1. Introduction

1.1 Introduction

GHD was engaged by Shoalhaven Starches Pty Ltd (Manildra) to conduct an air quality impact assessment for a proposed modification to the approved Shoalhaven Starches Expansion Project (SSEP) (Modification 19). The Shoalhaven Starches factory is located at Bolong Road in Bomaderry, New South Wales.

This report describes the background and scope of the proposed modifications, the pollutant inventory for odorous and non-odorous emission sources and the predicted air quality impacts at identified sensitive receptors.

1.2 Background

Flour and grains are processed at the factory to produce ethanol, starch, gluten, glucose and distiller's dried grain (DDG). Shoalhaven Starches is the holder of Environment Protection Licence number 883 issued for the plant by the NSW EPA.

The Shoalhaven Starches Bomaderry plant currently produces around 225 million litres (ML) of ethanol per year (production quantity fluctuates year to year based on demand). On 28 January 2009 the (then) Minister for Planning issued Project Approval MP 06_0228 for the Shoalhaven Starches Expansion Project. The Project Approval for the SSEP enabled Shoalhaven Starches, subject to certain conditions, to increase ethanol production in a staged manner at its Bomaderry Plant from the previous approved level of 126 million litres per year to 300 million litres per year. Following the Minister's determination Shoalhaven Starches have been implementing and commissioning works in accordance with this approval. Work on the change in operations has been completed, coupled to quarterly testing (independent audits) of emissions from licensed discharge points (a condition of the Licence), with the purpose to validate the predicted impacts against the original predictions in 2008 for the ethanol expansion.

The increase in ethanol production associated with the SSEP Project Approval was made in response to the NSW Government's ethanol mandate which increased the mandated ethanol content by volume in petrol in NSW from 2% to 6% in October 2011. The SSEP sought to increase ethanol production capacity at the Shoalhaven Starches site to meet the expected increase in demand for ethanol arising from this site. The increase in ethanol production required upgrades to the Stillage Recovery Plant including six additional Dried Distillers Grains Syrup (DDGS) dryers.

However, the anticipated increase in demand for ethanol has not occurred. In response, Manildra have undertaken a series of modifications to the site with a focus on exploring alternative options. These are summarised in Table 1-1.

Modifications 11, 12, 13, 16 and 17 were assessed by GHD in the following documents:

- *Shoalhaven Starches expansion project – Modification 11 and 12 (Project approval MP_06_0228) Revised odour and air quality assessment* (GHD 2017)
- *Shoalhaven Starches Mod 13 Air Quality Assessment Cumulative odour assessment* (GHD 2017)
- *Shoalhaven Starches Mod 13 Air Quality Assessment Updated Cumulative Air Quality Assessment* (GHD 2017).
- *Shoalhaven Starches Proposed modification application MP 06_0228 Shoalhaven Starches Expansion Project, Proposed new speciality processing facility, new gluten dryer and other*

associated works at 22, 24 and 171 Bolong Rd, Bomaderry, NSW (Mod 16) (GHD, February 2019).

- *Manildra Group Air Quality Assessment Mod 17, 2019* (GHD, 2020)

Modification 14 did not require an air quality assessment. Modification 15 was separately assessed by GHD for SupaGas in 2017.

Table 1-1 Summary of recent proposed modifications on site (2015-2020)

Modification	Summary of changes
Modification 11	• Reducing the number of approved DDGS Dryers from six to four. • A minor modification to the footprint of the four DDG dryers. • Relocation of the cooling towers in the DDG Plant. • A Mill Feed Silo and structure to feed DDG dryers. • Expanded use of the existing coal and woodchip storage area within the SS Environmental farm. • The addition of two biofilters to cope with the increased number of DDG Dryers. • A forklift maintenance building adjacent to the relocated DDG dryers, along with a container preparation area adjacent to the relocated DDG Dryers.
Modification 12	Modifications to the existing Ethanol Distillery Plant to: • increase the proportion of 'beverage" grade ethanol that is able to be produced on the site. This modification will enable increased flexibility in terms of the range of types of ethanol produced at the site (i.e. between fuel, industrial and beverage grade ethanol) to meet market demands; and • modify the type and location of the Water Balance Recovery Evaporator that has been previously approved under MOD 2 adjacent to the Ethanol Plant.
Modification 13	• Modification of boilers 2 and 4, with the conversion of boiler 4 from gas fired to coal fired. • Installation of an additional baghouse on boiler 6.
Modification 14	• Modifications to the former paper mill site.
Modification 15	• Construction of the SupaGas CO2 plant at the former Dairy Farmers factory site.
Modification 16	Modification 16 comprised of the following: • Installation of a third flour mill C within the existing flour mill B building • Undertaking modifications to flour mills A and B • The construction of a new industrial building adjoining the Starch Dryer No. 5 building containing:

Modification	Summary of changes
	• The new product dryer • Plant and equipment associated with the processing of specialised speciality products. • Addition to Starch Dryer No 5 building to house a bag house for this dryer • Conversion of two existing gluten dryers (1 and 2) to starch dryers • Additional sifter for the interim packing plant • Construction of a coal-fired co-generation plant to the south of the existing boiler house complex. The co-generation plant will house a new boiler (No. 8) • Construction of lime silos: The lime injection system will consist of two storage silos and associated equipment for injecting powdered lime into each of the coal fired boilers • Relocation of the existing boiler No. 7 to the northern side of the overall boiler house complex • Construction of an indoor electrical substation on the northern side of Bolong Road • Construction of an additional rail intake pit for the unloading of rail wagons • Extension of the existing electrical substation located within the main factory area.
Modification 17/18	Modification 17 comprised of the following: • Modification to the location of the baghouse for the No. 5 Starch Dryer. As part of this baghouse relocation, an additional stack was added to starch dryer 5. • Use of sawmilling residue (woodchips) for boiler fuel by blending woodchip with coal in Boilers 2 & 4 • Installation of a new product dryer (No. 9) within the footprint of the speciality products building as approved under Mod 16. • To install a ‘services lift’ to the outside of the existing staircase adjacent to the No. 5 Starches Dryer Building to allow on-going access for personnel and customers to the floors within the building • Modification of the service conduit extending from the Shoalhaven Starches factory site on the southern side of Bolong Road to the proposed Packing Plant on the northern side of Bolong Road by elevating a section of the conduit above ground level • Amendment to design specifications for silencers to exhaust fans for Flour Mill B • Extension of the approved footprint for the product dryer building. The building will need to be wider than the one that has been approved

Modification	Summary of changes
	• Installation of a wet end processing plant within the product dryer building • Extension of speciality products building to the north to provide bulk chemical storage to the south of the product dryer building • Demolition of existing stores and maintenance offices building • Repurposing the existing maintenance building • Changes to car parking arrangements.

1.3 Current proposal: Modification 19

Manildra continue to explore alternative markets for products used in the manufacture of ethanol. In line with this, modifications are proposed to the existing Ethanol Distillery Plant to increase the production of 'beverage' grade ethanol on site. The modification will enable increased flexibility in terms of the range of types of ethanol produced at the site to meet market demands.

The modification proposal will enable an increase in production of up to 100 ML of beverage grade ethanol per annum. The proposal will not however involve an increase in the overall ethanol production at the site above the current approved 300 ML per year. With current capacity of 110 ML of beverage grade ethanol, the proposal will allow production of up to 210 ML of 'beverage' grade ethanol per annum to meet increased market demand for these higher quality ethanol products. There will be no increase in the overall ethanol production above the current approved 300 ML per annum.

To increase the proportion of beverage grade ethanol production on site, Shoalhaven Starches propose to undertake the following modifications (Mod 19):

- The installation of distillation columns and associated processing equipment immediately to the west of the existing Ethanol Distillery Plant. The proposed plant and equipment is of similar design, size and operation to the existing Beverage Grade Ethanol modification approved under Mod 12.
- An additional three (3) ethanol storage tanks within the existing ethanol storage tank area.
- The distillery modification in the proposed location will require a boundary adjustment adjacent to Bolong Road. Discussions have commenced with Shoalhaven City Council and an application has been submitted seeking a boundary adjustment with Council.
- The construction of three (3) product silos above the existing interim packing plant. The construction of these three (3) silos will necessitate the relocation of an approved electrical substation that was approved (but not yet constructed) below and within the footprint of where it is now proposed to site the proposed product silos. This electrical sub-station is to be relocated to a position on the northern side (Bolong frontage) of the Gluten Dryer No. 5 building. North of Starch Dryer 5 Approved Baghouse.
- The relocation of six (6) approved but not yet constructed, and the construction of an additional ten (10) product tanks. Under the existing approvals for the site ten (10) product storage tanks were to be sited to the rear of the Gluten Dryer and Specialty Product Buildings on the western side of Abernethy's Creek. Following detailed design, the diameter of the tanks has now increased and additional area is required for associated pumps and supporting equipment. As a result there is insufficient room to locate these tanks in the approved location.

- The construction of an additional ethanol loadout immediately adjacent to and to the north of the existing loadout facility.
- Installation of additional cooling towers within the eastern part of the site
- The construction of a cable stay pipe bridge across Abernethy's Creek to supply power and product to these buildings.
- The relocation of the extension of the existing electrical substation located on the eastern side of Abernethy's Creek
- The extension of the existing car park located within the western part of the site in a south-westerly direction to provide an additional thirty-one (31) car parking staff for staff and contractors

The relocation of the existing ethanol distillery control room from its current position adjacent the existing ethanol plant, to the old fire pump station building which is located adjacent to the Bolong Road frontage of the site. This use was originally approved as part of Mod 15.

The changes are shown in Figure 1.

This Air Quality Impact Assessment addresses those components of Mod 19 that have potential air quality impacts, namely the installation of distillation columns and associated processing equipment immediately to the west of the existing Ethanol Distillery Plant and the construction of three (3) product silos above the existing interim packing plant.

1.4 Scope

The proposed changes (Mod 19) requires an application to the EPA assessing the associated off-site odour and air quality impacts.

In order to meet EPA NSW requirements, this report provides:

- A revised emissions inventory for odorous and non-odorous sources on site. A comparative analysis of the emissions inventory has been undertaken with the last major air quality assessments for the site
- A level 2 air quality assessment of odour and air quality in accordance with the *Approved Methods for the Modelling and Assessment of Air Pollutants in New South Wales* (EPA 2016). Dispersion modelling was undertaken using CALPUFF version 7
- A comparison of predicted odour and air quality results against the EPA criteria and against the previous modification results.

1.5 Assumptions

The major assumptions used in this assessment are as follows:

- Stack emission testing reports from the past measurements are accurate and representative of normal operations, and do not vary significantly
- The odour dispersion modelling using the NSW EPA and US EPA approved regulatory Gaussian puff dispersion model CALPUFF version 7, which was considered appropriate for the location. Limitations with the predicted odour are inherent within the model and in its ability to handle multiple buildings and stacks in a complex setup, with wake effects included. As such, the layout of the plant was simplified in order for the model to handle the setup
- Odour emissions from the major sources of odour were modelled as both variable emission and fixed point, volume and area sources in CALPUFF with appropriate dispersion characteristics

- The site representative meteorological data was obtained from previous assessments of the plant, which have been approved by EPA NSW in the past. The meteorological data is discussed in Section 5
- Small silos in the Packing Plant are conservatively assumed to be filled 24 hours a day
- Odour sources with horizontal releases have conservatively been modelled with vertical velocities of 0.1 m/s
- The VOC concentration in the biofilter exhaust is not high enough to induce density flows of the exhaust plume in ambient air
- The emissions inventory, and therefore the dispersion modelling results, is largely based on estimates and on data measured on site by Stephenson Environmental Management Australia (SEMA). Actual measurements are dependent on site conditions at the time of measurement and these conditions may change. GHD does not accept any responsibility for updating the measurements or estimates made by SEMA.

1.6 Report structure

This report:

- Describes the operations of the plant
- Describes the site-representative meteorological and background air quality data
- Describes the proposed modifications
- Characterises odour sources at the plant, accounting for the required changes to the Mod 19 model setup
- Presents the results of odour dispersion modelling for the proposed (Mod 19) scenario using CALPUFF
- Characterises non-odour sources at the plant
- Presents the results of air quality dispersion modelling for the proposed (Mod 19) scenario using CALPUFF
- Presents a summary of the results and draws conclusions as to the off-site impacts (both odour and non-odour)
- Outlines the limitations of the analyses and conclusions presented.

