Re: Microbat Habitat Response for Randwick Campus Redevelopment - Integrated Acute Services Building (IASB) Addition

To whom it may concern,

Narla understand that no existing building(s) are to be demolished for the IASB Addition. The construction of the proposed development is not considered likely to provide important shelter/ roost habitat for microchiropteran fauna (microbats).

In observing the precautionary principal, NSW Health Infrastructure or their contractors should engage appropriately licensed and qualified fauna Ecologists to search the 10 trees prior to their removal, in order to confirm the absence of native fauna, such as microbats. If they are found, the Ecologist will capture, treat and relocate such microbats to a suitable location.

Please feel free to get in touch with any questions.

Thank you

Yours sincerely,

Kurtis Lindsay BSc (Hons)
