the number of mature individuals.
• evidence of limited geographic range for the threatened species (Principle 3, clause 6.7(2)(c) BC Regulation) presented by: ▪ extent of occurrence	***Principle 3 SAII = Yes:*** *Extent of Occurrence (ha) = 7,161.929 km^2* *Area of Occupancy (ha) = 28 km^2*	***Principle 3 SAII = Yes:*** *Extent of Occurrence (ha) = 428.742km^2* *Area of Occupancy (ha) = 24 km^2*

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Euphrasia arguta*	*Euphrasia scabra* Rough Eyebright
▪ area of occupancy ▪ number of threat-defined locations (geographically or ecologically distinct areas in which a single threatening event may rapidly affect all species occurrences), and ▪ whether the species' population is likely to undergo extreme fluctuations	*No. Threat-defined locations = <= 3 locations* Extent of Occurrence (ha) = 7,161.929 km^2 (BCD data package) Area of Occupancy (ha) = 28 km^2 (BCD data package). No. Threat-defined locations = <= 3 location (DPE 2022). The species is known from six sites up to 25 km apart in the area of Nundle State Forest, south-east of Tamworth, NSW (Binns, pers. comm., 2009, cited in DSEWPAC 2011). All sites are in the Nandewar Bioregion of northern New South Wales, in the south-east section of Namoi NRM region (DSEWPAC 2011). The extent of occurrence of *Euphrasia arguta* is less than 100 km^2. Its known area of occupancy in 2009 was approximately 0.03 km^2. Of the six populations known in 2009, three are located in a cluster within approximately 2 km of each other, while the others are isolated by between 9 and 20 km (TSSC 2011). Any potentially suitable habitat ought to be considered a threat defined location within proximity to the known population (TSSC 2011). While the species' reproductive biology is poorly known, the fact that fruits produce "many seeds" (Benson and McDougall, 2001, cited in TSSC 2011) suggests the potential for rapid population growth under good conditions (TSSC 2011).	*No. Threat-defined locations = <= 3 locations* Extent of Occurrence (ha) = 428.742km^2 (BCD data package) Area of Occupancy (ha) = 24 km^2 (BCD data package). No. Threat-defined locations = <= 3 location (DPE 2022). There are three extant populations in NSW: Bondi State Forest, South East Forests National Park and near Nunnock Swamp (OEH 2018). Vegetation associations at known sites are typically in or at the margins of swampy grassland or in sphagnum bogs, often in wet, peaty soil (OEH 2018). The current distribution of this species is known, further identification of threat-defined locations is unlikely to occur. However, any potentially suitable habitat ought to be considered a threat defined location within proximity to the known population. OEH (2018) states that large, unexplained spatial fluctuations in population numbers are a threat to this species. DPE (1999) states that this species is susceptible to catastrophic events due to the fragmented nature of the populations and their small size.
• evidence that the species is unlikely to respond to management (Principle 4, clause 6.7(2)(d) BC Regulation) because: ▪ known reproductive characteristics severely limit the ability to increase the existing population on, or occupy new habitat (eg species is clonal) on, a biodiversity stewardship site ▪ the species is reliant on abiotic habitats which cannot be restored or replaced (eg karst systems) on a biodiversity stewardship site, or	***Principle 4 SAII = No*** The species has no known reproductive characteristics that could severely limit the ability to increase the existing population. This species is semi-parasitic and attaches to the roots of other associated plants (OEH 2020). This species has a high sensitivity to gain, although the ecology or response to management is poorly known (DPE 2022). The species is not reliant on abiotic factors that cannot be restored or replaced on a biodiversity stewardship site. The main identified threat to *Euphrasia arguta* is road maintenance and clearing of roadside vegetation for fire	***Principle 4 SAII = No*** The species has no known reproductive characteristics that could severely limit the ability to increase the existing population. This species has a high sensitivity to gain dependent although the ecology or response to management is poorly known (DPE 2022). This species habitat constraint is Montane bogs or within 50 m of Montane bogs (DPE 2022). The species requirement for certain habitat may be difficult to be replicated at biodiversity stewardship sites.

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Euphrasia arguta*	*Euphrasia scabra* Rough Eyebright
▪ life history traits and/or ecology is known but the ability to control key threatening processes at a biodiversity stewardship site is currently negligible (eg frogs severely impacted by chytrid fungus).	breaks (TSSC 2011a). Other threats include browsing by domestic stock, rabbits and macropods; however populations of these animals are currently sufficiently low that it appears not to be a current significant threat (Binns, pers. comm., 2009, cited in TSSC 23011a). As some of the known individuals occur on private land there is also a potential threat from land clearing (TSSC 2011a). The majority of these threatening processes can be reasonably controlled within a biodiversity stewardship site, therefore this species is expected to be responsive to management.	The main threat to *Euphrasia scabra* is habitat disturbance including grazing and weed invasion (DPE 1999). Key threatening processes associated with this species include: • Insufficient understanding: Lack of knowledge about species and microhabitat required for successful germination and survival. • Demographic threats: small population size. • Pest animals: Foraging and browsing activity of feral pigs and deer. • Weeds: *Rubus spp*. and potentially Holcus lanatus can exclude this species from habitat. • Habitat loss and disturbance: Disturbance from recreational 4WDs and domesticated stock. • Climate change: Changes to swamp hydrology and vegetation (DEP 2022). The majority of these key threatening processes can be reasonably controlled within a biodiversity stewardship site, therefore this species is expected to be responsive to management.
3. Where the TBDC indicates data is 'unknown' or 'data deficient' for a species for a criterion listed in Subsection 9.1.2(2.), the assessor must record this in the BDAR or BCAR.	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this species for a criterion listed in Subsection 9.1.1(2.). Some responses in this consideration of SAII cannot be completed comprehensively due to the following: • The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited • A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. • As such, we have noted the knowledge gaps in the TBDC and provided responses using information from the limited available sources.	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this species for a criterion listed in Subsection 9.1.1(2.). Some responses in this consideration of SAII cannot be completed comprehensively due to the following: • The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited • A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. • As such, we have noted the knowledge gaps in the TBDC and provided responses using information from the limited available sources.

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Euphrasia arguta*	*Euphrasia scabra* Rough Eyebright
4. In relation to the impacts from the proposal on the species at risk of an SAII, the assessor must include data and information on:		
• the impact on the species' population (Principles 1 and 2) presented by: ▪ an estimate of the number of individuals (mature and immature) present in the subpopulation on the subject land (the site may intersect or encompass the subpopulation) and as a percentage of the total NSW population, and ▪ an estimate of the number of individuals (mature and immature) to be impacted by the proposal and as a percentage of the total NSW population, or ▪ if the species' unit of measure is area, provide data on the number of individuals on the site, and the estimated number that will be impacted, along with the area of habitat to be impacted by the proposal	Habitat for *Euphrasia arguta* was detected within the project footprint in the Inland slopes BRA Subregion. Targeted flora surveys within the project footprint did not locate the species. Where survey effort was not adequate, species presence has been assumed within suitable habitat. There are no nearby records (within 20 km of the project footprint, with only 1 previous record in the Inland Slopes Bioregion (DPE 2022). Given the species was not recorded and is only assumed present, and the limited information available on the total population of the species, it is not possible to determine the number of individuals (mature and immature) that would be impacted by the project and as a percentage of the total NSW population. The species' unit of measure is area. The species was not located within the project footprint despite targeted surveys in accessible land. Where survey effort was not adequate, species presence has been assumed within suitable habitat. The total area of this species suitable habitat that would be directly impacted by the project is 92.90 ha.	It is not possible to determine how many individuals comprise the sub-population on the site from the available data. Suitable habitat for *Euphrasia scabra* was detected within the project footprint in the Snowy Mountains IBRA Subregion. Targeted flora surveys within the project footprint did not locate the species. Where survey effort was not adequate, species presence has been assumed within potential habitat. There are no records within 20 km of the project (DPE 2022). Given the species was not recorded and is only assumed present in inaccessible areas, and the limited information available on the total population of the species, it is not possible to determine the number of individuals (mature and immature) to be impacted by the project and as a percentage of the total NSW population. The species unit of measure is area. The species was not located within the project footprint despite targeted surveys in accessible land. Where survey effort was not adequate, species presence has been assumed within potential habitat. The total area of this species habitat to be directly impacted by the project is 1.90 ha.
• impact on geographic range (Principles 1 and 3) presented by: ▪ the area of the species' geographic range to be impacted by the proposal in hectares, and a percentage of the total area of occupancy or extent of occupancy within NSW ▪ the impact on the subpopulation as either: all individuals will be impacted (subpopulation eliminated); OR impact will affect some individuals and habitat; OR impact will affect	The project footprint contains 1,254.03 ha of suitable habitat for *Euphrasia arguta*, of this the project would impact on 92.90 ha (7%). The extent of occurrence (EOO) was estimated to be 7,161.929 km^2 (716,192.9 ha) (BCD data package). Therefore, the project may impact up to 0.013% of this species' EOO. The area of occupancy (AOO) was estimated to be 28 km^2 (2,800 ha) (BCD data package). Therefore, the project may impact up to 3.3% of this species' AOO. The project would impact on 92.90 ha (7%) of the 1,254.03 ha of suitable habitat for the species within the project footprint.	The project footprint comprises 6.20 ha of suitable habitat in the form of a species habitat polygon, of this the project would impact on 1.90 ha (30%). The extent of occurrence (EOO) is estimated to be 428.742 km^2 (42,874.2 ha) (BCD data package). Therefore, the project would impact 0.004% of this species' extent of occurrence. The area of occupancy (AOO) was estimated to be 24 $km^{2,}$ (2,400 ha) therefore the project would impact 0.08 % of the AOO for the species The project would impact on 1.90 ha (30%) of the 6.20 ha of potential habitat for the species within the project footprint.

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Euphrasia arguta*	*Euphrasia scabra* Rough Eyebright
some habitat, but no individuals of the species will be directly impacted ▪ to determine if the persisting subpopulation that is fragmented will remain viable, estimate (based on published and unpublished sources such as scientific publications, technical reports, databases or documented field observations) the habitat area required to support the remaining population, and habitat available within dispersal distance, and distance over which genetic exchange can occur (eg seed dispersal) and pollination distance for the species ▪ to determine changes in threats affecting remaining subpopulations and habitat if the proposed impact proceeds, estimate changes in environmental factors including changes to fire regimes (frequency, severity); hydrology, pollutants; species interactions (increased competition and effects on pollinators or dispersal); fragmentation, increased edge effects, likelihood of disturbance; and disease, pathogens and parasites. Where these factors have been considered elsewhere in relation to the target species, the assessor may refer to the relevant sections of the BDAR or BCAR.	The project would impact some habitat, but no individuals of the species is likely to be directly impacted in areas where targeted surveys were undertaken as the species was not detected. In areas that comprise the species polygon that could not be adequately surveyed, species presence has been assumed. As such, the number of individuals cannot be quantified. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. Therefore, if the species is present, the project would not create a barrier to dispersal of the species. The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence in suitable habitat. If the species is present, individuals in the project footprint may be affected by changes to fire regimes in surrounding vegetation as a result of management for asset protection, increased edge effects, altered hydrology due to drainage lines within the project footprint, off-road vehicle activities (access tracks).	The project would impact some habitat, but no individuals of the species is likely to be directly impacted in areas where targeted surveys were undertaken as the species was not detected. In areas that comprise the species polygon that were not adequately surveyed, species presence has been assumed. As such, the number of individuals cannot be quantified. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. Therefore, if the species is present, the project would not create a barrier to dispersal of the species. The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence in inaccessible suitable habitat. If the species is present, individuals in the project footprint may be affected by changes to fire regimes, increased edge effects, disturbance from vegetation removal and maintenance within the clearing footprint.
5. The assessor may also provide new information that can be used to demonstrate that the principle identifying the species as at risk of an SAII, is inaccurate.	Not applicable.	Not applicable.
Likely SAII assessment outcome against relevant principles.	*Euphrasia arguta* has been assumed present over a portion of the project footprint due to survey limitations. Only known population of the species occurs in the Nundle area of NSW. The species has a low likelihood of occurring within the project footprint.	*Euphrasia scabra* has been assumed present over a portion of the project footprint due to survey limitations. There are three known populations of the species in NSW: Bondi State Forest, South East Forests National Park and near Nunnock Swamp. The species has a low likelihood of occurring within the project footprint.

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Euphrasia arguta*	*Euphrasia scabra* Rough Eyebright
	Therefore, the project is unlikely to be deemed a significant risk to the species becoming extinct due to an impact on the habitat of the species that is currently observed, estimated, inferred or reasonably suspected to have a very limited geographic distribution.	Therefore, the project is unlikely to be deemed a significant risk to the species becoming extinct due to an impact on the habitat of the species that is currently observed, estimated, inferred or reasonably suspected to have a very limited geographic distribution.

3.1.6 Genoplesium superbum and Glycine latrobeana

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	***Genoplesium superbum* Superb Midge Orchid**	***Glycine latrobeana* Clover Glycine**
Impact summary	The project would result in direct impacts to a total of 8.80 ha of Superb Midge Orchid habitat (assumed presence), 95% of which is in moderate to high condition. Potential indirect impacts to the species include: • Transport of weeds and pathogens from the site to adjacent vegetation. • Trampling of threatened flora species. • Changed fire regimes.	The project would result in direct impacts to a total of 0.25 ha of Clover Glycine habitat (assumed presence), all of which is in high condition. Potential indirect impacts to the species include: • Transport of weeds and pathogens from the site to adjacent vegetation. • Trampling of threatened flora species • Changed fire regimes.
1. The assessor is required to provide further information in the BDAR or BCAR for any species at risk of an SAII, including the action and measures taken to avoid the direct and indirect impact on the species at risk of an SAII. Where these have been addressed elsewhere the assessor can refer to the relevant sections of the BDAR or BCAR.	The Superb Midge Orchid is restricted to the Central and Southern Tablelands of NSW where it has been recorded from two locations near Nerriga, about 20 km apart, and north of Wallerawang. Some plants occur in Morton National Park. The species is assumed present within potential habitats within the project footprint but has not been directly recorded. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened flora include: • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1). • Further avoidance and minimisation of impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying the extent of habitats, their existing condition and certainty levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed	The only known population of *Glycine latrobeana* in NSW occurs within Kosciuszko National Park. Within this location the species is found in natural grassland dominated by *Poa* species with emergent *Hakea macrocarpa* at an altitude of 1300 m above sea level (DPE 2015a). The species is assumed present within potential habitats within the project footprint but has not been directly recorded. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened flora include: • Design refinements to avoid impacts where practicable (B32) • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1). • Further avoidance and minimisation of impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying the extent of habitats, their existing condition and certainty levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey).

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Genoplesium superbum* Superb Midge Orchid	*Glycine latrobeana* Clover Glycine
	threatened flora habitats as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of temporarily disturbed areas within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with pathogens, pests and weeds (EMM B19).	• Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed threatened flora habitats as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of temporarily disturbed areas within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with pathogens, pests and weeds (EMM B19).
2. The assessor must consult the TBDC and/or other sources to report on the current population of the species including:		
• evidence of rapid decline (Principle 1, clause 6.7(2)(a) BC Regulation) presented by an estimate of the: ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer), or ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer) as indicated by: an index of abundance appropriate to the species; decline in geographic distribution and/or habitat quality; exploitation; effect of	***Principle 1 SAII = No:*** Long term population data for this species in NSW is not available and generation length is unknown. Therefore, the decline in population of the species in NSW in the past 10 years or three generations has not been estimated. The species has been recorded from two locations near Nerriga, c. 20 km apart, the population fluctuates from year to year and is currently estimated to contain fewer than 150 individuals (NSWSC 2005).	***Principle 1 SAII = No:*** The decline in the population of the species in NSW in the last 10 years cannot be assessed because long term population data for this species in NSW is limited or not available. Carter and Sutter (2010) note the last confirmed record of *Glycine latrobeana* was from Delegate in south-eastern NSW from 1885 but has not been seen since. This suggests the species fragility. Key threats to the species (DPE 2022), which are likely to have contributed to its low population are:

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Genoplesium superbum* Superb Midge Orchid	*Glycine latrobeana* Clover Glycine
introduced species, hybridisation, pathogens, pollutants, competitors or parasites	The decline in the population of the species in NSW in the last 10 years cannot be assessed at this time because the species information available in BioNet and other reliable/peer reviewed information about the species is limited and does not address this aspect. The decline in population of the species in NSW in the past 10 years or three generations based on the listed threats has not been estimated. The species is threatened by environmental and demographic stochasticity due to its small population size and limited distribution. The larger of the two populations is threatened by vehicular damage, habitat degradation and illegal collection associated with its proximity to roadsides. A proposed road realignment is likely to destroy some individuals and to increase the susceptibility of others (NSWSC 2005).	• Pest animals: Feral grazing animals and trampling (horses and pigs) • Demographic Threats: Restricted distribution only known in one location and poor recruitment • Weed invasion: Ox-eye Daisy competes, dominates, and excludes species
• evidence of small population size (Principle 2, clause 6.7(2)(b) BC Regulation) presented by: ▪ an estimate of the species' current population size in NSW, and ▪ an estimate of the decline in the species' population size in NSW in three years or one generation (whichever is longer), and ▪ where such data is available, an estimate of the number of mature individuals in each subpopulation, or the percentage of mature individuals in each subpopulation, or whether the species is likely to undergo extreme fluctuations	***Principle 2 SAII = Yes:*** The most recent estimate total population size for this species from two known locations in NSW was fewer than 150 individuals (NSWSC 2005). There are no long-term survey data, therefore it is not possible to directly estimate the rate of population decline. Annual monitoring and targeted surveys of three priority management sites, one in Morton National Park and two within the within the Queanbeyan-Palerang Regional LGA the other in the Braidwood areas are ongoing (OEH 2021). The monitoring data has not been published to date. Therefore, the decline in population of the species in NSW in the past 10 years or three generations has not been estimated. The decline in the population of the species in NSW in the last 10 years cannot be assessed at this time because the species information available in BioNet and other reliable/peer reviewed information about the species is limited and does not address this aspect. The total number of mature individuals of this species is low (estimated at less than 150 individuals in 2005 (NSWSC 2005).	***Principle 2 SAII = No:*** According to the DPE (2015a), there is a single population of about 500-1000 plants in the Kelly Plains. The species is confirmed in Kosciuszko National Park as of a 2013 transect line survey. The decline in the population of the species in NSW in the last three years cannot be assessed because of insufficient population data for this species in NSW. However, there are no records to suggest a decline in population since its confirmation in Kosciuszko National Park in 2011. The number of mature individuals in NSW cannot be assessed because of insufficient population data for this species in NSW. BioNet record data contains eight records of the species (DPE 2022). Of these records, seven are from 2019 offering a poor indication of decline. BioNet record data does not contain enough records to confidently identify a decline in the population over the last three years. DPE (2015a) describes 'that seed remains viable and dormant in the soil for many years and germinates in response to disturbance such as fire or

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Genoplesium superbum* Superb Midge Orchid	*Glycine latrobeana* Clover Glycine
	In NSW, no estimates are available on the number of mature individuals. The population is known to fluctuate from year to year (NSWSC 2005).	flood', indicating that this species may undergo extreme fluctuations.
• evidence of limited geographic range for the threatened species (Principle 3, clause 6.7(2)(c) BC Regulation) presented by: ▪ extent of occurrence ▪ area of occupancy ▪ number of threat-defined locations (geographically or ecologically distinct areas in which a single threatening event may rapidly affect all species occurrences), and ▪ whether the species' population is likely to undergo extreme fluctuations	***Principle 3 SAII = No:*** *Area of Occupancy (ha) = 2,754.360 km²* (BCD data package) *Extent of Occurrence (ha) = 48 km²* (BCD data package) *No. Threat-defined locations = no data* The BCD data package provided the extent of occurrence for this species listed as 2,754.360 km². The species has a small population size (less than 150 individuals estimated in 2005) and limited distribution, restricted to the southern tablelands of NSW where it has been recorded from two locations near Nerriga, c. 20 km apart (NSWSC 2005). The BCD data package provided the area of occupancy for this species listed as 48 km².. The species is known from only two locations where it grows predominantly in wet heathland on shallow soils above a sandstone cap but has also been found in open woodland interspersed with heath (NSWSC 2005). One of the known locations is within Morton National Park (NSWSC 2005). The number of threat defined locations for this species is not provided, however the species is known from only two locations (BioNet, DPE 2022). There is insufficient data to determine whether the species population size would be likely to undergo extreme natural fluctuations. However, the population is known to fluctuate from year to year (NSWSC 2005).	***Principle 3 SAII = Yes:*** *Extent of Occurrence (ha) = 69.688 km²* *Area of Occupancy (ha) = 40 km²* *No. Threat-defined locations = <= 3 locations* The size the area inhabited by the existing population of *G. latrobeana* is very highly restricted in geographic range (DPE 2015a). According to DPE (2015a), in 2013, the single known population in NSW is 3 ha in area. The extent of occurrence is estimated to be approximately 69.688 km² (BCD data package) The area of occupancy is estimated to be approximately 40 km². (BCD data package). No. Threat-defined locations = <= 3 locations. Vegetation associations at known sites are typically subalpine grassland and grassy woodland habitats at about 1300 m above sea level (DPE 2022). The current distribution of this species is known, further identification of threat-defined locations is unlikely to occur. However, any potentially suitable habitat ought to be considered a threat defined location within proximity to the known population. Extreme fluctuations in number = No information. There is insufficient data to determine whether the species population size would be likely to undergo extreme natural fluctuations.
• evidence that the species is unlikely to respond to management (Principle 4, clause 6.7(2)(d) BC Regulation) because: ▪ known reproductive characteristics severely limit the ability to increase the existing	***Principle 4 SAII = No:*** The reproductive traits of this species are not well known with limited information available. Orchid seeds are very small and can occasionally disperse widely (if on favourable winds) but	***Principle 4 SAII = No*** The species has no known reproductive characteristics that could severely limit the ability to increase the existing

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Genoplesium superbum* Superb Midge Orchid	*Glycine latrobeana* Clover Glycine
population on, or occupy new habitat (eg species is clonal) on, a biodiversity stewardship site ▪ the species is reliant on abiotic habitats which cannot be restored or replaced (eg karst systems) on a biodiversity stewardship site, or ▪ life history traits and/or ecology is known but the ability to control key threatening processes at a biodiversity stewardship site is currently negligible (eg frogs severely impacted by chytrid fungus).	generally disperse locally within their population extent. The species flowers sporadically, triggered by significant summer rainfall and does not flower every year (Bionet, DPE 2022). Little is known about the pollinator of this species (OEH 2021). Lack of genetic diversity and long-term viability due to small population sizes and limited geographic distribution (OEH 2021) could limit the ability to increase the existing population. The species is not reliant on abiotic factors which cannot be restored for replaced within a Biodiversity stewardship site. BioNet (DPE 2022) states that the species has a moderate sensitivity to gain, however this is dependent on the effectiveness of management in controlling threats. This species' ecology and response to management is poorly known. There is no listed critical habitat for this species, though the three priority management sites as part of the Saving Our Species program are likely to be critical for the species survival. The life-history traits and ecology of this species is not well known. There are no specified KTPs for this species.	population. It is understood that seeds can stay viable and dormant in the soil (DPE 2015a). BioNet states that the species has a high sensitivity to gain as the species is able to colonise improved habitat, dependent on the effectiveness of management to control threats. There is no known critical habitat for this species (DPE 2022). The life-history traits and ecology of this species is known. Predation, habitat degradation, competition and disease transmission by Feral Pigs is listed as a key threatening process (KTP) under the species' final determination. These KTPs can be reasonably controlled within a biodiversity stewardship site, therefore this species is expected to be responsive to management.
3. Where the TBDC indicates data is 'unknown' or 'data deficient' for a species for a criterion listed in Subsection 9.1.2(2.), the assessor must record this in the BDAR or BCAR.	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this species for a criterion listed in Subsection 9.1.1(2.). Some responses in this consideration of SAII cannot be completed comprehensively due to the following: • The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited • A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. • As such, we have noted the knowledge gaps in the TBDC and provided responses using information from the limited available sources.	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this species for a criterion listed in Subsection 9.1.1(2.). Some responses in this consideration of SAII cannot be completed comprehensively due to the following: • The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited • A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. • As such, we have noted the knowledge gaps in the TBDC and provided responses using information from the limited available sources.

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Genoplesium superbum* Superb Midge Orchid	*Glycine latrobeana* Clover Glycine
4. In relation to the impacts from the proposal on the species at risk of an SAII, the assessor must include data and information on:		
• the impact on the species' population (Principles 1 and 2) presented by: ▪ an estimate of the number of individuals (mature and immature) present in the subpopulation on the subject land (the site may intersect or encompass the subpopulation) and as a percentage of the total NSW population, and ▪ an estimate of the number of individuals (mature and immature) to be impacted by the proposal and as a percentage of the total NSW population, or ▪ if the species' unit of measure is area, provide data on the number of individuals on the site, and the estimated number that will be impacted, along with the area of habitat to be impacted by the proposal	It is not possible to determine how many individuals comprise the sub-population on the site from the available data. Suitable habitat for *Genoplesium superbum* was detected within the project footprint within the Bungonia IBRA Subregion. Targeted flora surveys within the project footprint did not locate the species. Where survey effort was not adequate, species presence has been assumed within suitable habitat. Given the species was not recorded and is only assumed present within potential habitat, and the limited information available on the total population of the species, it is not possible to determine the number of individuals (mature and immature) to be impacted by the project and as a percentage of the total NSW population. The species unit of measure is area. The species was not located within the project footprint despite targeted surveys in accessible land. Where survey effort was not adequate, species presence has been assumed within potential habitat. The total area of this species habitat to be directly impacted by the project is 8.80 ha.	It is not possible to determine how many individuals comprise the sub-population on the site from the available data. According to the DPE (2015), there is a single population of about 500-1000 plants in the Kelly Plains. The species is confirmed in Kosciuszko National Park as of a 2013 transect line survey. Suitable habitat for *G. latrobeana* was detected within the project footprint within the Snowy Mountains IBRA Subregion. Targeted flora surveys undertaken in areas of suitable habitat within the project footprint did not locate the species. Where survey effort was not adequate, species presence has been assumed within suitable habitat. There are no BioNet records within 20 km of the project footprint (DPE 2022). As such, a percentage present in the subpopulation of the total population cannot be attained. Given the species was not recorded and is only assumed present in inaccessible areas, and the limited information available on the total population of the species, it is not possible to determine the number of individuals (mature and immature) to be impacted by the project and as a percentage of the total NSW population. However, given that it was not recorded on the site during targeted surveys, there are no nearby records within 20 km of the site and there is only one known is very highly restricted population in the Kelly Plains in Kosciuszko National Park (DPE 2015a), it is unlikely that the project would substantially impact the local population for this species. The species unit of measure is area. The species was not recorded within the project footprint despite targeted surveys in accessible land. Where survey effort was not adequate, species presence has been assumed within suitable habitat.

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Genoplesium superbum* Superb Midge Orchid	*Glycine latrobeana* Clover Glycine
		The total area of this species habitat to be directly impacted by the project is 0.25 ha. However, given that this species was not recorded on the site during targeted surveys, there are no nearby records within 20 km of the site and similar habitat in the surrounding landscape would be retained, it is unlikely that the project would impact the local population for this species.
• impact on geographic range (Principles 1 and 3) presented by: ▪ the area of the species' geographic range to be impacted by the proposal in hectares, and a percentage of the total area of occupancy or extent of occupancy within NSW ▪ the impact on the subpopulation as either: all individuals will be impacted (subpopulation eliminated); OR impact will affect some individuals and habitat; OR impact will affect some habitat, but no individuals of the species will be directly impacted ▪ to determine if the persisting subpopulation that is fragmented will remain viable, estimate (based on published and unpublished sources such as scientific publications, technical reports, databases or documented field observations) the habitat area required to support the remaining population, and habitat available within dispersal distance, and distance over which genetic exchange can occur (eg seed dispersal) and pollination distance for the species ▪ to determine changes in threats affecting remaining subpopulations and habitat if the proposed impact proceeds, estimate changes in environmental factors including changes to fire regimes (frequency, severity); hydrology, pollutants; species interactions (increased competition and effects on pollinators or	The project footprint comprises 49.69 ha of suitable habitat, 8.80 ha (18%) of this would be impacted by the project. The extent of occurrence (EOO) was estimated to be 2,754.360 km^2 (275,436 ha). Therefore, the project may impact up to 0.003% of the species' extent of occurrence. The area of occupancy (AOO) was estimated to be 48 $km^{2,}$ (4,800 ha) therefore the project may impact up to 0.18 % of the AOO for the species. The project would impact on 8.80 ha (18%) of the 49.69 ha of potential habitat for the species within the project footprint. The project would impact some habitat, but no individuals of the species is likely to be directly impacted in areas where targeted surveys were undertaken as the species was not detected. In areas that comprise the species polygon that were not adequately surveyed, species presence has been assumed. As such, the number of individuals cannot be quantified. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. Therefore, if the species is present the project would not create a barrier to dispersal of the species. The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence. If the species is present, individuals in the project footprint may be affected by changes to fire regimes in surrounding vegetation as a result of management for asset protection, increased edge effects, altered hydrology due to drainage lines within the project footprint, off-road vehicle activities (access tracks).	The project footprint comprises 6.72 ha of suitable habitat in the form of a species habitat polygon, of this the project would impact on 0.25 ha (4%). The size of the area inhabited by the existing population of Clover Glycine is very highly restricted in geographic range (DPE 2015). According to DPE (2015a), in 2013, the single known population in NSW is 3 ha in area. The extent of occurrence (EOO) was estimated to be 69.688 km^2 (6,968.8 ha). Therefore, the project would impact 0.004% of the species' extent of occurrence. The area of occupancy (AOO) was estimated to be 40 $km^{2,}$ (4,000 ha) therefore the project would impact 0.006 % of the AOO for the species. The project would impact 0.25 ha of suitable habitat for this species within the project footprint. The project would impact some habitat, but no individuals of the species is likely to be directly impacted in areas where targeted surveys were undertaken as the species was not detected. In areas that comprise the species polygon for which adequate survey effort was not achieved, species presence has been assumed. As such, the number of individuals cannot be quantified. However, given that it was not recorded on the site, there are no nearby records within 20 km of the site and there is only one known population in the Kelly Plains in Kosciuszko National Park which is very highly restricted in geographic range (DPE 2015a), it is likely that the project would impact some potential habitat, but no individuals of the species is likely to be directly impacted.

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Genoplesium superbum* Superb Midge Orchid	*Glycine latrobeana* Clover Glycine
dispersal); fragmentation, increased edge effects, likelihood of disturbance; and disease, pathogens and parasites. Where these factors have been considered elsewhere in relation to the target species, the assessor may refer to the relevant sections of the BDAR or BCAR.		Given that Clover Glycine was not recorded on the site and there are no nearby records within 20 km of the site, the species is not likely to be fragmented by the project. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. Therefore, if the species is present the project is not likely to reduce the habitat area required to support a population of the species. The project is not likely to increase any of the above listed threats to the species because there are no nearby records of this species within 20 km of the project footprint. The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence in inaccessible suitable habitat. If the species is present, individuals in the project footprint may be affected by threats such as likelihood of disturbance, pest animals (feral horse and pigs) and weeds (Ox-eye daisy).
5. The assessor may also provide new information that can be used to demonstrate that the principle identifying the species as at risk of an SAII, is inaccurate.	Not applicable.	Not applicable.
Likely SAII assessment outcome against relevant principles.	Presence of *Genoplesium subperbum* has been assumed within suitable habitat. The species is only known from two locations near Nerriga and Morton National Park in NSW. The species has a low likelihood of occurring within the project footprint. Therefore, the project is unlikely to be deemed a significant risk to the species becoming extinct due to further reducing the population size of the species that is currently observed, estimated, inferred or reasonably suspected to have a very small population size.	*Glycine latrobeana* has been assumed present over a portion of the project footprint due to survey limitations. The closest known population is within Kosciuszko National Park. The species has a low likelihood of occurring within the project footprint. Therefore, the project is unlikely to be deemed a significant risk to the species becoming extinct due to an impact on the habitat of the species that is currently observed, estimated, inferred or reasonably suspected to have a very limited geographic distribution.

