1. Background

1.1 Introduction

TransGrid is the manager and operator of the major high-voltage electricity transmission network in New South Wales and the Australian Capital Territory. TransGrid is seeking approval under Division 5.2 of the *Environmental Planning and Assessment Act 1979* for the construction and operation of a new 330 kilovolt (kV) underground transmission cable circuit between the existing Rookwood Road substation in Potts Hill and the Beaconsfield West substation in Alexandria.

The project has been identified as a solution to address existing issues in the electricity supply network for inner Sydney, which is characterised by ageing and deteriorating electricity infrastructure and forecast increases in consumer demand.

Key components of the project include:

- cable works connecting Rookwood Road substation with the Beaconsfield West substation comprising:
 - a 330 kV underground transmission cable circuit comprising three cables installed in three conduits;
 - another set of three conduits for a possible future 330 kV transmission cable circuit if it is required;
 - four smaller conduits for carrying optical fibres;
 - around 26-30 joint bays, per circuit, where sections of cable would be joined together, located approximately every 600-800 metres along the transmission cable route;
 - link boxes and sensor boxes associated with each joint bay to allow cable testing and maintenance;
- seven special crossings of infrastructure or watercourses including two rail lines (at Chullora and St Peters), one freight rail line (Enfield Intermodal rail line at Belfield), one light rail line (at Dulwich Hill), the Cooks River and its associated cycleway (at Campsie/Croydon Park), a playground (at Marrickville) and the southern wetland at Sydney Park (at Alexandria);
- upgrade works at the Rookwood Road and Beaconsfield West substations to facilitate the new 330 kV transmission cable circuit;
- conversion works at the Beaconsfield West and Sydney South substations to transition the existing Cable 41 from a 330 kV connection to a 132 kV connection; and
- five temporary construction laydown areas to facilitate construction of the project.

As the project is State Significant Infrastructure under section 5.12 of the EP&A Act, an Environmental Impact Statement has been prepared to assess the impacts of the project. A Secretary's Environmental Assessment Requirements (SEARs) was issued for the project on [TBC] by the Secretary of the NSW Department of Planning, Industry and Environment (DPIE) for Application Number SSI 17_8583. The SEARs require 'an assessment of the likely impacts on street trees'.

1.2 The project location

The project would be located in the suburbs of Potts Hill, Yagoona, Chullora, Greenacre, Lakemba, Belmore, Belfield, Campsie, Croydon Park, Ashbury, Ashfield, Dulwich Hill, Marrickville, Newtown, St Peters, Alexandria and Picnic Point.

The project would be located in the following local government areas:

- City of Canterbury-Bankstown;
- Strathfield;
- Inner West; and
- City of Sydney.

The project would be located primarily within road reserves, at existing electrical infrastructure sites, within public open space and on previously disturbed area. Land uses adjacent to the road reserves are mainly residential with relatively short sections of commercial and mixed uses in the suburbs of Belfield, Croydon Park and Petersham. The project would be located close to industrial areas towards the western and eastern ends of the project area around Potts Hill, Chullora, Greenacre, Marrickville, St Peters and Alexandria.

This report includes a location map (Figure 1) and detailed site maps (Appendix A).

1.3 The project area

The project area (shown in Appendix A) comprises the overall potential area of direct disturbance by the project, which may be temporary (for construction) or permanent (for operational infrastructure) and extend below the ground surface. This includes the location of operational infrastructure and construction work sites for:

- the transmission cable route (including the entire road reserve of roads traversed);
- special crossings of infrastructure or watercourses;
- substation sites requiring upgrades (noting that all works would be contained within the existing site boundaries); and
- construction laydown areas.

Temporary construction laydown areas are proposed at five locations along the transmission cable route:

- 12 Muir Road, Chullora;
- Cooke Park, Belfield;
- Peace Park, Ashbury;
- Camdenville Park, St Peters; and
- Beaconsfield West substation, Alexandria.

At Campsie, the project would cross the Cooks River, the main watercourse within the project area. In the east, it would extend through Sydney Park north of Campbell Road. There are a number of major transport corridors that would be crossed by the project, including freight rail infrastructure at Chullora and the southern end of the Enfield Intermodal Logistics Centre, the Dulwich Hill Light Rail line, and the Sydney Trains network.