1.7 Limitations

This report: has been prepared by GHD for Manildra Group and may only be used and relied on by Manildra Group for the purpose agreed between GHD and the Manildra Group as set out in section 1.4 of this report.

GHD otherwise disclaims responsibility to any person other than Manildra Group arising in connection with this report. GHD also excludes implied warranties and conditions, to the extent legally permissible.

The services undertaken by GHD in connection with preparing this report were limited to those specifically detailed in the report and are subject to the scope limitations set out in the report.

The opinions, conclusions and any recommendations in this report are based on conditions encountered and information reviewed at the date of preparation of the report. GHD has no responsibility or obligation to update this report to account for events or changes occurring subsequent to the date that the report was prepared.

GHD has not been involved in the preparation of the planning submission and has had no contribution to, or review of the submission. GHD shall not be liable to any person for any error in, omission from, or false or misleading statement in, any other part of the submission.

The opinions, conclusions and any recommendations in this report are based on explicit assumptions made by GHD, described in section 1.5 and throughout the body of this document, and limitations of the modelling software CALPUFF. GHD disclaims liability arising from any of the assumptions being incorrect. GHD has prepared this report on the basis of information provided by Manildra Group and others who provided information to GHD (including Government authorities), which GHD has not independently verified or checked beyond the agreed scope of work. GHD does not accept liability in connection with such unverified information, including errors and omissions in the report which were caused by errors or omissions in that information.

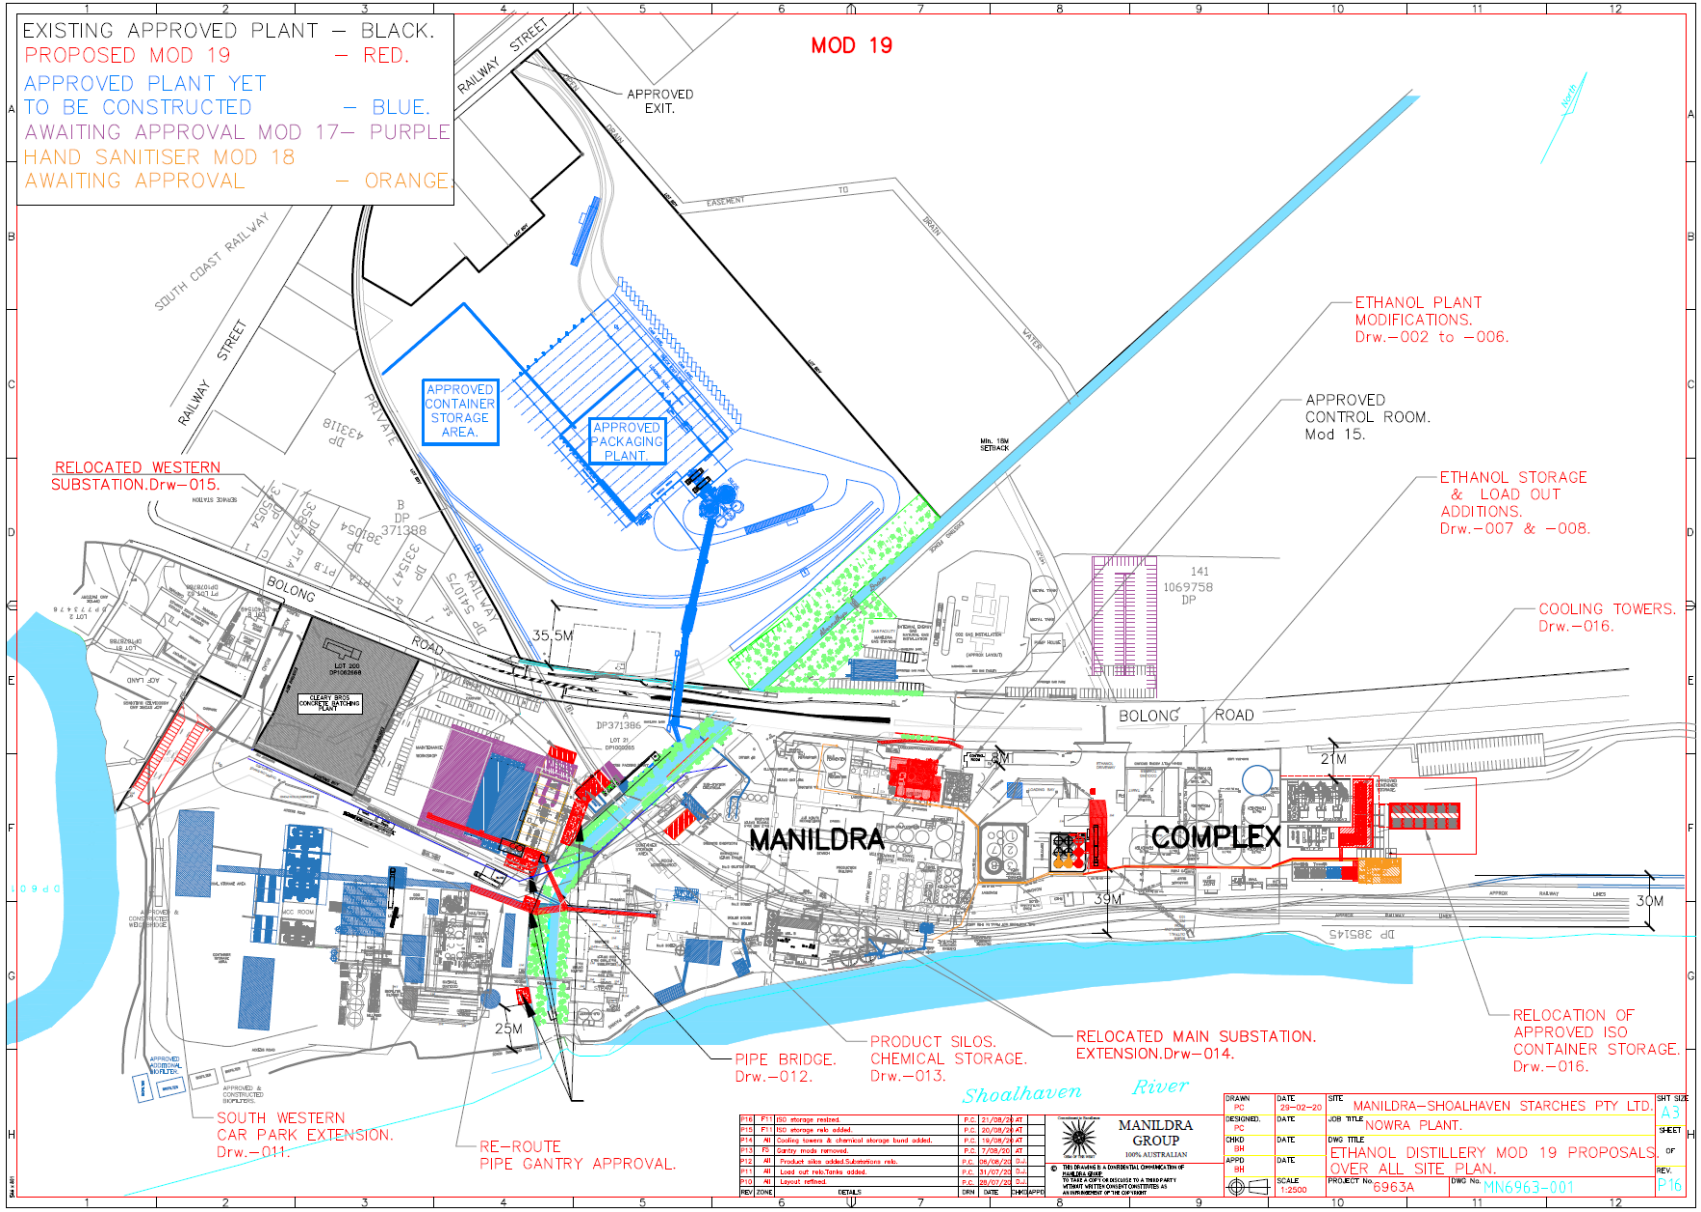

Figure 1 Proposed modification 19 changes (Source: Manildra)

2. Site location and context

2.1 Site description

Figure 2 shows the location and layout of the Shoalhaven Starches plant in Bomaderry, New South Wales. It is located between the Shoalhaven River and township of Bomaderry. The plant comprises a factory, a proposed (but not yet constructed) packing plant and environmental farm. The packing plant lies immediately to the north of the factory, while the environmental farm is situated approximately 400 m to the east.

2.1.1 Nearby sensitive receptors

The Approved Methods define a sensitive receptor as “a location where people are likely to work or reside; this may include a dwelling, school, hospital, office or public recreational area”.

The site is proximate to a number of sensitive receptors. The township of Bomaderry lies to the northwest of the factory and west of the packing plant. Nowra is situated south of the plant. Commercial and industrial sensitive receptors are located directly adjacent to the site and across from it along Bolong Road.

The nearest residential sensitive receptors are located between 150 to 1300 metres from the site. The nearest commercial/industrial sensitive receptors (denoted by a receptor ID beginning with C) and residential sensitive receptors (denoted by a receptor ID beginning with R) to the site have been included in the modelling and are listed in Table 2-1, including the approximate distances and orientation of each receptor from the site. The commercial/industrial receptors also include the operating times in brackets.

The sensitive receptors are shown in Figure 3.

Table 2-1 Location of identified sensitive receptors

3. Operation description

3.1 General overview

Wheat flour and grains (wheat) are processed at the Shoalhaven Starches factory to produce ethanol, starch, gluten and glucose. Solid wastes are treated to produce distiller's dried grain (DDG), with liquid wastes being transferred to the environmental farm waste water treatment plant. Excess treated waste water is irrigated onto pasture. The main processing and materials treatment areas at Shoalhaven Starches comprise the:

- Flour mill
- Starch plant
- Glucose plant
- Ethanol and distillation plants
- DDG plant
- Packing plant
- Pellet Plant
- Environmental farm.

A brief description of the production process associated (including emission control) with each plant is given below. Figure 4 shows the layout of the plant in terms of its operational areas, along with the major odour sources of the plant, accounting for around 80% of total odour emissions (excluding the environmental farm).

3.2 Flour mill

Shoalhaven Starches commenced full operations at the flour mill in June 2011. The flour mill was originally approved by NSW Department of Planning and Environment in 2007 and was consolidated into the ethanol expansion project approval in 2008.

Proposed modifications to the flour mill were approved in March 2016, which enabled an increase in the total flour production capacity on the site from the previously approved limit of 265,000 tonnes per annum to 400,000 tonnes per annum.

The flour is used in the plant to produce starch, gluten, glucose and ethanol. All remaining mill feed and pollard (flour sieving rejects) is processed through the DDG dryers for sale as stock feed. Flours from the various grinding operations are collected and blended together before passing through final treatment and weighing operations to bulk storage bins. Flour is taken from these bins for use in existing site production processes.

All air extracted from the mill is passed through Buhler Airjet bag houses prior to being discharged to the atmosphere vertically via ten individual stacks. Approval has previously been obtained for the installation of additional plant to increase production, along with two additional exhausts from the roof of the building.

3.3 Starch plant

Within the starch plant, flour is processed to separate the starch from gluten (the protein component of flour). The starch is graded, dried and packed for shipment. Different grades of starch are manufactured for food and paper making applications. Starch that is not used for these applications is used as a raw material for the ethanol plant. Gluten is dried and sold for use in the food industry.

Aqueous (water-based) wastes are reused within the plant or are transferred to the environmental farm waste water treatment plant.

Starch Dryer No.5 has been constructed and is currently operational (see Figure 4). No change to the production volume is predicted.

3.4 Glucose plant

The glucose plant (contained within the starch plant area) houses two lines; the 'confectioners' glucose line and the 'brewers' glucose line. Confectioner's glucose is distinguished by having been demineralised to remove latent odours and flavours that might be carried through to the final product by the glucose.

Both processes use starch as the raw material. The starch is broken down to its constituent glucose molecules using enzymatic and hydrolytic processes. Water is removed from the resulting solutions using evaporation to produce glucose and brewer's solutions of desired concentration. The glucose product is shipped to customers in bulk containers.