3.1.7 Grevillea iaspicula and Grevillea wilkinsonii

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	***Grevillea iaspicula* Wee Jasper Grevillea**	***Grevillea wilkinsonii* Tumut Grevillea**
Impact summary	The project would result in direct impacts to a total of 3.85 ha of Wee Jasper Grevillea habitat (assumed presence), 52% of which is in moderate to very high condition. Potential indirect impacts to the species include: • Transport of weeds and pathogens from the site to adjacent vegetation • Trampling of threatened flora species • Changed fire regimes.	The project would result in direct impacts to a total of 34.70 ha of Tumut Grevillea habitat (assumed present), 45% of which is in moderate to high condition). Potential indirect impacts to the species include: • Transport of weeds and pathogens from the site to adjacent vegetation • Trampling of threatened flora species • Changed fire regimes.
1. The assessor is required to provide further information in the BDAR or BCAR for any species at risk of an SAII, including the action and measures taken to avoid the direct and indirect impact on the species at risk of an SAII. Where these have been addressed elsewhere the assessor can refer to the relevant sections of the BDAR or BCAR.	*Grevilea iaspicula* is known from seven small populations; five around Wee Jasper and along the steep cliffs of the Goodradigbee River, and two on the shores of Lake Burrinjuck, near Burrinjuck village (Briggs & Leigh 1990 in DPE 2010a). The species grows only on skeletal grey-clay loam on rocky outcrops, sink-holes entrances and cliff bases in limestone country. It occurs in low woodland of Eucalyptus and Brachychiton, generally with an open understorey of shrubs and grasses (DPE 2010a). The species is assumed present within potential habitats within the project footprint but has not been directly recorded. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened flora include: • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1). • Further avoidance and minimisation of impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying the extent of habitats, their existing condition and certainty	*Grevillea wilkinsonii* has a highly restricted distribution in the NSW South-west Slopes region. Its main occurrence is along a 6 km stretch of the Goobarragandra River approximately 20 km east of Tumut where about 1,000 plants are known. The other occurrence is a small population that straddles the boundary of two private properties at Gundagai where only eight mature plants survive. The species generally grows in close proximity to the water, at altitudes between 310 and 340 m. The species is assumed present within potential habitats within the project footprint but has not been directly recorded. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened flora include: • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1). • Further avoidance and minimisation of impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying the extent of habitats, their existing condition and certainty levels regarding species occurrence where assumed

	levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed threatened flora habitats as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of temporarily disturbed areas within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with pathogens, pests and weeds (EMM B19).	present (ie likely/ unlikely to occur subject to further survey). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed threatened flora habitats as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of temporarily disturbed areas within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with pathogens, pests and weeds (EMM B19).
2. The assessor must consult the TBDC and/or other sources to report on the current population of the species including:		2. The assessor must consult the TBDC and/or other sources to report on the current population of the species including:
• evidence of rapid decline (Principle 1, clause 6.7(2)(a) BC Regulation) presented by an estimate of the: ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer), or ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer) as indicated by: an index	***Principle 1 SAII = No*** Based on surveys conducted in 2003, the total number of mature individuals of this species in the wild was estimated to be at least 144, and is unlikely to exceed 250 (Briggs et al., 2010), as only part of one of the seven populations remains uncounted (Bray, 2008). According to the DPIE (2021c), the wild population of *Grevilea iaspicula* has increased. Most notable outcomes to date include significant population	***Principle 1 SAII = No*** There is insufficient data on decline in population to assess *Grevillea wilkinsonii* against this criteria. NSW TSSC (2019) describes that between 1988 to 2017 the species had declined from 298 to 97 plants (67% decline in 19 years). The largest declines were the result of flood events in

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Grevillea iaspicula* Wee Jasper Grevillea	*Grevillea wilkinsonii* Tumut Grevillea
of abundance appropriate to the species; decline in geographic distribution and/or habitat quality; exploitation; effect of introduced species, hybridisation, pathogens, pollutants, competitors or parasites	increases across all sites, from a total population of 120 plants in 2000 to now over 1250 plants (DPIE 2021c). The combination of several management actions has led to an overall population increase of *Grevilea iaspicula* plants in the last five years (DPIE 2021c). This has been achieved through installation of fencing to protect plants from stock and feral goat browsing, weed control, feral goat culling and enhancement plantings (DPIE 2021c).	2010 and 2012. Key threats (NPWS, 2001a) to the species, which are likely to have contributed to its low population are: • Overgrazing: Domestic stock • Weed Invasion: Mixed weeds causing loss/ and degradation of habitat and inhibit recruitment • Native species: Competition with native species • Habitat loss: Loss of key habitat, Vegetation clearing for agricultural purposes, Rural/residential/industrial development. • Land management practices: Uncertainty of future land management practices • Demographic threats: Small population size • Fire: Risk of adverse fire/wildfire • The project may increase some of the above listed threats to the species due to its proximity to Tumut and Gundagai which are within 20 km of the project footprint.
• evidence of small population size (Principle 2, clause 6.7(2)(b) BC Regulation) presented by: ▪ an estimate of the species' current population size in NSW, and ▪ an estimate of the decline in the species' population size in NSW in three years or one generation (whichever is longer), and ▪ where such data is available, an estimate of the number of mature individuals in each subpopulation, or the percentage of mature individuals in each subpopulation, or whether the species is likely to undergo extreme fluctuations	***Principle 2 SAII = No*** According to DPIE (2021c), the wild population of this species has increased to now over 1250 plants. The species in not in decline in the wild as described in DPIE (2021c). According to the DPIE (2021c), the wild population of *Grevilea iaspicula* has increased in the previous 5 years. However, severe drought in 2017–18 resulted in an overall small net population decline in 2019–20 (DPIE 2021c). DPE (2010a) states that the total population of this species is deemed to include a very low number of mature individuals. The small range and population size of this species makes this species susceptible to environmental and demographic stochasticity (DPE 2010).	***Principle 2 SAII = No*** *Grevillea wilkinsonii* has a very highly restricted distribution in the NSW South-west Slopes region. Only two populations, its main occurrence is along a 6 km stretch of the Goobarragandra River approximately 20 km east of Tumut where about 1,000 plants are known. The other occurrence is a small population that straddles the boundary of two private properties at Gundagai where only eight mature plants survive (DPE 2022). DPE (2020) describes that between 1988 to 2017 the species had declined from 298 to 97 plants (67% decline in 19 years). BioNet record data contains 17 records of the species (DPE 2022). Of these records, none are within the last ten years, offering a poor indication of current decline. BioNet record data does not contain enough records to confidently identify a decline in the population over the last three years.

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	***Grevillea iaspicula* Wee Jasper Grevillea**	***Grevillea wilkinsonii* Tumut Grevillea**
		Various surveys of *Grevillea wilkinsonii* have been undertaken at the Goobarragandra River population since 1998 (Taws 2011, Taws 2013, Taws 2018 cited in TSSC 2021). The total number of plants in the naturally occurring patches (not including translocated individuals) has declined from 644 (298 mature) to 514 (291 mature) in 2008, 399 (268 mature) in 2011, 210 (127 mature) in 2012, and 192 (97 mature) in 2017 (Taws 2018 cited in TSSC 2021). There are currently known to be eight mature *Grevillea wilkinsonii* plants in the Gundagai population (J. Briggs in litt. Aug 2016 cited in TSSC 2021).
• evidence of limited geographic range for the threatened species (Principle 3, clause 6.7(2)(c) BC Regulation) presented by: ▪ extent of occurrence ▪ area of occupancy ▪ number of threat-defined locations (geographically or ecologically distinct areas in which a single threatening event may rapidly affect all species occurrences), and ▪ whether the species' population is likely to undergo extreme fluctuations	***Principle 3 SAII = Yes:*** *Extent of Occurrence (ha) = 66.156 km²* *Area of Occupancy (ha) = 40 km²* *No. Threat-defined locations = <= 3 locations* The extent of occurrence for *Grevilea iaspicula* is 66.156 km² (BCD data package). This species grows only on skeletal grey-clay loam on rocky outcrops, sink-holes entrances and cliff bases in limestone country. It occurs in low woodland of Eucalyptus and Brachychiton, generally with an open understorey of shrubs and grasses (DPE 2010a). *Grevilea iaspicula* is recorded in seven small populations; five around Wee Jasper and along the steep cliffs of the Goodradigbee River, and two on the shores of Lake Burrinjuck, near Burrinjuck village (Briggs & Leigh 1990 in DPE 2010a). *Grevilea iaspicula's* area of occupancy is approximately 40 km² (BCD data package). No threat defined locations are known for this species. The distribution of this species overlaps with the Natural Temperate Grassland of the Southern Tablelands of NSW and the ACT EPBC Act-listed TEC. Insufficient data to determine whether the species' population is likely to undergo extreme fluctuations. However, the small	***Principle 3 SAII = Yes*** *Area of Occupancy (ha) = 16 km²* *Extent of Occurrence (ha) = 35.759 km²* *No. Threat-defined locations = <= 3 locations* The extent of occurrence (EOO) was estimated to be 35.759 km² (BCD data package) Area of occupancy (AOO) was estimated to be 16 km² (BCD data package, NSW TSSC 2019) *Grevillea wilkinsonii* has a very highly restricted geographic distribution (TSSC 2021). This species is largely restricted to along the Goobarragandra River east of Tumut (Makinson 1993; Taws 2013; OEH 2018 cited in NSW TSSC 2019). Another small natural population occurs near Gundagai (J. Briggs in litt. March 2018 cited in NSW TSSC 2019). Most threats (see threat section above) impact on the plants and their habitat along the Goobarragandra River where the population occurs. Much of the private land, where 80% of the population occurs, is often used for stock grazing (NSW NPWS 2001; DOE n.d. cited in NSW TSSC 2019). The Gundagai population is located on a hillside close to the town centre on two private properties. Five plants occur in a small remnant (0.5 ha) of *Eucalyptus albens (*White Box) Grassy Woodland, and three plants are located in a private backyard (OEH n.d.; J. Briggs in litt. August

Official

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Grevillea iaspicula* Wee Jasper Grevillea	*Grevillea wilkinsonii* Tumut Grevillea
	range and population size of this species makes this species susceptible to environmental and demographic stochasticity (DPE 2010a).	2016 cited in NSW TSSC 2019). The long-term viability of the Gundagai population is reliant on ongoing active management (TSSC 2021). The distance between the two known populations is approximately 40 km. There is no possibility of natural seed dispersal between them (TSSC 2021). Data deficient – there is currently no documented evidence of extreme fluctuations in the species (NSW TSSC 2019). However, the decline of 67% seen in plant numbers in the naturally occurring sites (Taws 2018) indicates the natural population is declining rather than experiencing a fluctuation (NSW TSSC 2019).
• evidence that the species is unlikely to respond to management (Principle 4, clause 6.7(2)(d) BC Regulation) because: ▪ known reproductive characteristics severely limit the ability to increase the existing population on, or occupy new habitat (eg species is clonal) on, a biodiversity stewardship site ▪ the species is reliant on abiotic habitats which cannot be restored or replaced (eg karst systems) on a biodiversity stewardship site, or ▪ life history traits and/or ecology is known but the ability to control key threatening processes at a biodiversity stewardship site is currently negligible (eg frogs severely impacted by chytrid fungus).	***Principle 4 SAII = No*** The species has no known reproductive characteristics that could severely limit the ability to increase the existing population. Although, the species sets abundant seed and seedlings emerge episodically (Briggs et al. 2010). Levels of seedling recruitment are low and there is limited gene flow among populations, although genetic diversity within and between populations is high (Briggs et al. 2010). The populations are dependent on a persistent seed bank in the soil that regenerates after a fire (DPE 2010a). This species has a moderate sensitivity to gain (DPE 2022). This species population has an improving trend in the wild and has responded well to management actions undertaken so far (DPIE 2021). This species habitat constraint is rocky areas (Limestone rock substrate) (DPE 2022). The species requirement for certain habitat may be difficult to be replicated at biodiversity stewardship sites. Seedling recruitment for this species is episodic and dependent on favourable seasonal conditions, however in favourable conditions when stock grazing is excluded, seedling establishment can be quite abundant (DPE 2022). Threats to this species include:	***Principle 4 SAII = No*** The species has no known reproductive characteristics that could severely limit the ability to increase the existing population, however, it is believed to be insect pollinated (NPWS 2001a). BioNet states that the species has a high sensitivity to gain dependent on the effectiveness of management to control threats (DPE 2022). There is no known critical habitat for this species. The life-history traits and ecology of *Grevillea wilkinsonii* is known. 'Loss and degradation of native plant and animal habitat by invasion of escaped garden plants, including aquatic plants' and 'Invasion of native plant communities by exotic perennial grasses' are listed as a KTP under the final determination (TSSC 2021). The main threats to this species as described above can reasonably be controlled within a biodiversity stewardship site.

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	***Grevillea iaspicula* Wee Jasper Grevillea**	***Grevillea wilkinsonii* Tumut Grevillea**
	• Weed invasion: *Rubus spp.* poses the greatest threat but some sites are heavily infested with Sweet Briar, St. John's Wort and other woody weeds including Cotoneaster and Photinia. • Grazing: C*apra hircus* (Feral Goat) and domestic stock grazing has degraded or caused loss of habitat (DPIE 2021). Overabundant native herbivores also pose a threat to some populations, most notably from browsing by wallabies (DPE 2022) • Demographic threats: small population size leaves this species vulnerable to disturbance through fire and drought. • Fire: Loss and degradation of habitat in the early 2000's due to bushfires. Most of the mature plans and seedlings were killed within the populations that were burnt (Morris 2000 as cited in DPIE 2021c). The time taken for seedlings to reach maturity and produce seed is likely to be at least several years (DPE 2022). Frequent fires may therefore interrupt the life cycle and result in population declines (Keith 1996). 'High frequency fire resulting in disruption of life cycle processes in plants and animals and loss of vegetation structure and composition' is listed as a KTP under the *Biodiversity Conservation Act 2016.* The majority of these threats can be reasonably controlled within a biodiversity stewardship site, therefore this species is expected to be responsive to management.	
3. Where the TBDC indicates data is 'unknown' or 'data deficient' for a species for a criterion listed in Subsection 9.1.2(2.), the assessor must record this in the BDAR or BCAR.	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this species for a criterion listed in Subsection 9.1.1(2.). Some responses in this consideration of SAII cannot be completed comprehensively due to the following: The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this species for a criterion listed in Subsection 9.1.1(2.). 	A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. As such, we have noted the knowledge gaps in the TBDC and provided responses using information from the limited available sources.	A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. As such, we have noted the knowledge gaps in the TBDC and provided responses using information from the limited available sources.
4. In relation to the impacts from the proposal on the species at risk of an SAII, the assessor must include data and information on:		
• the impact on the species' population (Principles 1 and 2) presented by: ▪ an estimate of the number of individuals (mature and immature) present in the subpopulation on the subject land (the site may intersect or encompass the subpopulation) and as a percentage of the total NSW population, and ▪ an estimate of the number of individuals (mature and immature) to be impacted by the proposal and as a percentage of the total NSW population, or ▪ if the species' unit of measure is area, provide data on the number of individuals on the site, and the estimated number that will be impacted, along with the area of habitat to be impacted by the proposal	It is not possible to determine how many individuals comprise the sub-population on the site from the available data. Suitable habitat for Wee Jasper Grevillea was detected within the project footprint in the Crookwell, Inland Slopes and Murrumbateman IBRA Subregions. Targeted flora surveys undertaken in areas of suitable habitat within the project footprint did not locate the species, as such a percentage present in the subpopulation of the total population cannot be attained. There are 24 nearby records of this species (1,080 estimated individuals), the closest record is 11 km outside the project footprint (DPE 2022). It is known present in Bondo and Murrumbateman IBRA Subregions. Targeted flora surveys within the project footprint did not locate the species. Where survey effort was not adequate, species presence has been assumed within potential habitat. Given the species was not recorded and is only assumed present, and the limited information available on the total population of the species, it is not possible to determine the number of individuals (mature and immature) to be impacted by the project and as a percentage of the total NSW population. The species unit of measure is count. The species was not located within the project footprint despite targeted surveys in accessible land. Where survey effort was not adequate, species presence has been assumed within potential habitat. There are	It is not possible to determine how many individuals comprise the sub-population on the site from the available data. Suitable habitat for *Grevillea wilkinsonii* occurs within the project footprint within PCTs 266, 278 and 301 in the Inland Slopes IBRA Subregion. Targeted flora surveys within the project footprint did not locate the species. Where survey effort was not adequate, species presence has been assumed within suitable habitat. There are 17 records near the project, and the closest is 14 km from the project footprint (DPE 2022). Given the species was not recorded and is only assumed present, and the limited information available on the total population of the species, it is not possible to determine the number of individuals (mature and immature) that would be impacted by the project and as a percentage of the total NSW population. The species unit of measure is area. The species was not located within the project footprint despite targeted surveys in accessible land. Where survey effort was not adequate, species presence has been assumed within suitable habitat. The total area of this species suitable habitat that would be directly impacted by the project is 34.70 ha.

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Grevillea iaspicula* Wee Jasper Grevillea	*Grevillea wilkinsonii* Tumut Grevillea
	no BioNet records within the project footprint. The project would result in the direct impact to 3.85 ha of potential habitat for this species within the project footprint.	
• impact on geographic range (Principles 1 and 3) presented by: ▪ the area of the species' geographic range to be impacted by the proposal in hectares, and a percentage of the total area of occupancy or extent of occupancy within NSW ▪ the impact on the subpopulation as either: all individuals will be impacted (subpopulation eliminated); OR impact will affect some individuals and habitat; OR impact will affect some habitat, but no individuals of the species will be directly impacted ▪ to determine if the persisting subpopulation that is fragmented will remain viable, estimate (based on published and unpublished sources such as scientific publications, technical reports, databases or documented field observations) the habitat area required to support the remaining population, and habitat available within dispersal distance, and distance over which genetic exchange can occur (eg seed dispersal) and pollination distance for the species ▪ to determine changes in threats affecting remaining subpopulations and habitat if the proposed impact proceeds, estimate changes in environmental factors including changes to fire regimes (frequency, severity); hydrology, pollutants; species interactions (increased competition and effects on pollinators or dispersal); fragmentation, increased edge effects, likelihood of disturbance; and disease, pathogens and parasites. Where these factors	The project footprint contains 64.53 ha of suitable habitat in the form of a species habitat polygon, of this the project would impact on 3.85 ha (6%). The extent of occurrence (EOO) was estimated to be 66.156 km^2 (6,615.6 ha) (BCD data package). Therefore, the project would impact less than 0.06% of this species' extent of occurrence. The area of occupancy (AOO) was estimated to be 40 $km^{2,}$ (4,000 ha) therefore the project would impact 0.1 % of the AOO for the species. The project would impact on 3.85 ha (6%) of the 64.53 ha of potential habitat for the species within the project footprint. The project would impact some habitat, but no individuals of the species is likely to be directly impacted in areas where targeted surveys were undertaken as the species was not detected. In areas that comprise the species polygon that were not adequately surveyed, species presence has been assumed. As such, the number of individuals cannot be quantified. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. Therefore, if the species is present, the project would not create a barrier to dispersal of the species. The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence in inaccessible suitable habitat. If the species is present, individuals in the project footprint may be affected by changes to fire regimes, increased edge effects, disturbance from vegetation removal and maintenance within the clearing footprint.	The project would impact on 34.70 ha (11%) of the 304.72 ha of suitable habitat for the species within the project footprint. The extent of occurrence (EOO) was estimated to be 35.759 km^2 (3,575.9 ha) BCD data package). Therefore, the project may impact up to 1% of this species' extent of occurrence. The area of occupancy (AOO) was estimated to be 16 km^2 (1,600 ha) BCD data package). Therefore, the project may impact up to 2.2% of this species' extent of occurrence. The project would impact on 34.70 ha (11%) of the 304.72 ha of potential habitat for the species within the project footprint. The project would impact some habitat, but no individuals of the species is likely to be directly impacted in areas where targeted surveys were undertaken as the species was not detected. In areas that comprise the species polygon that could not be adequately surveyed, species presence has been assumed. As such, the number of individuals cannot be quantified. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. Therefore, if the species is present, the project would not create a barrier to dispersal of the species. The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence. If the species is present, individuals in the project footprint may be affected by changes to fire regimes in surrounding vegetation as a result of management for asset protection, increased edge effects, altered hydrology due to drainage lines within the project footprint, off-road vehicle activities (access tracks).

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Grevillea iaspicula* Wee Jasper Grevillea	*Grevillea wilkinsonii* Tumut Grevillea
have been considered elsewhere in relation to the target species, the assessor may refer to the relevant sections of the BDAR or BCAR.		
5. The assessor may also provide new information that can be used to demonstrate that the principle identifying the species as at risk of an SAII, is inaccurate.	Not applicable.	Not applicable.
Likely SAII assessment outcome against relevant principles.	*Grevillea iaspicula* has been assumed present over a portion of the project footprint due to survey limitations. The species is only known to occur on the shores of Lake Burrinjuck. The species has a low likelihood of occurring within the project footprint. Therefore, the project is unlikely to be deemed a significant risk to the species becoming extinct due to an impact on the habitat of the species that is currently observed, estimated, inferred or reasonably suspected to have a very limited geographic distribution.	*Grevillea wilkinsonii* has been assumed present over a portion of the project footprint due to survey limitations. The species is only known from two locations in NSW: Goobarragandra River and overlapping two properties at Gundagai. The species has a low likelihood of occurring within the project footprint. Therefore, the project is unlikely to be deemed a significant risk to the species becoming extinct due to an impact on the habitat of the species that is currently observed, estimated, inferred or reasonably suspected to have a very limited geographic distribution.

3.1.8 Irenepharsus magicus and Pomaderris delicata

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	***Irenepharsus magicus* Elusive Cress**	***Pomaderris delicata* Delicate Pomaderris**
Impact summary	The project would result in direct impacts to a total of 26.50 ha of Elusive Cress habitat (assumed presence), all of which is in high condition. Potential indirect impacts to the species include: • Transport of weeds and pathogens from the site to adjacent vegetation • Trampling of threatened flora species • Changed fire regimes.	The project would result in direct impacts to a total of 8.00 ha of Delicate Pomaderris habitat (assumed present), all of which is in moderate to high condition. Potential indirect impacts to the species include: • Transport of weeds and pathogens from the site to adjacent vegetation • Trampling of threatened flora species • Changed fire regimes.
1. The assessor is required to provide further information in the BDAR or BCAR for any species at risk of an SAII, including the action and measures taken to avoid the direct and indirect impact on the species at risk of an SAII. Where these have been addressed elsewhere the assessor can refer to the relevant sections of the BDAR or BCAR.	*Irenepharsus magicus* occurs as a single population within Kosciuszko National Park. Vegetation associations at known sites are typically 900 m above sea level, growing on mineral soil in open, recently disturbed embankments (NPWS 2001). The species is assumed present within potential habitats within the project footprint but has not been directly recorded. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened flora include: • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1). • Further avoidance and minimisation of impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying the extent of habitats, their existing condition and certainty levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed	*Pomaderris delicata* is known from only two sites; between Goulburn and Bungonia and south of Windellama (Cullula). Both known subpopulations of the species grow in dry sclerophyll forest dominated by *Eucalyptus sieberi* with a dense shrubby understorey on shallow, rocky soil, derived from Silurian and Ordovician sediments (Walsh & Coates 1997 cited in TSSC 2018). The species is assumed present within potential habitats within the project footprint but has not been directly recorded. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened flora include: • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1). • Further avoidance and minimisation of impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying the extent of habitats, their existing condition and certainty levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey).

	threatened flora habitats as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of temporarily disturbed areas within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with pathogens, pests and weeds (EMM B19).	• Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed threatened flora habitats as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of temporarily disturbed areas within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with pathogens, pests and weeds (EMM B19).
2. The assessor must consult the TBDC and/or other sources to report on the current population of the species including:		
• evidence of rapid decline (Principle 1, clause 6.7(2)(a) BC Regulation) presented by an estimate of the: ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer), or ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer) as indicated by: an index of abundance appropriate to the species; decline in geographic distribution and/or habitat quality; exploitation; effect of	***Principle 1 SAII = No*** According to the NSW Scientific Committee, there is a single population Kosciuszko National Park. The decline in the population of the species in NSW in the last 10 years cannot be assessed at this time because the species information available in BioNet and other reliable/peer reviewed information about the species is limited and does not address this aspect. This species is noted 'growing on mineral soil of embankment' and open, recently disturbed areas (NPWS 2001; BioNet 2022).	***Principle 1 SAII = No*** Generation length is uncertain, however, it is estimated to be 8-26 years (NSWSC 2009 cited in TSSC 2018). There has been an observed decline between 2002 (>215 plants) and 2016 (~86 plants) (TSSC 2018). This above decline is not considered to be simply the result of plant senescence (eg following fire or other disturbance) as a number of cooccurring species have been impacted and showed signs of dieback and decline. However, it is unknown

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Irenepharsus magicus* Elusive Cress	*Pomaderris delicata* Delicate Pomaderris
introduced species, hybridisation, pathogens, pollutants, competitors or parasites	Key Threats (NPWS 2001; BioNet 2022) to the species, which are likely to have contributed to its low population are: • Lack of knowledge: Insufficient understanding of distribution and/or abundance • Habitat loss: the removal of disturbance activities such as logging and grazing in Kosciuszko National Park has limited opportunities for the species to establish • Demographic Threats: Restricted distribution only known in one location, not often sampled as it may be dismissed as a weed. • The project is not likely to increase any of the above listed threats to the species.	whether this decline is a result of local environmental or site conditions, a pathogen or some other factor (TSSC 2018).
• evidence of small population size (Principle 2, clause 6.7(2)(b) BC Regulation) presented by: ▪ an estimate of the species' current population size in NSW, and ▪ an estimate of the decline in the species' population size in NSW in three years or one generation (whichever is longer), and ▪ where such data is available, an estimate of the number of mature individuals in each subpopulation, or the percentage of mature individuals in each subpopulation, or whether the species is likely to undergo extreme fluctuations	***Principle 2 SAII = Yes*** According to the NSW Scientific Committee, there is a single population in the upper Geehi Valley, Kosciuszko National Park (NPWS). There are no records to suggest a decline in distribution since there few collections of this species and little habitat information, due to the plant flowering in autumn and looking like a weed. The species information available in BioNet and other reliable/peer reviewed information about the species is limited and does not address these aspects. BioNet record data contains 1 record of the species dated in 1954 offering a poor indication of decline. BioNet record data does not contain enough records to confidently identify a decline in the population over the last three years. There is little evidence to suggest whether the species is likely to undergo extreme fluctuation. The *I. magicus* is described as likely being an opportunistic, disturbance-loving species (NPWS 2001).	**Principle 2 SAII = No** The most recent estimate of the species' population size in 2016 was approximately 86 plants (TSSC 2018). Assuming a constant rate of decline for the most conservative estimate of generation length of 8 years, decline is estimated to be >32% in one generation (TSSC 2018). The most recent estimate of the species' population size in 2016 was 67 and 19 mature individuals in each subpopulation respectively (TSSC 2018). It is unknown (but possible) whether the species is likely to undergo extreme fluctuations (TSSC 2018). However, the observed decline between 2002 (>215 plants) and 2016 (approximately 86 plants) suggests that the species has undergone extreme fluctuations in the past (TSSC 2018).
• evidence of limited geographic range for the threatened species (Principle 3, clause 6.7(2)(c) BC Regulation) presented by:	***Principle 3 SAII = Yes*** *Area of Occupancy (ha) = 4 km^2* *Extent of Occurrence (ha) = < 10 km^2*	***Principle 3 SAII = Yes:*** *Extent of Occurrence (ha) = < 100 km^2* *Area of Occupancy (ha) = < 10 km^2*

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Irenepharsus magicus* Elusive Cress	*Pomaderris delicata* Delicate Pomaderris
▪ extent of occurrence ▪ area of occupancy ▪ number of threat-defined locations (geographically or ecologically distinct areas in which a single threatening event may rapidly affect all species occurrences), and ▪ whether the species' population is likely to undergo extreme fluctuations	*Threat-defined locations = <= 3 locations* The size and area inhabited by the existing population of *I. magicus* is limited in geographic range. There are no nearby records of *I. magicus* within 10 km of the project footprint. BCD data package states the extent of occurrence for this species is 4 km^2. BioNet states the area of occupancy is less than 10 km^2. Vegetation associations at known sites are typically Kosciuszko National Park at approximately 3,000 ft above sea level, growing on mineral soil in open, recently disturbed embankments (NPWS 2001). The current distribution of this species is partially known, further identification of threat-defined locations is likely to occur. However, any potentially suitable habitat ought to be considered a threat defined location within proximity to the known population. There is insufficient data to determine whether the species population size would be likely to undergo extreme natural fluctuations.	*No. Threat-defined locations = <= 3 locations* Extent of Occurrence: The Extent of Occurrence of this species is < 12 km^2 (NSWSC 2019). Area of Occupancy: The Area of Occupancy for this species is < 8 km^2 (NSWSC 2019). Number of threat-defined locations: This species is known from two populations south-west of Goulburn that are separated by approximately 30 km (McDougall, K pers. comm. 2009 cited in NSWSC 2002, NSWSC 2010a). Both populations occur in road reserves and adjoin private property and each population is bisected by a road (NSWSC 2002, NSWSC 2010a). Extreme fluctuations: Low population numbers and the restricted distribution of this species make it susceptible to demographic and environmental stochasticity (NSWSC 2019). The greatest immediate threat to these population is from activities such as roadwork, slashing and fire prevention works that may be carried out in road reserves (NSWSC 2010a).
• evidence that the species is unlikely to respond to management (Principle 4, clause 6.7(2)(d) BC Regulation) because: ▪ known reproductive characteristics severely limit the ability to increase the existing population on, or occupy new habitat (eg species is clonal) on, a biodiversity stewardship site ▪ the species is reliant on abiotic habitats which cannot be restored or replaced (eg karst systems) on a biodiversity stewardship site, or ▪ life history traits and/or ecology is known but the ability to control key threatening processes at a biodiversity stewardship site is currently	***Principle 4 SAII = No*** The species has no known reproductive characteristics that could severely limit the ability to increase the existing population. BioNet states that the species has a high sensitivity to gain, however ecology and response to management is poorly known. There is no known critical habitat for this species. The life-history traits and ecology of *I. magicus* is not known well. There are no specified KFTs for this species.	***Principle 4 SAII = No*** The species has no known reproductive characteristics that could severely limit the ability to occupy new habitat on a biodiversity stewardship site. The species has a high sensitivity to gain (DPE 2022). Based on the species' known habitat preferences it does not appear to be reliant on abiotic habitats which cannot be restored or replaced on a biodiversity stewardship site. The life- history and ecology relevant to persistence of this species (eg germination requirements, flowering and successful seed production, development of soil seed banks and juvenile plant growth and survival) are not well known (TSSC 2018). Sensitivity to KTP that cannot be controlled (eg

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Irenepharsus magicus* Elusive Cress	*Pomaderris delicata* Delicate Pomaderris
negligible (eg frogs severely impacted by chytrid fungus).		sensitivity of the species to the pathogen *Phytophthora cinnamomic*) is also not well known (TSSC 2018).
3. Where the TBDC indicates data is 'unknown' or 'data deficient' for a species for a criterion listed in Subsection 9.1.2(2.), the assessor must record this in the BDAR or BCAR.	Some responses in this consideration of SAII cannot be completed comprehensively due to the following: • The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited • A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. • As such, we have noted the knowledge gaps in the TBDC and provided responses using information from the limited available sources.	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this species for a criterion listed in Subsection 9.1.1(2.). Some responses in this consideration of SAII cannot be completed comprehensively due to the following: • The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited • A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. • As such, we have noted the knowledge gaps in the TBDC and provided responses using information from the limited available sources.
4. In relation to the impacts from the proposal on the species at risk of an SAII, the assessor must include data and information on:		
• the impact on the species' population (Principles 1 and 2) presented by: ▪ an estimate of the number of individuals (mature and immature) present in the subpopulation on the subject land (the site may intersect or encompass the subpopulation) and as a percentage of the total NSW population, and ▪ an estimate of the number of individuals (mature and immature) to be impacted by the proposal and as a percentage of the total NSW population, or ▪ if the species' unit of measure is area, provide data on the number of individuals on the site, and the estimated number that will be	Habitat for *I. magicus* was detected within the project footprint in the Snowy Mountains IBRA Subregion. Targeted flora surveys within the project footprint did not locate the species. Where survey effort was not adequate, species presence has been assumed within suitable habitat. There are no nearby records (DPE 2022). Given the species was not recorded and is only assumed present, and the limited information available on the total population of the species, it is not possible to determine the number of individuals (mature and immature) that would be impacted by the project and as a percentage of the total NSW population. The species' unit of measure is area. The species was not located within the project footprint despite targeted surveys in accessible land. Where survey effort was not adequate, species	It is not possible to determine how many individuals comprise the sub-population on the site from the available data. Potential habitat for *Pomaderris delicata* was detected within the project footprint within the Bungonia IBRA Subregion. Targeted flora surveys within the project footprint did not locate the species. Where survey effort was not adequate, species presence has been assumed within potential habitat. There are no records within 20 km of the project (DPE 2022). Given the species was not recorded and is only assumed present, and the limited information available on the total population of the species, it is not possible to determine the number of individuals (mature and immature) to be impacted by the project and as a percentage of the total NSW population.

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Irenepharsus magicus* Elusive Cress	*Pomaderris delicata* Delicate Pomaderris
impacted, along with the area of habitat to be impacted by the proposal	presence has been assumed within suitable habitat. The total area of this species suitable habitat that would be directly impacted by the project is 26.50 ha.	The species unit of measure is area. The species was not located within the project footprint despite targeted surveys in accessible land. Certain areas of potential suitable habitat within the project footprint were inaccessible for surveys, therefore the species has been assumed present in these areas. The total area of this species habitat to be directly impacted by the project is 8.00 ha.
• impact on geographic range (Principles 1 and 3) presented by: ▪ the area of the species' geographic range to be impacted by the proposal in hectares, and a percentage of the total area of occupancy or extent of occupancy within NSW ▪ the impact on the subpopulation as either: all individuals will be impacted (subpopulation eliminated); OR impact will affect some individuals and habitat; OR impact will affect some habitat, but no individuals of the species will be directly impacted ▪ to determine if the persisting subpopulation that is fragmented will remain viable, estimate (based on published and unpublished sources such as scientific publications, technical reports, databases or documented field observations) the habitat area required to support the remaining population, and habitat available within dispersal distance, and distance over which genetic exchange can occur (eg seed dispersal) and pollination distance for the species ▪ to determine changes in threats affecting remaining subpopulations and habitat if the proposed impact proceeds, estimate changes in environmental factors including changes to fire regimes (frequency, severity); hydrology, pollutants; species interactions (increased	The project footprint contains 58.63 ha of suitable habitat, 26.50 ha (45%) would be impacted by the project. The area of occupancy (AOO) was estimated to be 4 km^2 (400 ha) (BCD data package). Therefore, the project would impact an estimated maximum of 6.6% of this species' AOO. The project would impact on 26.50 ha (45%) of the 58.63 ha of suitable habitat for the species within the project footprint. The project would impact some habitat, but no individuals of the species is likely to be directly impacted in areas where targeted surveys were undertaken as the species was not detected. In areas that comprise the species polygon that could not be adequately surveyed, species presence has been assumed. As such, the number of individuals cannot be quantified. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. Therefore, if the species is present, the project would not create a barrier to dispersal of the species. The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence in suitable habitat. If the species is present, individuals in the project footprint may be affected by changes to fire regimes in surrounding vegetation as a result of management for asset protection, increased edge effects, altered hydrology due to drainage lines within the project footprint, off-road vehicle activities (access tracks).	The project footprint contains 42.16 ha of potential habitat, 8.00 ha (19%) of this would be impacted by the project. The extent of occurrence (EOO) was estimated to be < 12 km^2 (NSWSC 2019). Therefore, the project may impact an estimated 1% of this species' EOO. The project would impact on 8.00 ha (19%) of the 42.16 ha of potential habitat for the species within the project footprint. The project would impact some habitat, but no individuals of the species is likely to be directly impacted in areas where targeted surveys were undertaken as the species was not detected. In areas that comprise the species polygon that could not be adequately surveyed, species presence has been assumed. As such, the number of individuals cannot be quantified. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. Therefore, if the species is present, the project would not create a barrier to dispersal of the species. The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence in inaccessible suitable habitat. If the species is present, individuals in the project footprint may be affected by changes to fire regimes, increased edge effects, disturbance from vegetation removal and maintenance within the clearing footprint.