The locations of the proposed special crossings are provided in Table 1.

Table 1: Proposed special crossing locations

Location	Suburb	Infrastructure or waterbody crossed	Crossing type
Muir Road	Chullora	Rail line	Cable bridge
Enfield Intermodal Terminal	Belfield	Freight rail line	Underbore
Cooks River	Croydon Park/Campsie	Cooks River and cycleway	Cable bridge or underbore
Arlington Light Rail Station	Dulwich Hill	Dulwich Hill Light Rail line	Underbore
Bedwin Road	St Peters	Rail Line	Cable Bridge
Sydney Park	Alexandria	Wetland	Underbore

Figure 1: The project location

2. Method

For the purpose of this assessment, it is assumed that any tree within the project area (as shown within Appendix A) could be impacted by the proposed works. This does not suggest that all the trees identified are likely to be removed but rather that they have been identified and assessed for their retention value. The final alignment within the project area would be determined during detailed design following consideration of existing infrastructure and services above and below ground, as well as the position of trees and tree roots within or adjacent to the cable route.

2.1 Definitions used in this assessment

2.1.1 Definition of a tree

A tree is defined under the *Australian Standard, AS 4970-2009, Protection of Trees on Development Sites* as a long lived woody perennial plant greater than (or usually greater than) three metres in height with one or relatively few main stems or trunks. This is the definition that has been adopted within this assessment.

2.1.2 Tree protection zone (TPZ)

The TPZ is the combination of crown and root area (as defined by AS 4970-2009) that requires restriction of access during the construction process (Figure 2). Tree sensitive construction measures must be implemented if works are to proceed within the TPZ.

2.1.3 Structural root zone (SRZ)

The SRZ is the area of the root system (as defined by AS 4970-2009) used for stability, mechanical support and anchorage of the tree. It is critical for the support and stability of trees (Figure 2). Severance of roots within the SRZ is not recommended as it may lead to the destabilisation and/or decline of the tree.

Figure 2: Indicative TPZ and SRZ

2.2 Visual tree assessment

The subject trees were assessed in accordance with a stage one visual tree assessment (VTA) as formulated by Mattheck & Breloer (1994), and practices consistent with modern arboriculture. Measurements to determine the TPZ were carried out in accordance with Clause 3.2 and 3.3.5 of AS4970-2000 Protection of Trees on Development Sites (Standards Australia 2009).

The subject trees were inspected in April-July 2018 and June 2019 by Australian Qualifications Framework AQF Level 5 Consulting Arborists Elizabeth Hannon and David Bidwell.

The following limitations apply to this methodology:

- trees were inspected from ground level, without the use of any invasive or diagnostic tools and testing;
- one tree located within an inaccessible area (Appendix A Figure 17) was not subject to a complete visual inspection (i.e. defects and abnormalities may be present but not recorded);
- no aerial inspections or root mapping was undertaken;
- tree heights, canopy spread and diameter at breast height (DBH) was estimated, unless otherwise stated;
- tree identification was based on broad taxonomical features present and visible from ground level at the time of inspection;

- locations of trees were recorded using hand-held GPS units so are likely to be accurate to within 5-20 metres; and
- a detailed design will be developed at a later date to confirm the cable alignment within the project area and the number of trees that would potentially be impacted.

2.3 Retention value

The retention value/importance of a tree or group of trees is determined using a combination of environmental, cultural, physical and social values. This tree retention assessment has been undertaken in accordance with the Institute of Australian Consulting Arboriculturists (IACA) *Significance of a Tree, Assessment Rating System (STARS[©])*. The following categories were used:

- **Low:** These trees are not considered important for retention, nor require special works or design modification to be implemented for their retention;
- **Medium:** These trees are moderately important for retention. Their removal should only be considered if adversely affected by the proposed works and all other alternatives have been considered and exhausted; and
- **High:** These trees are considered important and should be retained and protected. Design modification should be considered to accommodate the setbacks as prescribed by Australian Standard AS4970 - Protection of trees on development sites.