The glucose manufacturing process generates aqueous wastes, mostly condensate from the evaporators, which is reused during regeneration of the ion exchangers.

3.5 Ethanol and distillation plants

Waste starch from the starch plant is transferred to the ethanol plant and fermented to produce ethanol. Starch (described in section 3.3), which is in suspension, is heated in jet cookers before being fermented.

Fermentation is carried out in fermentation vessels using the treated substrate to which an ethanol-producing yeast inoculum has been added. The yeast inoculum is generated using yeast propagator vessels, these being seeded using commercial strains of yeast.

Wastes from the fermenters are transferred to the DDG plant (refer to section 3.6) for processing. Fermentation liquor from the ethanol plant is transferred to the distillation plant where water and other impurities are removed to produce various grades of ethanol.

3.6 DDG plant

Wastes from the ethanol and distillation plant are dewatered in decanter centrifuges and dried in steam dryers to produce granular DDG. Light phase from the DDG decanters is evaporated to recover soluble protein (syrup) and produce clear condensate (liquid line). The syrup is added to the dryer feed for recovery of the solids (solids line). DDG granular product is transferred to the DDG Pellet Plant for pelletising; the DDG pellets are stored in silos. Some of the granular DDG product is stored in a storage shed until it is loaded into trucks in the DDG load-out area.

Exhaust gases from the existing DDG dryers (three) are transferred to the boiler air intake in order to destroy odorous components of the gases by combustion.

3.7 Steam production

Steam is generated at Shoalhaven Starches by using a combination of three gas fired boilers (numbers 1, 3 and 7) and four coal fired boilers (numbers 2, 4, 5 and 6). The combustion gases from these boilers are discharged via stacks, with boilers 5 and 6 having a combined stack. Exhaust from boilers 2 and 4 is treated in a cyclone and baghouse prior to discharge to atmosphere. Exhaust from boilers 5 and 6 is treated in a baghouse prior to discharge to atmosphere.

The number of boilers operational at any given time depends on the operational and maintenance requirements of the plant. With boiler 8 installed and coal-fired boilers operating at full capacity, only one gas-fired boiler will be operational with the other two gas-fired boilers on standby. When coal-fired boilers are not at full capacity or offline for maintenance, steam requirements are met from the natural gas boilers.

3.8 Environmental farm

A number of wastewater streams are produced at the factory. These consist of five clear condensate streams (distillation plant condensate, evaporator condensate, DDG condensate, a small flow from the carbon dioxide plant and boiler blowdown) and a combined 'dirty' stream from the factory processes. The 'dirty' wastewater streams are combined in the farm tank (located at the factory) and pumped to the waste water treatment plant. Treated water is pumped back to the factory for re-use, while excess treated water is stored in dams for irrigation on the farm.

3.9 Packing plant (proposed)

It is proposed that dried gluten/starch will be pneumatically transferred from the existing site to the proposed new packing plant via underground pipes. This dried material is proposed to be stored in silos.

At present, the approved packing plant has not been constructed at the Shoalhaven Starches sites. The proposed packing plant was assessed by SEMA in 2015.

The packing plant will consist of seven silos that will store either gluten or starch product. The medium and large silos are to be filled 24 hours a day, seven days a week, while the small silos can be filled at any time of the day for eight hours.

3.10 Other activities

3.10.1 Product load-out areas

Starch, glucose and ethanol products are loaded into road tankers from bulk storage silos and tanks. Load out of starch and glucose does not have the potential to generate odours, as these products have a low inherent odour characteristic.

Given the flammable nature of ethanol, the load out process is strictly controlled for occupational health and safety purposes. These controls have the secondary effects of minimising the potential for vapour generation and spillage.

3.10.2 Cooling towers

Cooling towers operate as part of the cooling water circuit for the ethanol glucose and DDG plants. The recirculated cooling water has the potential to absorb odours and to disperse the odours to atmosphere during the evaporative cooling (aeration) process within the cooling towers. Odour sampling undertaken at the cooling towers observed a decline in odour emissions demonstrating relatively low odour emissions and it has since been removed as an

EPL odour monitoring point. Manildra advised that the cooling towers are no longer a source of odour and therefore they were removed from the odour emissions inventory.

3.10.3 Biofilters

Exhaust air from odorous sources at the DDG plant is captured and ducted to two existing soil-bed biofilters, each having a surface area of 110 m^2, located at the southwest corner of the factory (on the southern margin of the container storage area – placed to the left lower margin in Figure 4). The biofilters comprise a bed of organic bark and compost material (the matrix), with distribution of the odorous airstream through the floor of the biofilter via a manifold. Biological oxidation of odorous compounds takes place as the foul air percolates upward through the matrix. The oxidation is achieved by a population of microorganisms in the bed.

While the efficiency of biofilters destroying odorous components of the waste air varies according to a range of factors including soil moisture, composition and temperature, it is very high. Any odour in the exhaust air from the biofilter is due to the inherent odour of the matrix materials and typically has an ‘earthy’ characteristic. The odour level of the matrix is typically in the range of 250 to 500 OU, and it is this ‘background’ level that limits the efficiency of a soil-bed biofilter.

The two biofilters at the site operate in parallel and are sized so that one biofilter can be taken offline during periodic replacement of the matrix of the sister filter.

As such, a soil-bed biofilter operating as designed, with no malfunctions, will not vary significantly in its odour emissions; it will emit at the matrix background level independent of fluctuations in the input odour loading.

3.11 Proposed modifications

3.11.1 Mod 11, 12, 13, 16 and 17

Modifications 11, 12 and 13 focused on changing the configuration of the DDG plant (to the southwest of the factory), changes to the ethanol distillery and modification to boilers 2 and 4. These modifications have been discussed in Section 1.2. The resulting air quality impacts have been addressed in GHD's previous quality assessments (GHD 2017).

Mod 16 focused on changing the configuration of the flour mill exhausts, conversion of gluten dryers 1 and 2 to starch, change to boiler 7's location, a new gluten dryer (no. 8) and a new coal-fired boiler (boiler 8). The resulting air quality impacts from Mod 16 have been addressed in GHD's previous air quality assessment (GHD, February 2019).

Mod 17 focused on changes to the baghouse (including the addition of a new stack) for starch dryer 5, addition of a new product dryer and use of sawmilling residue (woodchips) for boilers 2 and 4. The resulting air quality impacts from Mod 17 were assessed by GHD (2020).

3.11.2 Mod 19

Modification 19 is discussed in Section 1.3. The main changes affecting odour and air quality impacts consist of:

- Additions to the existing Ethanol Distillery Plant. The additional plant will be of a similar design, size and operation to the existing beverage grade ethanol modification approved under Mod 12.
- The construction of three (3) product silos above the existing interim packing plant.

Further discussion of these changes in the context of the dispersion modelling is presented in Section 7.

4. Criteria for assessment

4.1 Odour

4.1.1 Odour Concentration

Odour 'strength' or concentration is measured in odour units (OU), where 1 OU represents the concentration of a sample that can just be detected by 50% of people in a controlled situation where there is no background ‘ambient ‘ odour.

4.1.2 Measurement of Odour

The most common method of measuring odour concentration is Dynamic Olfactometry using the ‘forced choice’ method. Dynamic olfactometry simply dilutes the odour sample in known ratios with odour free air. At each dilution, the diluted odour and a zero odour is presented in turn to six panellists via two ‘sniffing’ ports. Further, the selection of the port with the diluted odour sample is randomly reassigned at each presentation. Each panellist is required (forced) to nominate the port (left or right) from which the diluted odour emanates. Each panellist’s response (i.e. 'guess', 'likely' or 'certain') is recorded. The sequence of presentations generally follows a decreasing dilution ratio, and when half of the panellists have correctly returned a ‘certain’ response, that dilution ratio is numerically equal to the concentration of the original, undiluted odour sample. Hence, for example, if the dilution needed to get the 50% response was 250:1, then by definition the original sample had an odour concentration of 250 OU.

4.1.3 EPA Criterion for Odour

EPA has defined an odour criterion and the Odour Guideline specifies how it should be applied in dispersion modelling to assess the likelihood of nuisance impact arising from the emission of odour.

Odour impact is a subjective experience and has been found to depend on many factors, the most important of which are:

- The **F**requency of the exposure
- The **I**ntensity of the odour
- The **D**uration of the odour episodes
- The **O**ffensiveness of the odour
- The **L**ocation of the source

These factors are often referred to as the FIDOL factors.

DEC defined the odour criterion to take account of two of these factors (**F** is set at 99 percentile, **I** is set at from 2 to 7 OU). The choice of criterion odour level has also been made to be dependent on the population of the affected area, and to some extent it could be said that population is a surrogate for location – so that the **L** factor has also been considered. The relationship between the criterion odour level **C** to affected population **P** is given below.

$$C = [\log P\text{-}4.5] \div \text{-}0.6 \qquad \text{Equation 1}$$

Table 4-1 lists the values of C for various values of affected populations as obtained using equation 1.

Table 4-1 Odour criterion for the assessment of odour

Population of affected community	Odour performance criteria (nose response odour certainty units at 99th percentile)
Single Residence (≤ ~2)	7
~ 10	6
~ 30	5
~ 125	4
~ 150	3
Urban (~2,000)	2

The NSW Approved Methods specifies a criterion of two odour units at the 99th percentile over a short term averaging nose-response time of one second for a complex mixture of odorous air pollutants in an urban area (population greater than 2000 or with schools and hospitals). The criterion is applied at the location of the nearest sensitive receptor or likely future location of sensitive receptor.

5 OU is commonly taken as a conservative measure of the odour level which can be distinguished against the ambient background level of odour, and which if offensive, could result in complaint.

1 OU generally cannot be detected in a non-laboratory situation (i.e. where the ambient background odour levels reduce the detectability of a given odorant).

As the CALPUFF dispersion model (utilised in this assessment), when operating in micrometeorological mode can only predict concentrations over an averaging period of one hour, a ratio between the one second peak concentration and 60 minute average concentration has been applied to the source odour emission rates. In this manner, the predicted one hour odour levels predicted in CALPUFF represent the corresponding one second short-term levels required to be compared to the DEC criterion. The ratio is known as the peak to mean ratio (PM60). PM60 is a function of source type, stability category and range (i.e. near or far-field), and values are tabulated in the modelling Guideline[1]. This is reproduced in Figure 5.

Table 6.1: Factors for estimating peak concentrations in flat terrain (Katestone Scientific 1995 and 1998)

Source type	Pasquill–Gifford stability class	Near-field P/M60*	Far-field P/M60*

Volume	A–F	2.3	2.3

* Ratio of peak 1-second average concentrations to mean 1-hour average concentrations

Figure 5 Extract from NSW Approved Methods

[1] Approved Methods for the Modelling and Assessment of Air Pollutants in NSW (DEC, 2005).

4.2 Other air quality impacts

Potential non-odorous air quality impacts from the site include dust and products of combustion. The following pollutants have been assessed against relevant criteria:

- Total suspended particles (TSP)
- Fine particulate matter less than 10 micron equivalent aerodynamic diameter (PM_{10})
- Fine particulate matter less than 2.5 micron equivalent aerodynamic diameter ($PM_{2.5}$)
- Products of combustion including carbon monoxide, oxides of nitrogen (NOx), sulfur dioxide (SO_2), hydrogen chloride (HCL), heavy metals (Type I & II), total volatile organic compounds (VOC), polycyclic aromatic hydrocarbons (PAHs) and hydrogen fluoride (HF).

The air quality impact assessment criteria for these pollutants has been sourced from the Approved Methods and is summarised in Table 4-2.