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Irenepharsus magicus* Elusive Cress	*Pomaderris delicata* Delicate Pomaderris
competition and effects on pollinators or dispersal); fragmentation, increased edge effects, likelihood of disturbance; and disease, pathogens and parasites. Where these factors have been considered elsewhere in relation to the target species, the assessor may refer to the relevant sections of the BDAR or BCAR.		
5. The assessor may also provide new information that can be used to demonstrate that the principle identifying the species as at risk of an SAII, is inaccurate.	Not applicable.	Not applicable.
Likely SAII assessment outcome against relevant principles.	Elusive Cress has been assumed present over a portion of the project footprint due to survey limitations. Despite this, the species is considered to have a low likelihood of occurring within the project footprint. The only known records from Geehi Dam within Kosciuszko National Park. Therefore, the project is unlikely to be deemed a significant risk to the species becoming extinct due to either further reducing the population size of the species that is currently observed, estimated, inferred or reasonably suspected to have a very small population size, or due to an impact on the habitat of the species that is currently observed, estimated, inferred or reasonably suspected to have a very limited geographic distribution.	Pomaderris delicata has been assumed present over a portion of the project footprint due to survey limitations. The species is known from only two sites: between Goulburn and Bungonia and south of Windellama. The species has a low likelihood of occurring within the project footprint. Therefore, the project is unlikely to be deemed a significant risk to the species becoming extinct due to an impact on the habitat of the species that is currently observed, estimated, inferred or reasonably suspected to have a very limited geographic distribution.

3.1.9 Pomaderris pallida and Zieria obcordata

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	***Pomaderris pallida* Pale Pomaderris**	***Zieria obcordata* Granite Zieria**
Impact summary	The project would result in direct impacts to a total of 0.77 ha of Pale Pomaderris habitat (assumed presence), all of which is in moderate to very high condition. Potential indirect impacts to the species include: • Transport of weeds and pathogens from the site to adjacent vegetation • Trampling of threatened flora species • Changed fire regimes.	The project would result in direct impacts to a total of 43.40 ha of Granite Zieria habitat. Potential indirect impacts to the species include: • Transport of weeds and pathogens from the site to adjacent vegetation • Trampling of threatened flora species • Changed fire regimes.
1. The assessor is required to provide further information in the BDAR or BCAR for any species at risk of an SAII, including the action and measures taken to avoid the direct and indirect impact on the species at risk of an SAII. Where these have been addressed elsewhere the assessor can refer to the relevant sections of the BDAR or BCAR.	In NSW, *Pomaderris pallida* has been recorded from near Kydra Trig (north-west of Nimmitabel), Tinderry Nature Reserve, the Queanbeyan River (near Queanbeyan), the Shoalhaven River (between Bungonia and Warri), the Murrumbidgee River west of the ACT and the Byadbo area in Kosciuszko National Park (DPE 2022). The species is found in dry open forests and shrub communities associated with *Eucalyptus mannifera–E. macrorhynca– Callitris* woodland on granite slopes, river slopes and hillsides (TSSC 2008). The species is assumed present within potential habitats within the project footprint but has not been directly recorded. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened flora include: • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1). • Further avoidance and minimisation of impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying the extent of habitats, their existing condition and certainty levels regarding	*Zieria obcordata* occurs at two sites with a geographic range of 105 km. These are in the Wuuluman area near Wellington and Crackerjack Rock/Rock Forests area north-west of Bathurst. The species grows in Eucalypt woodland or shrubland dominated by species of Acacia on rocky hillsides. Also occurs in Eucalyptus and Callitris dominated woodland with an open, low shrub understorey, on moderately steep, mainly west to north-facing slopes in sandy loam amongst granite boulders. The altitude range of sites is 500 to 830 m. The species is assumed present within potential habitats within the project footprint but has not been directly recorded. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened flora include: • Avoiding and minimising impacts through route refinement and prioritising works within existing degraded (i.e. low vegetation integrity (VI)) remnants (EMM B1). • Further avoidance and minimisation of impacts to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying the extent of habitats, their existing condition and certainty

	species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed threatened flora habitats as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of temporarily disturbed areas within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with pathogens, pests and weeds (EMM B19).	levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed threatened flora habitats as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, construction management and post-construction rehabilitation of temporarily disturbed areas within the project footprint (EMM B18). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with pathogens, pests and weeds (EMM B19).
2. The assessor must consult the TBDC and/or other sources to report on the current population of the species including:		2. The assessor must consult the TBDC and/or other sources to report on the current population of the species including:
• evidence of rapid decline (Principle 1, clause 6.7(2)(a) BC Regulation) presented by an estimate of the: ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer), or	***Principle 1 SAII = No*** There is insufficient data to assess the decline in the population of the species in NSW in the last 10 years. Long term population data is not available for this species in NSW. Therefore, population estimates cannot be accurately determined. However, key threats to the species, which are likely to have contributed to its low population are habitat loss due to rural	***Principle 1 SAII = No*** There is insufficient data to show a meaningful trend yet. However, *Zieria obcordata* is thought to be declining in numbers mainly due to grazing by domestic stock and wallabies (DPIE 2020). Other threats to the species include (DPIE 2020):

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Pomaderris pallida* Pale Pomaderris	*Zieria obcordata* Granite Zieria
▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer) as indicated by: an index of abundance appropriate to the species; decline in geographic distribution and/or habitat quality; exploitation; effect of introduced species, hybridisation, pathogens, pollutants, competitors or parasites	residential development, weed competition (mainly from *Rubus spp.*), browsing by feral goats (*Capra hircus*), inappropriate fire regimes, increasing fragmentation and loss of remnants (TSSC 2008).	• Weed invasion (numerous exotic forbs, grasses and tree of heaven) • Habitat degradation (destruction of native understorey and microhabitats such as crevices between boulders and fallen branches) • Sites vulnerable to changes in stocking practices (such as the introduction of goats) • Limited observation of seedlings and juveniles. Browsing may be destroying the flowers and limiting subsequent seed pod growth • total population size and extent of occupancy of the species not being accurately known until the majority of suitable habitat between known populations has been adequately surveyed • Loss of mature plants and no regeneration due to repeated and lengthy dry periods combined with temperature extremes over summer months.
• evidence of small population size (Principle 2, clause 6.7(2)(b) BC Regulation) presented by: ▪ an estimate of the species' current population size in NSW, and ▪ an estimate of the decline in the species' population size in NSW in three years or one generation (whichever is longer), and ▪ where such data is available, an estimate of the number of mature individuals in each subpopulation, or the percentage of mature individuals in each subpopulation, or whether the species is likely to undergo extreme fluctuations	***Principle 2 SAII = No*** The Namadgi National Park, Bullen Range Nature Reserve and Stony Creek Nature Reserve have populations of <1000 individuals each (TSSC 2018). This species has 6 known populations in southern NSW, although population data is not available for these sites (DPE 2022). There was a report of a large population in a nature park in Canberra, leading to the suggestion that the species may not be as rare as once thought (Walker 1997 as cited in TSSC 2008). There is insufficient data to assess the decline in distribution of this species since there few collections and little habitat information, due to the plant flowering in autumn and looking like a weed. Research priority for this species would address these issues with aims to monitor and assess population size, distribution, ecological requirement and the relative impacts of threatening processes (TSSC 2008). In NSW, no estimates are available on the number of mature individuals. There is little data on mature individual numbers, with	***Principle 2 SAII = Yes*** Only two populations, totalling around 900 individuals occur in central west NSW: these are in the Wuuluman area near Wellington, comprising of a single subpopulation over 3 sites and Crackerjack Rock/Rock Forests area north-west of Bathurst (DPE 2022). *Zieria obcordata* is a naturally rare species, characterised by extremely low population numbers across a highly restricted geographic range and it is unknown whether the species is currently declining (DEC 2007). Occurs at two sites with a geographic range of 105 km. These are in the Wuuluman area near Wellington, with of a single subpopulation over 3 sites comprising up to 200 plants and Crackerjack Rock/Rock Forests area north-west of Bathurst, with a subpopulation comprising of 14 sites, totalling to approximately 700 adults plants after good seasons (DPE 2022).

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Pomaderris pallida* Pale Pomaderris	*Zieria obcordata* Granite Zieria
	only three sites, these being Namadgi National Park, Bullen Range Nature Reserve and Stony Creek Nature Reserve, having population estimates assigned to them, which have populations of <1000 individuals each (TSSC 2008). The number of mature individuals is not known.	
• evidence of limited geographic range for the threatened species (Principle 3, clause 6.7(2)I BC Regulation) presented by: ▪ extent of occurrence ▪ area of occupancy ▪ number of threat-defined locations (geographically or ecologically distinct areas in which a single threatening event may rapidly affect all species occurrences), and ▪ whether the species' population is likely to undergo extreme fluctuations	***Principle 3 SAII = No*** *Extent of Occurrence (ha) = < 100 km^2* *Area of Occupancy (ha) = < 10 km^2* *No. Threat-defined locations = <= 3 locations* No. Threat-defined locations: insufficient data. The current distribution of this species is reasonably well known, further identification of threat-defined locations is likely to occur as it is a research priority (TSSC 2008). However, any potentially suitable habitat ought to be considered a threat defined location within proximity to the known population. The main potential threat this species includes extinction through stochastic processes (DECC NSW 2005 as cited in TSSC 2008). There is insufficient data to determine whether the species population size would be likely to undergo extreme natural fluctuations.	***Principle 3 SAII = No*** Extent of Occurrence: Insufficient data to determine Area of Occupancy: Insufficient data to determine. Total population size and extent of occupancy of the species is not accurately known until majority of suitable habitat between known populations has been adequately surveyed (DPE 2022). Number of threat-defined locations: There is insufficient data to determine the number of threat-defined locations for this species. The species is currently known from only two populations in central west NSW. This species could be threatened by environmental and demographic stochasticity due to its very highly restricted distribution and small population size, with the possibility of a single event causing the extinction of the species (DEC 2007). Extreme fluctuations: The two currently known populations appear to fluctuate in numbers over time, although whether this is due to climatic responses, survey variation or some other factor is currently not known (DEC 2007).
• evidence that the species is unlikely to respond to management (Principle 4, clause 6.7(2)(d) BC Regulation) because: ▪ known reproductive characteristics severely limit the ability to increase the existing population on, or occupy new habitat (eg species is clonal) on, a biodiversity stewardship site ▪ the species is reliant on abiotic habitats which cannot be restored or replaced (eg	***Principle 4 SAII = No*** The species has no known reproductive characteristics that could severely limit the ability to increase the existing population (DPE 2022). There is no known critical habitat for this species. BioNet states that the species has a very high sensitivity to gain (DPE 2022). The species does not appear to be reliant on abiotic habitats which cannot be restored or replaced on a biodiversity stewardship site.	***Principle 4 SAII = Yes*** Very little is known about the ecology and reproductive biology of the species except that the species possesses functional pollen and is genetically self-incompatible, thus requiring pollen from other individuals to set seed. Both populations at present, however, are geographically separated to the extent that it is unlikely that cross-pollination occurs between the two populations. Further research is required in these areas to better understand the species and its ecological requirements (DEC 2007).

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Pomaderris pallida* Pale Pomaderris	*Zieria obcordata* Granite Zieria
karst systems) on a biodiversity stewardship site, or ▪ life history traits and/or ecology is known but the ability to control key threatening processes at a biodiversity stewardship site is currently negligible (eg frogs severely impacted by chytrid fungus).	The life-history traits and ecology of this species is not known well. There are no specified KTPs for this species. A research priority into reproductive ecology to determine the requirements for successful establishment (TSSC 2008).	BioNet states that the species has a high sensitivity to gain dependent on the effectiveness of management to control threats (DPE 2022). This species habitat constraint is land containing granite boulders or rocky outcrops with 100 m (DPE 2022). The species requirement for certain habitat may be difficult to be replicated at biodiversity stewardship sites. The ecology of the species is poorly understood, particularly with regard to the effects of threats on the species (DEC 2007). This species requires the application of ecological fire management (DPE 2022). The main threats to this species as described above can reasonably be controlled within a biodiversity stewardship site.
3. Where the TBDC indicates data is 'unknown' or 'data deficient' for a species for a criterion listed in Subsection 9.1.2(2.), the assessor must record this in the BDAR or BCAR.	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this species for a criterion listed in Subsection 9.1.1(2.). Some responses in this consideration of SAII cannot be completed comprehensively due to the following: • The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited • A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. • As such, we have noted the knowledge gaps in the TBDC and provided responses using information from the limited available sources.	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this species for a criterion listed in Subsection 9.1.1(2.). Some responses in this consideration of SAII cannot be completed comprehensively due to the following: • The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited • A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. • As such, we have noted the knowledge gaps in the TBDC and provided responses using information from the limited available sources.
4. In relation to the impacts from the proposal on the species at risk of an SAII, the assessor must include data and information on:		
• the impact on the species' population (Principles 1 and 2) presented by: ▪ an estimate of the number of individuals (mature and immature) present in the subpopulation on the subject land (the site	It is not possible to determine how many individuals comprise the sub-population on the site from the available data. Potential habitat for *Pomaderris pallida* was detected within the project footprint within the Murrumbateman IBRA Subregion. Targeted flora surveys within the project footprint did not locate the species.	Suitable habitat for *Zieria obcordata* was detected within the project footprint within PCTs 268, 280 and 287 in the Inland Slopes IBRA Subregion. Targeted flora surveys within the project footprint did not locate the species. Where survey effort was not adequate, species presence has been assumed

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Pomaderris pallida* Pale Pomaderris	*Zieria obcordata* Granite Zieria
may intersect or encompass the subpopulation) and as a percentage of the total NSW population, and ▪ an estimate of the number of individuals (mature and immature) to be impacted by the proposal and as a percentage of the total NSW population, or ▪ if the species' unit of measure is area, provide data on the number of individuals on the site, and the estimated number that will be impacted, along with the area of habitat to be impacted by the proposal	Where survey effort was not adequate, species presence has been assumed within potential habitat. There are no records within 20 km of the project (DPE 2022). Given the species was not recorded and is only assumed present, and the limited information available on the total population of the species, it is not possible to determine the number of individuals (mature and immature) to be impacted by the project and as a percentage of the total NSW population. The species unit of measure is area. The species was not located within the project footprint despite targeted surveys in accessible land. Certain areas of potential suitable habitat within the project footprint were inaccessible for surveys, therefore the species has been assumed present in these areas. The total area of this species habitat to be directly impacted by the project is 0.77 ha	within suitable habitat. There are no records within 20 km of the project (DPE 2022). As such, a percentage of the total population present in the subpopulation on the project footprint cannot be attained. Given the species was not recorded and is only assumed present, and the limited information available on the total population of the species, it is not possible to determine the number of individuals (mature and immature) that would be impacted by the project and as a percentage of the total NSW population. The species unit of measure is area. The species was not located within the project footprint despite targeted surveys in accessible land. Where survey effort was not adequate, species presence has been assumed within suitable habitat. The total area of this species habitat that would be impacted by the project is 43.40 ha.
• impact on geographic range (Principles 1 and 3) presented by: ▪ the area of the species' geographic range to be impacted by the proposal in hectares, and a percentage of the total area of occupancy or extent of occupancy within NSW ▪ the impact on the subpopulation as either: all individuals will be impacted (subpopulation eliminated); OR impact will affect some individuals and habitat; OR impact will affect some habitat, but no individuals of the species will be directly impacted ▪ to determine if the persisting subpopulation that is fragmented will remain viable, estimate (based on published and unpublished sources such as scientific publications, technical reports, databases or	The project footprint contains 42.10 ha of suitable habitat in the form of a species habitat polygon, of this the project would impact on 0.77 ha (2%). However, percentages of extents and areas of occupancy and percentages cannot be accurately determined as there is insufficient or inconsistent data available for this species. The project would impact on 0.77 ha (2%) of the 42.10 ha of suitable habitat for the species within the project footprint. However, no individuals of the species is likely to be directly impacted in areas where targeted surveys were undertaken and the species was not detected. In areas that comprise the species polygon that were not adequately surveyed, species presence has been assumed. As such, the number of individuals cannot be quantified. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. Therefore, if the species is present, the project would not create a barrier to dispersal of the species.	The project footprint comprises 594.30 ha of potential habitat for the species, 43.40 ha (7%) of which would be impacted by the project. However, percentages of extents and areas of occupancy and percentages cannot be accurately determined as there is insufficient or inconsistent data available for this species. The project would impact on 43.40 ha (7%) of the 594.30 ha of potential habitat for the species within the project footprint. The project would impact some habitat, but no individuals of the species is likely to be directly impacted in areas where targeted surveys were undertaken as the species was not detected. In areas that comprise the species polygon that could not be adequately surveyed, species presence has been assumed. As such, the number of individuals cannot be quantified. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Pomaderris pallida* Pale Pomaderris	*Zieria obcordata* Granite Zieria
documented field observations) the habitat area required to support the remaining population, and habitat available within dispersal distance, and distance over which genetic exchange can occur (eg seed dispersal) and pollination distance for the species ▪ to determine changes in threats affecting remaining subpopulations and habitat if the proposed impact proceeds, estimate changes in environmental factors including changes to fire regimes (frequency, severity); hydrology, pollutants; species interactions (increased competition and effects on pollinators or dispersal); fragmentation, increased edge effects, likelihood of disturbance; and disease, pathogens and parasites. Where these factors have been considered elsewhere in relation to the target species, the assessor may refer to the relevant sections of the BDAR or BCAR.	The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence in inaccessible suitable habitat. If the species is present, individuals in the project footprint may be affected by changes to fire regimes, increased edge effects, disturbance from vegetation removal and maintenance within the clearing footprint.	unaffected. Therefore, the project would not create a barrier to dispersal of the species. The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence. If the species is present, individuals in the project footprint may be affected by changes to fire regimes in surrounding vegetation as a result of management for asset protection, increased edge effects, altered hydrology due to drainage lines within the project footprint, off-road vehicle activities (access tracks).
5. The assessor may also provide new information that can be used to demonstrate that the principle identifying the species as at risk of an SAII, is inaccurate.	Not applicable.	Not applicable.
Likely SAII assessment outcome against relevant principles.	*Pomaderris pallida* has been assumed present over a portion of the project footprint due to survey limitations. There are no known records of the species within 20 km of the project footprint. The species is considered to have a low likelihood of occurring within the project footprint. The project is considered unlikely to lead to further decline or extinction of the species given it is not considered likely to be present within the project footprint.	*Zieria obcordata* is only known from two sites in NSW: one in the Wuuluman area near Wellington and the other at Crackerjack Rock/ Rock Forests area north-west of Bathurst. The species was not record during the field survey and has a low likelihood of occurring within the project footprint. The species has been assumed present over a portion of the project footprint due to survey limitations. The project would result in direct impacts to a total of 43.40 ha of potential habitat for Granite Zieria. About 34.40 ha (79%) of this habitat would be permanently cleared (i.e. TCZ).

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Pomaderris pallida* Pale Pomaderris	*Zieria obcordata* Granite Zieria
		The project is considered unlikely to lead to further decline or extinction of the species given it is not considered likely to be present within the project footprint.

3.3 Threatened fauna

3.3.1 Large Bent-winged Bat and Stuttering Frog

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	***Miniopterus orianae oceanensis* Large Bent-winged Bat**	**Stuttering Frog (*Mixophyes balbus)***
Impact summary	The project would result in direct impacts to a total of 0.12 ha of potential Large Bent-winged Bat habitat which constitutes SAII candidate habitat. Potential breeding habitat for the species has not been recorded however a single rocky gully situated in the Murrumbateman IBRA subregion has been identified as potential habitat. This potential breeding habitat would not be impacted by the project, however a small area (ie 0.12 ha) would be cleared within 100 m of the potential roost site. Potential indirect impacts to the species include: • Reduced viability of adjacent habitat due to noise, dust, or light spill • Increased risk of starvation or exposure, and loss of shade of shelter • Increase in pest animal populations and predation of native fauna • Changed fire regimes. Prescribed impacts to the species include: • Impacts to karst, caves, crevices, cliffs and gorges, including a total of 14.81 ha of potential karstic geologies within the project footprint • Fauna injury and/or mortality from transmission line collision, entanglement or electrocution.	The project would result in direct impacts to a total of 13.80 ha of Stuttering Frog habitat. Stuttering Frog was not recorded in the project footprint. Suitable wet sclerophyll forest habitat and permanent streams occur within the Bungonia IBRA subregion however the closest historic records are within the Blue Mountains (about 40km north). The species has been assumed present over a portion of the project footprint due to survey limitations. Where this species has been assumed present, nearby streams are predominantly limited to the headwaters of first order waterways (there are two third-order waterway crossings) and therefore are unlikely to comprise breeding habitat. Potential indirect impacts to the species include: • Reduced viability of adjacent habitat due to noise, dust, or light spill • Increased risk of starvation or exposure, and loss of shade or shelter • Increase in pest animal populations and predation of native fauna • Changed fire regimes.
1. The assessor is required to provide further information in the BDAR or BCAR for any species at risk of an SAII, including the action and measures taken to avoid the direct and indirect impact on the species at risk of an SAII. Where these have been addressed elsewhere the assessor can refer to the relevant sections of the BDAR or BCAR.	The Large Bent-winged bat occurs in heavily wooded areas where it forages for invertebrates above the tree canopy (DPIE 2022). The Large Bent-winged Bat roosts primarily in caves but also utilises man-mad structures like buildings and tunnels (DPE 2022). Large Bent-winged Bat was recorded within PCTs 266, 277, 278, 283, 351, 352, 1150 and 1330 in the project footprint.	The Stuttering Frog is found in rainforest and wet, tall open forest in the foothills and escarpment on the eastern side of the Great Dividing Range. Outside the breeding season adults live in deep leaf litter and thick understorey vegetation on the forest floor. The species is assumed present within potential habitats within the project footprint but has not been directly recorded.

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Miniopterus orianae oceanensis* Large Bent-winged Bat	Stuttering Frog (*Mixophyes balbus)*
	Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened bats include: • Avoiding and minimising impacts by route refinement, over-spanning and rerouting access tracks to avoid impacts within 100m of any potential roost habitats wherever possible (EMM B1). • Additional targeted surveys undertaken prior to commencement of construction to confirm the presence of active roosts within or immediately adjacent (i.e. within 100m) to the project footprint (EMM B2). • Further design avoidance and impact minimisation to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying threatened bat habitats, their existing condition, important connectivity corridors and certainty levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey). • Development of a Connectivity Strategy to ensure essential habitat linkages for the species are retained within the landscape (EMM B16). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed habitats within 100m of roost habitat as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, fauna handling, fauna habitat management measures, including construction connectivity strategy to maintain habitat linkages during the construction period and post-construction rehabilitation of temporarily disturbed habitats where relevant (EMM B18).	Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened frogs include: • Avoiding and minimising impacts by spanning over waterways and rerouting access tracks to avoid waterway habitats wherever possible (EMM B1). • Additional targeted surveys undertaken prior to commencement of construction to delineate the extent of habitats within inaccessible lands (EMM B2). • Further design avoidance and impact minimisation to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying threatened frog habitats, their existing condition, important connectivity corridors and certainty levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed habitat areas as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, fauna handling, fauna habitat management measures, including construction connectivity strategy to maintain habitat linkages during the construction period and post-construction rehabilitation of temporarily disturbed habitats where relevant (EMM B18). • Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7).

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Miniopterus orianae oceanensis* Large Bent-winged Bat	Stuttering Frog (*Mixophyes balbus)*
	• Use of directional lighting for all permanent lighting (i.e. substations). Artificial lighting required during construction would be directed towards work sites to minimise light spill as much as practicable (EMM B31).	• Implementation of biosecurity protocols during construction to manage any potential risks associated with Chytrid Fungus (EMM B19). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Use of directional lighting for all permanent lighting (i.e. substations). Artificial lighting required during construction would be directed towards work sites to minimise light spill as much as practicable (EMM B31).
2. The assessor must consult the TBDC and/or other sources to report on the current population of the species including:		
• evidence of rapid decline (Principle 1, clause 6.7(2)(a) BC Regulation) presented by an estimate of the: ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer), or ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer) as indicated by: an index of abundance appropriate to the species; decline in geographic distribution and/or habitat quality; exploitation; effect of introduced species, hybridisation, pathogens, pollutants, competitors or parasites	***Principle 1 SAII = No*** This is a data deficient species. There is insufficient data available in the literature to determine whether the species has undergone a decline in population in the past 10 years. The population of Large Bent-winged Bats is threatened by and may be declining due to: • Disturbance: caused by humans entering cave or nearby areas, or blocking of cave entrance for human health, or by encroaching weeds (DPIE 2022). This is particularly problematic during winter or breeding. • Habitat loss, fragmentation and degradation: the loss of high-quality foraging habitat, particularly moist, high productive forests, negatively effects foraging success (DPIE 2022; Threlfall et al. 2012). • Disease: the introduction of disease, particularly white nose-fungus (*Pseudogymnoascus destructans*) (DPIE 2022). • Fire: the presence of wildfires or hazard reduction fires during the breeding season (DPIE 2022).	***Principle 1 SAII = No*** DPE has not determined that this species is at risk of SAII due to Principle 1 – rapid decline (DPE 2022). There is no data available on the decline in population of the species in the past 10 years or three generations. However, the southern range of *M. balbu*s appears to have declined dramatically in recent times. Local extinctions of these population would represent a 50% reduction in the species range (DAWE 2021a). There is no data available on the decline in population of the species in the past 10 years or three generations as indicated by an index of abundance appropriate to the species; decline in geographic distribution and/or habitat quality; exploitation; effect of introduced species, hybridisation, pathogens, pollutants, competitors or parasites. Key threats to the species (DPE 2022), which are likely to have contributed to its decline in NSW: • Habitat loss: Vegetation clearing for agricultural purposes: Modification and loss of habitat • Disease: Chytridiomycosis: chytrid fungus

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Miniopterus orianae oceanensis* Large Bent-winged Bat	Stuttering Frog (*Mixophyes balbus)*
	• Predation: predation by foxes and feral cats (DPIE 2022). • Wind farms: there is a significant indirect, negative effect of wind turbine presence on the activity and habitat use of *Miniopterus* sp. (Millon et al. 2018).	• Disturbance: Hydrological disturbance: Changes to natural water flows and water quality; Forestry activity: Damage to habitat and impacts on water quality from forestry activities; Trampling by domestic or feral herbivores: Damage (vegetation removal, disturbance, turbidity) to habitat by domestic stock, feral cattle and pigs • Pest animal: Fish: Predation of eggs and tadpoles by introduced fish • Lack of knowledge: Insufficient understanding of species/community ecology: Poor knowledge of the species' distribution, taxonomy and history of local extinction.
• evidence of small population size (Principle 2, clause 6.7(2)(b) BC Regulation) presented by: ▪ an estimate of the species' current population size in NSW, and ▪ an estimate of the decline in the species' population size in NSW in three years or one generation (whichever is longer), and ▪ where such data is available, an estimate of the number of mature individuals in each subpopulation, or the percentage of mature individuals in each subpopulation, or whether the species is likely to undergo extreme fluctuations	***Principle 2 SAII = No*** This is a data deficient species. There is no data available in the literature to estimate the species population size in NSW. There are five known maternity roosts in Australia (OEH 2020). Three occur in NSW alongside numerous over-wintering roost sites (Mills 2021). Roosting populations are known to range between 100 – 150,000 individuals (DPE 2022). A recent population estimation of the nearest known maternity roost in Church Cave, Wee Jasper was 40,000 individuals (including females and juveniles) (Mills 2021). This is a data deficient species and an estimation of the decline in species' population size in NSW cannot be determined. Over the last 60 years, estimations of population size at the Church Cave maternity roost have been sporadic and varied considerably. This is due to considerable time gaps between observations as well as differences in survey methodologies which likely resulted in overestimations (Mills 2021). Data on the age structure composition of the species population is not available. There is insufficient data available in the literature to determine the number of mature individuals in each subpopulation or whether the species is	***Principle 2 SAII = No*** DPE have not determined that this species is at risk of SAII due to Principle 2 – small population size (DPE 2022). There is no data available to estimate the species current population size in NSW. There are no data available to evaluate the population trend over three years or one generation (DAWE 2021a). See section above. There is no data available to estimate the number of mature individuals in each sub population.

Official

	likely to undergo extreme fluctuations. Migration to maternity roosts is highly synchronised with parturition (Mills 2021), and the availability of suitable roosting sites may limit population growth. However, there is no information available in the literature on the reproductive biology of this species.	
• evidence of limited geographic range for the threatened species (Principle 3, clause 6.7(2)(c) BC Regulation) presented by: ▪ extent of occurrence ▪ area of occupancy ▪ number of threat-defined locations (geographically or ecologically distinct areas in which a single threatening event may rapidly affect all species occurrences), and ▪ whether the species' population is likely to undergo extreme fluctuations	***Principle 3 SAII = No*** The Large Bent-winged Bat is a highly mobile, migratory species found along the east and north-west coasts of Australia (OEH 2019; Mills 2021). When not breeding, populations disperse within about 300 km range of maternity caves (DPE 2022). Within NSW, it is known to occur in 83 subregions and 10 IBRA regions: Australian Alps, Brigalow Belt South, Nandewar, New England Tablelands, NSW North Coast, NSW South Western Slopes, Ocean, South East Corner, South Eastern Highlands, South Eastern Queensland and the Sydney Basin (OEH 2019). There is insufficient data available in the literature to determine whether the species population size would be likely to undergo extreme fluctuations. However, females show high fidelity to maternity roosts nearing parturition. The availability of suitable maternity roosts may therefore limit population growth in this species. The five known maternity roosts in Australia are considered threat-defined locations as *M. orianae oceanesis* exhibits high fidelity to these sites (Mills 2021), and maternity caves have very specific temperature and humidity regimes (OEH 2019).	***Principle 3 SAII = No*** DPE have not determined that this species is at risk of SAII due to Principle 3 – limited geographic range (DPE 2022). There is no data available on the calculated extent of occurrence (EOO). There is no data available on the calculated Area of occurrence (AOO). At present, no critical habitat has been identified or declared for the species, however all extant populations are considered critical for the long-term survival of this taxon (Hunter and Gillespie 2011). The populations from the southern lineage that are located south of the Hunter River generally appear to have been severely impacted by chytridiomycosis and any impact on them could be considered potentially serious and irreversible. The populations north of the Hunter River are more robust and impacts on them are currently unlikely to be considered potentially serious and irreversible (DPE 2022). The species is threatened by habitat fragmentation and degradation, which would isolate sub-populations and increases their vulnerability to local extinction (DAWE 2021a). There is no information/evidence of this species experiencing extreme fluctuations in population size or habitat.
• evidence that the species is unlikely to respond to management (Principle 4, clause 6.7(2)(d) BC Regulation) because: ▪ known reproductive characteristics severely limit the ability to increase the existing population on, or occupy new habitat (eg	***Principle 4 SAII = Yes*** DPE have determined that this species is at risk of SAII due to Principle 4 – unlikely to respond to management (DPE 2022). The species exhibits high fidelity to established maternity sites and requires specific temperature and humidity regimes to	***Principle 4 SAII = Yes*** DPE have determined that this species is at risk of SAII due to Principle 4 – unlikely to respond to management (DPE 2022). Principle 4 applies because' (1) known reproductive characteristics (clonality or sterility) severely limit the ability of

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Miniopterus orianae oceanensis* Large Bent-winged Bat	Stuttering Frog (*Mixophyes balbus)*
species is clonal) on, a biodiversity stewardship site ▪ the species is reliant on abiotic habitats which cannot be restored or replaced (eg karst systems) on a biodiversity stewardship site, or ▪ life history traits and/or ecology is known but the ability to control key threatening processes at a biodiversity stewardship site is currently negligible (eg frogs severely impacted by chytrid fungus).	rear its young, indicating that the species has a limited capacity to establish in a new site. The species requires intact native vegetation within 300 metres of maternity roosts, limited pesticide use within breeding and foraging habitats, and is also vulnerable to human disturbance which may lead to abandonment of the roost (DPE 2022). Therefore, a biodiversity stewardship site would need to include an established maternity roosting site and adequate undisturbed bushland in proximity to the site to have any positive effect on the population of the species. The species displays high fidelity to established roosting sites and requires specific abiotic factors (temperature, humidity) nearing parturition and when raising young. The specific locations and internal environments of the maternity roosting sites cannot be restored or replaced on a biodiversity stewardship site, unless it contains a known maternity roosting site. The ability to control these requirements at a biodiversity stewardship site is negligible.	the species to increase the existing population or occupy new habitat; or (2) the species is reliant on abiotic habitats which cannot be restored or replaced; or (3) life history traits and/or ecology is known but the ability to control key threatening processes is currently negligible. At present, no critical habitat has been identified or declared. The ability to control key threats at a biodiversity stewardship site is thought to be possible. The species is to be Very Highly sensitive to gain (DPE 2022). The removal of feral animals through fencing and control programs is achievable. To mitigate the threat of Amphibian Chytrid Fungus, a strict hygiene protocol would be able to be enforced on a biodiversity stewardship site in alignment with DEE (2016).
3. Where the TBDC indicates data is 'unknown' or 'data deficient' for a species for a criterion listed in Subsection 9.1.2(2.), the assessor must record this in the BDAR or BCAR.	Some responses in this consideration of SAII cannot be completed comprehensively due to the following: • The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited • A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. • As such, we have noted the knowledge gaps in the TBDC and provided responses using information from the limited available sources.	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this species for a criterion listed in Subsection 9.1.1(2.). Some responses in this consideration of SAII cannot be completed comprehensively due to the following: • The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited • A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. As such, we have noted the knowledge gaps in the TBDC and provided responses using information from the limited available sources.