A tree would be assigned a high retention value if it has good condition and vigour, is listed as a heritage item, and has a form typical of the species. Trees that are within a heritage area but have poor structure and health do not warrant high retention value. In other words, dead, dying and dangerous trees in a heritage listed area do not warrant high level protection.

Further details and assessment criteria are in **Appendix A**.

2.4 Potential impacts

Trees may be impacted by cutting or damaging roots or branches. Impacts to the tree protection zones are determined by the percentage of the area that the development incurs into the TPZ. The following are the definition of these impacts:

- **High impact:** The SRZ may be impacted if the proposed encroachment is greater than 20 % of the TPZ or works are to be carried out within the SRZ. Trees may not remain viable if they are subject to high impact;
- **Medium impact:** If the proposed encroachment is greater than 10% of the TPZ and outside of the SRZ. Detailed root investigation may be required to demonstrate that the tree(s) would remain viable;
- **Low impact:** If the proposed encroachment is less than 10% of the TPZ, and outside of the SRZ. Detailed root investigations should not be required; and
- **No impact:** No likely or foreseeable encroachment within the TPZ.

Figure 3: Indicative zones of impact

3. Results

In total, 2606 trees were assessed in the project area. The locations and retention values of these trees are mapped in Appendix A. Details of the arboriculture assessment of all 2606 trees are tabulated in Appendix B and summarised as follows:

- 121 high retention value trees;
- 1765 medium retention value trees; and
- 720 low retention values trees.

As mentioned above, this assessment assumes that any tree assessed within the project area (Appendix A) could be impacted by the proposed works. This information will assist TransGrid to avoid or reduce tree impacts, where possible. The specific impacts related to tree removal, such as excavation within the tree root zone or machinery damage caused to the trunk and crown would be determined during detailed design.

Conditions for root growth beneath the road pavement will be poor due to the level of previous soil compaction (for the pavement sub-grade) and the low permeability of the road surface (asphalt or concrete). In many instances, roots will be deflected by the kerb and gutter. This does not mean that roots will not be encountered beneath road pavements, but more that the intensity and distribution of roots is difficult to predict. Mitigation measures should therefore be implemented where excavation will have a high or medium impact (as defined in section 2.4) to avoid adverse impact on existing trees.

4. Recommended mitigation measures

As mentioned previously, the final alignment of the project area would be determined during detailed design following consideration of existing infrastructure and services above and below ground, as well as the position of trees and tree roots within or adjacent to the cable route. Measures to avoid or mitigate these potential impacts to trees where possible are outlined below.

Under AS 4970-2009 - *Protection of trees on development sites*, the project arborist is required to demonstrate the tree(s) would remain viable by consideration of relevant factors including root location and distribution, tree species, condition, site constraints and design factors.

4.1 During the detailed design phase

The following should be considered during the detailed design phase to retain trees where practicable, considering the retention value of the tree and the complexity and cost of any measures to change the design to avoid impacts.

- Relocate services and other construction impacts (e.g. site offices, plant/equipment storage) outside of tree protection zones; and
- Review the alignment of the transmission cable circuit to avoid impacting the SRZ or more than 10% of the TPZ where possible, with priority consideration given to heritage areas and high retention value trees.

4.2 During the construction phase

These measures would apply to trees located in open space areas and along the road verge:

- the location and distribution of roots of trees to be retained will be determined through low or non-destructive excavation methods such as hydro-vacuum excavation (sucker truck), air spade and manual excavation, where required, immediately prior to excavation works commencing;
- if trenching activities impact tree roots to a point where the tree is no longer viable (as determined by the project arborist), the tree will be removed at the time of construction;
- if the trenching impacts tree roots, but the tree is still deemed to be viable by the project arborist, the tree can remain in situ;
- root barriers may be considered to prevent future growth of tree roots into the trench space.
- all tree pruning must be in accordance with the Australian Standard AS 4373-2007, *Pruning of Amenity Trees* and the NSW WorkCover Code of Practice for the Amenity Tree Industry (1998);
- all tree work on retained trees is to be carried out by an arborist with a minimum AQF Level 3 qualification in Arboriculture;
- trunk, branch and/ or ground protection measures for high retention value trees that extend into or are located in the roadway, will comply with AS 4970-2009 *Protection of trees on development sites* (Standards Australia, 2009a) and ground protection will be used within the TPZ and SRZ, where possible, to prevent root damage caused by compaction of the soil and the loss of water infiltration and oxygen to the trees root system (refer to guidelines in Appendix C). Ground protection may include a permeable membrane such as geotextile fabric beneath a layer of mulch, crushed rock or rumble boards; and

- a qualified arborist will inspect high retention value trees within the project area for any damage once construction is completed and tree protection measures have been removed.