Table 4-2 Air quality impact assessment criteria - other pollutants

Pollutant	Averaging period	Criterion
Particulate Matter PM_{10}	24 hours	50 µg/m^3
	Annual	25 µg/m^3
Particulate Matter $PM_{2.5}$	24 hours	25 µg/m^3
	Annual	8 µg/m^3
TSP	Annual	90 µg/m^3
Carbon monoxide (CO)	15 minutes	100 mg/m^3
	1 hour	30 mg/m^3
	8 hours	10 mg/m^3
Sulfur dioxide (SO_2)	10 minutes	712 µg/m^3
	1 hour	570 µg/m^3
	24 hours	228 µg/m^3
Nitrogen dioxide (NO_2)	1 hour	246 µg/m^3
	Annual	62 µg/m^3
Hydrogen fluoride (HF)	90 days	0.25 µg/m^3
	30 days	0.4 µg/m^3
	7 days	0.8 µg/m^3
	24 hours	1.5 µg/m^3
Hydrogen Chloride (HCL)	1 hour	0.14 mg/m^3
Polycyclic aromatic hydrocarbon (PAH)	1 hour	0.0004 mg/m^3
Type 1 metals		
Antimony	1 hour	0.009 mg/m^3
Arsenic	1 hour	0.00009 mg/m^3
Cadmium	1 hour	0.000018 mg/m^3
Lead	Annual	0.5 µg/m^3
Mercury	1 hour	0.0018 mg/m^3
Type 2 metals		
Beryllium	1 hour	0.000004 mg/m^3

Pollutant	Averaging period	Criterion
Chromium	1 hour	0.00009 mg/m^3
Manganese	1 hour	0.018 mg/ m^3
Nickel	1 hour	0.00018 mg/ m^3

5. Meteorological data

A 12-month dataset was constructed using the 3D prognostic modelling package, TAPM and the diagnostic 3D meteorological model, CALMET for the period from January to December 2004. This 12 month period was chosen to be consistent with previous modelling undertaken for the 2008 Air Quality Assessment, approved at the time by EPA and to allow to a direct comparison to previous modelling. Further detail is provided in Appendix A in regards to the selection and construction of the meteorological dataset used in the modelling.

The CALMET modelling can be summarised as follows:

- Prognostic models TAPM and CALMET were used for initial wind field 'guesses'
- Observations from both the environmental farm Automatic Weather Station (AWS) and Nowra AWS were used to optimise and check the prognostic model simulations
- Wind speeds and direction observations from the environmental farm AWS were assimilated into the prognostic model to make the data site-specific

The result of assimilating this data into the CALMET simulations makes the data site-specific (required for a Level 2 assessment), and inter-annual variability is not required to be accounted for, with the conditions of the Approved Methods met for using "*at least one-year of site-specific meteorological data*".

An annual wind rose generated using CALMET is provided in Figure 6 to show the wind field at the factory. The following trends are evident from Figure 6:

- Annual average wind speed of 3.2 m/s
- Winds are most prevalent from the west and west northwest, accounting for around one third of all winds
- Winds are least prevalent along the north-south axis
- Light winds (shown in grey) are more prevalent from the northwest
- Drainage flows occurring during stable conditions at night time are dominated by the following distinct features (in order of scale):
  - Shoalhaven River running west to east through the site
  - Browns Mountains to the northwest of the site
  - Yalwal State Forest mountain range to the west.

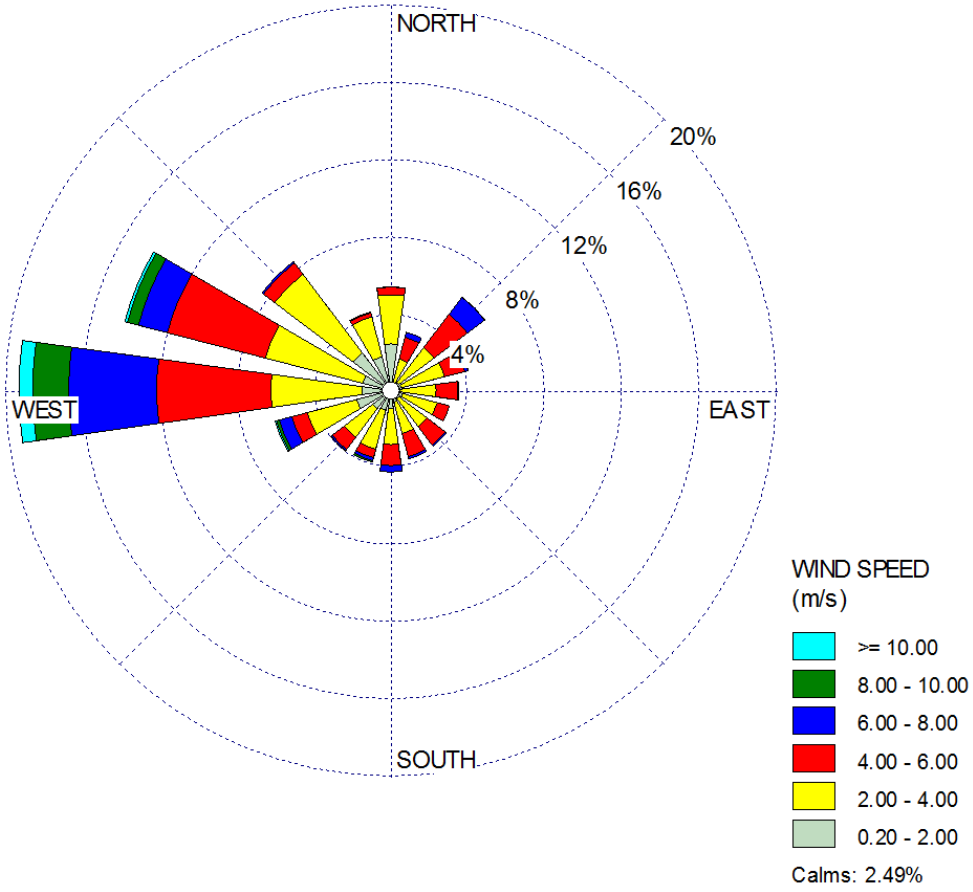

Figure 6 CALMET wind rose for the factory

6. Background air quality

The OEH runs a state wide air quality monitoring network, with the nearest monitoring site to Shoalhaven Starches being Albion Park South. Albion Park South commenced operation in 2006 meaning that daily background particulate levels ($PM_{2.5}$ and PM_{10}) cannot be directly compared to the GHD CALPUFF model of the site which uses meteorology from 2004.

Background levels of pollutants used in the assessment are provided in Table 6-1, with the exception of $PM_{2.5}$ and PM_{10}, which is based on 2004 data from Wollongong. This is because the nearest monitoring station that operated in 2004 with both $PM_{2.5}$ and PM_{10} data is the Wollongong site, approximately 20 km to the north of Albion Park. Wollongong generally experiences elevated particulate levels compared to Albion Park South due to the greater presence of emissions from urban and industrial sources (refer to Table 6-1).

Highest measured levels of particulate for the year 2004 at Wollongong are shown in the contemporaneous assessment in Section 8.

A reasonable representation of ambient $PM_{2.5}$ and PM_{10} (24-hour) concentration levels is the 70th percentile for use in plotting general cumulative impacts. The 70th percentile at Albion Park South in 2016 was 18.3 $\mu g/m^3$ for PM_{10} and 8.0 $\mu g/m^3$ for $PM_{2.5}$.

Table 6-1 Background Air Quality Data – Albion Park South (2016)

Pollutant	Averaging Period	Concentration (100th percentile)	Units
Nitrogen dioxide (NO_2)	1 hour	80.8	$\mu g/m^3$
	Annual	7.1	
Sulfur dioxide (SO_2)	1 hour	57.6	$\mu g/m^3$
	24 hour	15.7	
	Annual	1.6	
Carbon monoxide (CO)[1]	1 hour	1.0	mg/m^3
	8 hour	0.6	
PM_{10}	24 hours	43.2	$\mu g/m^3$
	Annual	14.9	
$PM_{2.5}$	24 hours	30.7	$\mu g/m^3$
	Annual	7.2	

[1] CO was sourced from the Wollongong monitoring station as this was not available at Albion Park South

The contemporaneous particulate assessment was undertaken using data from Wollongong in 2004. A review of particulate levels at Wollongong and Albion Park is provided in Table 6-2. Average particulate levels at Wollongong have reduced from 2004 to 2016. Levels at Albion Park South in 2016 are lower than the levels at Wollongong over the same period.

Table 6-2 Review of particulate monitoring at Albion Park South and Wollongong, μg/m³

Site and Year	Albion Park 2016	Wollongong 2016	Wollongong 2004
Average PM_{10}	14.9	17.3	25.5
70th percentile PM_{10}	18.3	20.7	28.8
90th percentile PM_{10}	25.6	29.7	37.8
Average $PM_{2.5}$	7.2	7.4	9.7
70th percentile $PM_{2.5}$	8.0	8.3	12.2
90th percentile $PM_{2.5}$	11.2	11.6	16.4

Shoalhaven Starches engaged Stephenson Environmental Management Australia to conduct targeted background ambient air quality monitoring at 26 Coomea Street, Bomaderry over four seasons. (AMBIENT AIR QUALITY MONITORING –SUMMARY REPORT 2015-2016, Stephenson Environmental Management Australia, April 2016). The maximum measured levels of pollutants measured over the monitoring periods with a 24 hour averaging period were:

- SO_2 – 10.2 μg/m³
- NO_2 – 54.5 μg/m³
- PM_{10} – 28.1 μg/m³

The results show all pollutants are significantly lower than the levels recorded at Albion Park South, and would include any emissions from the Shoalhaven Starches site. The maximum levels all readily comply with the relevant criteria. Using the background data from Albion Park South in this assessment allows for additional conservatism.

7. Odour assessment

7.1 Emissions inventory

7.1.1 Source identification

Odour emanating from Shoalhaven Starches is comprised of a complex mixture of primarily odorous volatile organic compounds (VOCs). VOC speciation data from a range of principal odour sources indicates that the individual VOCs within the mixture tend to be classified under odour-based air quality criteria rather than toxicity-based[2] criteria. Therefore, the identified sources of odour are modelled collectively as odour.

Consistent with the previous air quality assessments, the following sources contribute to the majority of the odour impacts from the Shoalhaven Starches sites:

- DDG Plant (including Pellet Plant exhaust stack and biofilters)
- Starch Plant (Gluten and Starch Dryers)
- Ethanol Plant (yeast propagators and retention tank).

A number of other minor odour sources contribute to the remainder of the plant's odour impact. These are detailed in Appendix B.

7.1.2 Changes to baseline odour model

The baseline odour model includes all existing and proposed odour sources at the Shoalhaven Starches plant, including EPA monitored sources and all minor sources, up to Mod 17. The odour sources associated with these modifications have been discussed in depth in previous air quality assessments.

The following assumptions and additional changes were made to the baseline odour model:

- Peak odour emission rates were sourced from the odour monitoring conducted by SEMA in the previous four quarters for EPA ID sources. The sources were scaled to a 300 ML per year production. The quarter with the maximum measured total OER was selected for use in the assessment and is consistent with guidance in the Approved Methods and the recommendation from EPA (16 February 2017) that peak emissions should be assessed. The peak period was found to be quarter 3, 2019 (November 2019)
- The exit velocities and temperatures for EPA ID sources were adjusted to the modelled quarter. These measurements include the mitigation modifications made to No. 3 and No. 4 gluten dryer exhausts as part of the Mod 11 and 12 air quality assessment recommendations
- No. 1 and No. 2 gluten dryers were proposed to be modified to starch dryers as part of Mod 16 assessment. Therefore, the emission rates assigned to these dryers remains unchanged from the Mod 16 assessment as the dryers have not been modified yet
- Mod 16 assessed the addition of a new gluten dryer (GD8). The emission rates assumed in Mod 16 remain unchanged as the dryer has not been constructed yet.
- Mod 17 assessed the addition of a new product dryer (No. 9) (PD9) is planned to be installed within the speciality products building. The product dryer will comprise about 20% of the size and production capacity of the approved (but not yet constructed) Gluten Dryer 8. It is envisaged that Product Dryer 9 will be used on an interim basis to process gluten

[2] Based on VOC speciation data for selected sources in the DDG plant: DDG dryers, palmer cooler and condensate tanks.

allowing for an incremental increase in processing of gluten until the approved product dryer building is constructed and gluten dryer 8 is operational.