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Miniopterus orianae oceanensis* Large Bent-winged Bat	Stuttering Frog (*Mixophyes balbus)*
4. In relation to the impacts from the proposal on the species at risk of an SAII, the assessor must include data and information on:		
• the impact on the species' population (Principles 1 and 2) presented by: ▪ an estimate of the number of individuals (mature and immature) present in the subpopulation on the subject land (the site may intersect or encompass the subpopulation) and as a percentage of the total NSW population, and ▪ an estimate of the number of individuals (mature and immature) to be impacted by the proposal and as a percentage of the total NSW population, or ▪ if the species' unit of measure is area, provide data on the number of individuals on the site, and the estimated number that will be impacted, along with the area of habitat to be impacted by the proposal	It is not possible to determine how many individuals comprise the sub-population from the available data as this is a data deficient species. A total of 217 passes were acoustically recorded in all IBRA subregions traversed by the project footprint. It was recorded in non-native areas and several PCTs in poor, fair, moderate, good and high conditions. The age of these individuals could not be determined. No roosts were identified within the project footprint. The extent of roosting habitat was difficult to determine as a definitive end to the cavities could not always be seen. As such it cannot be established if a crevice/cave occupying the species is located within the project footprint. However, seasonal migration patterns and maternity roosts are well documented for this species and therefore, maternity roost was not recorded and is unlikely to be within the project footprint. According to BioNet, there are 131 nearby records (1061 estimated individuals), with the closest record 100 m from project footprint. All BioNet records along the alignment are within 20 km radius of the project footprint. It is known to occur within all IBRA Subregions the project is in (Bondo, Bungonia, Crookwell, Murrumbateman, Inland Slopes and Snowy Mountain subregions). The five known maternity roosts in Australia are considered threat-defined locations as this species exhibits high fidelity to these sites (Mills 2021), and maternity caves have very specific temperature and humidity regimes (OEH 2019). Two of these known maternity roosts are located within 40 km of the project footprint. As above, the total population in NSW is unknown, as such a percentage to be impacted of the total population cannot be determined.	Suitable habitat for Stuttering Frog was detected within the project footprint within PCTs 870, 1097, 1107 and 1150 in the Bungonia IBRA subregion. It is not possible to determine how many individuals comprise the sub-population from the available data. The total population in NSW is unknown, as such a percentage to be impacted of the total population cannot be attained. The species was not recorded in the project footprint during targeted surveys and is assumed present. There are no nearby records of the Stuttering Frog (DPE 2022). The closest records are near Ruby Creek in Blue Mountains. As above, the total population in NSW is unknown, as such a percentage to be impacted of the total population cannot be determined. The project would result in the direct impact to 13.8 ha of potential habitat for Stuttering Frog. The species unit of measure is area, with the species polygon mapped as per the requirements in the NSW Survey Guide for Threatened Frogs (DPIE 2020d) (Figure 13-3). Up to 13.8 ha of potential habitat would be directly impacted as a result of the project. The project has the potential to impact on water quality, water bodies and hydrological processes. A total of 1,139 streams are located within the project footprint (of various types and condition). There are several major waterbodies that intersect the project footprint. However, construction work would mostly be limited to above-ground transmission line construction installation, which would avoid direct impacts to waterways, especially major waterways, with appropriate water management measures to be implemented. Work within proximity of aquatic ecosystems would require stringent erosion and sediment controls to avoid increased

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Miniopterus orianae oceanensis* Large Bent-winged Bat	Stuttering Frog (*Mixophyes balbus)*
	The species unit of measure is area. There are numerous PCTs on the project footprint to which the species is associated. All breeding habitat including the cave, or other features, used for breeding and the area immediately surrounding this feature must be mapped. Species polygon boundaries should have a 100 m radius buffer around an accurate GPS point location centred on the cave/feature entrance. The species polygon covers an area of 7.73 ha, all of which meets the definition of breeding constraints ie, within 100 m of the aforementioned features on the project footprint. The species polygon (breeding habitat only) for this species within the project footprint that would be impacted by the project is approximately 0.12 ha. Suitable habitat in the form of associated PCTs was identified present in the project footprint and therefore direct impacts could result in the loss of approximately 0.12 ha potential breeding habitat. The project has the potential to impact on caves, crevices, cliffs, rock habitats that are considered important to the lifecycle of this species. The project intersects 160 ha of potential of potentially karstic geologies that may be considered important as staging, migration and breeding habitat for Large Bent winged bat. Further, some of the limestone deposits across the project footprint are of the same formation group and epoch as karst environments in the broader region (eg, Bungonia Caves and Careys Cave). However, no deep exaction or drilling is required within in areas suspected of being karstic that intersect the project footprint. Therefore, the consequence of the potential impacts would be minor and non-significant as a result of the avoidance of deep excavations in areas underlain by Karstic landscapes. Furthermore, the project footprint is greater than 20 km from any known maternity sites for the species.	run-off and pollutant loads. Once operational, such impacts are considered to be negligible on an ongoing basis.

Official

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Miniopterus orianae oceanensis* Large Bent-winged Bat	Stuttering Frog (*Mixophyes balbus)*
	No cave environments were identified within the project footprint during field campaigns. However, there is important cave roosting habitat beyond the project footprint, including: • Black Andrew Mine (within 14 kilometres) • Dip Cave, Wee Jasper (within 28 kilometres) • Punchbowl Cave (within 27 kilometres, known roosting site and staging site for gravid females enroute to Church Cave maternity site) • Pylon 58 Cave (within 20 kilometres) • Church Cave (within 27 kilometres) (Maternity roost site) • Drum Cave (within 37 kilometres) (Maternity roost site). Roosting populations are known to range between 100 – 150,000 individuals (DPE 2022). A recent population estimation of the nearest known maternity roost in Church Cave, Wee Jasper was 40,000 individuals (including females and juveniles) (Mills 2021). When not breeding, populations disperse within about 300 km range of maternity caves (DPE 2022). Therefore, it is likely that the project footprint may support intermittent roosting sites and staging site for gravid females enroute to maternity colonies (eg, Church Cave). A total of 217 passes were acoustically recorded across the project footprint. Although the records were distributed across the site, assuming that each pass was a different individual, this number was small in comparison to the individuals in Church Cave roost, representing only approximately 0.5% of the population. Furthermore, suitable foraging and intermittent roosting site habitat impacted by the project would constitute approximately 0.5% of the species non-breeding dispersal range. The number of BioNet records in the area outside the project footprint indicate that the species is utilising habitat outside the project footprint for foraging.	

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Miniopterus orianae oceanensis* Large Bent-winged Bat	Stuttering Frog (*Mixophyes balbus)*
	Areas of typical rocky hillslope and rock overhangs occur throughout the project footprint. These areas may support intermittent roosting sites for this species. However, impacts would be negligible; the rocky environment described would be minimally impacted, and these habitats would remain post-construction. Impacts to caves, crevices and rock as a result of the project are likely to be negligible. Therefore, the project is not likely to alter the species geographic range. Culverts, bridges, and dilapidated structures may be used by roosting bats such as the Large Bent-winged bat. Niche surveys (2022) identified the following Large Bent-winged Bats were acoustically recorded within proximity of human-made structures: • 2 kilometres from road bridge at Middle Creek in the Crookwell IBRA subregion. • 5 kilometres from unknown structure at Dowlings Creek in the Murrumbateman IBRA subregion. • Two Large Bent-winged bat records within 1 kilometres of unknown structure at Logbridge Creek in the Snowy Mountains IBRA subregion. No removal or upgrades of anthropogenic structures such as existing culverts or bridges is proposed at this stage, so such impacts are negligible.	
• impact on geographic range (Principles 1 and 3) presented by: ▪ the area of the species' geographic range to be impacted by the proposal in hectares, and a percentage of the total area of occupancy or extent of occupancy within NSW ▪ the impact on the subpopulation as either: all individuals will be impacted (subpopulation eliminated); OR impact will affect some individuals and habitat; OR impact will affect	The area of occupancy or extent of occupancy within NSW and percentages cannot be provided as there is insufficient data available for this species. However, it is known that when not breeding, populations are highly mobile and disperse within about 300 km range of maternity caves (DPE 2022). There are no known maternity roosts or cave roosting habitat on the site. The project would impact habitat used by the Large Bent winged bat for intermittent roosting sites and foraging habitat. However, the rocky environment in the project footprint that is potentially used as intermittent roosting sites	The project footprint comprises of 78.35 ha of potential habitat for the species, 13.8 ha (18%) of which would be impacted by the project. The extent of occurrence and area of occupancy for this species is unknown. Therefore, it is unknown how much of the species range would be impacted by the project. It is unlikely that the geographic range or area/extent of occupancy of this highly mobile species would be substantially impacted by the project. This species was not recorded in the project footprint and there were no records near the project footprint. It is likely

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Miniopterus orianae oceanensis* Large Bent-winged Bat	Stuttering Frog (*Mixophyes balbus)*
some habitat, but no individuals of the species will be directly impacted ▪ to determine if the persisting subpopulation that is fragmented will remain viable, estimate (based on published and unpublished sources such as scientific publications, technical reports, databases or documented field observations) the habitat area required to support the remaining population, and habitat available within dispersal distance, and distance over which genetic exchange can occur (eg seed dispersal) and pollination distance for the species ▪ to determine changes in threats affecting remaining subpopulations and habitat if the proposed impact proceeds, estimate changes in environmental factors including changes to fire regimes (frequency, severity); hydrology, pollutants; species interactions (increased competition and effects on pollinators or dispersal); fragmentation, increased edge effects, likelihood of disturbance; and disease, pathogens and parasites. Where these factors have been considered elsewhere in relation to the target species, the assessor may refer to the relevant sections of the BDAR or BCAR.	would be minimally impacted, and would remain post-construction. There are large areas of suitable habitat for this species surrounding the project footprint, as indicated by the 131 BioNet records all of which are outside the project footprint. Furthermore, this mobile species has a high dispersal range of 300 km from maternity caves (when not breeding), indicating that the habitat in the project footprint constitutes part of the broad ranging foraging habitat for this species. Therefore, whilst there would be an impact on 0.12 ha of suitable breeding habitat in the project footprint, it is considered to be of negligible consequence to the species on a regional scale. The impact on the sub-population(s) cannot be quantified, as it considered likely that individuals recorded on site also utilise suitable habitat outside the project footprint. Vegetation clearing impacts to this species habitat may result in the loss of individuals of the sub-population(s), however is unlikely to result in the loss of an entire sub-population. This species is highly mobile and is likely to be able to traverse the long, linear nature of the area to be cleared. It is therefore unlikely that a population of the species would be fragmented by the project. Therefore, the project is not likely to reduce the habitat area required to support a population of the species. The project would result in the development of highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected this species. Any affects are likely to reduce over time as biodiversity acclimatises to the presence of the transmission lines (and structures), further a connectivity strategy is to be developed after the design refinement stage to minimise the extent of connectivity impacts, which may include retaining of corridors adjacent to easement to facilitate fauna movement. The consequence of the impacts would be minor and non-significant.	that the project would affect up to 13.8 ha of suitable habitat. In areas that comprise the species polygon that could not be adequately surveyed, species presence has been assumed. As such, the number of individuals cannot be quantified. The project would result in the development of highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. This species is likely to be able to traverse the long, linear nature of the area to be cleared. Any impacts on species connectivity are likely to reduce over time as biodiversity acclimatises to the presence of the transmission lines (and structures), further a connectivity strategy is to be developed after the design refinement stage to minimise the extent of connectivity impacts, which may include retaining of corridors adjacent to easement to facilitate fauna movement. The consequence of the impacts would be minor and non-significant. It is therefore unlikely that a population of the species would be fragmented by the project. The impact on the sub-population(s) cannot be quantified, as the Stuttering Frog was not recorded on site and the species polygon has been calculated based on assumed presence in suitable habitat. The project would impact 13.8 ha of suitable habitat for this species. If the species is present, individuals in the project footprint may be affected by changes to water quality, habitat loss, disturbance from access tracks, chemical pollution, vegetation removal and maintenance within the clearing footprint. Stuttering Frog is also threatened by Amphibian Chytrid Fungus which causes the disease Chytridiomycosis. There is the potential for the introduction or spread of pathogens by means of imported materials, machinery movements and increased foot traffic during the construction phase. No evidence of pathogens such as Chytrid Fungus was recorded within the project footprint. However,

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Miniopterus orianae oceanensis* Large Bent-winged Bat	Stuttering Frog (*Mixophyes balbus)*
	The project is highly likely to increase the listed threats to the species due to records being found within and immediately adjacent to the project footprint. The project would modify fire regimes in surrounding vegetation as a result of management for asset protection and hydrology of drainage lines within the project footprint, however this species is not reliant on the drainage lines in the project footprint. Individuals in the project footprint may be affected by an increase in habitat loss (the loss of high-quality foraging habitat, particularly moist, high productive forests), as well as disturbance from vegetation removal and maintenance within the clearing footprint. A discussion of prescribed impacts to karst, caves, crevices, cliffs, rocks and other geological features of significance is provided in BDAR - Stage 2.	these have potential to occur. Given the likelihood of Chytrid Fungus occurring on the site is low, mitigation can be implemented via hygiene protocols.
5. The assessor may also provide new information that can be used to demonstrate that the principle identifying the species as at risk of an SAII, is inaccurate.	Not applicable.	Not applicable
Likely SAII assessment outcome against relevant principles	Based on a low likelihood of modelled roost habitat being confirmed as important breeding habitat and no direct impacts to this habitat, it is considered an SAII outcome decision is low likelihood.	Based on a low likelihood of the species occurrence or direct impacts to breeding habitat and appropriate mitigation measures with regard to stream protection, it is considered an SAII outcome decision is very low likelihood.

3.3.2 Brush-tailed Rock-wallaby and Large-eared Pied Bat

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	***Petrogale penicillata* Brush-tailed Rock-wallaby**	***Chalinolobus dwyeri* Large-eared Pied Bat**
Impact summary	The project would result in direct impacts to a total of 1.1 ha of Brush-tailed Rock-wallaby habitat. The species was not recorded during field survey and habitat within accessible areas is considered sub-optimal. Potential indirect impacts to the species includes: • Reduced viability of adjacent habitat due to noise, dust, or light spill. • Increased risk of starvation, exposure, and loss of shade or shelter. • Changed fire regimes.	The project would result in direct impacts to a total of 7.7 ha of Large-eared Pied Bat habitat. Large-eared Pied Bat was not recorded in or adjacent to the project footprint despite survey. Potential breeding habitat (the SAII component for the species) has been assumed within 2 km of mapped potential karst and clifflines, due to survey limitations. Potential indirect impacts to the species include: • Reduced viability of adjacent habitat due to noise, dust, or light spill. • Increased risk of starvation or exposure, and loss of shade or shelter. • Increase in pest animal populations and predation of native fauna. • Changed fire regimes. Prescribed impacts to the species include: • Impacts to karst, caves, crevices, cliffs and gorges, including a total of 6.23 ha of steep cliffline habitat within the project footprint. • Impacts on connectivity and fauna movement. • Fauna injury and/or mortality from transmission line collision, entanglement, or electrocution.
1. The assessor is required to provide further information in the BDAR or BCAR for any species at risk of an SAII, including the action and measures taken to avoid the direct and indirect impact on the species at risk of an SAII. Where these have been addressed elsewhere the assessor can refer to the relevant sections of the BDAR or BCAR.	Brush-tailed Rock-wallaby occupy rocky escarpments, outcrops and cliffs with a preference for complex structures with fissures, caves and ledges, often facing north. The species is assumed present within potential habitats within the project footprint but has not been directly recorded. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to Brush-tailed Rock-wallaby include:	Large-eared Pied Bats roost in caves (near their entrances), crevices in cliffs, old mine workings and in the disused, bottle-shaped mud nests of the Fairy Martin (*Petrochelidon ariel*), frequenting low to mid-elevation dry open forest and woodland close to these features. Females have been recorded raising young in maternity roosts from November through to January in roof domes in sandstone caves and overhangs. No maternity caves were identified during targeted surveys, however not all lands were accessed during surveys. There is

Official

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Petrogale penicillata* Brush-tailed Rock-wallaby	*Chalinolobus dwyeri* Large-eared Pied Bat
	• Avoiding and minimising impacts by route refinement, over-spanning and rerouting access tracks to avoid potential rocky habitats wherever possible (EMM B1). • Additional targeted surveys undertaken prior to commencement of construction to further delineate the extent of habitats within the project footprint (EMM B2). • Further design avoidance and impact minimisation to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying Brush-tailed Rock-wallaby habitats, their existing condition, important connectivity corridors and certainty levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey). • Development of a Connectivity Strategy to ensure essential habitat linkages for the species are retained within the landscape (EMM B16). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed habitat areas as no-go zones during the construction phase (EMM B23. • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, fauna handling, fauna habitat management measures, including construction connectivity strategy to maintain habitat linkages during the construction period and post-construction rehabilitation of temporarily disturbed habitats where relevant (EMM B18). • Use of directional lighting for all permanent lighting (i.e. substations). Artificial lighting required during construction would be directed towards work sites to	one record of the species having been trapped in Bungonia National Park, which is 52 km from the project footprint. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened bats include: • Avoiding and minimising impacts by route refinement, over-spanning and rerouting access tracks to avoid impacts within 100m of any potential roost habitats wherever possible (EMM B1). • Additional targeted surveys undertaken prior to commencement of construction to confirm the presence of active roosts within or immediately adjacent (i.e. within 100m) to the project footprint (EMM B2). • Further design avoidance and impact minimisation to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying threatened bat habitats, their existing condition, important connectivity corridors and certainty levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey). • Development of a Connectivity Strategy to ensure essential habitat linkages for the species are retained within the landscape (EMM B16). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed habitats within 100m of roost habitat as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, fauna handling, fauna habitat management measures, including construction connectivity strategy to maintain habitat linkages during the construction period and post-construction

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Petrogale penicillata* Brush-tailed Rock-wallaby	*Chalinolobus dwyeri* Large-eared Pied Bat
	minimise light spill as much as practicable (EMM B31).	rehabilitation of temporarily disturbed habitats where relevant (EMM B18). • Use of directional lighting for all permanent lighting (i.e. substations). Artificial lighting required during construction would be directed towards work sites to minimise light spill as much as practicable (EMM B31).
2. The assessor must consult the TBDC and/or other sources to report on the current population of the species including:		
• evidence of rapid decline (Principle 1, clause 6.7(2)(a) BC Regulation) presented by an estimate of the: ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer), or ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer) as indicated by: an index of abundance appropriate to the species; decline in geographic distribution and/or habitat quality; exploitation; effect of introduced species, hybridisation, pathogens, pollutants, competitors or parasites	***Principle 1 SAII = No*** DPE has not determined that this species is at risk of SAII due to Principle 1 – rapid decline (DPE 2022). There are no data available to evaluate the population trend over ten years or three-generation period. According to TSSC (2021b) The Brush-tailed Rock-wallaby has declined significantly in the west and south of its former range, and populations have become more fragmented throughout. Most populations are now small and isolated. There is no data available on the decline in population of the species in the past 10 years or three generations as indicated by an index of abundance appropriate to the species; decline in geographic distribution and/or habitat quality; exploitation; effect of introduced species, hybridisation, pathogens, pollutants, competitors or parasites. Key threats to the species (DPE 2022), which are likely to have contributed to its decline in NSW: • Pest animals: Foxes: Predation by foxes and wild dogs; Feral goats: Competition for forage and refuge areas with feral goats; Feral cats: predation by feral cats; Feral pigs: Habitat degradation caused by feral pigs • Habitat loss: Loss of key habitat: Loss, degradation and fragmentation of habitat	***Principle 1 SAII = No*** DPE have determined that this species is not at risk of SAII due to Principle 1 – rapid decline (DPE 2022). The decline in population of the species in NSW in the last 10 years cannot be assessed at this time because: • The species information available in BioNet and other reliable/peer reviewed information about the species is limited and does not address this aspect (DPE 2022). • BioNet record data exhibits a bias toward increased survey effort, resulting in an increase of species records within the last 10 years (DPE 2022). • The species breeding habitat constitutes habitat within 100m of rocky areas containing caves, or overhangs or crevices, cliffs or escarpments, or old mines, tunnels, culverts, derelict concrete buildings (DPE 2022). Key threats to the species, which are likely to have contributed to its decline are: • Habitat loss, including clearing and isolation of forest and woodland habitats near cliffs, caves and old mine workings for agriculture or development, and damage to roosting and maternity sites from mining operations, and recreational caving activities. • Fire and inappropriate fire regimes: Loss of foraging habitat close to cliffs, caves and old mine workings

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Petrogale penicillata* Brush-tailed Rock-wallaby	*Chalinolobus dwyeri* Large-eared Pied Bat
	• Demographic threats: small population size: The small and isolated nature of some populations may lead to demographic effects (eg, inbreeding depression) • Fire: Fire destroying key habitat: Fire regimes that reduce the abundance and diversity of ground forage • Native species: Competition with native species: Competition for food and shelter from wallaroos and other native macropods • Weeds: Infestation by invasive weeds causing loss and degradation of foraging habitat • Lack of knowledge: Insufficient understanding of distribution and/or abundance: Poor understanding of the distribution, abundance and population structure at some locations; Insufficient understanding of species/community ecology: Limited understanding of the species' ecology, threat dynamics and response to management • Direct take/mortality: Road mortality and injury • Disturbance: Road/track works: Creation of tracks within colony leading to greater predator incursions.	from forestry activities and too-frequent burning, usually associated with grazing. • Disturbance: Use of pesticides. • Pest animals: Disturbance to roosting areas by goats • Lack of knowledge: Insufficient understanding of habitat requirements (DPE 2022). According to BioNet, there are several records of this species within 10 km of the project footprint (DPE 2022). Note that lack of knowledge about this species is a significant issue. Currently there are only four known maternity caves for this species and two of these are no longer active (DAWE n.d.). Breeding cave dwelling species such as this species tend to display fidelity to their breeding sites and maternity caves and may breed in large numbers, however this species breeding behaviours are not well studied and only two active maternity caves are known from Coonabarabran and the Pilliga, and evidence of a maternity cave has been found near Ulan (ie, capture of lactating females and females with young) (Pennay 2008). Requirements of maternity roosts are highly specific, and given the scarcity of this habitat feature, the loss of a maternity cave would constitute a significant reduction in an important area of occupancy of a population. Further, DERM (2011) state that any maternity roosts must be considered habitat critical to the survival of the species. Any impacts on breeding habitat used by this species could be considered potentially serious and irreversible (DPE 2022).
• evidence of small population size (Principle 2, clause 6.7(2)(b) BC Regulation) presented by: ▪ an estimate of the species' current population size in NSW, and	**Principle 2 SAII = No** DPE have not determined that this species is at risk of SAII due to Principle 2 – small population size (DPE 2022). There is no data available to estimate the species current population size in NSW.	***Principle 2 SAII = No*** DPE have determined that this species is not at risk of SAII due to Principle 2 – small population size (DPE 2022). Responses to i and ii cannot be provided because:

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Petrogale penicillata* Brush-tailed Rock-wallaby	*Chalinolobus dwyeri* Large-eared Pied Bat
▪ an estimate of the decline in the species' population size in NSW in three years or one generation (whichever is longer), and ▪ where such data is available, an estimate of the number of mature individuals in each subpopulation, or the percentage of mature individuals in each subpopulation, or whether the species is likely to undergo extreme fluctuations	There are no data available to evaluate the population trend over three years or one generation (TSSC 2021b). See section a) i) There is no data available to estimate the number of mature individuals in each sub population.	• The species information available in BioNet and other reliable/peer reviewed information about the species is limited and does not address these aspects • BioNet record data does not contain enough records to confidently identify a decline in the population over the last three years • BioNet record data contains 2,022 records of the species, however this is in no way an indication of the current population size. It is estimated that the species occurs in small populations of around 50 individuals (TSSC 2012). The number of breeding females has been observed at one of the known sites to be between 14 and 40 (Pennay 2008). There is insufficient data to determine whether the species population size would be likely to undergo natural fluctuations, however given its low fecundity rate and highly specific requirements for breeding, the species does not fit the model for typical boom-bust population dynamics.
• evidence of limited geographic range for the threatened species (Principle 3, clause 6.7(2)(c) BC Regulation) presented by: ▪ extent of occurrence ▪ area of occupancy ▪ number of threat-defined locations (geographically or ecologically distinct areas in which a single threatening event may rapidly affect all species occurrences), and ▪ whether the species' population is likely to undergo extreme fluctuations	***Principle 3 SAII = No*** DPE have not determined that this species is at risk of SAII due to Principle 3 – limited geographic range (DPE 2022). There is no data available on the calculated extent of occurrence (EOO). There is no data available on the calculated Area of occurrence (AOO). At present, no critical habitat has been identified or declared for the species. There are three distinctive groups of the species known as Evolutionary Significant Units (ESUs) that exhibit low migration rates between colonies and low recolonisation rates (TSSC 2021b): • Central ESU: a well-defined group consisting of closely related populations in the region from central	***Principle 3 SAII = No*** DPE have determined that this species is not at risk of SAII due to Principle 3 – limited geographic range (DPE 2022). The current distribution of this species is poorly known, noting that lack of knowledge about this species is a significant issue. Within NSW it is known from 77 parts of eight IBRA bioregions: Border Rivers-Gwydir, Central West, Hawkesbury-Nepean, Hunter-Central Rivers, Namoi, Northern Rivers, Southern Rivers and Sydney Metro (DPIE 2015). This species requires a combination of sandstone cliff/escarpment to provide roosting and breeding habitat that is adjacent to higher fertility sites particularly box gum woodlands or river/rainforest corridors which are used for foraging (TSSC 2012). As such, it is suggested that within its

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Petrogale penicillata* Brush-tailed Rock-wallaby	*Chalinolobus dwyeri* Large-eared Pied Bat
	NSW, including Kangaroo Valley, Jenolan Caves, Broke and the Warrumbungles; • Northern ESU: a less well-defined group comprising locations in north-east NSW and south-east Queensland, which extends as far south as Armidale. At the northern end, there exists a narrow hybrid zone between *P. penicillata* and *P. herberti;* • Southern ESU: a highly divergent lineage from Victoria, and previously south-east NSW (NSW NPWS 2002). There is no information/evidence of this species experiencing extreme fluctuations in population size or habitats.	extent of occupancy it is limited to within two kilometres of rocky areas containing caves, overhangs, escarpments, outcrops, or crevices, or within 2 km of old mines or tunnels, and breeding habitat is further restricted to within 100 m of cliffs and other rock features (DPE 2022). The species area of occupancy is limited within its known distribution, restricted by availability of suitable roosting habitat. Requirements of nursery roosts are highly specific, including arched caves with indented dome roofs for heat capture and retention, and deep enough for juveniles to learn to fly inside (TSSC 2012). These physical characteristics are very uncommon in the landscape and therefore a limiting factor to the species area of occupancy. Currently there are only four known maternity caves for this species and two of these are no longer active (DAWE n.d.). The two known active maternity roosts are located near Coonabarrabran and in the Pilliga (Pennay 2008, DERM 2011). It is suggested that at the breeding stage of the lifecycle, the species distribution becomes highly concentrated into very limited areas (TSSC 2012). The current distribution of this species is poorly known, further identification of threat-defined locations is unlikely to be possible without knowledge of the whereabouts of maternity roosts. DERM (2011) state that any maternity roosts must be considered habitat critical to the survival of the species. Therefore, any potentially suitable roosting and breeding habitat ought to be considered a threat defined location. There is insufficient data to determine whether the species population size would be likely to undergo natural fluctuations, however given its low fecundity rate and highly specific requirements for breeding, the species does not fit the model for boom-bust population dynamics. Therefore, it is considered that if a sub-population lost a significant number of individuals, the recovery of the sub-population would be slow. Given the

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Petrogale penicillata* Brush-tailed Rock-wallaby	*Chalinolobus dwyeri* Large-eared Pied Bat
		small size of the species sub-populations (around 50 individuals), a loss of many individuals from a single population may also lead to increased susceptibility to disease and infertility as a result of a drastic genetic bottleneck, which may eventually result in the loss of that sub-population. However, little is known about this species, and it is suggested that at the breeding stage of the lifecycle, the species distribution becomes highly concentrated into very limited areas (TSSC 2012), it's possible that the species maintains genetic diversity through breeding outside their sub-population.
• evidence that the species is unlikely to respond to management (Principle 4, clause 6.7(2)(d) BC Regulation) because: ▪ known reproductive characteristics severely limit the ability to increase the existing population on, or occupy new habitat (eg species is clonal) on, a biodiversity stewardship site ▪ the species is reliant on abiotic habitats which cannot be restored or replaced (eg karst systems) on a biodiversity stewardship site, or ▪ life history traits and/or ecology is known but the ability to control key threatening processes at a biodiversity stewardship site is currently negligible (eg frogs severely impacted by chytrid fungus).	***Principle 4 SAII = No*** DPE have not determined that this species is at risk of SAII due to Principle 4 – unlikely to respond to management (DPE 2022). Brush-tailed Rock-wallabies typically exhibit low migration rates between colonies and low recolonisation rates, further impeding persistence and recovery of colonies affected by threatening processes (TSSC 2021b) The habitat of Brush-tailed Rock-wallabies tend to take one of three forms: loose piles of large boulders containing a maze of subterranean holes and passageways; cliffs (usually over 15m high) with many mid-level ledges and with some caves and/or ledges covered by overhangs; and isolated rock stacks, usually sheer-sided and often girdled with fallen boulders (TSSC 2021b). At present, no critical habitat has been identified or declared. The ability to control key threats at a biodiversity stewardship site is thought to be possible. The species is to be Very Highly sensitive to gain (DPE 2022). The removal of feral animals through fencing and control programs is achievable. Retaining key habitat attributes in large stewardship sites is vital to the species as well as encourage gene flow within large populations.	***Principle 4 SAII = Yes*** DPE have determined that this species is at risk of SAII due to Principle 4 – unlikely to respond to management (DPE 2022). The species has low fecundity, with a mean yearly litter size of 1.8, and the generation length is unknown (TSSC 2012). As discussed previously, the species has a very specific requirement of maternity caves. Additionally, there are many suitable roost caves within the Pilliga that are not used by the species, which indicates the species has a limited capacity to occupy new habitat within a biodiversity stewardship site. A biodiversity stewardship site would need to be established around a known maternity cave for any management actions to have a positive effect on/protect the entire lifecycle of the species. As previously discussed, the species is reliant on abiotic habitats which cannot be restored or replaced (eg, caves) on a biodiversity stewardship site. Additionally, relatively low levels of disturbance from macropods is known to have resulted in permanent abandonment of one of the four known maternity roosts, indicating that the species lifecycle may be impacted by very low levels of disturbance which may not necessarily result in the loss or modification of the maternity cave (ie, while the

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Petrogale penicillata* Brush-tailed Rock-wallaby	*Chalinolobus dwyeri* Large-eared Pied Bat
		cave may still be present, the species use of it may not be restored following minor disturbances). The life history traits and ecology of the Large-eared Pied Bat is not well known. Threats listed in response to 2) are for the most part controlled within a biodiversity offset site, with the exception of disturbance to roost sites by mining operations. The KTP defined as *Alteration of habitat following subsidence due to longwall mining* cannot be precluded from a biodiversity stewardship site where it is established within an existing mining lease. This KTP may induce cracking, slabbing and rockfalls that may result in the loss of individuals or abandonment of the roost site as a result of the disturbance.
3. Where the TBDC indicates data is 'unknown' or 'data deficient' for a species for a criterion listed in Subsection 9.1.2(2.), the assessor must record this in the BDAR or BCAR.	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this species for a criterion listed in Subsection 9.1.1(2.). Some of the questions in this consideration of SAII cannot be assessed at this time because: • The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited • A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. As such, we have noted the knowledge gaps in the TBDC and provided responses using available information sources.	Some of the questions in this consideration of SAII cannot be assessed at this time because: • The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited • A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. • As such, we have noted the knowledge gaps in the TBDC and provided responses using information we have been able to source.
4. In relation to the impacts from the proposal on the species at risk of an SAII, the assessor must include data and information on:		
• the impact on the species' population (Principles 1 and 2) presented by: ▪ an estimate of the number of individuals (mature and immature) present in the subpopulation on the subject land (the site may	Suitable habitat for Brush-tailed Rock-wallaby was detected within the project footprint within PCTs 283, 870, 1093, 1107, 1150, and 1330 in the Bungonia IBRA subregion. Targeted fauna surveys within the project footprint did not locate the species. Where survey effort was not adequate, species	It is not possible to determine how many individuals comprise the sub-population from the available data. The total population in NSW is unknown, as such a percentage to be impacted of the total population cannot be attained. The species was not recorded in the project footprint during

