

Use buses to transport workers to the site.

After the project is finished, who is going to pay for re-habilitation?

Government agents have flooded 5 victims to care, will be no spare funds, not the Councils responsibility

I think The Hills of Gold Wind Farm company should have to put in place, with Tamworth City Council a trust fund, with enough money to cover the cost of leaving the area as close to its natural state as possible - eg planting mature trees and native shrubs to help stop erosion.

They say the whole area will be cleaned at the end of its life = what about the concrete blocks or any other below the ground? Perhaps funding should be put aside by them, in a secure banking system that can't be breached by the firm, so in case of bankruptcy it can't be removed.

(For all the disruption, stress and inconvenience, to compensate us all for having to put up with their intrusion into our daily existence. Seeing they have so much cash to set this up, why not? We are going to have more trucks up here due to the transport of material from the Quarry.)

Withhold name from publication please.

Why is this firm so determined to get this in place.

All the environment elements that are being set up to save eg Roala and the forests, waterways

The money that the over all costs that will be spent, the entire indifference to the impact of setting up this project will have on us all, even our health problems that will be affected beggers belief.

Actually, I feel an under current in the whole thing.

Quenies?

How much soil is going to be moved for each tower - plus installations and roads etc on the site

Where is it going to be dumped?

The change of the terrain will cause flooding, plus the cement blocks will ^{change} direction of under ground springs.

Shortly minutes before rain fall there is an air flow = moss dust, pollen etc - fatal for some sufferers of asthma, emphysema, bad chest infections and blockages.

The movement of all the construction disturbances will need to be monitored on windy days. These disturbances are (monitored) frightening at times I have bashed my back on a wall to catch my breath.

Fire hazard.

The Hanging Rock to Pundell has been classed as catastrophic, an out of fire control will cause the Sheba dams to boil in 3 minutes, and the windows of Pundell houses will blow out in the first phase. The Dept of Crown Lands has closed it down, and gates are in place. The worst fires to control come up through Morrisons Gap and are extremely hard to fight. The volunteers who assisted in the last break out, received a rare medal - only the 2nd time - with the approval of Queen Elizabeth.

On a TV report a rep stated - with this area having the towers in place, Pundell wouldn't be troubled by fires anymore."

The Devil's Elbow is perfectly safe, the contours of the road all meld to one another, there are no rock falls & shouldn't be interfered with. Hanging Rock is built on an ancient sea bed - breached by an erupting volcano & the hanging rock was its core. The rock formations show the dip & strike of the geology of the event, surrounding rock formations show the metamorphism which took place when it was "live". To interfere with it, for no valid reason would truly be destructing something of ~~quite~~ great value in telling the story of how the area evolved & can't be replaced. Also features in Aboriginal knowledge.