- Once gluten dryer 8 is operational, it is envisaged that product dryer 9 will revert to processing starch. PD9 will not result in any increase in production above the current approval limit for flour processing under Mod 16 of 25,400 tonnes per week.
- For the purposes of odour modelling, as part of Mod 17, PD9 was modelled as processing gluten with odour emission rates conservatively modelled as per gluten dryer 1 (which is of a similar size). The stack from the dryer will rise above and through the roof of the speciality product building at a height of 35.6 m. The diameter of the stack is proposed to be 0.85 m. The flow rates were calculated based on 20% of the proposed gluten dryer 8.
- As part of the current proposal, a new distillation plant (with columns and associated processing equipment) is proposed to be installed immediately to the west of the existing Ethanol Distillery Plant. One additional emission source associated with this change is the new Distillation plant Column Washing Vent (CWV2), which is a duplication of the existing source (CWV). The stack height of the new source as provided by Manildra, is 55 metres tall. Stack diameter, exit velocity and temperature were sourced from the sampling report for the similar existing source (*Odour Research Laboratories Australia (2020) Olfactometry Test Report for Beverage Ethanol D500 Vent Report No. 7091/ORLA/01)*.
- Cooling tower odours are not included in the MOD19 emissions inventory based on improvements at the site and subsequently being removed as a EPL odour sampling point
- Odour emission rates were assumed to be unchanged for the other emission sources.

7.1.3 Source summary and comparison

Modelling for the proposed Mod 19 scenario comprised the following sources:

- 67 point sources in total throughout the site;
    - 64 point sources with constant emissions
    - Three point sources with variable emissions
- 11 area sources (consisting of two biofilters and the effluent treatment ponds)
- Five volume sources within the factory area.
- These sources are detailed in Table 7-1 and Appendix B.

A comparison of the sources between Mod 13, Mod 16, Mod 17 and the current modification is also provided in Table 7-1. This shows that the total odour levels increase by approximately 13.5% between the previous (Mod 17) and current modifications (Mod 19).

This increase is primarily due to the highest quarterly results displaying significantly higher source emissions for the following three sources (compared to Mod 17):

- Boiler no 5 & 6: Increase from an MOER of 68,610 to 88,902
- Ethanol recovery scrubber: Increase from an MOER of 15,405 to 33,091
- Environmental farm after WWTP (including biofilters, effluent storage dams, sulphur oxidation basin and membrane bio-reactor): Increased from an MOER of 9,671 to 21,557.

7.2 Dispersion modelling

The odour dispersion modelling was conducted using the Gaussian puff model CALPUFF Version 7. This model is also a recognised regulatory model in NSW. Where the modelling of odour dispersion is in complex terrain (as is the case at the Shoalhaven site), CALPUFF is recommended for use under NSW Guidelines. CALPUFF is especially suited for modelling light to calm wind conditions.

The following settings were used in the simulations:

- Model: CALPUFF Version 7
- The receptor grid was 10 km x 10 km, with a 200 m grid resolution
- The nearest receptors from the townships of Bomaderry (to the west) and Nowra (to the south) were used as sensitive receptors, along with a few isolated residences around the factory and environmental farm
- Ground level receptor heights have been modelled using the same terrain data as the original 2008 GHD assessment. This terrain data was used in the CALMET 2004 model which is used for CALPUFF modelling
- Emissions were scaled based on a nose-response time for odour of one second, applying a peak-to-mean ratio to the one hour average concentration of 2.3 for wake affected point sources and volume sources, and variable scaling for non-wake affected sources and area sources
- Meteorology was taken from the CALMET 2004 synthesised dataset, approved for use in previous studies
- Building wake effects (including changes to the building layouts) were modelled to the extent practicable.

7.3 Predicted odour impacts

Figure 7 shows the predicted 99th percentile odour impacts (one minute nose-response time) for the proposed Mod 19 operations and the previous modifications.

Table 7-2 shows the predicted odour levels for the proposal (Mod 19). Table 7-2 also shows the previous modification results.

The predicted odour levels are generally equivalent to those predicted for Modification 17, with the exception of an increase at commercial receptors C2, C3, C4, C6 and C7. The increase is primarily attributed to higher quarterly sampling results particularly at the boiler house.

The results show that the impact assessment odour criteria are achieved at all residential sensitive receptors.

Seven commercial/industrial receptors are included in the assessment. These are all located within approximately 125 m of the site. One hour, 99th percentile odour impacts have been predicted based on the hours of operation of the receptors as per Section 2.1.1 (i.e. predicted odour impacts when the sites are not operational have been excluded from the assessment). Commercial/industrial receptors C4, C5, and C7 marginally exceed the criteria of 6 OU (assumed the same criteria as R1) due to the higher quarterly results.

Commercial receptor C1 is located approximately 45 m from the site and is the BOC CO2 Plant. Given the industrial nature of C1, and its existing proximity to the site no significant odour impacts are anticipated from the proposal.

One odour complaint (in July 2020) attributed to the Shoalhaven Starches plant was received in the last year.

Table 7-2 Predicted peak (99th percentile, short term averaged) odour impact at nearby receptors

8. Air quality assessment

8.1 Emissions inventory

In addition to odour emissions, the operation of the Shoalhaven Starches plant also has the potential to generate emissions of particulate matter and products of combustion.

The emissions inventory for Modification 19 includes all existing air emissions sources and those proposed in previous Modifications (up to and including Modification 17). Emission rates were estimated for a factory throughput of 300 Mega litres per annum (maximum approved throughput).

One new emission source, the three new product silos, is proposed as part of Modification 19. The operation of these silo's has the potential to emit particulate matter. The silos are not a source of products of combustion or PAH, VOC's and metals.

Generally the emissions estimation methodology adopted for Modification 19 was consistent with that of Modification 17. Modification 19 emission rates were updated based on most recent sampling data to reflect the site's current operations. Assumptions and changes made to the baseline air quality model as part of this assessment are discussed in detail below for each of the individual source types.

8.1.1 Boiler emissions

Emission estimation based on site specific sampling data was prioritised where available. If monitoring data was not available, National Pollutant Inventory emissions factors (NPI factors) were used. Boiler emission rates were updated based on recent site sampling reports which are provided in Appendix C. Emission was scaled based on proposed boiler fuel usage rates for Modification 19 provided by Manildra.

Boiler emissions were estimated based on the properties outlined in Table 8-1.

Table 8-1 Boiler emissions estimation

Boiler	Fuel type	Modification 19 fuel usage	Emission estimation methodology[3]
Boiler 1	Gas fuelled	71.5 GJ/hour	NPI factors
Boiler 2	75% coal, 25% woodchips	Coal: 1.17 t/hr Woodchips: 0.62 t/hr	Coal: SEMA (2020) Compliance Stack Emission Survey - Q4 2019-2020 - Boiler 2 - Report No. 7050 Woodchips: Average of past sampling data as presented in GHD (2020)
Boiler 3	Standby boiler, operation not proposed and therefore not included in this assessment		

[3] PAH and FL emissions for all boilers have been calculated based on the emission factors listed in *National Pollutant Inventory Emission estimation technique manual For Combustion in boilers Version 3.6* (December 2011) Table 10

Boiler	Fuel type	Modification 19 fuel usage	Emission estimation methodology[3]
Boiler 4	84% coal, 16% woodchips	Coal: 2.43 t/hr Woodchips: 0.74 t/hr	SEMA (2020) Compliance Stack Emission Survey - Q4 2019-2020 - Boiler 4 - Report No. 7051A Woodchips: NPI factors
Boiler 5/6	Coal	12.2 t/hr	SEMA (2020) Compliance Stack Emission Survey - Q4 2019-2020 - Boiler 5&6 - Report No. 7049
Boiler 7	Standby boiler, operation not proposed and therefore not included in this assessment		
Boiler 8	Coal	8.3 t/hr	Scaled off boiler 5/6 emission rates based on proposed fuel usage rates

Boiler details and modelled emission rates used as part of the Modification 19 air quality assessment are summarised in Table 8-2 and Table 8-3.

8.1.2 Product dryer emissions

The following updates have been made to the site emissions inventory for the product dryers:

- Emissions rates were updated based on recent sampling including:
    - NO_x emissions from starch dryers 2, 4 and 5 and gluten dryers 1, 2, 3 and 4 were updated based on the measured NO_x concentrations and flowrates provided in SEMA (2020) Starch and Gluten Dryers NO_x Emission Test Report No. 7093. NOx emissions from Starch dryer 3 were scaled off starch dryer 4 based on flowrate. NO_x emissions from starch dryer 5 and gluten dryers 6, 7 and 8 were calculated using NPI factors
    - Particulate matter emissions from starch dryers 1 and 4 and the spray dryer were updated based on SEMA (2020) Stack Emission Survey - Particulate Matter - Starch Dryer 1, 4 and Spray Dryer - Report No. 7071
- All other dryer emissions sources are as per Mod 17.

8.1.3 Other emission sources

Other emissions sources, including the two gas turbines, would remain unchanged from previous assessments.

It should be noted that the gas turbines were assessed as part of the 2008 air quality assessment (GHD, 2008) and have been approved by EPA. However, the gas turbines have not yet been constructed.

The gas turbines would be installed as part of a gas-fired co-generation plant, which would be used to supply electricity and steam to the factory.

The turbines have been included as part of the cumulative assessment. The modelled emission rates from turbines are summarised in Table 8-2 and Table 8-3.

The emission rate limits are as follows:

Protection of the Environment Operations (Clean Air) Regulation (2010): CO: 125 mg/m^3, SO_2: 1000 mg/m^3, NO_2: 500 mg/m^3, TSP: 50 mg/m^3, Type 1 and 2 metals (combined): 1 mg/m^3, Cadmium: 0.2 mg/m^3, Mercury: 0.2 mg/m^3, VOC: 40 mg/m^3, HCL: 100 mg/m^3, FL: 50 mg/m^3

EPA: SO_2: 600 mg/m^3, NO_2: 500 mg/m^3, TSP: 30 mg/m^3, Type 1 and 2 metals (combined): 1 mg/m^3, Cadmium: 0.2 mg/m^3, Mercury: 0.2 mg/m^3, VOC: 40 mg/m^3.

8.2 Dispersion modelling

The air quality dispersion modelling was conducted using the Gaussian puff model CALPUFF Version 7. The model settings were as described in Section 7.2.

8.3 Predicted air quality impacts

8.3.1 Particulates

The impact of dust emissions principally relates to the potential effect on human health of inhalation of particles in the air column, and it is the finer fraction that have the greater potential to cause respiratory health effects. EPA have advised to assess $PM_{2.5}$, if PM_{10} impacts are significant. The $PM_{2.5}$ emissions from some sources on site are not known, however guidance is available for estimates of $PM_{2.5}$ from boilers in the NPI. NPI emission factors for coal boilers with a baghouse states that $PM_{2.5}$ emissions are half of PM_{10} emissions and the ratio of $PM_{2.5}$ to PM_{10} in gas fired boilers is the same. Therefore a ratio of PM_{10} to $PM_{2.5}$ emissions of 2:1 was adopted.

A summary of the maximum incremental predicted levels at each receptor site is presented in Table 8-4. The worst case predicted incremental PM_{10} level at a residential sensitive receptors is at R1 with a level of 7.9 µg/m^3.

Table 8-4 Maximum predicted incremental ground level PM_{10}, $PM_{2.5}$ and TSP concentrations

Receiver	Pollutant				
	PM_{10} (24 hour)	PM_{10} (Annual)	$PM_{2.5}$ (24 hour)	$PM_{2.5}$ (Annual)	TSP (Annual)
Criteria µg/m^3	50	25	25	8	90
R1	7.9	0.7	4.0	0.4	0.8
R2	4.3	0.4	2.1	0.2	0.5
R3	4.9	0.6	2.5	0.3	0.6
R4	4.6	0.9	2.3	0.4	0.9
C1	11.3	1.6	5.7	0.8	2.0
C2	15.8	2.7	7.9	1.3	3.0
C3	16.0	2.6	8.0	1.3	2.8
C4	15.3	2.3	7.6	1.2	2.5
C5	13.5	2.0	6.7	1.0	2.1
C6	16.5	3.2	8.3	1.6	3.5
C7	15.6	2.8	7.8	1.4	3.0

A contemporaneous assessment has been undertaken for the year 2004 in accordance with the Approved Methods. Predicted 24 hour $PM_{2.5}$ and PM_{10} values from the site in 2004 have been added to the 24 hour measured values at Wollongong for every day in the year.
The top predicted, measured and total concentrations at the most impacted residential receptor (R1) and commercial receptor (C6) are presented in Table 8-5 to Table 8-8 below. The background and incremental contributions for the highest cumulative concentrations are also included.