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Petrogale penicillata* Brush-tailed Rock-wallaby	*Chalinolobus dwyeri* Large-eared Pied Bat
intersect or encompass the subpopulation) and as a percentage of the total NSW population, and ▪ an estimate of the number of individuals (mature and immature) to be impacted by the proposal and as a percentage of the total NSW population, or ▪ if the species' unit of measure is area, provide data on the number of individuals on the site, and the estimated number that will be impacted, along with the area of habitat to be impacted by the proposal	presence has been assumed within suitable habitat. There are no records within 20 km of the project (DPE 2022). As such, a percentage of the total population present in the subpopulation on the project footprint cannot be attained. Given the species was not recorded and is only assumed present, and the limited information available on the total population of the species, it is not possible to determine the number of individuals (mature and immature) that would be impacted by the project and as a percentage of the total NSW population. As above, the total population in NSW is unknown, as such a percentage to be impacted of the total population cannot be determined. The project would result in the direct impact to 1.1 ha of potential habitat for Brush-tailed Rock-wallaby. The species unit of measure is area. The species was not located within the project footprint despite targeted surveys in accessible land. Where survey effort was not adequate, species presence has been assumed within suitable habitat. The total area of this species habitat that would be impacted by the project is 1.1 ha.	targeted surveys. According to BioNet, there are 19 nearby records (31 estimated individuals) of this species within 20 km of the project footprint. All records are outside footprint and the closest record is 8 km from the project footprint boundary, connectivity of escarpment, boulders, crevices and other rock habitat is good in the area. The species is suggested to be confined to within two kilometres of rocky areas containing caves, overhangs, escarpments, outcrops, or crevices, or within 2 km of old mines or tunnels (BioNet 2022). It is known to occur within the Bungonia and Inland Slopes IBRA subregions where the project is partially located. As previously mentioned, it is suggested that at the breeding stage of the lifecycle, the species distribution becomes highly concentrated into very limited areas (ie known maternity caves, TSSC 2012), and currently only two maternity roosts are known to be in use in NSW despite extensive surveys to locate more. These roosts are not located within the locality of the project footprint. Furthermore, requirements of nursery roosts for this species are highly specific (TSSC 2012). These physical characteristics are very uncommon in the landscape and therefore a limiting factor to the species area of occupancy. The species was not recorded within the project footprint during targeted survey efforts and no maternity caves were identified during targeted surveys, however not all lands were accessed during surveys. The impact on the sub-population(s) cannot be quantified as the total population in NSW is unknown and the species was not recorded within the project footprint during targeted survey efforts. The project would result in the removal of up to 7.7 ha of potential foraging habitat in the form of associated PCTs for this species. No breeding habitat for the species would be impacted. The species unit of measure is area. There are numerous PCTs on the project footprint to which the species is associated and

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Petrogale penicillata* Brush-tailed Rock-wallaby	*Chalinolobus dwyeri* Large-eared Pied Bat
		rock outcrop/ surface rock features were identified in three of these PCTs. Based on associated PCTs, the total area of habitat for this species within the project footprint that would be impacted by the project is 7.7 ha of foraging habitat (no breeding habitat impacted). The species polygon for this species would be formed from PCTs on the project footprint to which the species is associated that are within 2 km of identified potential roost habitat features (see Figure 13a). The species polygon covers an area of 63.53 ha, of this 1.11 ha meets the definition of breeding constraints ie, within 100 m of the aforementioned features and within 100 m of the project footprint. No breeding habitat would be impacted by the project. The project intersects approximately 160 ha of steep sandstone geologies within the Bungonia and Inland Slopes IBRA Subregion portion of the project footprint that may be considered potential roosting habitat for Large-eared Pied Bat. However, no deep excavation or drilling is required within high potential cave roosting habitat intersecting the project footprint and spanning of structures across steep gullies and outcropping would occur. Therefore, suitable rocky habitat for Large-eared Pied Bat would be avoided and the project is unlikely to impact any potential rocky habitat for this species. Whilst there would be an impact on 7.7 ha of potential foraging habitat in the project footprint , given that the nearest record of this species is within 8 km of the eastern end of the project footprint (suggesting that there is more preferred habitat outside the project footprint), no maternity caves were identified during targeted surveys (it is unlikely that there would be a maternity cave present considering that only two are known in NSW despite extensive survey effort and requirements of nursery roosts for this species are highly specific and very uncommon in the landscape), it is unlikely

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Petrogale penicillata* Brush-tailed Rock-wallaby	*Chalinolobus dwyeri* Large-eared Pied Bat
		that the project would substantially impact the local population for this species. Regardless, although no breeding individuals or maternity caves were recorded on the project footprint during targeted surveys, breeding habitat must be considered present on the subject land if there is potential breeding habitat (OEH 2018a). Potential breeding habitat for this species must be assumed within the project footprint in accordance with the requirements of BioNet (DPIE 2022). Potential breeding habitat is PCTs associated with the species within 100 m of rocky areas containing caves, or overhangs or crevices, cliffs or escarpments, or old mines, tunnels, culverts, derelict concrete buildings, equating to 1.11 ha of the project footprint (none of which would be impacted by the project (Figure 13-5).
• impact on geographic range (Principles 1 and 3) presented by: ▪ the area of the species' geographic range to be impacted by the proposal in hectares, and a percentage of the total area of occupancy or extent of occupancy within NSW ▪ the impact on the subpopulation as either: all individuals will be impacted (subpopulation eliminated); OR impact will affect some individuals and habitat; OR impact will affect some habitat, but no individuals of the species will be directly impacted ▪ to determine if the persisting subpopulation that is fragmented will remain viable, estimate (based on published and unpublished sources such as scientific publications, technical reports, databases or documented field observations) the habitat area required to support the remaining population, and habitat available within dispersal distance, and distance over which genetic exchange can occur (eg seed	The project footprint comprises of 10.96 ha of potential habitat for the species, 1.1 ha (10%) of which would be impacted by the project in the Bungonia IBRA subregion. However, percentages of extents and areas of occupancy and percentages cannot be accurately determined as there is insufficient or inconsistent data available for this species. The project would impact on 1.1 ha (10%) of the 10.97 ha of potential habitat for the species within the project footprint of the Bungonia IBRA subregion. The project would impact some habitat, but no individuals of the species is likely to be directly impacted in areas where targeted surveys were undertaken as the species was not detected. In areas that comprise the species polygon that could not be adequately surveyed, species presence has been assumed. As such, the number of individuals cannot be quantified. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. Therefore, the project would not create a barrier to dispersal of the species.	The project would result in the removal of up to 7.7 ha of potential foraging habitat in the form of associated PCTs for this species. The project footprint comprises 62.36 ha of land that meets the habitat constraints for the species, ie, within 2 km of rocky areas containing caves, overhangs, escarpments, outcrops, or crevices, or within two kilometres of old mines or tunnels (BioNet 2022). A total of 1.11 ha meets the definition of breeding constraints ie, within 100m of the aforementioned features, within 100m of the project footprint, none which would be impacted by the project. Percentages of extents and areas of occupancy and percentages cannot be provided as there is insufficient or inconsistent data available for this species. The project would result in the removal of up to 7.7 ha of potential foraging habitat in the form of associated PCTs for this species. However, no individuals of the species is likely to be directly impacted in areas where targeted surveys were undertaken and the species was not detected. In areas that comprise the species polygon species presence has been

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Petrogale penicillata* Brush-tailed Rock-wallaby	*Chalinolobus dwyeri* Large-eared Pied Bat
dispersal) and pollination distance for the species ▪ to determine changes in threats affecting remaining subpopulations and habitat if the proposed impact proceeds, estimate changes in environmental factors including changes to fire regimes (frequency, severity); hydrology, pollutants; species interactions (increased competition and effects on pollinators or dispersal); fragmentation, increased edge effects, likelihood of disturbance; and disease, pathogens and parasites. Where these factors have been considered elsewhere in relation to the target species, the assessor may refer to the relevant sections of the BDAR or BCAR.	The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence. If the species is present, individuals in the project footprint may be affected by changes to fire regimes in surrounding vegetation as a result of management for asset protection, increased edge effects, altered hydrology due to drainage lines within the project footprint, off-road vehicle activities (access tracks).	assumed as these areas were inaccessible for targeted surveys. As such, the number of individuals cannot be quantified. The project also has the potential to impact 160 ha of land containing caves, crevices, cliffs, rock habitats that are considered important to the lifecycle of this species. Across the project footprint, there are numerous limestone deposits displaying features that are expected in karst environments. No cave environments were identified within the project footprint during field campaigns. Areas of typical rocky hillslope and rock overhangs occur throughout the project footprint, in area with moderate to high topographic relief. However, impacts to the rocky environment would be negligible as would be minimally impacted, and these habitats would remain post-construction. The project has the potential to impact on connectivity for Large-eared Pied Bat through interaction with the proposed transmission line. However, the project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected for all bird and bat species. The impacts are likely to reduce over time as biodiversity acclimatises to the presence of the transmission lines (and structures), further a connectivity strategy is to be developed after the design refinement stage to minimise the extent of connectivity impacts, which may include retaining of corridors adjacent to easement to facilitate fauna movement. The consequence of the impacts would be minor and non-significant. Avoidance behaviour (such as avoiding nesting or foraging resources) and habitat utilisation (such as diverging around the broader area where easements, substations and transmission lines are located) may create a barrier effect which causes microchiropteran bats to alter their flight pathways to avoid certain areas (Threlfall et al. 2011). Reduced connectivity would be permanent, however, the impacts associated with reduced connectivity are likely to reduce over

Official

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	*Petrogale penicillata* Brush-tailed Rock-wallaby	*Chalinolobus dwyeri* Large-eared Pied Bat
		time as biodiversity acclimatises, and connectivity would be retained in some sections with the implementation of a connectivity strategy to maintain fauna connectivity. Therefore, the risk of isolating threatened microbats due to increased fragmentation is considered low across the project footprint. The species (or any maternity caves) was not recorded during targeted surveys, there are no BioNet records within the project footprint and individuals recorded in the surrounding landscape would not be directly impacted by the project, therefore it is unlikely that the project would increase threats to the local population for this species. The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence in suitable habitat. If the species is present, individuals in the project footprint may be affected by changes to fire regimes, increased edge effects, changes in drainage and hydrology, disturbance from vegetation removal and maintenance within the clearing footprint. However, this species is not reliant on the drainage lines in the project footprint. A discussion of prescribed impacts to karst, caves, crevices, cliffs, rocks and other geological features of significance is provided in BDAR - Stage 2.
5. The assessor may also provide new information that can be used to demonstrate that the principle identifying the species as at risk of an SAII, is inaccurate.	Not applicable	Not applicable.
Likely SAII assessment outcome against relevant principles.	Given the limited extent of impact and limited likelihood of occurrence of the species an SAII outcome decision is considered unlikely.	Modelled breeding habitat of this species does not occur within the indicative disturbance area. Confinement of impacts away from potential breeding habitat and no observations of the species from targeted survey suggests an SAII outcome is unlikely. Additional inspections for cave habitat or survey for the species would aid in confirming no impacts to habitat within 2 km of breeding habitat.

3.3.3 Southern Corroborree Frog

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	Southern Corroboree Frog (*Pseudophryne corroboree)*
Impact summary	The project would result in direct impacts to a total of 22.2 ha of Southern Corroboree Frog habitat. Potential indirect impacts to the species include: • Reduced viability of adjacent habitat due to noise, dust, or light spill. • Increased risk of starvation or exposure, and loss of shade or shelter. • Increase in pest animal populations and predation of native fauna. • Changed fire regimes.
1. The assessor is required to provide further information in the BDAR or BCAR for any species at risk of an SAII, including the action and measures taken to avoid the direct and indirect impact on the species at risk of an SAII. Where these have been addressed elsewhere the assessor can refer to the relevant sections of the BDAR or BCAR.	The habitat of Southern Corroboree Frog comprises of a breeding season habitat associated with pools and seepages in Sphagnum bogs, wet tussock grasslands and wet heath, and a terrestrial non-breeding habitat in forest, sub-alpine woodland and tall heath adjacent to the breeding area. The species is assumed present within potential habitats within the project footprint but has not been directly recorded. Chapter 12 and 14 of the BDAR address avoidance and mitigation measures proposed as a part of the project. Specific measures proposed to address project impacts to threatened frogs include: • Avoiding and minimising impacts by spanning over waterways and rerouting access tracks to avoid waterway habitats wherever possible (EMM B1). • Additional targeted surveys undertaken prior to commencement of construction to delineate the extent of habitats within inaccessible lands (EMM B2). • Further design avoidance and impact minimisation to be prioritised through detailed design and micro-siting (EMM B1). This process would be supported by detailed constraints mapping identifying threatened frog habitats, their existing condition, important connectivity corridors and certainty levels regarding species occurrence where assumed present (ie likely/ unlikely to occur subject to further survey). • Establishment of biodiversity exclusion zones in retained vegetation to demarcate confirmed habitat areas as no-go zones during the construction phase (EMM B23). • Implementation of a Biodiversity Management Plan documenting approved protocols for vegetation clearing, fauna handling, fauna habitat management measures, including construction connectivity strategy to maintain habitat linkages during the construction period and post-construction rehabilitation of temporarily disturbed habitats where relevant (EMM B18).

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	Southern Corroboree Frog (*Pseudophryne corroboree)*
	• Implementation of erosion and sediment controls and soil and water management plans to manage any potential habitat disturbance as a result of ground and surface water quality or changed hydrology during construction (EMM B7). • Implementation of biosecurity protocols during construction to manage any potential risks associated with Chytrid Fungus (EMM B19). • Implementation of a Weed Control Strategy documenting measures for operational weed management to minimise ongoing disturbance associated with invasive species (EMM B20). • Use of directional lighting for all permanent lighting (i.e. substations). Artificial lighting required during construction would be directed towards work sites to minimise light spill as much as practicable (EMM B31).
2. The assessor must consult the TBDC and/or other sources to report on the current population of the species including:	
• evidence of rapid decline (Principle 1, clause 6.7(2)(a) BC Regulation) presented by an estimate of the: ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer), or ▪ decline in population of the species in NSW in the past 10 years or three generations (whichever is longer) as indicated by: an index of abundance appropriate to the species; decline in geographic distribution and/or habitat quality; exploitation; effect of introduced species, hybridisation, pathogens, pollutants, competitors or parasites	***Principle 1 SAII = Yes*** DPE has determined that this species is at risk of SAII due to Principle 1 – rapid decline (DPE 2022). The decline in population of the species in NSW is a reduction of >=80% in 10 years or three generations. This is attributed to the introduced Amphibian Chytrid Fungus (*Batridiochytrum dendrobatoides*). According to the TSSC (2021a) the species has undergone or is likely to undergo, within a time frame appropriate to the life cycle and habitat characteristics of the species, a very large reduction in population size based on either: an index of abundance appropriate to the taxon, geographic distribution, habitat quality or diversity, or genetic diversity. Key threats to the species (DPE 2022), which are likely to have contributed to its decline in NSW over the last 10 years are: • Pest animals: Feral pigs: Damage to breeding sites by feral pigs and horses • Disease: Chytridiomycosis: chytrid fungus • Climate Change: Alteration of habitat structure, composition, resource availability • Demographic threats: small population size: High risk of extinction due to very small population size.
• evidence of small population size (Principle 2, clause 6.7(2)(b) BC Regulation) presented by: ▪ an estimate of the species' current population size in NSW, and	***Principle 2 SAII = Yes***

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	Southern Corroboree Frog (*Pseudophryne corroboree)*
▪ an estimate of the decline in the species' population size in NSW in three years or one generation (whichever is longer), and ▪ where such data is available, an estimate of the number of mature individuals in each subpopulation, or the percentage of mature individuals in each subpopulation, or whether the species is likely to undergo extreme fluctuations	DPE have determined that this species is at risk of SAII due to Principle 2 – small population size (DPE 2022). The species population is estimated at < 50 individuals or < 250 individuals where threats are known. There are no data available to evaluate the population trend over three years or one generation (TSSC 2021a). See above for more detail. According to TSSC (2021a) the estimated total number of mature individuals is 'very low'. The TSSC (2021a) estimates a wild population between 100 and 150 individuals.
• evidence of limited geographic range for the threatened species (Principle 3, clause 6.7(2)(c) BC Regulation) presented by: ▪ extent of occurrence ▪ area of occupancy ▪ number of threat-defined locations (geographically or ecologically distinct areas in which a single threatening event may rapidly affect all species occurrences), and ▪ whether the species' population is likely to undergo extreme fluctuations	***Principle 3 SAII = Yes*** DPE have determined that this species is at risk of SAII due to Principle 3 – limited geographic range (DPE 2022). The calculated extent of occurrence (EOO) is <45 km^2 (DPE 2022). The area of occupancy (AOO) for the species is estimated to be <36 km^2 (DPE 2022). At present, no critical habitat has been identified or declared for the species. The species has a very highly restricted distribution, with populations occurring entirely within Kosciuszko National Park (TSSC 2021a). This has now contracted further to the western edge of its former distribution. There is no information/evidence of this species experiencing extreme fluctuations in population size or habitat.
• evidence that the species is unlikely to respond to management (Principle 4, clause 6.7(2)(d) BC Regulation) because: ▪ known reproductive characteristics severely limit the ability to increase the existing population on, or occupy new habitat (eg species is clonal) on, a biodiversity stewardship site ▪ the species is reliant on abiotic habitats which cannot be restored or replaced (eg karst systems) on a biodiversity stewardship site, or ▪ life history traits and/or ecology is known but the ability to control key threatening processes at a biodiversity stewardship site is currently negligible (eg frogs severely impacted by chytrid fungus).	***Principle 4 SAII = No*** DPE have not determined that this species is at risk of SAII due to Principle 4 – unlikely to respond to management (DPE 2022). This species has no known characteristics that could severely limit its ability to increase on a biodiversity stewardship site. The habitat of Southern Corroboree Frog comprises of a breeding season habitat associated with pools and seepages in Sphagnum bogs, wet tussock grasslands and wet heath, and a terrestrial non-breeding habitat in forest, sub-alpine woodland and tall heath adjacent to the breeding area. At present, no critical habitat has been identified or declared. The ability to control key threats at a biodiversity stewardship site is thought to be possible. The species is to be Very Highly sensitive to gain (DPE 2022). The removal of feral animals through fencing and control programs

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	Southern Corroboree Frog (*Pseudophryne corroboree)*
	is achievable. To mitigate the threat of Amphibian Chytrid Fungus, a strict hygiene protocol would be able to be enforced on a biodiversity stewardship site in alignment with DEE (2016).
3. Where the TBDC indicates data is 'unknown' or 'data deficient' for a species for a criterion listed in Subsection 9.1.2(2.), the assessor must record this in the BDAR or BCAR.	The TBDC does not indicate that data is 'unknown' or 'data deficient' for this species for a criterion listed in Subsection 9.1.1(2.). Some responses in this consideration of SAII cannot be completed comprehensively due to the following: • The species information available in TBDC, BioNet and other reliable/peer reviewed information about the species is limited • A lot of the information is not covered by scientific papers, and there are significant knowledge gaps. As such, we have noted the knowledge gaps in the TBDC and provided responses using information from the limited available sources.
4. In relation to the impacts from the proposal on the species at risk of an SAII, the assessor must include data and information on:	
• the impact on the species' population (Principles 1 and 2) presented by: ▪ an estimate of the number of individuals (mature and immature) present in the subpopulation on the subject land (the site may intersect or encompass the subpopulation) and as a percentage of the total NSW population, and ▪ an estimate of the number of individuals (mature and immature) to be impacted by the proposal and as a percentage of the total NSW population, or ▪ if the species' unit of measure is area, provide data on the number of individuals on the site, and the estimated number that will be impacted, along with the area of habitat to be impacted by the proposal	Suitable habitat for *Pseudophryne corroboree* was detected within the project footprint within PCTs 679 and 1196 in the Snowy Mountains IBRA subregion. Targeted fauna surveys within the project footprint did not locate the species. Where survey effort was not adequate, species presence has been assumed within suitable habitat. There are no records within 20 km of the project (DPE 2022). As such, a percentage of the total population present in the subpopulation on the project footprint cannot be attained. Given the species was not recorded and is only assumed present, and the limited information available on the total population of the species, it is not possible to determine the number of individuals (mature and immature) that would be impacted by the project and as a percentage of the total NSW population. As above, the total population in NSW is unknown, as such a percentage to be impacted of the total population cannot be determined. The project would result in the direct impact to 22.2 ha of potential habitat for South Corroborree Frog. The species unit of measure is area. The species was not located within the project footprint despite targeted surveys in accessible land. Where survey effort was not adequate, species presence has been assumed within suitable habitat. The total area of this species habitat that would be impacted by the project is 22.14 ha.
• impact on geographic range (Principles 1 and 3) presented by:	The project footprint comprises of 43.94 ha of potential habitat for the species, 22.2 ha (51%) of which would be impacted by the project. The extent of occurrence and area of occupancy for this species was estimated to be <45 km^2 and <36 km^2, respectively (TSSC, 2021). Therefore, the

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	Southern Corroboree Frog (*Pseudophryne corroboree)*
▪ the area of the species' geographic range to be impacted by the proposal in hectares, and a percentage of the total area of occupancy or extent of occupancy within NSW ▪ the impact on the subpopulation as either: all individuals will be impacted (subpopulation eliminated); OR impact will affect some individuals and habitat; OR impact will affect some habitat, but no individuals of the species will be directly impacted ▪ to determine if the persisting subpopulation that is fragmented will remain viable, estimate (based on published and unpublished sources such as scientific publications, technical reports, databases or documented field observations) the habitat area required to support the remaining population, and habitat available within dispersal distance, and distance over which genetic exchange can occur (eg seed dispersal) and pollination distance for the species ▪ To determine changes in threats affecting remaining subpopulations and habitat if the proposed impact proceeds, estimate changes in environmental factors including changes to fire regimes (frequency, severity); hydrology, pollutants; species interactions (increased competition and effects on pollinators or dispersal); fragmentation, increased edge effects, likelihood of disturbance; and disease, pathogens and parasites. Where these factors have been considered elsewhere in relation to the target species, the assessor may refer to the relevant sections of the BDAR or BCAR.	project may impact 0.6% of the Southern Corroboree Frog range however it is not known whether the impact areas are within the calculated extent of occurrence or area of occupancy given the limited distribution of the species. The project would impact on 22.2 ha (51%) of the 43.94 ha of potential habitat for the species within the project footprint. The project would impact some habitat, but no known individuals of the species. Where targeted surveys were undertaken the species was not detected. In areas that comprise the species polygon that could not be adequately surveyed, species presence has been assumed. The project would impact on 22.2 ha (51%) of the 43.94 ha of potential habitat for the species within the project footprint. The project would impact some habitat, but no individuals of the species is likely to be directly impacted in areas where targeted surveys were undertaken as the species was not detected. In areas that comprise the species polygon that could not be adequately surveyed, species presence has been assumed. As such, the number of individuals cannot be quantified. The project would result in a highly permeable structure for biodiversity and connectivity is expected to remain largely unaffected. This species is likely to be able to traverse the long, linear nature of the area to be cleared. Any impacts on species connectivity are likely to reduce over time as biodiversity acclimatises to the presence of the transmission lines (and structures), further a connectivity strategy is to be developed after the design refinement stage to minimise the extent of connectivity impacts, which may include retaining of corridors adjacent to easement to facilitate fauna movement. The consequence of the impacts would be minor and non-significant. Therefore, the project would not create a barrier to dispersal of the species. The impact on the sub-population(s) cannot be quantified, as the species polygon has been calculated based on assumed presence. If the species is present, individuals in the project footprint may be affected by changes to fire regimes in surrounding vegetation as a result of management for asset protection, habitat loss, increased edge effects, introduction or spread of pathogens such as Chytrid Fungus, altered hydrology due to drainage lines within the project footprint, chemical pollution, and off-road vehicle activities (access tracks).
5. The assessor may also provide new information that can be used to demonstrate that the principle identifying the species as at risk of an SAII, is inaccurate.	Not applicable
Likely SAII assessment outcome against relevant principles.	There is unlikely to be a significant risk that the species would be impacted such that an SAII occurs given the low likelihood of occurrence within the impacted areas. Additional targeted

Additional impact assessment provisions for species at risk of SAII (Section 9.1.2 of the BAM)	Southern Corroboree Frog (*Pseudophryne corroboree)*
	survey over the limited extent of potential impact areas will assist in clarifying whether habitat is suitable for the species.

Attachment 15: BC Act candidate species bushfire assessment table

Table A15- 1: Candidate threatened flora species within severely burnt sites.

Scientific Name	Common name	BC Act Status*	EPBC Act Status*	Credit status	SAII	IBRA sub region			Associated PCTs within severely burnt sites.	Species response to fire	Assessment considerations
						BON[1]	INL[2]	SNO[3]			
Acacia ausfeldii	Ausfeld's Wattle	V	-	Species	-		X		277	*Acacia ausfeldii* has been found to have a strong germination at high temperature treatments (100°C) (Brown *et al.* 2003). Prior to temperatures reaching 100 °C no difference in germination rates was observed in the species. The species response to higher temperatures is unknown. A study conducted after a 2013 bushfire in the Warrumbungle's showed that Acacia species were typically denser in regrowth in areas burnt at high severity (Palmer et al. 2018).	**Targeted surveys appropriate** Research shows that Acacia species, and specifically *Acacia ausfeldii* respond well to fire. If the species did occur within vegetation severely burnt, prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic survey effort (Inland Slopes) (Table 4-13).
Acacia phasmoides	Phantom Wattle	V	V	Species	Yes		X		287	There is little data about *Acacia phasmoides* response to fire. There was some evidence of basal resprouting post low to medium intensity fire, and post drought stress (DPIE, 2021). There is scant information on seed germination rates post-fire, however, like other acacia species, *Acacia phasmoides* is assumed to recruit from the soil-stored seed bank (Palmer, 2016).	**Targeted surveys appropriate** While there is little research on *Acacia phasmoides* response to fire, studies show that Acacia species respond well to fire. If the species did occur within severely burnt vegetation prior to the 2019-2020 bushfire, considering the time frame post fire it is reasonable to assume that the species would have persisted and could be detected post fire. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic survey effort (Table 4-13).
Ammobium craspedioides	Yass Daisy	V	V	Species	-	X	X		268, 277, 287, 290 & 352	A study completed by Doherty and Wright (2006) on the 2003 bushfire in the Australian Alps, found *Ammobium craspedioides* to be sufficiently re-sprouting and flowering in the vicinity of burnt areas near Burrinjuck.	**Targeted surveys appropriate** Given previous research showed that *Ammobium craspedioides* responds well to fire, if the species did occur within the project footprint prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, targeted surveys are considered an appropriate method for confirming species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic survey effort (Bondo and Inland Slopes) (Table 4-13).
Bossiaea fragrans	-	CE	CE	Species	Yes		X		268	There is little data about *Bossiaea fragrans* response to fire. The species very limited known distribution and lack of bushfires in that area has resulted in a knowledge gap surrounding fire response. Similar to other *Bossiaea* species, it is thought to both set a long-lived seedbank, and also resprout post fire (Clarke et al 2009; DCCEEW 2022a).	**Targeted surveys appropriate** Given the broadly positive response of other Bossiaea species to fire, if the species did occur within the project footprint prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, targeted surveys are considered an appropriate method for confirming species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic survey effort (Inland Slopes) (Table 4-13).
Caesia parviflora var. minor	Small Pale Grass-lily	E	-	Species	-		X		297	There is very little data about *Caesia parviflora var. minor* response to fire. The closely related, more common *Caesia parviflora var. parviflora* has been shown to resprout post fire in multiple locations (Kubiak 2009). Given ongoing taxonomic issues in this genus, much of the life history traits and fire response of *Caesia parviflora var. minor* are assumed to be similar to its common relative (Henderson 1987).	**Targeted surveys appropriate** Given the positive fire response traits of this genus, if *Caesia parviflora var. minor* did occur within the project footprint prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, targeted surveys are

[1] Bondo IBRA subregion
[2] Inland Slopes IBRA subregion
[3] Snowy Mountains IBRA subregion

Scientific Name	Common name	BC Act Status*	EPBC Act Status*	Credit status	SAII	IBRA sub region			Associated PCTs within severely burnt sites.	Species response to fire	Assessment considerations
						BON[1]	INL[2]	SNO[3]			
											considered an appropriate method for confirming species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic survey effort (Inland Slopes) (Table 4-13).
Caladenia concolor	Crimson Spider Orchid	E	V	Species	Yes		X		268, 280 & 290	*Caladenia concolor* have been found to respond positively to fire (Duncan 2012). Duncan notes that Caladenia species are stimulated by bushfire.	**Targeted surveys appropriate** Given the literature shows *Caladenia concolor* responds well to fire, if the species occurred within the project footprint prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, targeted surveys are considered an appropriate method for confirming species presence/absence. **Assessment approach:** Targeted surveys – threatened flora parallel field traverse survey effort (Inland Slopes) (Table 4-14).
Caladenia montana	-	V	-	Species	-	X		X	300, 638, 679, 953 & 1196	The ACT Orchid Field Guide (2008) reported that *Caladenia montana* displayed a strong post-fire flowering response following the 2003 bushfire (in the ACT).	**Targeted surveys appropriate** Given the literature shows *Caladenia montana* responds well to fire, if the species occurred within the project footprint prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, targeted surveys are considered an appropriate method for confirming species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Bondo and Snowy Mountains) (Table 4-13).
Calotis glandulosa	Mauve Burr-daisy	V	V	Species	Yes			X	679, 1196 & 1224	Currently there is no literature on this species response to fire. The common species *Calotis lappulacea* (Yellow Burr-daisy) has been observed to resprout after a burn was applied (Watson 2005; Morris *et al.* 2021).	**Targeted surveys appropriate** Given the similar growth forms and life cycle of the two species it could be assumed *Calotis glandulosa* would behave in a similar way to *Calotis lappulacea* post fire. Therefore, if the species did occur within the project footprint, prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, targeted surveys are considered an appropriate method for confirming species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Snowy Mountains) (Table 4-13) and threatened flora parallel field traverse survey effort (Snowy Mountains) (Table 4-14).
Calotis pubescens	Max Mueller's Burr-daisy	E	-	Species	No			X	1224	Currently there is no literature on this species response to fire. The common species *Calotis lappulacea* (Yellow Burr-daisy) has been observed to resprout after a burn was applied (Watson 2005; Morris *et al.* 2021).	**Targeted surveys appropriate** Given the similar growth forms and life cycle of the two species it could be assumed *Calotis pubescens* would behave in a similar way to *Calotis lappulacea* post fire. Therefore, if the species did occur within the project footprint, prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, targeted surveys are considered an appropriate method for confirming species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Snowy Mountains) (Table 4-13).
Cullen parvum	Small Scurf-pea	E	-	Species	-		X		277	Grassland communities require some level of disturbance, whether from light grazing or fire, to maintain diversity and prevent a monoculture of grass species (Hobbs and Huenneke 1992). There is currently no research on the species response to fire, however similar genus in the Fabaceae family have been widely documented to quickly resprout post fire (Kubiak 2009).	**Targeted surveys appropriate** Given the similarity between *Cullen parvum* and other genus with similar growth forms and life cycle in the Fabaceae, it could be assumed *Cullen parvum* would behave in a similar way to Glycine and *Desmodium* species post fire. Therefore, if the species did occur within the project footprint, prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As

Scientific Name	Common name	BC Act Status*	EPBC Act Status*	Credit status	SAII	IBRA sub region			Associated PCTs within severely burnt sites.	Species response to fire	Assessment considerations
						BON[1]	INL[2]	SNO[3]			
											such, targeted surveys are considered an appropriate method for confirming species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Inland Slopes) (Table 4-13).
Discaria nitida	Leafy Anchor Plant	V	-	Species	-			X	679	*Discaria nitida* is mostly found in areas that are rarely burnt. The species is considered to be highly fire sensitive and will die with limited post fire recruitment (DPE 2022).	**Targeted surveys NOT appropriate** Prior to the 2019-2020 bushfire, the last known fires in the area of potential habitat were 1964-65 and 1938-39. Given *Discaria nitida* is highly sensitive to fire, the species is unlikely to occur in the project footprint given the history of fires. A conservative approach has been adopted and species presence has been assumed within severely burnt habitats. **Assessment approach:** Assumed presence within suitable habitats.
Eucalyptus aggregata	Black Gum	V	V	Species	-		X		N/A	Whilst there isn't any current literature on *Eucalyptus aggregata* response to fire, most eucalypts persist through fire due to adaptive traits, including epicormic sprouting after fire (Crisp *et al.*, 2011). Inappropriate fire regimes may stunt the growth of mature trees and kill juveniles.	**Targeted surveys appropriate** Given the *Eucalyptus* genera is known to have many adaptive traits to deal with fire, if the species did occur within the project footprint, prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, targeted surveys are considered an appropriate method for confirming species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Inland Slopes and Snowy Mountains) (Table 4-13) and threatened flora parallel field traverse survey effort (Snowy Mountains) (Table 4-14).
Eucalyptus alligatrix subsp. alligatrix	-	V	V	Species	Yes		X		287 & 290	*Eucalyptus alligatrix subsp. alligatrix* is known to regenerate well post fire. Populations that were burnt in the 2009 Black Saturday fire were noted to be regenerating both vegetatively and from seed (Tolsma et al. 2012).	**Targeted surveys appropriate** Given *Eucalyptus alligatrix subsp. alligatrix* is known to have many adaptive traits to deal with fire, if the species did occur within the project footprint, prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, targeted surveys are considered an appropriate method for confirming species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Inland Slopes) (Table 4-13).
Eucalyptus cannonii	Capertree Stringybark	V	-	Species	-		X		290	*Eucalyptus cannonii* is known to regenerate well post fire, with mature trees resprouting from epicormic buds post burn. Inappropriate fire regimes may stunt the growth of mature trees and kill juveniles (Benson & McDougall, 1998).	**Targeted surveys appropriate** Given the *Eucalyptus* genera is known to have many adaptive traits to deal with fire, if the species did occur within the project footprint, prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, targeted surveys are considered an appropriate method for confirming species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Inland Slopes) (Table 4-13).
Eucalyptus robertsonii subsp. hemisphaerica	Robertson's Peppermint	V	V	Species	Yes		X		352	*Eucalyptus robertsonii subsp haemsphaerica* is known to regenerate well post fire, with mature trees resprouting from epicormic buds post burn. Inappropriate fire regimes may stunt the growth of mature trees and kill juveniles (Benson & McDougall, 1998).	**Targeted surveys appropriate** Given the *Eucalyptus* genera is known to have many adaptive traits to deal with fire, if the species did occur within the project footprint, prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, targeted surveys are considered an appropriate method for confirming species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Inland Slopes) (Table 4-13).