4.3 Mitigation measures during operation

Once the cable is operational, it will be monitored by a consulting arborist in consultation with cable specialists to identify any locations where trees may be detrimentally affecting the operation of the transmission cable circuit or at risk of doing so. As this could have safety or supply impacts on the transmission network, action may be required. If trees are identified that are detrimentally affecting the operation of the transmission cable circuit or are at risk of doing so, the tree will need to be removed. Removal will be limited to only the trees that are necessary.

4.4 Offsetting

Any loss of trees resulting from construction of the project should be offset with replacement planting (1:1) or equivalent as negotiated between TransGrid and the relevant local council.

4.5 Hold points, inspection and certification

To ensure compliance with this report, hold points have been specified in the schedule of works below. Once each stage is reached, the work will be inspected and certified by the project arborist and the next stage may commence. Alterations to this schedule may be required, however, this should be through consultation with the project arborist.

Table 2: Schedule of works

Pre-construction	Prior to site establishment, indicate clearly (with spray paint on trunks) the trees that need to be removed to enable construction. Trees that will need to be removed are those that would have significant disturbance to the TPZ as a result of excavation, operation of machinery etc. As outlined in Clause 2.2, where possible, trees of low retention value shall be removed rather than trees of medium or high retention value. High retention trees shall be avoided and retained wherever possible. Trees will be pruned to establish clearances for plant and equipment if necessary.
During Construction	A qualified arborist will be consulted in the event there is a change to the condition of trees in the project area due to construction activity.
Post Construction	A qualified arborist will inspect retained trees within the project area for any damage once construction is completed.

Appendix C Tree protection guidelines

The following are guidelines for tree protection during the construction period.

C1 Tree protection fencing

The TPZ is a restricted area delineated by protective fencing or the use of an existing structure (such as a wall or fence).

Trees that are to be retained must have protective fencing erected around the TPZ (or as specified in the body of the report) to protect and isolate it from the construction works. Fencing must comply with the *Australian Standard, AS 4687-2007, Temporary fencing and hoardings*.

Tree protection measures must be installed prior to site establishment and remain intact until completion of works. Once erected, protective measures must not be removed or altered without the approval of the project arborist.

If the protective fencing requires temporary removal, trunk, branch and ground protection must be installed and must comply with *AS 4970-2009, Protection of Trees on Development Sites*.

Tree protection fencing shall be:

- Enclosed to the full extent of the TPZ (or as specified in the Recommendations).
- Cyclone chain wire link fence or similar, with lockable access gates.
- Certified and Inspected by the project arborist.
- Installed prior to the commencement of works.
- Prominently signposted with 300-millimetre x 450-millimetre boards stating, “NO ACCESS - TREE PROTECTION ZONE”.

C2 Trunk protection

Where provision of tree protection fencing is impractical or must be temporarily removed, trunk protection shall be installed for the nominated trees to avoid accidental mechanical damage.

The removal of bark or branches allows the potential ingress of micro-organisms which may cause decay. Furthermore, the removal of bark restricts the trees' ability to distribute water, mineral ions (solute), and glucose.

Trunk protection shall consist of a layer of either carpet underfelt, geotextile fabric or similar wrapped around the trunk, followed by 1.8 metre lengths of softwood timbers aligned vertically and spaced evenly around the trunk (with an approx. 50 millimetre gap between the timbers).

The timbers must be secured using galvanised hoop strap (aluminium strapping). The timbers shall be wrapped around the trunk but not fixed to the tree, as this will cause injury/damage to the tree.

C3 Crown protection

Tree crowns/canopy may be injured or damaged by machinery such as; excavators, drilling rigs, trucks, cranes, plant and vehicles. Where crown protection is required, it will usually be located at least one meter outside the perimeter of the crown.