Results of the assessment show full compliance with the $PM_{2.5}$ and PM_{10} 24 hour criteria at the worst impacted residential sensitive receptor R1.

Results of the assessment predict exceedances of the PM_{10} 24 hour criteria for 3 days of the year and an exceedance of the $PM_{2.5}$ 24 hour criteria for one day of the year at the worst impacted commercial receptor C6. The exceedances are bold in Table 8-7 and Table 8-8. The exceedances are primarily attributed to high background concentrations as background PM_{10} accounts for 94%, 92% and 97% of the criteria and background $PM_{2.5}$ accounts for 89% of the criteria on the days of the predicted exceedances.

Plots of the predicted 24 hour maximum PM_{10} levels are provided in Figure 8 (incremental impact) and in Figure 9 (cumulative impact with 70^{th} percentile PM_{10} levels at Albion Park South 2016 for comparative purposes).

Plots of the predicted 24 hour maximum $PM_{2.5}$ levels are provided in Figure 10 (cumulative impact with 70^{th} percentile $PM_{2.5}$ levels at Albion Park South 2016 for comparative purposes).

Table 8-5 Summary of highest measured and predicted PM_{10} levels, µg/m³ (R1)

Top 10 PM_{10} background		Top 10 PM_{10} incremental		Top 10 PM_{10} cumulative

8.3.2 Products of combustion

The primary pollutants in coal and gas fired boiler emissions are oxides of nitrogen (NO_x), formed by the high temperatures in the combustors, sulfur dioxide (SO_2), formed from the sulfur content of the fuel, VOCs, hydrogen chloride (HCL), polycyclic aromatic hydrocarbons (PAH), carbon monoxide (CO) and hydrogen fluoride (HF) all formed by incomplete combustion of the fuel.

All pollutants have all been assessed against their relevant criteria from the Approved Methods.

Predicted levels for SO_2, NO_2, CO, HF and HCL are provided in Table 8-9 to Table 8-13. The predicted levels comply at all receptors for SO_2, CO, HF and HCL.

Contour plot of cumulative hourly average SO_2 predictions are shown in Figure 11, in order to get an appreciation of the hourly averaged pattern of dispersion.

The predicted levels for nitrogen dioxide exceed the criteria at all commercial/industrial sensitive receptors. However, the predicted levels assume that 100% of NO will be converted to NO_2 as per Method 1 (Section 8.1.1) of the Approved Methods. This is considered extremely conservative as in reality, only a fraction of the NO will be converted to NO_2.

Therefore, a more detailed assessment has been undertaken for all receptors using Method 2 (Section 8.2.2) of the Approved Methods. Method 2 is based on NO reacting with ozone in the atmosphere to form NO_2. Background ozone data was sourced from Kembla Grange for the year 2004. The calculated NO_2 levels using Method 2 are provided in Table 8-10. Using this method no exceedances are predicted.

Effect of Mod 19 changes

No new sources of combustion products are proposed as part of Modification 19. The emissions inventory was updated with the most recent sampling results and therefore there is a slight variation in the predicted products of combustion concentrations.

Table 8-9 Maximum predicted ground level Sulfur Dioxide concentrations

Receptor	Total impact (Incremental plus background) (µg/m^3)			
Criteria, µg/m^3	712 (10 min[1])	570 (1 hour)	228 (24 hour)	60 (Annual)
Background, µg/m^3	No data[2]	57.6	15.7	1.6

8.3.3 PAH, VOCs and metals

The maximum predicted (99.9 percentile, 1-hour average) ground level incremental PAH, VOC and metal concentrations (with the exception of lead which is presented as a 100 percentile annually averaged concentration to align with its assessment criteria), within and beyond the factory site boundary are provided in Table 8-14. The predicted levels are significantly lower than the respective EPA principal toxic air pollutant criteria for all substances both within and beyond the site boundary.

Effect of Mod 19 changes

No new sources of PAH, VOC or metal emissions are proposed as part of Modification 19 compared to those assessed in Modification 17.

Table 8-14 Maximum predicted ground level PAH, VOC and metals concentrations

9. Conclusions

GHD was engaged by Manildra to conduct an air quality and odour impact assessment for a proposed modification to the approved SSEP.

The modification proposes changes to the existing Ethanol Distillery Plant to increase the production of ‘beverage’ grade ethanol on site and would include the installation of distillation columns and associated processing equipment, a site boundary adjustment, the addition of 3 ethanol storage tanks, the construction of an additional ethanol loadout and the construction of three product silos.

A marginal increase was observed in predicted odour impacts as a result of the modification. The odour criteria is met at all residential sensitive receptors and it is considered highly unlikely that the increase in odour would be detected at sensitive receptors.

Air quality impacts are predicted to comply with the criteria at all residential sensitive receptors.

Overall, the proposal should be acceptable from an air quality perspective.

Appendix A – Meteorological analysis

The following section is taken from the Shoalhaven Starches Report on Ethanol Upgrade: Air Quality Assessment (GHD, 2008), and describes the meteorology of the area and how the dataset was compiled.

A1 Meteorology

The three-dimensional meteorological data for a CALPUFF model simulation are provided by CALMET[5], its meteorological pre-processor. CALMET requires meteorological input from surface weather station networks and upper air stations.

The following sub-sections describe the available meteorological data, how the data was applied and the features of the dispersion meteorological data used to run CALPUFF.

A1.1 Data Available

Wind data were collected at three locations within the Shoalhaven Starches facility. Of these three stations, only one station, the automated weather station (AWS) located near the storage ponds at the environmental farm (hereafter referred to as Farm AWS), is compliant with the Australian Standard for the measurement of horizontal wind for air quality applications (AS 2923:1987). The other two stations, in particular the weather station located at the factory, are compromised by building and equipment infrastructure. Wind data have been collected at the Farm AWS since 2003, with the most complete data set collected in 2004.

The nearest source of additional surface meteorological data was the Bureau of Meteorology (BoM) Nowra AWS located approximately 12 km to the west at the Royal Australian Navy base at Nowra (HMAS ALBATROSS). This data source was considered to be too far from the subject area to be site-representative.

The nearest source of upper air meteorological data was also the HMAS ALBATROSS site, which does irregular upper air soundings based on operational requirements. However, the time gap between these vertical atmospheric soundings is too large to be suitable for use as model input.

A1.2 Data Application

To take full advantage of the CALPUFF features, described in Section 7.1, and make use of the available meteorological data described above, a combined prognostic/diagnostic meteorological modelling approach was used to synthesise the three-dimensional meteorological data input required by CALPUFF.

The regional-scale prognostic meteorological model, TAPM[6], was used to simulate the meteorology over the subject site with consideration to the DECC *Approved Methods*. TAPM is an approved model for specialist applications and its use, as part of this assessment, is described in the next section.

The observations from the Farm AWS and Nowra AWS were first used for optimising and checking the performance of the prognostic model simulation.

Wind speed and wind direction data from the Farm AWS were then assimilated into the prognostic model.

The subsequent TAPM output (with assimilated Farm AWS data) was then passed to meteorological pre-processor model CALMET (version 5.5).

A2 Prognostic Meteorological Modelling

TAPM (version 3.0.7) was developed at CSIRO Division of Atmospheric Research as a PC-based prognostic modelling system that can predict regional scale three-dimensional meteorology. TAPM accesses databases of synoptic weather analyses from the Bureau of Meteorology. The model then provides the link between the synoptic large-scale flows and local climatology, which includes characterising such factors as local land use and topography, and their influence on atmospheric stability and mixing height.

TAPM was initially configured with a nested model grid coverage designed to capture:

- Broad scale synoptic flows
- Regional to local scale wind channelling
- The influence of local land use

The nested grids were then configured with surface characteristics, such as terrain elevation, surface type (land use and vegetation type), soil type and deep soil moisture content.

Specific model settings were:

- Four nested grids at 1 000 m, 3 000 m, 10 000 m and 25 000 m resolution, with 55 x 55 grid points. The grid was set to ensure the locations of the Farm AWS and Nowra AWS were within the inner nested grid
- Surface vegetation and precipitation processes were included, whereas, non-hydrostatic processes were not included

Following an initial model run, the model output from the grid point nearest to the Farm AWS was compared with data recorded at that station. Specifically, the predicted hourly ambient temperatures and the annual wind rose (wind speed and direction distributions) were compared with corresponding recordings. Model output from the model grid point nearest to the Nowra AWS was also compared with an annual wind rose derived from data recorded at that station.

Figure A1 shows the scatter plot of observed and predicted ambient temperature at the Farm AWS. The determined optimal model configuration produced a correlation coefficient of 0.88 for predicted temperature. The strong correlation between predicted and recorded temperature indicates that the model is accurately calculating the surface energy balance, which, in turn, adds confidence to the hourly varying predictions made for atmospheric stability and the height of the mixed layer.

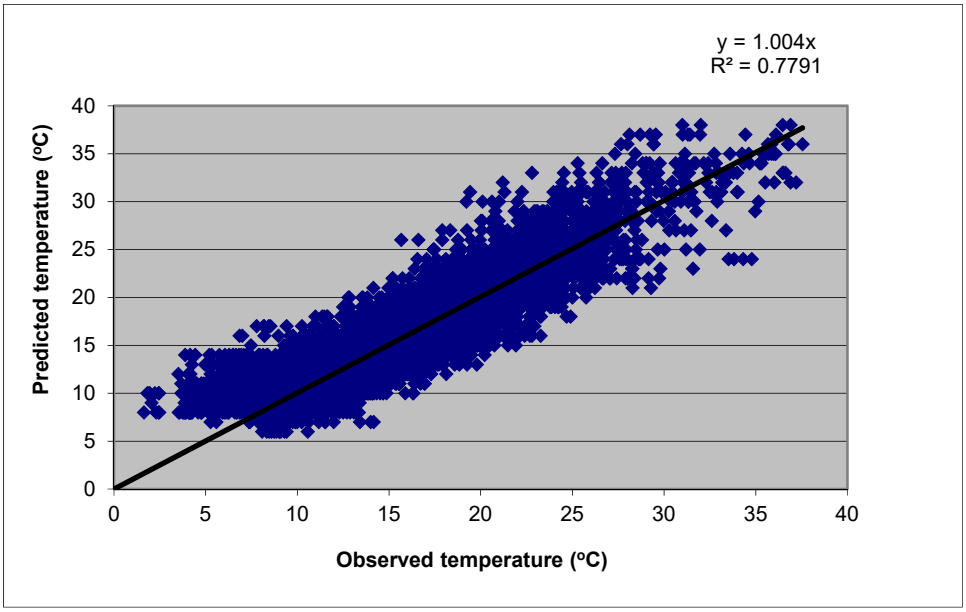

Figure A1 Scatter Plot of Observed and Predicted Ambient Temperature

A2.1 Wind Distribution

Figure A2 shows the predicted (a) and observed (b) wind roses for the location of the Nowra AWS. The directional distribution of winds predicted by TAPM shows reasonable agreement with the recorded observations and with the wind patterns expected for this region.

Figure A3 shows the predicted (a) and observed (b) wind roses for the location of the Farm AWS after the initial TAPM simulation. The directional distribution of winds predicted by TAPM shows reasonable agreement with the recorded wind patterns expected for this region.

The wind speed and direction observations from the Farm AWS were assimilated into the prognostic model simulation to improve the ability of the model to capture the effects of local wind channelling and low wind speed conditions. The improvement to wind direction distributions in the model output is clearly evident in Figure A3(c). The marked improvement in the capture of low wind events is examined below.

It is understood that TAPM performs reasonably well at simulating low wind speeds when the atmosphere is unstable but is known to perform relatively poorly during stable atmospheric conditions[7]. This is a critical factor in this assessment given that odour emissions occur 24-hours per day, resulting in predictions of maximum odour impact dominating during these conditions.

Figure A4 shows a histogram of wind speed distribution for observations at the Farm AWS, predictions from TAPM and predictions from TAPM after wind speed and direction data from the Farm AWS were assimilated into TAPM. It is clear from this figure that TAPM did reasonably well at originally predicting moderate to high wind speeds but did relatively poorly predicting low wind speeds. However, Figure A4 also shows that the representation of low winds in the TAPM output was significantly improved once the Farm AWS data were assimilated into the model.