Scientific Name	Common name	BC Act Status*	EPBC Act Status*	Credit status	SAII	IBRA sub region			Associated PCTs within severely burnt sites.	Species response to fire	Assessment considerations
						BON[1]	INL[2]	SNO[3]			
Euphrasia arguta	-	CE	CE	Species	Yes		X		277, 287 & 290	There is limited literature on *Euphrasia arguata's* response to fire. Observations of other species in the *Euphrasia* genus showed that species often require open areas for regeneration and recruitment and were found in areas that were kept open due to disturbance (Moritz and Bickerton 2010).	**Targeted surveys appropriate** Given the literature shows *Euphrasia* species to typically respond well to disturbance, and known populations are still present post the 2019-2020 bushfires, if the species occurred within the project footprint prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, targeted surveys are considered an appropriate method for confirming species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Inland Slopes) (Table 4-13).
Euphrasia scabra	Rough Eyebright	E	-	Species	Yes			X	679 & 939	There is limited literature on *Euphrasia scabra*'s response to fire. Observations of other species in the *Euphrasia* genus showed that species often require open areas for regeneration and recruitment and were found in areas that were kept open due to disturbance (Moritz and Bickerton 2010). The Saving Our Species report for *Euphrasia scabra* noted that post the 2019-2020 bushfires, known populations declined, however, were still present when surveyed (DPE 2020a).	**Targeted surveys appropriate** Given the literature shows *Euphrasia* species to typically respond well to disturbance, and known populations are still present post the 2019-2020 bushfires, if the species occurred within the project footprint prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, targeted surveys are considered an appropriate method for confirming species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Snowy Mountains) (Table 4-13).
Glycine latrobeana	Clover Glycine	CE	V	Species	Yes			X	1224	The current Nation Recovery Plan (Carter and Sutter 2010) for *Glycine latrobeana* suggests the species requires disturbance (including fire) for germination and is known to be abundant post fire.	**Targeted surveys appropriate** Given the recovery plan suggests that *Glycine latrobeana* responds well to fire, if the species did occur within the project footprint prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, targeted surveys are considered an appropriate method for confirming species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Snowy Mountains) (Table 4-13).
Grevillea wilkinsonii	Tumut Grevillea	E	-	Species	Yes		X		301	Currently there is no literature on *Grevillea wilkonsonii* response to fire, but there are some studies involving the genus. Tozer (1995) found that although some Grevillea species have their seed dormancy broken by fire events, the results are generally Grevillea varied species.	**Targeted surveys NOT appropriate** Given the lack of literature and the general varied response of Grevillea to bushfire events, a conservative approach has been adopted and species presence has been assumed within severely burnt habitats. **Assessment approach:** Assumed presence within suitable habitats.
Haloragis exalata subsp. exalata	Square Raspwort	V	V	S+pecies	No			X	638	There is limited literature on *Halorgis exalata subsp. exalata's* response to fire, however the species appears to be a post-disturbance coloniser. This is based on observation made 10 months after the 2003 Kosciuszko wildfires. Thousands of *Haloragis exalta subsp. exalata* seedlings were found extending up slopes above roads near the dam in burnt forest, however on an unburnt powerline easement there was no apparent change in plant numbers (Miles & Cameron 2007).	**Targeted surveys appropriate** Given research shows *Haloragis exalata subsp. exalata* sprouts abundantly post disturbance, including fire, if the species did occur within the project footprint prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, targeted surveys are considered an appropriate method for confirming species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Snowy Mountains) (Table 4-13).
Irenepharsus magicus	Elusive Cress	E	-	Species	Yes			X	638	There is extremely limited literature on the life history traits or response to fire of *Irenepharsus magicus. However, there was a* record found of the species in a rocky outcrop in eastern Victoria after the 2003 alpine fires, suggesting that it does occur post fire *(DPE 2022b).* Other threatened species in the genus, e.g. *Irenepharsus trypherus,* have been shown to be killed by fire but to resprout from a stored seed bank (DEC 2005).	**Targeted surveys appropriate** While the species is extremely data deficient, previous species records post fire and the life history traits of closely related species suggest that it would likely to resprout post fire. Given time since fire, if the species did occur within the project footprint prior to the 2019-2020 bushfire, it is reasonable to assume that it would be present post bushfire. As such, the surveys targeting this species are

Scientific Name	Common name	BC Act Status*	EPBC Act Status*	Credit status	SAII	IBRA sub region			Associated PCTs within severely burnt sites.	Species response to fire	Assessment considerations
						BON[1]	INL[2]	SNO[3]			
											considered to be suitable for detecting the species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Snowy Mountains) (Table 4-13).
Leucochrysum albicans var. *tricolor*	Hoary Sunray	-	E	Species	-		X	X	268, 352, 679, 953 & 1196	Grassland communities require some level of disturbance, whether from light grazing or fire, to maintain diversity and prevent a monoculture of grass species (Hobbs and Huenneke 1992). Frequent (7-11 years) fires are considered ideal for the conservation of *Leucochrysum albicans* var. *tricolor,* however, how fire intensity impacts the species is unknown (Sinclair 2010).	**Targeted surveys appropriate** Given the species life cycle requires some disturbance (in the form of frequent fires), if the species did occur within the project footprint, prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, the surveys targeting this species are considered to be suitable for detecting the species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Bondo, Inland Slopes and Snowy Mountains) (Table 4-13) and threatened flora parallel field traverse survey effort (Inland Slopes and Snowy Mountains) (Table 4-14).
Persoonia marginata	Clandulla Geebug	V	V	Species	-		X		287	The response of *Persoonia marginata* to fire appears to be variable, with some mature individuals resprouting while others have been killed by the fire (DEWHA 2008). While inappropriate fire regimes appear to be a threat to the species, some fire in the landscape appears to be an important trigger for seed germination, in line with other Proteaceae species (NSW NPWS 2000).	**Targeted surveys appropriate** Given adaptations to fire noted if the species did occur within the project footprint, prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, the surveys targeting this species are considered to be suitable for detecting the species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Inland Slopes) (Table 4-13).
Prasophyllum bagoense	Bago Leek Orchid	CE	CE	Species	Yes			X	1196 & 1224	There is no current literature on *Prasophyllum bagoense* response to bushfire. However, many species in the *Prasophyllum* genera were observed in high abundance post the Black Saturday Victoria 2009 (Duncan 2012), and it has been assumed that the genera responds well to bushfire.	**Targeted surveys appropriate** Given the literature shows *Prasophyllum* spp. respond well to fire, if *Prasophyllum bagoense* occurred within the project footprint prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, the surveys targeting this species are considered to be suitable for detecting the species presence/absence. **Assessment approach:** No targeted surveys conducted (Table 4-13).
Prasophyllum innubum	Brandy Marys Leek-orchid	CE	CE	Species	Yes			X	1224	There is no current literature on *Prasophyllum innubum* response to bushfire. However, many species in the *Prasophyllum* genera were observed in high abundance post the Black Saturday Victoria 2009 (Duncan 2012), and it has been assumed that the genera responds well to bushfire.	**Targeted surveys appropriate** Given the literature shows *Prasophyllum* spp. respond well to fire, if *Prasophyllum innubum* occurred within the project footprint prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, the surveys targeting this species are considered to be suitable for detecting the species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Snowy Mountains) (Table 4-13).
Prasophyllum keltonii	Kelton's Leek Orchid	CE	CE	Species	Yes			X	1196	There is no current literature on *Prasophyllum sp.* keltoniiresponse to bushfire. However, many species in the *Prasophyllum* genera were observed in high abundance post the Black Saturday Victoria 2009 (Duncan 2012), and it has been assumed that the genera responds well to bushfire.	**Targeted surveys appropriate** Given the literature shows *Prasophyllum* spp. respond well to fire, if *Prasophyllum keltonii* occurred within the project footprint prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, the surveys targeting this species are considered to be suitable for detecting the species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Snowy Mountains) (Table 4-13).

Scientific Name	Common name	BC Act Status*	EPBC Act Status*	Credit status	SAII	IBRA sub region			Associated PCTs within severely burnt sites.	Species response to fire	Assessment considerations
						BON[1]	INL[2]	SNO[3]			
Prasophyllum petilum	Tarengo Leek Orchid	E	E	Species	-		X		277	There is no current literature on *Prasophyllum sp. Petilum* response to bushfire. However, many species in the *Prasophyllum* genera were observed in high abundance post the Black Saturday Victoria 2009 (Duncan 2012), and it has been assumed that the genera responds well to bushfire.	**Targeted surveys appropriate** Given the literature shows *Prasophyllum* spp. Respond well to fire, if *Prasophyllum petilum* occurred within the project footprint prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, the surveys targeting this species are considered to be suitable for detecting the species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Inland Slopes) (Table 4-13).
Prasophyllum sp. Wybong	-	-	CE	Species	Yes		X		277	There is no current literature on *Prasophyllum sp. Wybong* response to bushfire. However, many species in the *Prasophyllum* genera were observed in high abundance post the Black Saturday Victoria 2009 (Duncan 2012), and it has been assumed that the genera responds well to bushfire.	**Targeted surveys appropriate** Given the literature shows *Prasophyllum* spp. Respond well to fire, if *Prasophyllum sp. Wybong* occurred within the project footprint prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, the surveys targeting this species are considered to be suitable for detecting the species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Inland Slopes) (Table 4-13) and threatened flora parallel field traverse survey effort (Bondo and Inland Slopes) (Table 4-14).
Pterostylis alpina	Alpine Greenhood	V	-	Species	No			X	679 & 1196	There is limited information on *Pterostylis alpina* response to high intensity fires. The *Pterostylis* genera is variable in its response to fire, some species are fire sensitive while others are neutral (Duncan 2012).	**Targeted surveys NOT appropriate** Given the limited knowledge of *Pterostylis alpina* response to fire, and the known negative or neutral response of other species (Duncan 2012), a conservative approach has been adopted and species presence has been assumed within severely burnt habitats. **Assessment approach:** Assumed presence within suitable habitats.
Pterostylis foliata	Slender Greenhood	V	-	Species	No			X	638, 679 & 1196	There is limited information on *Pterostylis foliata* response to high intensity fires. The *Pterostylis* genera is variable in its response to fire, some species are fire sensitive while others are neutral (Duncan 2012).	**Targeted surveys NOT appropriate** Given the limited knowledge of *Pterostylis foliata* response to fire, and the known negative or neutral response of other species (Duncan 2012), a conservative approach has been adopted and species presence has been assumed within severely burnt habitats. **Assessment approach:** Assumed presence within suitable habitats.
Pterostylis oreophila	Blue-tongued Greenhood	CE	CE	Species	Yes			X	939	There is limited information on *Pterostylis oreophila* response to high intensity fires. The *Pterostylis* genera is variable in its response to fire, some species are fire sensitive while others are neutral (Duncan 2012).	**Targeted surveys NOT appropriate** Given the limited knowledge of *Pterostylis oreophila* response to fire, and the known negative or neutral response of other species (Duncan 2012), a conservative approach has been adopted and species presence has been assumed within severely burnt habitats. **Assessment approach:** Assumed presence within suitable habitats.
Pultenaea humilis	Dwarf Bush-pea	V	-	Species	-		X		268, 287, 290 & 306	There is currently no literature on how P*ultenaea humilis* responds to bushfires. Another threatened species in the *Pultenaea* genera, *Pultenaea weindorferi* (Swamp Bush-pea) is known to be fire sensitive, with bushfires killing adults and recruitment occurring from a persistent soil stored seed bank. Seed germination will not occur in the absence of fire as the hard-coated seed required heat to break seed dormancy, as is typical of species within Fabaceae. It is assumed that *Pultenaea humilis* would have a similar fire response (NSW OEH 2022b).	**Targeted surveys appropriate** Given the literature shows *Pultenaea* spp. requires fire as part of its life history, if P*ultenaea humilis* occurred within the project footprint prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, the surveys targeting this species are considered to be suitable for detecting the species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Inland Slopes) (Table 4-13).
Rutidosis leiolepis	Monaro Golden Daisy	V	V	Species	-			X	1224	Generally, Australian grassland species are well adapted to fire, particularly if they occur after seed set, however there is currently no	**Targeted surveys appropriate**

Scientific Name	Common name	BC Act Status*	EPBC Act Status*	Credit status	SAII	IBRA sub region			Associated PCTs within severely burnt sites.	Species response to fire	Assessment considerations
						BON[1]	INL[2]	SNO[3]			
										literature on the response of *Rutidosis leiolepis* to fire. *Rutidosis leptorrhynchoides* (Button Wrinklewort), another species in the genus, requires burning every 2-5 years in areas of high productivity to prevent increased biomass of other native and introduced grasses and reduce the risk of being smothered or outcompeted. However, it is believed that high frequency or high intensity fires and fires during the flowering period may prove detrimental as seeds are only viable in the soil for up to 18 months (DSE 2012a)	Given the literature shows *Rutidiosis* spp. Requires fire as part of its life history, if *Rutidosis leiolepis* occurred within the project footprint prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, the surveys targeting this species are considered to be suitable for detecting the species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Snowy Mountains) (Table 4-13).
Senecio garlandii	Woolly Ragwort	V	-	Species	No		X		287 & 290	A study of the effect of fire on a large population of *Senecio garlandii* showed that while 95% of the adult population was killed, significant and vigorous resprouting from seed was noted post fire. Many of the seedlings produced flowers two years post fire, with some resprouting noted from mature plants that were not killed (Burrows 1995).	**Targeted surveys appropriate** Given the limited knowledge *Senecio garlandii* response to fire, a conservative approach has been adopted and species presence has been assumed within severely burnt habitats. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Bondo and Inland Slopes) (Table 4-13) and threatened flora parallel field traverse survey effort (Inland Slopes) (Table 4-14).
Swainsona recta	Small Purple-pea	E	E	Species	-		X		268 & 277	Research indicates that while the larger above ground biomass of *Swainsona recta* may be burnt by fire, individuals are not frequently killed in this event. The species favours periodic burning, which reduces build-up of dead plant matter and reduces competition with native grassland species such as Kangaroo Grass. Fire is also an important factor in seedling regeneration, as dormancy of the hard-coated seed is broken by fire (OEH 2012).	**Targeted surveys appropriate** Given the literature shows *Swainsonia recta* requires fire as part of its life history, if the species occurred within the project footprint prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, the surveys targeting this species are considered to be suitable for detecting the species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Inland Slopes) (Table 4-13) and threatened flora parallel field traverse survey effort (Bondo and Inland Slopes) (Table 4-14).
Swainsona sericea	Silky Swainson-pea	V	-	Species	-		X		277, 280 & 290	Like other Swainsona species, *Swainsona sericea* can persist during adverse conditions as a soil-stored seed, requiring cool-season rains or fire events to release dormancy (NSW Scientific Committee 2008).	**Targeted surveys appropriate** Given the literature shows *Swainsonia sericea* requires fire as part of its life history, if the species occurred within the project footprint prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, the surveys targeting this species are considered to be suitable for detecting the species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Inland Slopes) (Table 4-13) and threatened flora parallel field traverse survey effort (Bondo, Inland Slopes and Snowy Mountains) (Table 4-14).
Thelymitra alpicola	Alpine Sun-orchid	V	-	Species	No			X	939	There is no current literature on *Thelymitra alpicola's* response to bushfire. However, many species in the *Thelymitra* genera were observed in high abundance post the Black Saturday Victoria 2009 (Duncan 2012), and it has been assumed that the genera responds well to bushfire.	**Targeted surveys appropriate** Given the literature shows *Thelymitra* spp. Respond well to fire, if *Thelymitra alpicola* occurred within the project footprint prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, the surveys targeting this species are considered to be suitable for detecting the species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Snowy Mountains) (Table 4-13).
Thesium australe	Austral Toadflax	V	V	Species	No	X		X	679, 1196 & 1224	There is very little literature on the impacts of fire on *Thesium australe*. Cohn (2004) observed that *Thesium australe* occurred in lower densities in recently burned areas when compared to long unburned areas, suggesting that this species may not respond well to fire.	**Targeted surveys NOT appropriate** According to the results of Cohn's (2004) study, this species has been recorded at lower densities in recently burned areas when compared to long unburned areas. Therefore, a conservative

Scientific Name	Common name	BC Act Status*	EPBC Act Status*	Credit status	SAII	IBRA sub region			Associated PCTs within severely burnt sites.	Species response to fire	Assessment considerations
						BON[1]	INL[2]	SNO[3]			
											approach has been adopted and species presence has been assumed within severely burnt habitats. **Assessment approach:** Assumed presence within suitable habitats.
Xerochrysum palustre	Swamp Everlasting	-	V	Species	-			X	679 & 939	There is limited literature on *Xerochrysum palustre* response to fire, what is known is that adult plants usually resprout from an underground rootstock following fire (DCCEEW 2022b). This is further exhibited by Walsh and McDougall (2004), which showed the species was relatively unaffected by the 2003 bushfire in Kosciuszko National Park.	**Targeted surveys appropriate** Given the findings of Walsh and McDougall (2004), this species has been observed to be relatively unaffected by fire, therefore the surveys targeting this species are considered to be suitable for detecting the species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Snowy Mountains) (Table 4-13).
Zieria obcordata	Granite Zieria	E	E	Species	Yes		X		268, 280 & 287	There is little literature on the impacts of fire on *Zieria obcordata,* however a similar species *Zieria involcruata* is a fire sensitive species known to resprout from seed post fire. While disturbance, and particularly fire appears to be an important trigger for seed germination, inappropriate fire regimes, including fires that are too high intensity or too frequent can destroy both seedlings and the seedbank (NSW NPWS 1998).	**Targeted surveys appropriate** Given the literature shows *Zieria* spp. requires fire for seed germination, it is likely that if *Zieria obcordata* occurred within the project footprint prior to the 2019-2020 bushfire, it is reasonable to assume that it would have persisted post bushfire. As such, the surveys targeting this species are considered to be suitable for detecting the species presence/absence. **Assessment approach:** Targeted surveys – threatened flora two-phase grid-based systematic effort (Inland Slopes) (Table 4-13).

Table A15- 2: Candidate threatened fauna species within severely burnt sites.

Birds													
Burhinus grallarius	Bush Stone-curlew	E	-	Species	-		X		277, 280, 287, 290 & 352	Inappropriate fire regimes over time and/or a single fire event have the potential to reduce the suitability of habitat for this species. Woody debris and leaf litter used by the species for foraging and camouflage is burnt in fires and can take time to build up to a suitable level. Bushfire affected areas would still be suitable for nesting sites, as they are frequently located in relatively open areas where ground cover is extremely low. The presence of fallen timber however is critical to the selection of day roost sites. Chicks that cannot yet fly rely heavily on camouflage for protection, so in bushfire affected areas they would be vulnerable to predation (DEC 2006; Gates 2001).	Fallen/standing dead timber including logs	Bush stone-curlew feed at night on insects and small vertebrates including frogs, lizards, snakes and mice.	**Targeted surveys appropriate** Previous studies have shown *Burhinus grallarius* returning to use areas previously burnt by fire due to increased foraging and nesting habitat opportunities (Gates & Paton 2005). Given time since fire and the presence of fallen timber confirmed by field survey, it is likely that appropriate habitat would be found within the previously severely burnt areas. Given the above, it is likely that targeted surveys are suitable for detecting the species presence/absence. **Assessment approach:** Targeted surveys – diurnal bird surveys (Table 4-17).
Callocephalon fimbriatum	Gang-gang Cockatoo	V	E	Dual	-	X	X	X	268, 277, 280, 285, 287, 290, 295, 297, 299, 300, 306, 314,	Loyn (1997) found that large hole-nesters (hollow nesters) declined after fire (to less than 30% of pre-fire levels), remained scarce for two years, and then increased to pre-fire levels in the third year. This	**Breeding:** Hollow bearing trees; Eucalypt tree species	Gang-gang Cockatoos feed on seeds obtained in trees and shrubs, mostly from eucalypts and wattles. They may also eat some	**Targeted surveys NOT appropriate** According to Loyn's (1997) study, large hollow nesting birds appear to recover more slowly from large scale bushfire

						BON[4]	INL[5]	SNO[6]					
									352, 638, 679, 953 & 1196	increase was evident for Crimson Rosella and Yellow-tailed Black Cockatoo, but not for Gang-gang Cockatoo which remained uncommon.	with hollows greater than 9 cm diameter.	seeds of introduced trees and shrubs around human settlements in winter, and insect larvae (galls, sawflies).	events, with the Gang-gang Cockatoo in particular remaining uncommon after three years. Despite this, the Gang-gang Cockatoo was recorded on several occasions within severely burned PCTs within the Project Footprint. This would suggest that the species has returned to burnt areas. Regardless, a precautionary approach has been adopted and species presence assumed. **Assessment approach**: Hollow-bearing tree survey and mapping. Assumed presence within suitable habitats.
Calyptorhynchus lathami	Glossy Black Cockatoo	V	-	Dual	-	X	X		290	Loyn (1997) found that large hole-nesters (hollow nesters) declined after fire (to less than 30% of pre-fire levels), remained scarce for two years, and then increased to pre-fire levels in the third year. This increase was evident for Crimson Rosella and Yellow-tailed Black Cockatoo, but not for Gang-gang Cockatoo which remained uncommon. **Impact of fire:** Inappropriate fire regimes and excessively frequent fire eliminate sheoaks from areas, prevents the development of mature sheoak stands, and destroys nest trees are listed as key threats to this species (TBDC). Allocasuarinas, especially the preferred *Allocasuarina verticillata,* generally don't resprout post burn. Instead, the serotinous seed bank germinates vigorously post fire. The result of this is a 5–10-year gap before seedlings start to fruit. Observations of the more diet-selective sub species *Calyptorhynchus lathami halmaturinus* on Kangaroo Island indicated that they avoid burnt areas for greater than 10 years. While the mainland species is known to have a slightly more generalised diet, a loss of allocasuarinas would almost certainly stymie return post- fire (Delzoppo et al., 2021).	**Foraging:** Presence of Allocasuarina and casuarina species **Breeding:** Hollow bearing trees; Living or dead tree with hollows greater than 15cm diameter and greater than 8m above ground.	Glossy Black-cockatoos feed almost exclusively on the seeds of *Allocasuarina* species. Occasionally they may eat insect larvae and have been observed feeding on seeds from some eucalypts, angophoras, acacias and hakeas.	**Targeted surveys NOT appropriate** According to Loyn's (1997) study, large hollow nesting birds appear to recover more slowly from large scale bushfire events and remain scarce for two years following intensive bushfire. The diurnal bird surveys for the Project were undertaken during the second and third year following the bushfire. Considering the above, it is possible that the Glossy Black Cockatoo could have occurred in the Project area prior to the 2019/2020 bushfires and may return to the area during the next few years. However, considering the time frame required for *Casuarinaceae* seedlings to grow to maturity, it is unlikely this area would provide adequate foraging resources in this time. Hence, targeted surveys are unlikely to be appropriate at this time. **Assessment approach**: Hollow-bearing tree survey and mapping. Assumed presence within suitable habitats.
Haliaeetus leucogaster	White-bellied Sea Eagle	V	-	Dual (breeding)	-	X	X	X	268, 277, 280, 285, 287, 290, 295, 297, 299, 300, 301, 306, 314, 352, 638, 679, 939, 953, 1196 & 1224	There is little data on the behaviour of diurnal raptors after fire. Significant bushfires may impact breeding indirectly, including the loss of large eucalyptus trees required to support stick nest building, and through the direct impact of heat and smoke on stick nests, nestlings and adults (Larkin et. al., 2020).	**Foraging:** Waterbodies; Within 1km of a rivers, lakes, large dams or creeks, wetlands and coastlines **Breeding:** Living or dead mature trees within suitable vegetation within 1km of a rivers, lakes, large	The White-bellied Sea-Eagle feeds opportunistically on a variety of fish, birds, reptiles, mammals and crustaceans, and on carrion and offal.	**Targeted surveys appropriate** While Loyn (1997) did not consider carnivores due to lack of data, it is considered that the Little Eagle like many other carnivores would recolonise given adequate resources. As this species is known to be highly mobile, their presence in an area is unlikely to be related to ability to survive the initial fire, and instead influenced by resource and breeding habitat availability post fire. The diurnal

						BON[4]	INL[5]	SNO[6]					
											dams or creeks, wetlands and coastlines.		bird surveys for the Project were undertaken during the second and third year following the 2019/2020 bushfire. Given that the species may utilise dead trees, it likely that habitat and foraging requirements are met post fire in this area, with foraging resources potentially increasing post fire. Given the above, it is likely that the above surveys are suitable for detecting the species presence/absence. **Assessment Approach:** Targeted surveys - diurnal bird surveys; mapping of suitable canopy nest (Table 4-17).
Hieraaetus morphnoides	Little Eagle	V	-	Dual (breeding)	-	X	X	X	268, 277, 280, 285, 287, 290, 295, 297, 299, 300, 301, 306, 314, 352, 638, 679, 939, 953, 1196 & 1224	There is little data on the behaviour of diurnal raptors after fire. Significant bushfires may impact breeding indirectly, including the loss of large eucalyptus trees required to support stick nest building, and through the direct impact of heat and smoke on stick nests, nestlings and adults (Larkin et. al., 2020).	**Breeding:** Nest trees - live (occasionally dead) large old trees within vegetation.	Preys on birds, reptiles and mammals, occasionally adding large insects and carrion.	**Targeted surveys appropriate** While Loyn (1997) did not consider carnivores due to lack of data, it is considered that the Little Eagle like many other carnivores would recolonise given adequate resources. As this species is known to be highly mobile, their presence in an area is unlikely to be related to ability to survive the initial fire, and instead influenced by resource and breeding habitat availability post fire. The diurnal bird surveys for the Project were undertaken during the second and third year following the 2019/2020 bushfire. Given that the species may utilise dead trees, it likely that habitat and foraging requirements are met post fire in this area. Given the above, it is likely that the above surveys are suitable for detecting the species presence/absence. **Assessment Approach:** Targeted surveys - diurnal bird surveys; mapping of suitable canopy nests (Table 4-17).
Lophoictinia isura	Square-tailed Kite	V	-	Dual (Breeding)	-	X	X		268, 277, 280, 287, 290, 352 & 953	There is little data on the behaviour of diurnal raptors after fire. Significant bushfires may impact breeding indirectly, including the loss of large eucalyptus trees required to support stick nest building, and through the direct impact of heat and smoke on stick nests, nestlings and adults (Larkin et. al., 2020).	**Breeding:** Nest trees.	The Square-tailed Kite is a specialist hunter of passerines, especially honeyeaters, and most particularly nestlings, and insects in the tree canopy, picking most prey items from the outer foliage.	**Targeted surveys appropriate** While Loyn (1997) did not consider carnivores due to lack of data, it is considered that the Little Eagle like many other carnivores would recolonise given adequate resources. As this species is known to be highly mobile, their presence in an area is unlikely to be related to ability to survive the initial fire, and instead influenced by resource and breeding habitat availability post fire. The diurnal bird surveys for the Project were undertaken during the second and third year following the 2019/2020 bushfire. Given that the species may utilise dead trees, it likely that habitat and foraging requirements are met post fire in this area.

						BON[4]	INL[5]	SNO[6]					
													Given the above, it is likely that the above surveys are suitable for detecting the species presence/absence. **Assessment Approach:** Targeted surveys - diurnal bird surveys; mapping of suitable canopy nests (Table 4-17).
Ninox connivens	Barking Owl	V	-	Dual (Breeding)	-	X	X	X	268, 277, 280, 287, 290, 295, 314, 352, 638 & 953	Much like the Powerful Owl and Sooty Owl, the Barking Owl prefers relatively dense canopy cover for roosting/resting (Kavanagh et al. 1995b). Kavanagh (et al. 1995b) have observed that owls such as the Powerful Owl and the Sooty Owl appear to display a strong association with long-unburnt forest, particularly in their choice of nesting and roosting locations, this is likely due to their preference for dense canopy cover.	**Breeding:** Hollow bearing trees; Living or dead trees with hollows greater than 20 cm diameter and greater than 4m above the ground.	Preferentially hunts small arboreal mammals such as Squirrel Gliders and Common Ringtail Possums, but when loss of tree hollows decreases these prey populations the owls become more reliant on birds, invertebrates and terrestrial mammals such as rodents and rabbits.	**Targeted surveys NOT appropriate** Much like the Powerful Owl and Sooty Owl, the Barking Owl prefers relatively dense canopy cover for roosting/resting (Kavanagh et al. 1995b). Kavanagh (et al. 1995b) have observed that owls such as the Powerful Owl and the Sooty Owl appear to display a strong association with long-unburnt forest, particularly in their choice of nesting and roosting locations, likely due to their preference for dense canopy cover. This species was heard calling during targeted surveys adjacent to severely burned areas in the Snowy Mountains IBRA subregion, however there were no sightings in severely burnt areas within the project footprint. Given the above, a precautionary principle of assumed presence has been applied to these species in areas where breeding habitat may have occurred pre-fire. **Assessment Approach:** Hollow-bearing tree survey and mapping. Assumed presence within suitable habitats.
Ninox strenua	Powerful Owl	V	-	Dual (Breeding)	-	X	X	X	287, 290, 295, 297, 300, 314, 352, 638 & 953	The Powerful Owl and the Sooty Owl appear to display a strong association with long-unburnt forest, particularly in their choice of nesting and roosting locations (Kavanagh 1997). However, foraging habitat for both species may be greatly enhanced in some environments by infrequent wildfires that re-set patterns of understorey succession, thus providing good habitat for several important prey species in the medium term (10-40 years post-wildfire) (Kavanagh 1997).	**Breeding:** Hollow bearing trees; Living or dead trees with hollow greater than 20cm diameter.	The main prey items are medium-sized arboreal marsupials, particularly the Greater Glider, Common Ringtail Possum and Sugar Glider.	**Targeted surveys NOT appropriate** Kavanagh (et al. 1995b) have observed that owls such as the Powerful Owl and the Sooty Owl appear to display a strong association with long-unburnt forest, particularly in their choice of nesting and roosting locations. Given this, a conservative approach has been adopted and species presence has been assumed within severely burnt habitats. **Assessment Approach:** Hollow-bearing tree survey and mapping. Species presence assumed within suitable habitats.
Petroica rodinogaster	Pink Robin	V	-	Species	-	X	X	X	299, 300, 638, 679, 953 & 1196	Loyn (1997) found that damp-ground or understorey insectivores and bark foragers showed negligible changes over time (p : 0.80 and 0.90 respectively) and in some cases were observed to have increased in abundance following bushfire.	Nil.	Pink Robins mainly forage on the ground for prey. Main dietary items are insects and spiders.	**Targeted surveys appropriate** According to Loyn's (1997) study, ground or understorey insectivore species such as *Petroica rodinogaster* are likely to have recovered quickly from the 2019-2020 bushfire. Considering Loyn's (1997) findings, if the species did occur within the severely burned PCTs in the project footprint prior

Scientific Name	Common name	BC Act Status*	EPBC Act Status*	Credit status	SAII	IBRA sub region			Associated PCTs within severely burnt sites.	Species response to fire	TBDC habitat constraints	Diet	Assessment considerations
						BON[4]	INL[5]	SNO[6]					
													to the 2019-2020 bushfire, it is reasonable to assume that they would have persisted post bushfire given their observed response to bushfires. As such, the surveys targeting this species are considered to be suitable for detecting the species presence/absence. **Assessment Approach:** Targeted surveys - diurnal bird surveys (Table 4-17).
Polytelis swainsonii	Superb Parrot	V	V	Dual	-		X		277, 280 & 352	Loyn (1997) found that large hole-nesters (hollow nesters) declined after fire (to less than 30% of pre-fire levels), remained scarce for two years, and then increased to pre-fire levels in the third year. This increase was evident for Crimson Rosella and Yellow-tailed Black Cockatoo, but not for Gang-gang Cockatoo which remained uncommon.	**Breeding:** Hollow bearing trees; Living or dead *E. blakelyi, E. melliodora, E. albens, E. camaldulensis, E. acrocarpus, E. polyanthemos, E. mannifera, E. intertexta* with hollows greater than 5cm diameter; greater than 4m above ground or trees with a DBH of greater than 30cm.	Superb Parrots feed in trees, understorey shrubs and on the ground and their diet consists mainly of grass seeds and herbaceous plants. Also eaten are fruits, berries, nectar, buds, flowers, insects and grain.	**Targeted surveys appropriate** According to Loyn's (1997) study, large hollow nesting birds appear to recover more slowly from large scale bushfire events, they remained scarce for two years following intensive bushfire. The diurnal bird surveys for the Project were undertaken during the second and third year following the bushfire. Considering the above, it is possible that the Superb Parrot could have occurred in the project footprint prior to the 2019/2020 bushfires and may return to the area during the next few years. If this is the case, the timing of the targeted surveys may be considered too early to detect this species. However, the Gang-gang Cockatoo has been recorded within severely burned PCTs within the project footprint, therefore it is reasonable to assume that the Superb Parrot may also have returned, given that other large hollow nesters have been observed within severely burned PCTs in the project footprint. Based on this assumption, the surveys targeting this species are considered to be suitable for detecting the species presence/absence. **Assessment Approach:** Targeted surveys - diurnal bird surveys (Table 4-17).
Tyto novaehollandiae	Masked Owl	V	-	Dual (Breeding)	-	X	X	X	277, 280, 287, 290, 352, 638 & 953	The Masked Owl displays a stronger association with forest that has been burnt more frequently (Kavanagh et al. 1995b). This species appears to forage near ecotones, whether "internal" (i.e. at the boundary of forests of different structural composition) or "external" (i.e. at the forest edge). The mosaic nature of burnt-unburnt patches in the landscape after fire contributes to structural diversity in forest stands which appears to improve foraging opportunities for the Masked Owl.	**Breeding:** Hollow bearing trees; Living or dead trees with hollows greater than 20cm diameter.	The typical diet consists of tree-dwelling and ground mammals, especially rats.	**Targeted surveys appropriate** Given the observations of Kavanagh (et al. 1995b), Masked Owls appear to respond better than some other species of owl to the impacts of wildfire. This species response to wildfire impacts can be somewhat attributed to its hunting behaviours, they are often found hunting along the edges of forests, including roadsides. Many prey species for this species have been recorded during surveys, including gliders, rats and other arboreal and ground mammals. Thus, the ability for this species to persist in the subject area would depend on the availability of breeding habitat. A precautionary

Scientific Name	Common name	BC Act Status*	EPBC Act Status*	Credit status	SAII	IBRA sub region			Associated PCTs within severely burnt sites.	Species response to fire	TBDC habitat constraints	Diet	Assessment considerations
						BON[4]	INL[5]	SNO[6]					
													approach of assumed presence has still been applied to areas where breeding habitat is considered to have been severely damaged by the fires. **Assessment Approach:** Targeted surveys - diurnal bird surveys; stagwatching; nocturnal call playback; spotlighting (Table 4-17).
Tyto tenebricosa	Sooty Owl	V	-	Dual (Breeding)	Yes (Breeding)	X		X	638	The Powerful Owl and the Sooty Owl appear to display a strong association with long-unburnt forest, particularly in their choice of nesting and roosting locations (Kavanagh 1997). However, foraging habitat for both species may be greatly enhanced in some environments by infrequent wildfires that re-set patterns of understorey succession, thus providing good habitat for several important prey species in the medium term (10-40 years post-wildfire) (Kavanagh 1997).	**Breeding:** Caves; Caves or cliff lines/ledges| Hollow bearing trees; Living or dead trees with hollows greater than 20cm diameter.	Main prey are small ground mammals or tree-dwelling mammals such as the Common Ringtail Possum and Sugar Glider.	**Targeted surveys NOT appropriate** Kavanagh (et al. 1995b) have observed that owls such as the Powerful Owl and the Sooty Owl appear to display a strong association with long-unburnt forest, particularly in their choice of nesting and roosting locations. Given the above, a precautionary principle of assumed presence has been applied to these species in areas where breeding habitat may have occurred pre-fire. **Assessment Approach:** Hollow-bearing tree survey and mapping. Species presence assumed within suitable habitats.
Mammals													
Cercartetus nanus	Eastern Pygmy-possum	V	-	Species	-	X	X	X	268, 277, 280, 285, 287, 290, 295, 297, 299, 300, 306, 314, 352, 638, 953 & 1196	Hollow-dependant arboreal mammals have been observed to respond poorly to wildfire, with populations observed to continue declining long after the fire (Lindenmayer et al 2022). Possums are particularly more at risk because they are less mobile than gliders which significantly limits their capability to escape wildfire. However, the species has been known to recolonise burnt areas driven by post-fire flowering flush of their food of choice, especially Callistemons and Eucalypts (Tulloch & Dickman, 2006).	Nil.	Feeds largely on nectar and pollen collected from banksias, eucalypts and bottlebrushes. When flowers are scarce, they also eat fruit, seeds and insects.	**Targeted surveys appropriate** Given the observations of Lindenmayer (et al 2022), hollow-dependant arboreal mammals such as possums have been observed to respond poorly to wildfire. However, given time since fire it is likely that foraging resources are regenerating in the area, which is linked positively to possible presence on site. Two Eastern Pygmy Possums were also recorded in close proximity to severely burned areas within the Snowy Mountains IBRA subregion (NSW DPE 2020b). Based on this assumption, the surveys targeting this species are considered to be suitable for detecting the species presence/absence. **Assessment Approach:** Targeted surveys - remote cameras; hair tubes (Table 4-17).
Chalinolobus dwyeri	Large-eared Pied Bat	V	V	Species	Yes (Breeding)		X		277	Due to the species tendency to congregate and roost in shallow caves, mortality rates due to fire are likely to be high. It is estimated that almost 30% of the Large-eared Pied Bat habitat was affected during the 2019/20 fires, however the longer-term impacts of fire frequency and intensity on the species are unknown (Legge et. al., 2021). The species is not thought to disperse widely, due to shorter broader wings than comparable	**Breeding and Roosting:** Cliffs; Within two kilometres of rocky areas containing caves, overhangs, escarpments, outcrops, or crevices, or within two kilometres of old mines or tunnels.	This species forages for small, flying insects just below the forest canopy and in moist drainage gullies.	**Targeted surveys appropriate** Potential roost habitat for this species largely occurs outside of areas impacted by the 2019/20 bushfires. There is a good likelihood of the species being present in the project footprint and detected using targeted survey methods, given the species tendency to forage in gullies and wetter areas that would recover more quickly.

