

Mount Owen continuation project (SSD 5850 Mod 2)

To Department of Planning

I object to the project application on these grounds

1. Air quality and pollution impacts human and environmental health, the area already experiences high levels of poor air quality
2. The final voids are health concern to environment
3. There is no proven economic value of having a final void in the final landform
4. The mine will destroy more vegetated land, which will increase the impacts of climatic conditions
5. Increase the area to less productive land and more instability in recovery to massive climatic conditions
6. All residents have the right for clean air and mitigations has not proven effective, the number of exceedances has shown this is accurate.
7. That water is so precious that we continue to destroy the whole water network system, How many now are experiencing in our state related to lack of water and yet we continue to destroy the one resource that sustains life.
8. That no resident should be denied the right for acquisition on request as Glencore owns so many mines that the cumulative impact from this mega mine situation has contributed to the poor air quality, that they should be held accountable, as they state is economic to the state, so there it is economic to impacted that they have the right to leave.
9. The impacted should have the right to hold account of the mine if they don't deliver the on the statements they make that the air quality will be controlled, but how many times have we heard these words when actually when it comes to the crunch, the impacts hold these residents are captives in their homes and remove their rights of freedom to have a window open or to drink clean water from a tank.