Figure A3 Farm AWS - Annual Wind Roses (year 2004)

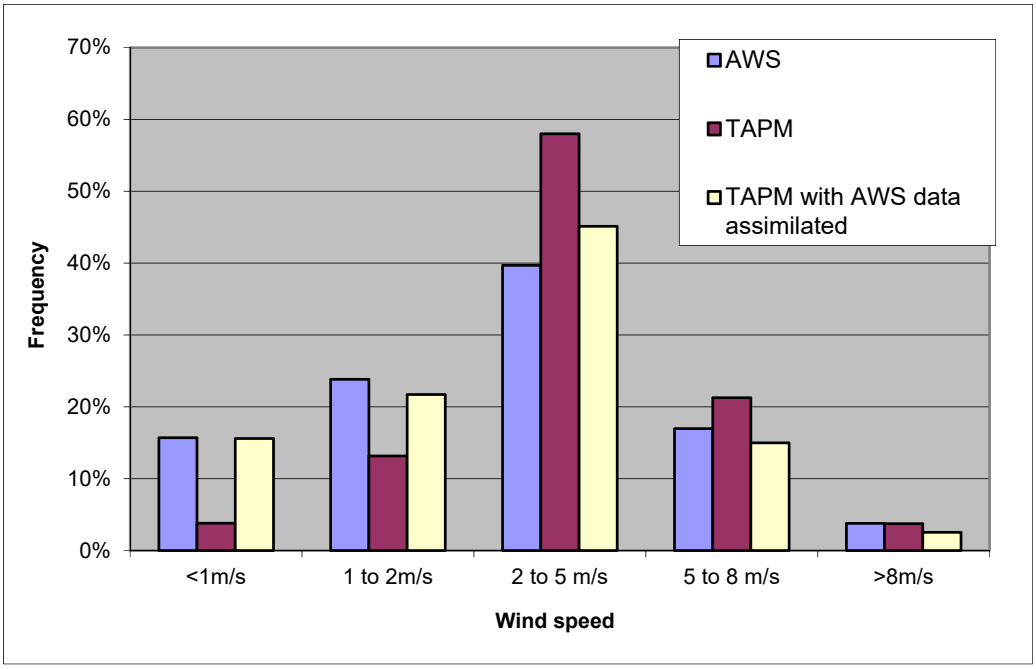

Figure A4 Wind Speed Distribution – TAPM and Farm AWS

To further investigate the effect of data assimilation on model output, a sensitivity analysis was conducted to compare the subsequent CALPUFF model predictions using meteorological input derived with and without the assimilation of observed wind speed and wind direction data from the Farm AWS into TAPM. Good agreement was found in the general pattern of dispersion (i.e. similar directions of poor dispersion), however, the highest ground level odour concentrations were predicted when the assimilated meteorological data file was used, which was expected given the higher frequency of light winds.

A3 Diagnostic Meteorological Model - CALMET

The TAPM output (with assimilated data) was then passed to model CALMET (version 5.5)[8], which is the 3D meteorological diagnostic model pre-processor to the CALPUFF 3D puff based dispersion model.

Hourly varying 3D meteorological data, at a 1000 m resolution, were extracted from the TAPM inner nested grid and passed to CALMET in their entirety as initial guess fields. Surface meteorological parameters and vertical profile data were also extracted from TAPM at a grid point near the factory, and used as if they were observations in the diagnostic model (i.e. pseudo-data).

CALMET was configured with a 15 km by 15 km grid at 200 m resolution and with local scale surface characteristics, such as terrain elevation and land use (e.g. forest or sparse growth, water or residential). The land use and terrain elevation information was derived from US Geological Survey and AusLig data, respectively, with adjustments based upon inspection of aerial photographs, topographical and land uses maps, and a site inspection.

CALMET was used to produce hourly site-representative winds and micrometeorological information, which was used with the CALPUFF 3D puff-based dispersion model to assess the impacts of the air pollutants on the surrounding land uses.

A3.1 Site-specific meteorology

Figure A5 shows a wind rose that illustrates the distribution of wind speed and direction at the location of the Factory. On an annual basis the prevailing winds are from the west with winds also from the west-north-west, north-west, west-south-west and north-east. The mean wind speed is 3.2 m/s, with higher speed winds associated with westerly winds with speeds up to 11 m/s; such speeds are not reached from other directions. The highest frequency of light winds occurs from the south-west, west and north.

Figure A6 provides a seasonal breakdown of the predicted wind distribution at the Factory, this figure reveals a north-easterly predominance during summer (sea-breeze) and a westerly predominance during the other seasons, in particular during winter.

Figure A6 Factory Seasonal Wind Roses - Year 2004

A categorised measure of atmospheric stability is also output from the model. These can be broadly defined as listed in Table A1.

Table A1 Atmospheric Stability Classes and Distribution

Stability Class	Description	Frequency of Occurrence [1]
A	Extremely unstable atmospheric conditions, occurring near the middle of day, with very light winds, no significant cloud.	2%
B	Moderately unstable atmospheric conditions occurring during mid-morning/mid-afternoon with light winds or very light winds with significant cloud.	14%
C	Slightly unstable atmospheric conditions occurring during early morning/late afternoon with moderate winds or lighter winds with significant cloud.	17%
D	Neutral atmospheric conditions. Occur during the day or night with stronger winds. Or during periods of total cloud cover, or during twilight (transition) period.	22%
E	Slightly stable atmospheric conditions occurring during the night-time with some cloud and/or light-moderate winds.	12%
F	Moderately stable atmospheric conditions occurring during the night-time with no significant cloud and light winds.	32%

1. Stability data in this table extracted from Factory meteorological data

Potential off-site odour impact would tend to be maximised when winds are light and the atmosphere is stable, conditions that typically occur during the early evening and night-time. Table A1 shows that these conditions occurred for approximately 44% of the time.

The occurrence of stable air flows is of significance as these generally provide the conditions for worst case dispersion of emissions to air from ground based (or near-ground based) sources, and hence potentially the highest impact to odour amenity. This is due to the limited mixing in the vertical plane of these light wind airflows, and hence less dilution of the emissions from the majority of odour sources, which are either at ground level or wake affected short stacks. Therefore, the distribution of light wind stable flows can define the directions of “poor odour dispersion” from the factory and environmental farm.

Vertical mixing of airflows can be brought about by two mechanisms. The first is mechanical mixing caused by the shear stresses as air moves over rough terrain. The second is via thermal convective mixing, which has the potential to occur significantly only during daytime. The occurrence of unstable and strong-wind neutral air flows generally provide the conditions for the highest ground level concentrations due to emissions to air from elevated stack sources, such as the coal-fired boiler exhaust stacks found at the factory.

A rose that illustrates the directional distribution of the predicted atmospheric stability is shown in Figure A7. During these stable periods, the regional scale cool air drainage flows down the river valley from the west to dominate the transport and dispersion of emissions to air from the factory and environmental farm. To a lesser extent, local slope drainage flows from the elevated terrain located to the north, west-north-west and west-south-west of the site would also generate these conditions for poor dispersion.

Project	ORLA Report Number:	7091/ORLA/01
	Project Manager:	Margot Kimber
	Testing operator:	Peter Stephenson
	ORLA Sample number(s):	5394 to 5395
	SEMA Sample number(s):	728109 to 728110
Order	Analysis Requested:	Odour Analysis
	Order requested by:	SEMA on behalf of Shoalhaven Starches
	Date of order:	16 July 2020
	Order number:	5123
	Telephone:	02 9737 9991
	Signed by:	Margot Kimber
	Order accepted by:	Peter Stephenson
Report	Date of issue:	21 July 2020

NATA accredited laboratory number 15043.

Accredited for Compliance with ISO/IEC 17025 - Testing

Investigated Item	Odour concentration in odour units 'ou' determined by Sensory odour concentration measurements, of an odour sample supplied in a sampling bag. All samples were received in good condition.
Analysis Method	The samples were analysed in accordance with AS/NZS4323.3:2001.
Identification	The odour sample bags were labelled individually. Each label recorded the testing laboratory, sample number, sampling location (or Identification) sampling date and time, dilution ratio (if dilution was used) and whether further chemical analysis was required.
Method	The odour concentration measurements were performed using dynamic olfactometry according to the Australian Standard 'Determination of Odour Concentration by Dynamic Olfactometry AS/NZS4323.3:2001. The odour perception characteristics of the panel within the presentation series for the samples were analogous to that for n-butanol calibration. Any deviation from the Australian standard is recorded in the 'Comments' section of this report.
Instrument Used	The Olfactometer used during this testing session was: AC'SCENT International Olfactometer
Measuring Range	The measuring range of the AC'SCENT International olfactometer is $12 \leq \chi \leq 92{,}102$ ou. . If the measuring range was insufficient the odour samples will have been pre-diluted.
Environment	The measurements were performed in an air- and odour-conditioned room. The room temperature is maintained between ± 3°C.
Measuring Dates	The date of each measurement is specified with the results.
Instrument Precision	The precision of this instrument (expressed as repeatability) for a sensory calibration must be $r \leq 0.05$ in accordance with the Australian Standard AS/NZS4323.3:2001. AC'SCENT International Olfactometer: $r = 0.0020$ (February 2020) Compliance – Yes
Instrumental Accuracy	The accuracy of this instrument for a sensory calibration must be $A \leq 0.20$ in accordance with the Australian Standard AS/NZS4323.3:2001. AC'SCENT International Olfactometer: $A = 0.020$ (February 2020) Compliance – Yes
Lower Detection Limit (LDL)	The LDL for the AC'SCENT International Olfactometer has been determined to be 12 ou.
Traceability	The measurements have been performed using standards for which the traceability to the national standard has been demonstrated. The assessors are individually selected to comply with fixed criteria and are monitored every session to keep within the limits of the standard. The results from the assessors are traceable to primary standards of n-butanol in nitrogen.

21 July, 2020

Peter Stephenson
Managing Director

Odour Emission Sampling

Odour emission sampling was undertaken on the Vent D500 Beverage Ethanol Plant.

Odour Emission Test Results

The measured odour emission concentrations and exhaust gas flow rates are summarised in Table 1 and detailed in Tables 2.

Table 1 - Summary of Odour Emission Test Results – D500 Vent, July 15th 2020

Sample location	Run No.	Date sampled	Odour Conc. (ou)	Stack Gas Temp. (°C)	Velocity (m/s)	Volumetric Flow rate dry (**wet**) (m^3/s)	MOER ($ou.m^3/s$)	Oxygen (%)
D500 Vent	1	15-July-20	20,700	39.1	8.8	0.03 (0.03)	660	20.7
	2	15-July-20	26,600	39.1			850	20.8

Key:

MOER	=	Mass Odour Emission Rate
ou	=	odour units
ou.m3/s	=	odour unit volume per second
Temp.	=	temperature
^oC	=	degrees Celsius
m^3/s	=	cubic metres per second (at 1atmosphere and 273 Kelvin)
m/s	=	metres per second
%	=	percentage

Odour Panel Calibration Results – 7091/ORLA/01

Reference Odorant	ORLA Sample No.	Date	Concentration of Reference Gas (ppm)	Reference Gas Measured Concentration (ou)	Panel Average Measured Concentration (ppb) [3]	Does panel calibration measurement comply with AS/NZS4323.3:P2001 (Yes/No) [4]
n-butanol	5393	16.07.2020	62.0	1421	43.6	Yes

Comments: All samples were collected by Stephenson Environmental Management Australia and analysed by Odour Research Laboratories Australia at their Sydney Laboratory.

Notes from Odour Olfactometry Results:

[1] Sample Odour Concentration: as received in the bag

[2] Sample Odour Concentration: allowing for pre-dilution

[3] Panel Average Measured Concentration: indicates the sensitivity of the panel for the session completed

[4] Target Range for reference gas n-butanol is $20 \leq \chi \leq 80$ ppb and compliance with AS/NZ4323.3:2001 is based on the individuals rolling average and not on the panel average measured concentration.