Scientific Name	Common name	BC Act Status*	EPBC Act Status*	Credit status	SAII	IBRA sub region			Associated PCTs within severely burnt sites.	Species response to fire	TBDC habitat constraints	Diet	Assessment considerations
						BON[4]	INL[5]	SNO[6]					
										microbat species, although there is a lack of research on this area. Immediately post fire, foraging resources may be impacted through changes in vegetation composition and structure, however this species preferential foraging habitat is forest edges and wet gullies which are likely to recover faster from fire (Williams & Bruce 2018; DERM 2011).			**Assessment Approach:** Targeted surveys - acoustic microbat surveys, microbat harp trapping (Table 4-17).
Mastacomys fuscus	Broad-toothed Rat	V	V	Species	-	X		X	679 & 1224	While high intensity fires are likely to immediately impact population of the Broad-toothed rat through direct mortality and loss of resources, changes to vegetation communities (i.e., loss of sphagnum and increase of sedgeland) may increase population size post fire. (McDougall and Broome 2007; Macdonald 2009).	Nil.	The Broad-toothed Rat feeds solely on greenery such as grass and sedge stems, supplemented by seeds and moss spore cases.	**Targeted surveys appropriate** Previous studies have shown persistence of the Broad-toothed Rat in unburnt habitat, and good dispersion and recolonisation post high intensity fire (Carey et al. 2003). If this species was present in the project footprint pre 2019/2020 bushfires, it is reasonable to assume that it would have persisted post bushfire. As such, the surveys targeting this species are considered to be suitable for detecting the species presence/absence. **Assessment Approach:** Targeted surveys - remote cameras; hair tubes (Table 4-17).
Miniopterus orianae oceanensis	Large Bent-winged Bat	V	-	Dual	Yes (Breeding)	X	X		277, 280, 285, 290, 295, 297, 299, 300, 306, 352, 638, 679, 939, 953 & 1196	Jemison et al (2012) found that microbats have varied responses to bushfire depending on the species of bat and their differing ecology and biology. Jemison (2012) observed that the Large Bent-winged Bat generally responded poorly to fire, with “markedly lower numbers and activity levels of Eastern Bent-wing Bats in the severely burnt area…to pre-fire surveys”. This is believed to be due to this species’ flying/foraging behaviour.	**Breeding:** Caves; Cave, tunnel, mine, culvert or other structure known or suspected to be used for breeding including species records with microhabitat code "IC - in cave;" observation type code "E nest-roost;" with numbers of individuals >500.	Hunt in forested areas, catching moths and other flying insects above the tree tops.	**Targeted surveys not appropriate** Jemison (2012) observed that Large Bent-winged Bat generally responded poorly to fire, with markedly lower numbers and activity levels than that of Eastern Bent-wing Bats in the severely burnt areas compared to pre-fire surveys. This is believed to be due to the species’ flying/foraging behaviour. This species has been recorded within and near the project footprint, however no calls were recorded within severely burnt habitats. **Assessment Approach:** Assume presence within severely burnt associated PCTs situated within 100m of potential roost sites
Myotis macropus	Southern Myotis	V	-	Species	-	X	X		299 & 352	Jemison et al (2012) found that microbats have varied responses to bushfire depending on the species of bat and their differing ecology and biology. The Southern Myotis has rather specialised habitat preferences and foraging behaviour compared to other species of microbat. The Southern Myotis forage within the riparian areas of waterways and tend to roost nearby, this would likely give the Southern Myotis more protection from bushfires than other species of bats.	**Breeding:** Hollow bearing trees; Within 200 m of riparian zone| Bridges, caves or artificial structures within 200 m of riparian zone| Waterbodies; rivers, creeks, billabongs, lagoons, dams and other waterbodies on or within 200m of the site.	The Southern Myotis feeds on insects and small fish.	**Targeted surveys appropriate** Based on the general findings of Jemison et al (2012), and the known habitat and foraging preferences of the Southern Myotis, it is considered that this species is not likely to be significantly impacted by bushfires. As such, targeted surveys for this species that were undertaken within severely burned PCTs are considered sufficient to determine this species presence.

Scientific Name	Common name	BC Act Status*	EPBC Act Status*	Credit status	SAII	IBRA sub region			Associated PCTs within severely burnt sites.	Species response to fire	TBDC habitat constraints	Diet	Assessment considerations
						BON[4]	INL[5]	SNO[6]					
													Assessment Approach: Targeted surveys - acoustic microbat surveys, microbat harp trapping (Table 4-17).
Petauroides volans	Greater Glider	-	V	Species	-	X	X	X	295, 299, 300, 306, 638, 953 & 1196	Hollow-dependant arboreal mammals have been observed to respond poorly to wildfire, with populations observed to continue declining long after the fire (Lindenmayer et al 2022). However, a recent study in Monga National Park showed that within a year post fire *Petauroides volans* were found within burnt areas, with the highest population density within low intensity burn areas. This suggests that the species may take refuge within areas of low intensity burn during bushfire, before returning to forage and breed in areas more severely burnt (May-Stubbles 2022)	**Breeding:** Hollow bearing trees.	Feeds mostly on eucalypt leaves and flowers.	**Targeted surveys appropriate** Given the observations of Lindenmayer (et al 2022), hollow-dependant arboreal mammals such as gliders have been observed to respond poorly to wildfire. Whilst hollow-bearing trees were still present within severely burnt vegetation, it is not clear to what extent these would be utilised by Greater Glider. Despite this, considerable regeneration of vegetative materials was observed within severely burnt sites indicating good availability of foraging resources. Given this, it is likely these sites would be utilised where connectivity to unburnt breeding habitats exists. Available literature indicates the species can survive severe fires by taking refuge in areas of less intense burn. Based on the results of field survey, Greater Glider were recorded within severely burned PCTs within the site. As such, targeted surveys are considered a suitable method for informing species presence. **Assessment Approach:** Targeted surveys - remote cameras; hair tubes; stagwatching; spotlighting; mapping of potential nesting habitat (Table 4-17).
Petaurus norfolcensis	Squirrel Glider	V	-	Species	-	X	X	X	268, 277, 280, 285, 287, 290, 297, 306, 314, 352 & 953	There is minimal research into direct effects of fires on the Squirrel Glider. Hollow-dependant arboreal mammals have been observed to respond poorly to wildfire, with populations observed to continue declining long after the fire. The greatest factor influencing absence-presence post fire for the Squirrel glider appears to be loss of hollow bearing trees (Lindenmayer et al 2022).	Nil.	Squirrel Gliders diet varies seasonally and consists of *Acacia* gum, eucalypt sap, nectar, honeydew and manna, with invertebrates and pollen providing protein.	**Targeted surveys appropriate** Given the observations of Lindenmayer (et al 2022), hollow-dependant arboreal mammals such as gliders have been observed to respond poorly to wildfire. Whilst hollow-bearing trees were still present within severely burnt vegetation, it is not clear to what extent these would be utilised by Squirrel Glider. Despite this, considerable regeneration of vegetative materials (including flowering and fruiting species) was observed within severely burnt sites indicating good availability of foraging resources. Given this, it is likely these sites would be utilised where connectivity to unburnt breeding habitats exists. One Squirrel Glider was recorded in close proximity to severely burned areas within the Snowy Mountains IBRA subregion, another two were recorded within the Inland Slopes IBRA subregion. Based on the above, targeted surveys are considered

Scientific Name	Common name	BC Act Status*	EPBC Act Status*	Credit status	SAII	IBRA sub region			Associated PCTs within severely burnt sites.	Species response to fire	TBDC habitat constraints	Diet	Assessment considerations
						BON[4]	INL[5]	SNO[6]					
													a suitable method for informing species presence. **Assessment Approach:** Targeted surveys - remote cameras; hair tubes; stagwatching; spotlighting; mapping of potential nesting habitat (Table 4-17).
Petaurus australis – endangered population	Yellow-bellied Glider population on the Bago Plateau - South Eastern Highlands	E	-	Species	-			X	638	Yellow-bellied Gliders's are considered to be one of the species most heavily impacted by severe fire (Legge et al 2021). Hollow-dependant arboreal mammals have been observed to respond poorly to wildfire, with populations observed to continue declining long after the fire (Lindenmayer et al 2022). Yellow-bellied Gliders also have a preference for alive living hollow-bearing trees, mean the death of hollow-bearing trees and consumption of hollows as a result of fire is particularly harmful to this species (DAWE 2022d). The Yellow-bellied Glider have been estimated to experienced immediate local population losses of over 75% (Legge et al 2021). A recent study of the Bago Plateau Yellow-bellied Glider population indicates a 26% reduction in the population was detected six to twelve months post-fire (ie spring / autumn 2020/21) (Bilney, et al 2022). Extinction probability at surveyed sites significantly increased within areas of high bushfire severity. However, no impact on species occupancy was detected within low burn severity areas, indicating pockets of unburnt and low-severity fire-affected forests may serve as refugia from wildfire (Bilney, et al 2022).	Hollows	A particularly important component of this species' diet is obtained through licking sap tapped from incisions made in the bark of mostly eucalypt trees. This behaviour occurs on a variety of mostly smooth-barked eucalypt trees, with only single trees within a stand of similar trees used for tapping sap.	**Targeted surveys appropriate** Given the observations of Lindenmayer (et al 2022), hollow-dependant arboreal mammals such as gliders have been observed to respond poorly to wildfire. Whilst hollow-bearing trees were still present within severely burnt vegetation, it is not clear to what extent these would be utilised by the Yellow-bellied Glider. There was considerable regrowth noted in the last 2 years, with large pockets of unburnt refugia noted within the burnt mosaic. Given this, it is likely these sites would be utilised where connectivity to unburnt breeding habitats exists. However, 12 Yellow-bellied Gliders were recorded within 500m of the project footprint within areas affected by the 2019/2020 bushfires, suggesting the species can be detected in this area and targeted surveys are appropriate Assessment Approach: Targeted surveys - remote cameras; hair tubes; stagwatching; spotlighting; mapping of potential nesting habitat (Table 4-17).
Phascogale tapoatafa	Brush-tailed Phascogale	V	-	Species	-	X		X	277, 280, 352, 638 & 953	Hollow-dependant arboreal mammals have been observed to respond poorly to wildfire, with populations observed to continue declining long after the fire (Lindenmayer et al 2022). *Phascogale tapoatafa* appear to be particularly deterred from burnt areas, even when nesting resources are available. A small-scale study in Victoria showed that nestbox use initially rose, then declined 18 months post fire. This suggests other factors such as foraging resources or habitat fragmentation may be a significant factor in whether the species are present post fire (Terry 2016).	Nil.	Feeds mostly on arthropods but will also eat invertebrates, nectar and sometimes small vertebrates.	**Targeted surveys appropriate** Given the observations of Lindenmayer (et al 2022), hollow-dependant arboreal mammals such as the Brush-tailed Phascogale have been observed to respond poorly to wildfire. Whilst hollow-bearing trees were still present within severely burnt vegetation, it is not clear to what extent these would be utilised by the species. Despite this, insect activity and considerable regeneration of vegetative materials were observed within severely burnt sites indicating good availability of foraging resources. It is likely these sites would be utilised where connectivity to unburnt breeding habitats exists. This species is highly cryptic and is difficult to detect by means of targeted surveys.

						BON[4]	INL[5]	SNO[6]					
													Arboreal Elliot traps are considered the most appropriate method of survey. However, these were not undertaken as a part of the assessment. **Assessment Approach:** Species presence assumed within suitable habtiats.
Phascolarctos cinereus	Koala	V	E	Species	-	X	X	X	268, 277, 280, 285, 287, 290, 295, 297, 299, 300, 301, 306, 314, 352, 638, 679, 939, 953 & 1196	Following the 2019/2020 bushfires, a study was undertaken by Phillips (et al 2021) to determine the impacts on Koala populations. While noting that the impacts of bushfire on koalas is poorly understood, Phillips (et al 2021) found that the median reduction in the occupancy rate of koalas within Phillips' (et al 2021) study area was 71% when standardized against pre-fire occupancy levels. Phillips (et al 2021) also stated that "koala survival was five times more likely in areas where forest canopies were modelled as Unburnt or Partially burnt, compared to areas where forest canopies were Fully burnt".	Nil.	Koalas feed almost exclusively on eucalypt leaves; with the species they use as their primary food source varying geographically. Within the Central and Southern Tablelands, primary food trees include *E. viminalis* (Ribbon Gum) and *E. camaldulensis* (River red gum). Secondary food tree species include *E. albens* (White box), *E. blakelyi* (Blakely's red gum) and *E. melliodora* (Yellow box).	**Targeted surveys appropriate** Given the observations of Phillips (et al 2021), PCTs that are associated with the Koala, and that have been severely burned, will be considered as habitat for Koala. Thus, a precautionary principle of assumed presence of Koalas has been applied to these areas. **Assessment Approach:** Targeted surveys - Koala Spot Assessment Technique (SAT) (Table 4-17).
Pseudomys fumeus	Smoky Mouse	CE	E	Species	Yes	X		X	638, 953 & 1196	Inappropriate fire regimes are likely to simplify the heath understorey in dry forests; depleting floristic diversity and encouraging predators, which may result in the loss of *Pseudomys* species. However, *Pseudomys fumeus* have been noted within burnt areas 1-2 years post fire, suggesting that fire does not preclude them from an environment given time for vegetation regeneration. Frequent burning can also result in low abundance of hypogeal fungi, an important food resource, and can remove hollow logs, which are often used for protection (DSE 2006)	Nil.	Seeds and fruits from leguminous shrubs form the main summer and autumn diet, with some invertebrates. Hypogeal fungi predominate in winter and spring, with some flowers, seeds and soil invertebrates.	**Targeted surveys appropriate** Research has shown that while inappropriate fire regimes impact Smoky mouse habitat and foraging resources, however, given time since fire it is possible that requirements may be met in previously burnt areas. This is supported by multiple records of the Smoky mouse found within sites previously burnt in the Dunn's Road fire (DPE 2020b). **Assessment Approach:** Targeted surveys – Elliot traps and hair tubes (Table 4-17).
Pteropus poliocephalus	Grey-headed Flying-fox	V	V	Dual	-		X		277, 287 & 290	The response of Grey-headed flying fox roosts to wildfire are still not understood well. In a recent study on the impacts of the 2019/2020 bushfires on Grey-headed flying fox, Baranowski (et al 2021) concluded that "the responses of both roosts and resources to fire severity need to be included in future work".	**Breeding**: Breeding camps.	Nectar and pollen from the flowers of eucalypts, melaleucas and banksias are the primary food for the Grey-headed Flying-fox. The species has no adaptations for withstanding food shortages and migrates in response to changes in the amount and location of flowering.	**Targeted surveys appropriate** Locality of established camps within the region include Yass, Tumut River Island, Tarcutta, and Wagga Wagga. No roost sites have been previously recorded within or near the Project site. Unlikely to have been any splinter camps within the project footprint prior to the 2019/2020 bushfires. **Assessment Approach:** Targeted surveys - mapping of potential breeding and roosting habitat (Table 4-17).
Reptiles													
Aprasia parapulchella	Pink-tailed Legless Lizard	V	V	Species	-		X		277, 280 & 290	A review of several studies on the impacts of the 2019/2020 bushfires has found that reptile species richness may be higher in burnt sites than unburnt, suggesting that	Rocky areas; Or within 50m of rocky areas / South of Grabben	Feeds on the larvae and eggs of the ants with which it shares its burrows.	**Targeted surveys appropriate** Given the findings of Price (et.al 2022), it appears that reptiles generally respond positively to burned areas, thus the

Scientific Name	Common name	BC Act Status*	EPBC Act Status*	Credit status	SAII	IBRA sub region			Associated PCTs within severely burnt sites.	Species response to fire	TBDC habitat constraints	Diet	Assessment considerations
						BON[4]	INL[5]	SNO[6]					
										burnt areas may be used preferentially for foraging by survivors and/or immigrants (Price et.al 2022).	Gullen (Cro); West of Dalton (Mur)		targeted surveys for reptiles are considered adequate to determine the presence of these species in severely burned PCTs. **Assessment Approach:** Targeted surveys – reptile searches; mapping of suitable habitat (Table 4-17).
Delma impar	Striped Legless Lizard	V	V	Species	-		X		277	A review of several studies on the impacts of the 2019/2020 bushfires has found that reptile species richness may be higher in burnt sites than unburnt, suggesting that burnt areas may be used preferentially for foraging by survivors and/or immigrants (Price et.al 2022).	Nil.	This species feeds primarily on spiders, crickets, grasshopper, lepidopteran larvae and cockroaches.	**Targeted surveys appropriate** Given the findings of Price (et.al 2022), it appears that reptiles generally respond positively to burned areas, thus the targeted surveys for reptiles are considered adequate to determine the presence of these species in severely burned PCTs. **Assessment Approach:** Targeted surveys - reptile searches; mapping of suitable habitat (Table 4-17).
Invertebrates													
Keyacris scurra	Key's Matchstick Grasshopper	E	-	Species	-		X	X	277	Following the 2019/2020 bushfires, Saunders (et al 2021) state that there is very limited understanding of bushfire impacts on Australian invertebrates to date. Saunders (et al 2021) suggests that future studies be undertaken to fill this gap in knowledge. This wingless species does not disperse far (<10m) and occupies intact native grassland habitats. A key threat to the species is disturbance of this habitat, whether by slashing or fire (DPE 2022c).	Nil.	Feeds on a large range of species including but not limited to Themeda sp., Scirpus sp., Trifolium sp. And Helichrysum sp.	**Targeted surveys appropriate** This species colonises grassland habitats. Whilst these would have been impacted by the fire, they were determined to be sufficiently recovered in accordance with the BAM guidelines. Whilst targeted surveys are considered appropriate within severely burnt sites, no targeted surveys were carried out for the species given it was only recently listed. **Assessment Approach:** Species presence assumed within suitable habitats
Amphibians													
Crinia sloanei	Sloane's Froglet	V	E	Species	-		X		9997 (waterbody)	The impacts of fire on frogs has not been well studied. The few studies that have been undertaken suggest that frogs are generally not significantly impacted by fire, they remain present in burned areas though their abundance levels are lower during the first few years following a fire (Gillespie & West 2012).	**Foraging and Breeding:** Semi-permanent/ ephemeral wet areas; Containing relatively shallow sections with submergent and emergent vegetation, or within 500 m of wet area. Swamps; Within 500 m of swamps. Waterbodies; Within 500 m of waterbody.	Diet likely consists of insects for adult frogs and algae for tadpoles.	**Targeted surveys appropriate** Given the findings of Gillespie & West (2012), frogs are generally still recorded in burned areas during the first few years following bushfire, but their abundance is lower than pre-fire numbers. Considering the above, surveys targeting frogs in severely burned areas are considered adequate to determine the presence of these species in severely burned PCTs. **Assessment Approach:** Targeted surveys – active frog searches; call playback (frogs) (Table 4-17).
Litoria booroolongensis	Booroolong Frog	E	E	Species	-	X	X		268, 277, 280, 287, 290, 295, 299, 306 & 352	The impacts of fire on frogs has not been well studied. The few studies that have been undertaken suggest that frogs are generally not significantly impacted by fire, they remain present in burned areas though their abundance levels are lower	Nil.	Booroolong frogs are generalist predators of arthropods and tadpoles are generalist benthic grazers.	**Targeted surveys appropriate** Given the findings of Gillespie & West (2012), frogs are generally still recorded in burned areas during the first few years following bushfire, but their abundance is lower than pre-fire numbers. Considering

Scientific Name	Common name	BC Act Status*	EPBC Act Status*	Credit status	SAII	IBRA sub region			Associated PCTs within severely burnt sites.	Species response to fire	TBDC habitat constraints	Diet	Assessment considerations
						BON[4]	INL[5]	SNO[6]					
										during the first few years following a fire (Gillespie & West 2012).			the above, surveys targeting frogs in severely burned areas are considered adequate to determine the presence of these species in severely burned PCTs. **Assessment Approach:** Targeted surveys – active frog searches; call playback (frogs) (Table 4-17).
Litoria castanea	Yellow-spotted Tree Frog	CE	CE	Species	Yes			X	939	The impacts of fire on frogs has not been well studied. The few studies that have been undertaken suggest that frogs are generally not significantly impacted by fire, and that they remain present in burned areas though their abundance levels are lower during the first few years following a fire (Gillespie & West 2012).	Nil.	Diet likely consists of insects for adult frogs and algae for tadpoles.	**Targeted surveys appropriate** Given the findings of Gillespie & West (2012), frogs are generally still recorded in burned areas during the first few years following bushfire, but their abundance is lower than pre-fire numbers. Considering the above, surveys targeting frogs in severely burned areas are considered adequate to determine the presence of these species in severely burned PCTs. **Assessment Approach:** Targeted surveys – active frog searches; call playback (frogs) (Table 4-17).
Pseudophryne corroboree	Southern Corroboree Frog	CE	CE	Species	Yes			X	679, 1196 & 1224	Evidence from a subalpine fire that occurred in Kosciuszko National Park during frog breeding season, shows that even though the fire burnt to near the edges of the Sphagnum bog pools, the frogs still returned the following season. Autumn fires that burn through woodland and heath surrounding breeding sites are likely to have a greater potential influence as frogs have moved further away from bogs. Extensive burning of understorey litter and grass cover in these areas, such as occurs during prescribed burns, is likely to reduce the shelter available to the frogs and make them more vulnerable to dehydration or freezing (NPWS 2001)	**Geographical** Above 1000m altitude.	Feed primarily on small black ants and other invertebrates.	**Targeted surveys appropriate** Given the findings of Gillespie & West (2012), frogs are generally still recorded in burned areas during the first few years following bushfire, but their abundance is lower than pre-fire numbers. Considering the above, surveys targeting frogs in severely burned areas are considered adequate to determine the presence of these species in severely burned PCTs. **Assessment Approach:** Targeted surveys – active frog searches; call playback (frogs) (Table 4-17).

Attachment 16. MNES likelihood of occurrence

A list of potentially occurring EPBC Act listed threatened flora and fauna species was derived for the locality from data sources including the BAM Calculator (BAM-C), NSW BioNet Atlas (ATLAS) and EPBC Act Protected Matters Search Tool (PMST). Further analysis of the likelihood of those species occurring within the subject land was undertaken in accordance with the criteria outlined in Table A16- 1. Unless otherwise stated, habitat information used to inform the assessment was obtained from Department of the Environment and Energy (DoEE) 2022b and Department of Planning, Industry and Environment (DPIE) 2022b.

The results of the likelihood of occurrence assessment are presented in Table A16- 3. Further assessment in accordance with the Commonwealth *Significant Impact Guidelines 1.1: Matters of National Environmental Significance* (Department of the Environment (DoE), 2013) is presented in Attachment 18 for all threatened species assigned a 'Known' to 'Moderate' likelihood of occurrence or transient species with a perceived risk of transmission line collision.

Table A16- 1: Likelihood of occurrence criteria

Likelihood rating	Threatened flora criteria	Threatened and migratory fauna criteria
Known	The species was observed or has been previously recorded within the project footprint.	The species was observed or has been previously recorded within the project footprint.
High	There are previous records of the species in close vicinity (within 5 km) of the project footprint and potential habitat in the project footprint. It is likely that a species inhabits the project footprint.	There are previous records of the species in close vicinity of the project footprint (within 5 km) and potential habitat in the project footprint. It is likely that a species inhabits or utilises habitat within the project footprint.
Moderate	Potential habitat for a species occurs in the project footprint. There are previous records of the species in the wider locality (within 20 km). Adequate field survey would determine if there is a 'high' or 'low' likelihood of occurrence for the species within the project footprint.	Potential habitat for a species occurs in the project footprint and the species may occasionally utilise that habitat. There are previous records of the species in the wider locality (within 20 km). Species unlikely to be wholly dependent on the habitat present within the subject land.
Low	There are no records of the species in the wider locality (within 20 km), but records may occur within the IBRA subregion, and/or there is no/marginal potential habitat in the project footprint. It is unlikely that the species inhabits the project footprint.	There are no records of the species in the wider locality (within 20 km), but records may occur within the IBRA subregion, and/or there is no/marginal potential habitat in the project footprint. It is unlikely that the species inhabits the project footprint. If present, the species would likely be a transient visitor. The project footprint may

Likelihood rating	Threatened flora criteria	Threatened and migratory fauna criteria
		contain very common habitat for this species which the species would not rely on for its on-going local existence.
Unlikely	There are no records of the species in the wider locality (20 km) or IBRA subregion and there is no potential habitat in the project footprint. The habitat within the project footprint is unsuitable for the species.	There are no records of the species in the wider locality (20 km) or IBRA subregion and there is no potential habitat in the project footprint. The habitat within the project footprint is unsuitable for the species.

The results of the likelihood of impacts assessment are presented in Table A16- 3. This assessment is based on technical expertise and the results of the information collected from the desktop searches.

Table A16- 2 Likelihood of impact criteria

Likelihood rating	Threatened flora criteria	Threatened and migratory fauna criteria
Potential impacts	Potential for impacts to species habitat where clearing is likely to occur.	Potential for transmission line strikes due to migration route or feeding zones. Potentially impacted by access tracks crossings of streams where habitat is known or has the potential to occur. Potential impacts to foraging habitat where vegetation clearing is likely to occur. Potential impacts to breeding habitat where vegetation or land features are likely to be disturbed. Potential impacts to foraging and shelter habitat where vegetation or land features are likely to be disturbed.
Unlikely impacts	The species was not located during surveys of potential habitat and there is little suitable habitat found in the areas not surveyed. Species that grow in a wide range of habitats and are not restricted to the type being impacted which is not considered limiting/important habitat. No important habitat is present within the footprint.	The species was not located during surveys of potential habitat and there is little suitable habitat found in the areas not surveyed. Species that can use a wide range of habitats and are not restricted to the type being impacted which is not considered limiting/important habitat. No important habitat is present within the footprint. The project footprint is outside the natural range of the species.

Likelihood rating	Threatened flora criteria	Threatened and migratory fauna criteria
	The project footprint is outside the natural range of the species.	
Direct/indirect impacts to species as a result of the project are highly unlikely	There is no habitat suitable for this species present	There is no habitat suitable for this species present.

Table A16- 3: Likelihood of occurrence

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
Fauna										
Amphibians										
Crinia sloanei (BAM-C, PMST, BioNet)	Sloane's Froglet	V	-	E	-	INL: 3	INL: 154	Sloane's Froglet has been recorded from widely scattered sites in the floodplains of the Murray-Darling Basin, with most records in the Darling Riverine Plains, NSW Southwestern Slopes and Riverina bioregions in New South Wales. It has not been recorded recently in the northern part of its range and has only been recorded infrequently in the southern part of its range in NSW. At several sites where records are verified by museum specimens, the species has not been subsequently detected during more recent frog surveys in the vicinity (e.g., Holbrook, Nyngan, Wagga Wagga and Tocumwal). The low number of sites, low number of recorded individuals per site, and the low proportion of records of this species in regional surveys all indicate that a moderately low number of mature individuals exist. The apparent loss from previous recorded sites and decline in recording rates indicates that this is not just a rare or uncommonly encountered species, but that there has been a reduction in population size and range. It is typically associated with periodically inundated areas in grassland, woodland, and disturbed habitats.	INL: **Moderate** – suitable habitat across a variety of locations within subregion. However, the apparent loss from previously recorded sites and decline in recording rates indicates that there has been a reduction in population size and range within south-west NSW (Inland Slopes region).	Potentially impacted by access crossings of streams.