Crown protection may include the installation of a physical barrier, pruning selected branches to establish clearance, or the tying/bracing of branches.

C4 Ground protection

Tree roots are essential for the uptake/absorption of water, oxygen and mineral ions (solute). It is essential to prevent the disturbance of the soil beneath the dripline and within the TPZ of trees that are to be retained. Soil compaction within the TPZ will adversely affect the ability of roots to function correctly.

If temporary access for machinery is required within the TPZ, ground protection measures will be required. The purpose of ground protection is to prevent root damage and soil compaction within the TPZ. Ground protection may include a permeable membrane such as geotextile fabric beneath a layer of mulch, crushed rock or rumble boards.

If the grade is to be raised within the TPZ, the material should be coarser or more porous than the underlying material.

C5 Root protection & pruning

If incursions/excavation within the TPZ are unavoidable, exploratory excavation (under the supervision of the project arborist) using non-destructive methods may be considered to evaluate the extent of the root system affected and determine whether the tree can remain viable.

If the project arborist identifies conflicting roots that requiring pruning, they must be pruned with a sharp implement such as; secateurs, pruners, handsaws or a chainsaw, back to undamaged tissue. The final cut must be a clean cut.

Appendix D Tree retention assessment method

D1 Tree significance assessment criteria - STARS[©]

Low	Medium	High
The tree is in fair-poor condition and good or low vigour.	The tree is in fair to good condition	The tree is in good condition and good vigour
The tree has form atypical of the species	The tree has form typical or atypical of the species	The tree has a form typical for the species
The tree is not visible or is partly visible from the surrounding properties or obstructed by other vegetation or buildings	The tree is a planted locally indigenous or a common species with its taxa commonly planted in the local area	The tree is a remnant or is a planted locally indigenous specimen and/or is rare or uncommon in the local area or of botanical interest or of substantial age.
The tree provides a minor contribution or has a negative impact on the visual character and amenity of the local area	The tree is visible from surrounding properties, although not visually prominent as partially obstructed by other vegetation or buildings when viewed from the street	The tree is listed as a heritage item, threatened species or part of an endangered ecological community or listed on council's significant tree register
The tree is a young specimen which may or may not have reached dimensions to be protected by local Tree Preservation Orders or similar protection mechanisms and can easily be replaced with a suitable specimen	The tree provides a fair contribution to the visual character and amenity of the local area	The tree is visually prominent and visible from a considerable distance when viewed from most directions within the landscape due to its size and scale and makes a positive contribution to the local amenity.
The tree's growth is severely restricted by above or below ground influences, unlikely to reach dimensions typical for the taxa in situ – tree is inappropriate to the site conditions	The tree's growth is moderately restricted by above or below ground influences, reducing its ability to reach dimensions typical for the taxa in situ	The tree supports social and cultural sentiments or spiritual associations, reflected by the broader population or community group or has commemorative values.
The tree is listed as exempt under the provisions of the local Council Tree Preservation Order or similar protection mechanisms		
The tree has a wound or defect that has the potential to become structurally unsound.		
The tree is an environmental pest species due to its invasiveness or poisonous/allergenic properties.		
The tree is a declared noxious weed by legislation		

D2 Matrix assessment

Tree significance

		High	Medium	Low		
Useful Life Expectancy	Long >40 years					
	Medium 15-40 years					
	Short <1-15 years					
	Dead					

Legend

	Priority for retention (High): Tree considered important so should be retained and protected. Design modification or re-location of structure should be considered to accommodate the setbacks as prescribed by the <i>Australian Standard AS4970 Protection of trees on development sites</i> . Tree sensitive construction measures must be implemented if works are to proceed within the Tree Protection Zone.
	Consider for retention (Medium): Tree considered less important, however, retention should remain priority. Removal considered only if adversely affecting the proposed building/works and all other alternatives have been considered and exhausted.
	Consider for removal (Low): Tree not considered important for retention, nor requiring special works or design modification to be implemented for their retention.
	Consider for removal (Low): Tree not considered important for retention, nor requiring special works or design modification to be implemented for their retention.