Scientific name (Data source)	**Common name**	**NSW BC Act**	**NSW FM Act**	**EPBC Act**	**Records within 5km**	**Records within 20km**	**Records within IBRA Subregion**	**Habitat**	**Likelihood of occurrence (per IBRA subregion)***	**Likelihood to be impacted by the project**
Heleioporus australiacus (BAM-C, PMST, BioNet)	Giant Burrowing Frog	V	-	V	-	CRO: 1	BUN: 1 CRO: 1	Found in heath, woodland, and open dry sclerophyll forest on a variety of soil types except those that are clay based. Spends more than 95% of its time in non-breeding habitat in areas up to 300 m from breeding sites. Whilst in non-breeding habitat it burrows below the soil surface or in the leaf litter. Individual frogs occupy a series of burrow sites, some of which are used repeatedly. The Giant Burrowing Frog has a generalist diet and studies to date indicate that they eat mainly invertebrates including ants, beetles, cockroaches, spiders, centipedes, and scorpions. When breeding, frogs will call from open spaces, under vegetation or rocks or from within burrows in the creek bank. Males show strong territoriality at breeding sites. This species breeds mainly in autumn but has been recorded calling throughout the year. Egg masses are foamy with an average of approximately 500-800 eggs and are laid in burrows or under vegetation in small pools. After rains, tadpoles are washed into larger pools where they complete their development in ponds or ponded areas of the creeklines. Breeding habitat of this species is generally soaks or pools within first or second order streams. They are also commonly recorded from 'hanging swamp' seepage lines and where small pools form from the collected water.	BUN: **Unlikely** – The species is considered to be coastal, and reliant on Sydney sandstone geologies. No Sydney sandstone geologies occur within the project footprint, and therefore the species has been excluded on that basis. CRO: **Low –** The species is considered to be coastal, and reliant on Sydney sandstone geologies. No Sydney sandstone geologies occur within the project footprint, and therefore the species has been excluded on that basis.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Litoria aurea (BAM-C, PMST, BioNet)	Green and Golden Bell Frog	E	-	V	-	MUR: 1	BUN: 2 MUR: 3	There are Green and Golden Bell Frog records from west to Bathurst, Tumut and the ACT region. Since 1990 there have been approximately 50 recorded locations in NSW, most of which are small, coastal, or near coastal populations. These locations occur over the species' former range; however, they are widely separated and isolated. Large populations in NSW are located around the metropolitan areas of Sydney, Shoalhaven, and mid north coast (one an island population). There is only one known population on the NSW Southern Tablelands. Inhabits marshes, dams, and stream-sides, particularly those containing bullrushes (*Typha* spp.) or spike rushes (*Eleocharis* spp.). Optimum habitat includes waterbodies that are unshaded, free of predatory fish such as Plague Minnow, have a grassy area nearby and diurnal sheltering sites available.	BUN: **Low –** There is superficially suitable habitat within the Bungonia IBRA subregion portion of the project footprint. There are historic records in Sutton area and Molonglo area. However, vagrant to the project footprint. CRO: **Low –** There is superficially suitable habitat within the Crookwell IBRA subregion portion of the project footprint, but no nearby records within the area. MUR: **Low –** There was suitable habitat within the	Direct/indirect impacts to species as a result of the project are highly unlikely.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
								Some sites, particularly in the Greater Sydney region occur in highly disturbed areas. The species is active by day and usually breeds in summer when conditions are warm and wet.	Murrumbateman IBRA subregion portion of the project footprint. There are three records within the IBRA subregion, one of which occurs within 20 km of the project footprint, however it is from over 10 years ago, is not associated with any known populations of the species and there are no records within 5 km of the project footprint (BioNet 2022).	
Litoria booroolongensis (BAM-C, BioNet, PMST)	Booroolong Frog	E	-	E	INL: 12	BON:78 INL: 23 MUR: 1	BON: 83 BUN: 1 CRO: 5 INL: 35 MUR: 4	The Booroolong Frog is restricted to NSW and north-eastern Victoria, predominantly along the western-flowing streams of the Great Dividing Range. Live along permanent streams with some fringing vegetation cover such as ferns, sedges, or grasses. Adults occur on or near cobble banks and other rock structures within stream margins. Shelter under rocks or amongst vegetation near the ground on the stream edge. Sometimes bask in the sun on exposed rocks near flowing water during summer. Breeding occurs in spring and early summer and tadpoles metamorphose in late summer to early autumn.	BON: **Moderate** – Suitable permanent streams with cobble banks, woody debris and fringing riparian vegetation occur within the Bondo IBRA subregion portion of the project footprint. BUN: **Low** – less known to occur within the Bungonia IBRA subregion portion of the project footprint. Review of Booroolong Department of Planning and Environment (DPE) mapped streams indicates no mapped streams intersect the alignment within this IBRA subregion. CRO: **Moderate** – Suitable permanent streams with cobble banks, woody debris and fringing riparian vegetation occur within the Crookwell IBRA subregion portion of the project footprint, however, no nearby records within 20 km of the project footprint. INL: **High** – Suitable permanent streams with cobble banks, woody debris and fringing	Potentially impacted by access crossings of streams.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
									riparian vegetation occur within the Inland Slopes IBRA subregion portion of the project footprint. There are numerous records in the Inland Slopes IBRA subregion, 12 of which occur within 5 km of the project footprint. MUR: **Low** – Review of Booroolong DPE mapped streams indicates no mapped streams intersect the alignment within this IBRA subregion	
Litoria castanea	Yellow-spotted Tree Frog	CE	-	E	-	MUR: 2	MUR: 3	Require large permanent ponds or slow flowing 'chain-of-ponds' streams with abundant emergent vegetation such as bulrushes and aquatic vegetation. Adults are active during spring and summer and bask on sunny days. Move and forage at night on grassy banks or float on the water's surface. Shelter during autumn and winter under fallen timber, rocks, other debris or thick vegetation.	CRO: **Low** – Suitable permanent streams habitat occurs within the Crookwell IBRA subregion portion of the project footprint, however, no previous records within project footprint or the IBRA subregion. MUR: **Moderate**– Suitable permanent streams habitat occurs within the Murrumbateman IBRA subregion portion of the project footprint. SNO: **Low –** No BioNet records of this species within IBRA subregion (DPE 2022). Suitable habitat occurs in multiple locations (in the form of bogs, fens, ponds, stock dams and drainage channels) within the Snowy Mountains IBRA subregion portion of the project footprint.	Potentially impacted by access crossings of streams.
Litoria littlejohni (BAM-C, BioNet, PMST)	Littlejohn's Tree Frog	V	-	V	-	-	-	This species breeds in the upper reaches of permanent streams and in perched swamps. Non-breeding habitat is heath-based forests and woodlands where it shelters under leaf litter and low vegetation, and hunts for	BUN: **Low** –A recent taxonomic revision divided this species into two species: the northern population = Littlejohn's Tree	Direct/ indirect impacts to species as a result of the

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
								invertebrate prey either in shrubs or on the ground. Breeding is triggered by heavy rain and can potentially occur all year but is usually from late summer to early spring when conditions are favourable.	Frog (*L. littlejohni*) and the southern population = Watson's Tree Frog (*L. watsoni*). Following this revision, the distribution of Littlejohn's Tree Frog is now confined to the Sydney Basin While suitable habitat is present and multiple records occur in the locality, the project footprint is outside of known distribution of the species and records local records are likely Watson's Tree Frog prior to taxonomic revision. Bioregion. Species excluded from assessment.	project are highly unlikely.
Litoria spenceri	Spotted Tree Frog	CE	-	E	-	-	SNO: 6 BON: 1	Occur among boulders or debris along naturally vegetated, rocky fast flowing upland streams and rivers. In summer, during the breeding season, adults bask on large in-stream boulders while juveniles occupy shingle banks. In winter animals are thought to hibernate in vegetation outside of the mainstream environment. The Spotted Tree Frog is extremely rare and occurs in scattered, geographically isolated populations. Historically it was known from two streams in southern NSW on the north-west side of the Great Dividing Range, however both populations appeared to have become locally extinct. One population has been re-established via a reintroduction program. It is also known from 15 locations in north-eastern Victoria.	SNO: **Unlikely–** No suitable habitat is present, and known populations are isolated and are not near the project footprint. BON: **Unlikely–** No suitable habitat is present, and known populations are isolated and are not near the project footprint.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Litoria verreauxii alpina (BAM-C, BioNet, PMST)	Alpine Tree Frog	E	-	V	-	SNO: 33	SNO: 262	Found in a wide variety of habitats including woodland, heath, grassland, and herb fields. Breed in natural and artificial wetlands including ponds, bogs, fens, streamside pools, stock dams and drainage channels that are still or slow flowing. It does not climb well and spends most of its time on the ground. Eats beetles, flies, spiders, and moth larvae. Non-breeding habitat and overwintering refuges are poorly known but are likely to include flat rocks, fallen logs, leaf litter and other ground debris.	CRO: **Unlikely–** No suitable habitat is present, and known populations are isolated and are not near the project footprint. MUR: **Unlikely–** No suitable habitat is present, and known populations are isolated and are not near the project footprint.	Direct/indirect impacts to species as a result of the project are highly unlikely.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
									SNO: **Low–** No suitable habitat is present, and known populations are isolated and are not near the project footprint. BON: **Unlikely–** No suitable habitat is present, and known populations are isolated and are not near the project footprint.	
Mixophyes balbus (BAM-C, PMST)	Stuttering Frog	E	-	V	-	-	-	Found in rainforest and wet, tall open forest in the foothills and escarpment on the eastern side of the Great Dividing Range. Outside the breeding season adults live in deep leaf litter and thick understorey vegetation on the forest floor. Breed in streams during summer after heavy rain. Eggs are laid on rock shelves or shallow riffles in small, flowing streams.	BUN: **Low** – Suitable wet sclerophyll forest habitat and permanent streams are within the Bungonia IBRA subregion portion of the project footprint. However, closest records are near Ruby Creek in the Blue Mountains (about 40 km north of the project). Species excluded from assessment.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Pseudophryne corroboree (BAM-C, PMST)	Southern Corroboree Frog	CE	-	CE	-	SNO: 1	SNO: 86	The Southern Corroboree Frog is limited to sphagnum bogs of the northern Snowy Mountains, in a strip from the Maragle Range in the north-west, through Mt Jagungal to Smiggin Holes in the south. Summer breeding habitat is pools and seepages in sphagnum bogs, wet tussock grasslands and wet heath. Outside the breeding season adults move away from the bogs into the surrounding heath and snow gum woodland to overwinter under litter, logs and dense groundcover.	SNO: **Low** – The project footprint is outside of known distribution of the species (highly restricted distribution), there is a lack of sphagnum bog habitat within the project footprint, and there are no recent nearby records. Species excluded from assessment.	Unlikely impacts
Pseudophryne pengilleyi (BAM-C, BioNet, PMST)	Northern Corroboree Frog	CE	-	CE	-	BON: 86 SNO: 3 INL: 2	BON: 474 INL: 2 SNO: 12	Summer breeding habitat is pools and seepages in sphagnum bogs, wet heath, wet tussock grasslands and herb fields in low-lying depressions. Feed primarily on small black ants and other invertebrates. Tadpoles overwinter in the pools, feed and grow slowly through spring as the water warms and metamorphose in early summer. Outside the breeding season adults move away from the bogs into the surrounding heath,	INL: **Low –** The species has been excluded vagrant as the project footprint is north of Wee Jasper State Forest. Species excluded from assessment. SNO: **Low –** The species has been excluded vagrant based	Direct/ indirect impacts to species as a result of the project are highly unlikely.

Species excluded from assessment. BON: **Low –** The species has been excluded vagrant based on consultation with BCD as the project footprint is north of Wee Jasper State Forest. Species excluded from assessment.	
Aves										
Anthochaera Phrygia (BAM-C, BioNet, PMST)	Regent Honeyeater	CE	-	CE	-	BON: 2 BUN: 7 CRO: 1 INL: 4 MUR: 3	BON: 3 BUN: 50 CRO: 1 INL: 164 MUR: 9	The Regent Honeyeater is a flagship threatened woodland bird whose conservation will benefit a large suite of other threatened and declining woodland fauna. The species inhabits dry open forest and woodland, particularly Box-Ironbark woodland, and riparian forests of River She oak. Regent Honeyeater inhabit woodlands that support a significantly high abundance and species richness of bird species. These woodlands have significantly large numbers of mature trees, high canopy cover and abundance of mistletoes. Every few years non-breeding flocks are seen foraging in flowering coastal Swamp Mahogany and Spotted Gum forests, particularly on the central coast and occasionally on the upper north coast. Birds are occasionally seen on the south coast. In the last 10 years Regent Honeyeaters have been recorded in urban areas around Albury where woodlands tree species such as Mugga Ironbark and Yellow Box were planted 20 years ago. The Regent Honeyeater is a generalist forager, although it feeds mainly on the nectar from a relatively small number of eucalypts that produce high volumes of nectar. Key eucalypt species include Mugga Ironbark, Yellow Box, White Box and Swamp Mahogany. Other tree species may be regionally important. For example, the Lower Hunter Spotted Gum	BON: **Moderate (foraging)** – Only suitable foraging habitat is present in the project footprint. The project footprint is not within the important areas mapping. BUN: **Moderate (foraging)** – Only suitable foraging habitat is present in the project footprint. The project footprint is not within the important areas mapping. CRO: **Moderate (foraging)** – Only suitable foraging habitat is present in the project footprint. The project footprint is not within the important areas mapping. INL: **Moderate (foraging)** – Only suitable foraging habitat is present in the project footprint. The project footprint is not within the important areas mapping.	Potential impacts to foraging habitat.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
								forests have recently been demonstrated to support regular breeding events. Flowering of associated species such as Thin-leaved Stringybark *Eucalyptus eugenioides* and other Stringybark species, and Broad-leaved Ironbark *E. fibrosa* can also contribute important nectar flows at times. Nectar and fruit from the mistletoes *Amyema miquelii*, *A. pendula* and *A. cambagei* are also utilised. When nectar is scarce lerp and honeydew can comprise a large proportion of the diet. Insects make up about 15% of the total diet and are important components of the diet of nestlings. Colour-banding of Regent Honeyeater has shown that the species can undertake large-scale nomadic movements in the order of hundreds of kilometres. However, the exact nature of these movements is still poorly understood. It is likely that movements are dependent on spatial and temporal flowering and other resource patterns. There are three known key breeding areas, two of them in NSW - Capertee Valley and Bundarra-Barraba regions. The species breeds between July and January in Box-Ironbark and other temperate woodlands and riparian gallery forest dominated by River Sheoak Regent Honeyeaters usually nest in horizontal branches or forks in tall mature eucalypts and She oaks. Also nest in mistletoe haustoria. An open cup-shaped nest is constructed of bark, grass, twigs and wool by the female. Two or three eggs are laid and incubated by the female for 14 days. Nestlings are brooded and fed by both parents at an average rate of 23 times per hour and fledge after 16 days. Fledglings fed by both parents 29 times per hour.	MUR: **Moderate (foraging)** – Only suitable foraging habitat is present in the project footprint. The project footprint is not within the important areas mapping.	
Apus pacificus	Fork-tailed Swift	-	-	Migratory	INL: 9	INL: 10	INL: 17	The Fork-tailed Swift is almost exclusively aerial, flying from less than one metre to at least 300 metres above ground and probably much higher.	INL: **Known (recorded) (1 individual) –** Incidental species sighting recorded outside the project footprint buffer approximately 6.3km away. Species may utilise the suitable foraging habitat present in the subject land on occasion. There	Potential for transmission line strikes.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
									are multiple records around Lake Albert which is approximately 3.2 km from the project footprint. Parts of the project footprint may be used as a thoroughfare by this species, including the Murrumbidgee River which intersects the project footprint. As such, this species is a potential candidate for transmission line strikes.	
Botaurus poiciloptilus	Australasian Bittern	E	-	E	-	-	BUN: 1 INL: 3	The Australasian Bitterns is widespread but uncommon over south-eastern Australia. In NSW they may be found over most of the State except for the far north-west. Favours permanent freshwater wetlands with tall, dense vegetation, particularly bullrushes and spikerushes.	BUN: **Low –** Species may utilise the limited suitable aquatic habitat present in the subject land on occasion, however there is only one record within the broader IBRA subregion, and it does not occur within 20 km of the project footprint. INL: **Low –** Species may utilise the limited suitable aquatic habitat present in the subject land on occasion, however there are only a small number of records within the broader IBRA subregion, none of which occur within 20 km of the project footprint.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Calidris acuminata	Sharp-tailed Sandpiper	-	-	Migratory	INL: 7	INL: 20	INL: 22	The Sharp-tailed Sandpiper is widespread in most regions of NSW, especially in coastal areas, but sparse in the south-central Western Plain and east Lower Western Regions. Prefers muddy edges of shallow or brackish wetlands, with inundated or emergent sedges, saltmarsh or other low vegetation. Also found foraging in sewage ponds and flooded paddocks. Non-breeding migrant to Australia.	INL: **High –** Species may utilise the limited suitable aquatic habitat present in the subject land on occasion. There are multiple records within the broader IBRA subregion, seven of which occur within 5 km of the project footprint. There are multiple records around Lake Albert which is approximately 3.2 km from the project footprint, and within the	Potential for transmission line strikes.

									Murrumbidgee River which intersects the project footprint. This species is a potential candidate for transmission line strikes given that parts of the project footprint may be used as a thoroughfare by this species.	
Calidris ferruginea (PMST)	Curlew Sandpiper	E	-	CE	INL: 2	INL: 3	INL: 3	Generally, occupies littoral and estuarine habitats, and in New South Wales is mainly found in intertidal mudflats of sheltered coasts. It also occurs in non-tidal swamps, lakes and lagoons on the coast and sometimes inland. It forages in or at the edge of shallow water, occasionally on exposed algal mats or waterweed, or on banks of beach-cast seagrass or seaweed. It roosts on shingle, shell or sand beaches; spits or islets on the coast or in wetlands; or sometimes in salt marsh, among beach-cast seaweed, or on rocky shores.	INL: **Low** – outside of mapped important areas. The species is rare to western NSW, and prefers estuarine, and intertidal habitats. There are a small number of previous records within 5 km of the project footprint.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Calidris ruficollis (BioNet)	Red-necked Stint	-	-	Migratory	INL: 3	INL: 5	INL: 6	In Australasia, the Red-necked Stint is mostly found in coastal areas, including in sheltered inlets, bays, lagoons and estuaries with intertidal mudflats, often near spits, islets and banks and, sometimes, on protected sandy or coralline shores. Occasionally they have been recorded on exposed or ocean beaches, and sometimes on stony or rocky shores, reefs or shoals. They also occur in saltworks and sewage farms; saltmarsh; ephemeral or permanent shallow wetlands near the coast or inland, including lagoons, lakes, swamps, riverbanks, waterholes, bore drains, dams, soaks and pools in saltflats. They sometimes use flooded paddocks or damp grasslands. They have occasionally been recorded on dry gibber plains, with little or no perennial vegetation. During the non-breeding season, over 80% (260 000) of the global population resides in Australia.	INL: **High –** Species may utilise the limited suitable aquatic habitat present in the subject land on occasion. There are multiple records within the broader IBRA subregion, three of which occur within 5 km of the project footprint. 								functional mouthparts; the larvae are thought to feed exclusively on the roots of wallaby grasses. The flight period is relatively short, typically lasting from six to eight weeks (during November and December in the ACT region, possibly earlier or later in other regions). Males fly only in bright sunshine during the warmest part of the day (1000 - 1400 hrs).		
Mammals										
Burramys parvus	Mountain Pygmy-possum	E		E		SNO: 75	SNO: 739	The Mountain Pygmy-possum lives only in alpine and subalpine areas on the highest mountains of Victoria and NSW. Lives on the ground in rocky areas where boulders have accumulated below mountain peaks; frequently associated with alpine heathland shrubs dominated by the Mountain Plum-pine (*Podocarpus lawencei*). Survives winter by fattening in late summer and autumn and hibernating for up to seven months, from autumn until the snow melts in spring. Seventy percent of the diet is invertebrates such as the migratory Bogong Moth, caterpillars, beetles, spiders, and millipedes; the remainder comprises fruits and seeds from species such as the Mountain Plum Pine and Snow Beard-heath. One litter of four young are produced in spring; young are independent by late summer; breeds when one year old; average longevity is two to three years, but females may live up to thirteen years and males five years. Daily movements between habitat patches can be up to 1 km for females and 3 km for males; males and young animals disperse in autumn. The only Australian mammal to be entirely restricted to the alpine zone in areas above the winter snowline; it is dependent on the insulation provided by snow for its survival.	SNO: **Low -** In NSW, the entire range is in a 30 km by 8 km area of Kosciuszko National Park between Thredbo and Kerries Ridge, where it occupies less than four km² of habitat. The total population size is less than 500 adults. Two of the four main sub-populations in NSW are found within ski resort areas. The project footprint does not intersect the four-square kilometre area of habitat.	Direct/indirect impacts to species because of the project are highly unlikely.
Chalinolobus dwyeri	Large-eared Pied Bat	V		V		BUN: 15	BUN: 49 INL: 12	Roosts in caves (near their entrances), crevices in cliffs, old mine workings and in the disused, bottle-shaped mud nests of the Fairy Martin (*Petrochelidon ariel*), frequenting low to mid-elevation dry open forest and woodland close to these features. Females have been recorded raising young in maternity roosts (c. 20-40 females) from November through to January in roof	BUN: **Moderate –** There are multiple Large-eared Pied Bat records within the broader Bungonia IBRA subregion (15 records within 20 km of the project footprint, none within 5 km of the project footprint).	Potential impacts to common foraging habitat.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
								domes in sandstone caves and overhangs. They remain loyal to the same cave over many years. Found in well-timbered areas containing gullies. The relatively short, broad wing combined with the low weight per unit area of wing indicates manoeuvrable flight. This species probably forages for small, flying insects below the forest canopy. Likely to hibernate through the coolest months. It is uncertain whether mating occurs early in winter or in spring.	There are also portions of the project footprint with high topographical relief. Ultrasonic surveys were conducted within five locations across the Bungonia section of the project footprint for a total of 45 trap nights, and no Large-eared Pied Bat individuals were recorded. Despite this, limited survey coverage suggests that there is still potential for the species to occur within the project footprint. INL: **Low –** There are a low number Large-eared Pied Bat records within the broader Inland Slopes IBRA subregion (greater than 20 km from the project footprint). Ultrasonic surveys were conducted within 11 locations across the Inland Slopes section of the project footprint for a total of 306 trap nights, and no Large-eared Pied Bat individuals were recorded. Based on the above factors, there is a low likelihood of the species occurring within the Inland Slopes section of the project footprint.	
Dasyurus maculatus (BAM-C, BioNet)	Spotted-tailed Quoll	V	-	E	BON: 7 INL: 3 SNO: 7	BON: 18 BUN: 3 CRO: 1 INL: 12 MUR: 1 SNO: 10	BON: 22 BUN: 53 CRO: 5 INL: 43 MUR: 2 SNO: 23	Spotted-tailed Quoll are found on the east coast of NSW, Tasmania, eastern Victoria and north-eastern Queensland. 									SNO: **High –** Suitable foraging and den habitat is present in the subject land. There are multiple records within the broader IBRA subregion, seven of which occur within 5 km of the project footprint	
Isoodon obesulus obesulus	Southern Brown Bandicoot (eastern)	E		E			BUN: 1	Southern Brown Bandicoots are largely crepuscular (active mainly after dusk and/or before dawn). They are generally only found in heath or open forest with a heathy understorey on sandy or friable soils. They feed on a variety of ground-dwelling invertebrates and the fruit-bodies of hypogenous (underground-fruiting) fungi. Their searches for food often create distinctive conical holes in the soil. Males have a home range of approximately 5-20 ha whilst females forage over smaller areas of about 2-3 ha. Nest during the day in a shallow depression in the ground covered by leaf litter, grass or other plant material. Nests may be located under Grass trees *Xanthorrhoea spp*., blackberry bushes and other shrubs, or in rabbit burrows. The upper surface of the nest may be mixed with earth to waterproof the inside of the nest. Mating occurs any time of the year, usually following heavy rain. Two or three litters of 2-4 young may be produced annually. The gestation period of 11-12 days is the shortest known of any marsupial while young remarkably become independent around 60 days after being born.	BUN: **Low –** The Southern Brown Bandicoot (eastern) has a patchy distribution. There are no records within 10-km of the project footprint. Across the Bungonia section of the project footprint, surveys targeting Southern Brown Bandicoot (eastern) included baited hair tubes for 126 traps nights, spotlighting surveys for 15 person hours, and baited remote camera traps deployed in suitable habitat for 265 trap nights (total survey effort of 391.15 trap nights). Based on multiple lines of evidence (survey effort, restricted distribution and no nearby records), the likelihood of occurrence for Southern Brown Bandicoot (eastern) is considered low.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Mastacomys fuscus	Broad-toothed Rat	V		V	SNO: 10	BON: 11 SNO: 90	BON: 37 SNO: 630	The Broad-toothed Rat lives in a complex of runways through the dense vegetation of its wet grass, sedge, or heath environment, and under the snow in winter. This relatively warm under-snow space enables it to be active throughout winter. A male's home range overlaps those of several females. Sheltering nests of grass are built in the understorey or under logs, where two or three young are born in summer. In winter, the rats huddle together	BON: **Low –** Broad-toothed Rat occupies alpine sedge, heath environments. No suitable habitat for the species occurs within the project footprint. The species has several records (DPE 2022) within the broader Bondo IBRA subregion,	Potential impacts to foraging and nesting habitat.

Scientific name (Data source)	Common name	NSW BC Act	NSW FM Act	EPBC Act	Records within 5km	Records within 20km	Records within IBRA Subregion	Habitat	Likelihood of occurrence (per IBRA subregion)*	Likelihood to be impacted by the project
								in nests, for warmth. Food is mostly, gathered at night, in summer and autumn and during the afternoon and early evening in winter. The diet consists almost solely of greenery - grass and sedge stems, supplemented by seeds and moss spore cases.	however, none within the project footprint. Surveys targeting Broad-toothed Rat, include baited terrestrial hair tubes for 306 trap nights, and baited remote cameras for 8 trap nights (total survey effort of 404 trap nights). No individuals were identified during targeted surveys. SNO: **High –** Suitable habitat for Broad-toothed Rat has been recorded by the NSW Forestry Corporation within Bago State Forest in proximity to the project footprint. There are multiple previous records (DPE 2022) within the Snowy Mountains portion of the project footprint. Surveys targeting Broad-toothed Rat, include baited terrestrial hair tubes for 90 trap nights, baited remote cameras for 318 trap nights, and spotlighting for 64 person hours (total survey effort of 409 trap nights). No individuals were identified during targeted surveys Further, a dead carcass of small mammal was identified during the spotlighting surveys, however, DNA analyses confirmed that the specimen was not a Broad-toothed Rat.	
Nyctophilus corbeni (BAM-C, BioNet)	Corben's Long-eared Bat	V	-	V			INL: 9	The Corben's Long-eared Bat has a limited distribution that is restricted around the Murray-Darling Basin in south-eastern Australia. 								an essential part of habitat, and may consist of grasstrees, sedges, ferns, or heath, or of low shrubs of tea-trees or melaleucas. A sandy loam soil is also a common feature. The fruit-bodies of hypogenous (underground-fruiting) fungi are a large component of the diet of the Long-nosed Potoroo. They also eat roots, tubers, insects and their larvae and other soft-bodied animals in the soil. Often digs small holes in the ground in a similar way to bandicoots. Mainly nocturnal, hiding by day in dense vegetation - however, during the winter months animals may forage during daylight hours. Individuals are mainly solitary, non-territorial and have home range sizes ranging between 2-5 ha. Breeding peaks typically occur in late winter to early summer and a single young is born per litter. Adults are capable of two reproductive bouts per annum.		
Pseudomys fumeus	Smoky Mouse	CE		E		BON: 9 SNO: 28	BON: 24 SNO: 236	The Smoky Mouse appears to prefer heath habitat on ridge tops and slopes in sclerophyll forest, heathland, and open forest from the coast (in Victoria) to sub-alpine regions of up to 1800 metres, but sometimes occurs in ferny gullies. Seeds and fruits from leguminous shrubs form the main summer and autumn diet, with some invertebrates, e.g., Bogong Moths in the high country. Hypogeal (truffle-like) fungi predominate in winter and spring, with some flowers, seeds and soil invertebrates. May occur singly, as pairs or small communal groups based around patches of heath, sometimes comprising a male and up to five females sharing a burrow system. Breeding is in spring with one or two litters produced of up to four young. Nesting burrows have been found in rocky localities among tree roots and under the skirts of Grass Trees Xanthorrhoea spp. The persistence of colonies appears to be very ephemeral. It is not known how much this is due to natural fluctuations in food availability, but predation from feral carnivores appears to be implicated.	BON: **Moderate –** Smoky Mouse has several records (DPE 2022) within 20 km of the project footprint, in the Bondo IBRA subregion, however, none within the project footprint. The species occupies alpine sedge, heath environments. Surveys targeting Smoky Mouse, include baited terrestrial hair tubes for 306 trap nights, and baited remote cameras for 8 trap nights (total survey effort of 404 trap nights). No individuals were identified during targeted surveys. SNO: **Moderate –** Smoky Mouse has multiple previous records (DPE 2022) within 20 km of the Snowy Mountains portion of the project	Potential impacts to foraging and nesting habitat.

Cyclodomorphus praealtus	Alpine She-oak Skink	E		E		SNO: 24	SNO: 378	The Alpine She-oak Skink has specific habitat requirements, preferring tree-less or very lightly treed areas that contain tussock grasses, low heath or a combination of both. Within this habitat the species shelters beneath litter, rocks, logs and other ground debris, and has been observed basking on grass tussocks. In NSW, Alpine She-oak Skinks have been observed in alpine to sub-alpine grasslands in flat to gently sloping areas. Little is known about the breeding biology of the species as it is difficult to detect, spending much of its time sheltering within tussock clumps. The species gives birth to live young and a study of preserved museum specimens found several females, which had been collected during summer, pregnant with between two and nine embryos, suggesting a summer breeding period. The diet of the Alpine She-Oak Skink is largely carnivorous, mostly consisting of small invertebrates, such as molluscs and insects. The species has also been recorded to occasionally feed on small lizards and snakes and potentially consumes a limited amount of plant material. Adults appear to have relatively small home ranges and remain in the same general area for long periods of time. The largest distance recorded between sightings of the same individual is roughly 45 metres. As a result of its narrow altitudinal range and specific habitat requirements, the Alpine She-oak Skink is considered to have a limited capacity for dispersal.	SNO: **Low –** Alpine She-oak Skink has a relatively small home range and is confined to native grassland or heath habitats within a narrow altitudinal range. Based on consultation with the BCD, the species is unlikely to occur west of Maragle at elevations less than 1200 m elevation. Given this, the project footprint is considered outside of the known range of the species.	Direct/indirect impacts to species as a result of the project are highly unlikely.
Delma impar	Striped Legless Lizard	V		V	INL: 3 MUR: 13	INL: 4 MUR: 13	INL: 4 MUR: 13	Found mainly in Natural Temperate Grassland but has also been captured in grasslands that have a high exotic component. Also found in secondary grassland near Natural Temperate Grassland and occasionally in open Box-Gum Woodland. Habitat is where grassland is dominated by perennial, tussock-forming grasses such as Kangaroo Grass *Themeda australis*, spear-grasses *Austrostipa spp*. and poa tussocks *Poa spp.*, and occasionally wallaby grasses *Austrodanthonia* spp. Sometimes present in modified grasslands with a significant content of exotic grasses. Sometimes found in	BON: **Moderate** - Two reptile searches surveys were undertaken in suitable rocky habitat within the Bondo IBRA subregion portion of the project footprint. However, no individuals were identified and there was limited suitable rocky habitat observed. There are also generally low numbers of records across the broader	Potential impacts to foraging and shelter habitat.

								grasslands with significant amounts of surface rocks, which are used for shelter. Sometimes utilises dried cowpats for shelter. Actively hunts for spiders, crickets, moth larvae and cockroaches. Two papery eggs are laid in early summer. Goes below ground or under rocks or logs over winter.	Bondo IBRA subregion, and none within 20 km of the project footprint (DPE 2022). Given the low number of surveys undertaken, the likelihood of occurrence is considered moderate. BUN: **Moderate** - Two reptile searches surveys were undertaken in suitable rocky habitat within the Bungonia IBRA subregion portion of the project footprint. However, no individuals were identified and there was limited suitable rocky habitat observed. There are also generally low numbers of records across the broader Bungonia IBRA subregion, and none within 20 km of the project footprint (DPE 2022). Given the low number of surveys undertaken, the likelihood of occurrence is considered moderate. CRO: **Low** – 19 reptile searches surveys were undertaken in suitable rocky habitat within the Crookwell IBRA subregion portion of the project footprint. However, no individuals were identified and there was limited suitable rocky habitat observed. There are also generally low numbers of records across the broader Crookwell IBRA subregion (DPE 2022). Given the considerable number of surveys undertaken,

									the likelihood of occurrence is considered low within the project footprint. INL: **High** – 31 reptile searches surveys were undertaken in suitable rocky habitat within the Inland Slopes IBRA subregion portion of the project footprint. However, no individuals were identified and there was limited suitable rocky habitat observed. There are a small number of records within 5 km of the project footprint. Given the nearby records, the likelihood of occurrence is considered high. MUR: **High** – 27 reptile searches surveys were undertaken in suitable rocky habitat within the Murrumbateman IBRA subregion portion of the project footprint. However, no individuals were identified and there was limited suitable rocky habitat observed. There are records within 5 km of the project footprint, however there are also generally low numbers of records across the broader Murrumbateman IBRA subregion (DPE 2022). Given the nearby records, the likelihood of occurrence is considered high.	
Hoplocephalus bungaroides	Broad-headed Snake	E		V				The Broad-headed Snake is restricted to the sandstone ranges in the Sydney Basin and within a radius of	BUN: **Unlikely –** Across the Bungonia section of the project	Direct/indirect impacts to

								approximately 200 km of Sydney (Cogger et al. 1993; NSW National Parks and Wildlife Service 2001), and typically occupy west and north facing aspects sandstone ridgetops. Nocturnal. Shelters in rock crevices and under flat sandstone rocks on exposed cliff edges during autumn, winter, and spring. Moves from the sandstone rocks to shelters in cervices or hollows in large trees within 500m of escarpments in summer. Feeds mostly on geckos and small skinks; will also eat frogs and small mammals occasionally. Females produce four to 12 live young from January to March, which is a relatively low level of fecundity.	footprint, there is no known Sydney sandstone ridgetop habitat available to support the species. Based on multiple lines of evidence such as the species habitat requirements, restricted known and predicted distribution and no nearby records, the likelihood of occurrence for Broad-headed Snake is considered highly unlikely.	species as a result of the project are highly unlikely.
Liopholis guthega	Guthega Skink	E		E			SNO: 586	The Guthega Skink occurs between 1600 m and 2170 m – in the coldest (winter snow cover) and some of the wettest regions on mainland Australia. Preferred habitats are usually rocky or have sub-surface boulders hidden beneath soil or thick vegetation. The NSW distribution occurs where there is a granite substrate and decomposing granite soils. Individuals have been recorded in a range of vegetation types, including open *Eucalyptus pauciflora* (Snow Gum) woodland with grassy or shrubby understoreys, dry tussock grassland, and tall and short heath. A review of the life history of all *Liopholis* and *Egernia* species suggests that the Guthega skink would take 3–4 years to reach sexual maturity and have a lifespan of at least 8–10 years. The Guthega Skink mates in late spring or early summer and gives birth to three or four live young in February–March. Otherwise, the breeding system and breeding success of the Guthega Skink is largely unknown. The social structure and dispersion of the Guthega Skink is poorly known, but they are known to be colonial, and live in warren systems. It is likely that adults have considerable site fidelity frequenting a familiar burrow network and basking and foraging areas. Consequently, home ranges are likely to be small.	SNO: **Unlikely–** Guthega Skink is restricted to locations above 1600 m asl in the Australia Alps and Bogong High Plains. The species has a narrow altitudinal range and therefore, the project footprint is considered outside of the known range. Further, 48 targeted reptile searches were undertaken within the project footprint and did not identify the species.	Direct/indirect impacts to species as a result of the project are highly unlikely.