Panellist Rolling Average:

16/07/2020: SR =46.9, PR = 61.3, TL =33.3, JW= 43.8

^ denotes the Average Hedonic Tone: describes the pleasantness of the odour being presented where (+5) represents Very Pleasant, (0) represents Neutral and (-5) represents Very Unpleasant and has been derived from the panellist responses at the recognition threshold.

+ This value is not part of our NATA Scope of Accreditation and AS4323.3

Managing Director

1.1 SUMMARY OF AVERAGE EMISSION RESULTS – TEST REPORT NO. 7071(SD#1) - EPL ID 12

Parameter	Unit of measure	Location EPL ID 12 (Starch Dryer No. 1) Tested: 14 April 2020 Average Result
Sampling times	hours	13:45-15:15
Temperature	^oC	38
Pressure	kPa	102.7
Velocity	m/s	6
Actual Volumetric Flow	am^3/s	13
Volumetric Flow	m^3/s	11
Moisture	%	1.6
Molecular Weight Dry Stack Gas	g/g mole	28.5
Dry Gas Density	kg/m^3	1.27
Oxygen	%	20.9
Particulate Matter less than 10 microns	mg/m^3	3
Total Solid Particulates	mg/m^3	4

Key to Table 1.1:

EPL	=	Environment Protection Licence
ID	=	identification no.
%	=	percentage
Conc.	=	concentration
--	=	Not referenced in EPL
^oC	=	degrees Celsius
<	=	less than
>	=	greater than
kg/m^3	=	kilograms per cubic metre
kPa	=	kilo Pascals
g/g mole	=	grams per gram mole
m^3/s	=	dry cubic metre per second 0^oC and 101.3 kilopascals (kPa)
m/s	=	metres per second
am^3/s	=	dry cubic metre per second @ in-stack conditions
mg/m^3	=	milligrams per cubic metre at 0^oC and 101.3 kilopascals (kPa) @ Reference Conditions (where specified)

1.2 ESTIMATED UNCERTAINTY OF MEASUREMENT

Pollutant	Methods	Uncertainty
Moisture	AS4323.2, NSW TM-22, USEPA 4	25%
Particulate > 20 mg/m^3	NSW TM-15, AS4323.2, USEPA 201A	15%
Particulate < 20 mg/m^3	NSW TM-15, AS4323.2, USEPA 201A	50%
Velocity	AS4323.1, NSW TM-2, USEPA M2	5%

Key:

Unless otherwise indicated the uncertainties quoted have been determined @ 95% level of Confidence level (i.e. by multiplying the repeatability standard deviation by a co-efficient equal to 1.96) (Source – Measurement Uncertainty)

Sources: *Measurement Uncertainty – implications for the enforcement of emission limits by Maciek Lewandowski (Environment Agency) & Michael Woodfield (AEAT) UK*

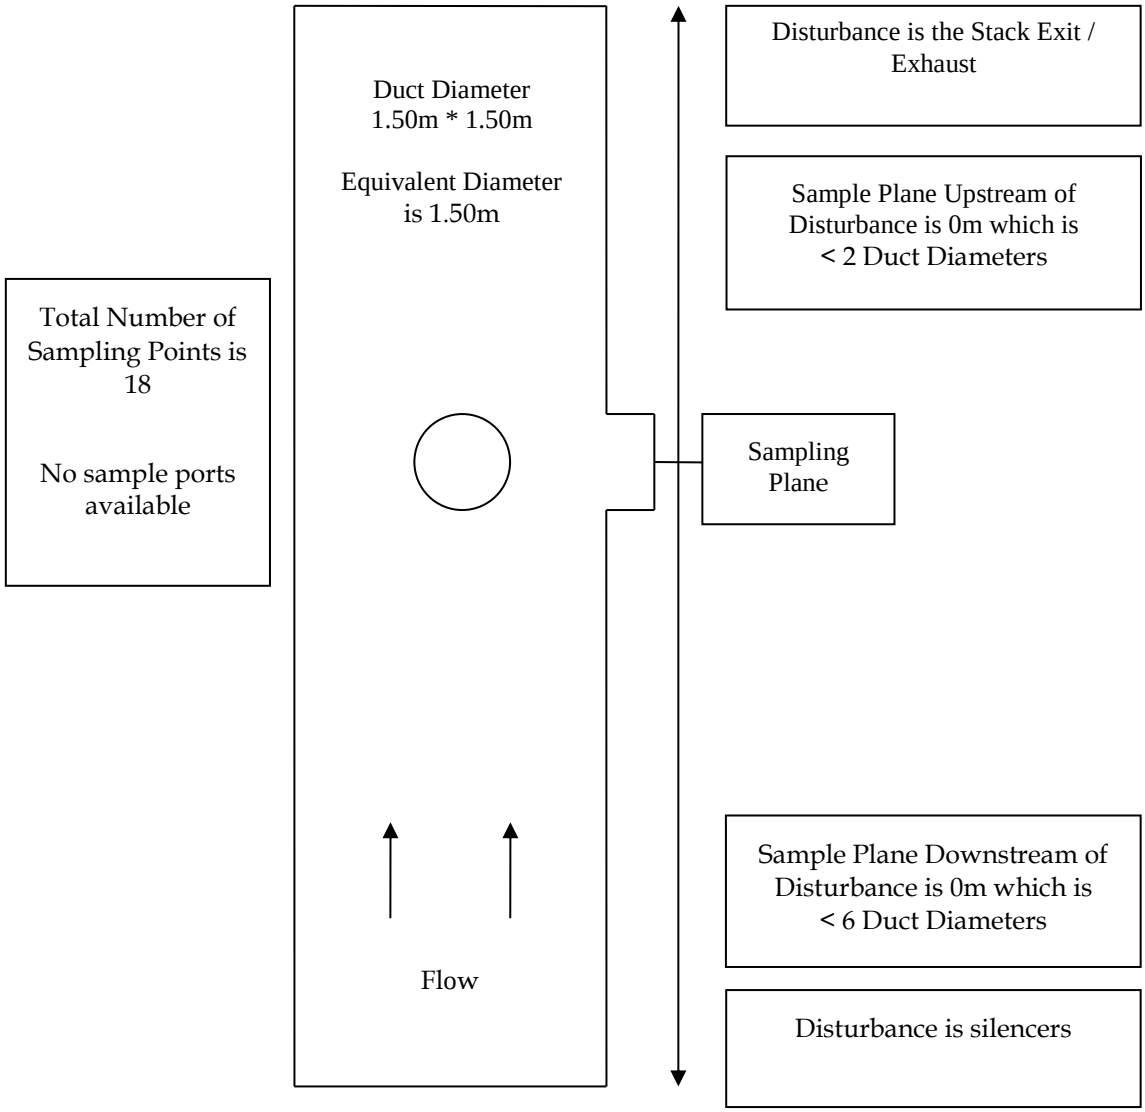
Technical Guidance Note (Monitoring) M2 Monitoring of stack emissions to air Environment Agency Version 3.1 June 2005.

Note: ISO 9096 is for 20-1000 mg/m^3- which AS4323.2 is based on. Note DSEN 13284-1 testing for < 5 mg/m^3 correlates to 5 mg/m^3 with most quoted uncertainties of $\pm$ 5.3 mg/m^3 @ 6.4 mg/m^3. From Clean Air Engineering in the United States the lowest practical limit of USEPA M5 is 5 mg/m^3 under lab conditions.

1.3 PROCESS DATA - STARCH DRYER NO. 1

Shoalhaven Starches personnel considered Starch Dryer No.1 was operating under typical conditions on the day of testing. Refer Shoalhaven Starches for details.

1.4 SAMPLING LOCATION – STARCH DRYER NO. 1



In the absence of cyclonic flow activity ideal sampling plane position will be found to exist at 6-8 duct diameters downstream and 2-3 duct diameters upstream from a flow disturbance. The sampling plane does not meet this criterion. Additional sample points were used in compliance with AS4323.1 as the sampling plane was non-ideal.

However the sample plane also does not meet the minimum sampling plane position; sampling plane position will be found to exit at 2 duct diameters downstream and 0.5 duct diameters upstream from a flow disturbance. A suitable sampling plane should be sought fitting these criteria.

The location of the sampling plane complies with AS4323.1 temperature, velocity and gas flow profile criteria for sampling.

FIGURE D-1 STARCH DRYER NO. 1 – SAMPLE LOCATION

(2) Schedule 4 and 5 of the Protection of the Environment Operations (Clean Air) Regulations

All associated NATA endorsed Test Reports/Certificates of Analysis are provided separately in Attachment A.

Issue Date: 22 April 2020

Peter Stephenson
Managing Director

1.1 SUMMARY OF AVERAGE EMISSION RESULTS – TEST REPORT NO. 7050 - EPL ID 45

Parameter	Unit of measure	Location EPL ID 45 (Boiler 2)	EPL 883 100% Emission Conc. Limit (mg/m^3)
		Tested 1 April 2020 Average Result	
Sampling times	hours	12:56-14:30	--
Temperature	^oC	221	--
Pressure	kPa	102.0	--
Velocity	m/s	8.8	--
Actual Volumetric Flow	am^3/s	8.4	--
Volumetric Flow	m^3/s	4.4	--
Moisture	%	6.7	--
Molecular Weight Dry Stack Gas	g/g mole	30	--
Dry Gas Density	kg/m^3	1.34	--
Carbon dioxide	%	10.3	--
Carbon monoxide (1 hr block average @ 7% O_2)	mg/m^3	32	--
Sulfur dioxide (1 hr block average @ 7% O_2)	mg/m^3	444	600
Nitrogen oxides (1 hr block average @ 7% O_2)	mg/m^3	276	500
Oxygen	%	8.8	> 5%
Particulate Matter less than 10 microns	mg/m^3	11.5	--
Total Solid Particulates (@ 7% O_2)	mg/m^3	14.1	30
VOCs (as n-propane equivalent @ 7% O_2)	mg/m^3	<5.1	40
VOCs (uncorrected for n-propane @ 7%O_2)	mg/m^3	<5.3	--
Metals - Type I & II Substances in Aggregate (@ 7% O_2)	mg/m^3	0.074	1
Antimony (Sb) Type I	mg/m^3	< 0.00430	--
Arsenic (As) Type I	mg/m^3	< 0.00430	--
Beryllium (Be) Type II	mg/m^3	< 0.00032	--
Cadmium (Cd) Type I	mg/m^3	0.00021	0.2
Chromium (Cr) Type II	mg/m^3	0.00322	--
Cobalt (Co) Type II	mg/m^3	0.00322	--
Copper (Cu)	mg/m^3	0.00967	--
Lead (Pb) Type I	mg/m^3	0.02042	--
Magnesium (Mg)	mg/m^3	< 0.16118	--
Manganese (Mn) Type II	mg/m^3	0.00322	--
Mercury (Hg) Type I	mg/m^3	0.00092	0.2
Nickel (Ni) Type II	mg/m^3	0.02149	--
Selenium (Se) Type II	mg/m^3	0.02149	--
Tin (Sn) Type II	mg/m^3	< 0.01075	--
Vanadium (V) Type II	mg/m^3	< 0.00537	--

Key to Table 1.1:

EPL	=	Environment Protection Licence
ID	=	identification no.
%	=	percentage
Conc.	=	concentration
--	=	Not referenced in EPL
^{o}C	=	degrees Celsius
<	=	less than
>	=	greater than
kg/m^3	=	kilograms per cubic metre
kPa	=	kilo Pascals
g/g mole	=	grams per gram mole
m^3/s	=	dry cubic metre per second $0^{o}C$ and 101.3 kilopascals (kPa)
m/s	=	metres per second
am^3/s	=	dry cubic metre per second @ in-stack conditions
mg/m^3	=	milligrams per cubic metre at $0^{o}C$ and 101.3 kilopascals (kPa)
		@ Reference Conditions (where specified)

1.2 ESTIMATED UNCERTAINTY OF MEASUREMENT

Pollutant	Methods	Uncertainty
Moisture	AS4323.2, NSW TM-22, USEPA 4	25%
Nitrogen Oxides	NSW TM-11, USEPA 7E	15%
Oxygen and Carbon Dioxide	NSW TM-24, TM-25, USEPA 3A	1% actual
Carbon Monoxide	TM-32, USEPA 10	15%
Particulate > 20 mg/m^3	NSW TM-15, AS4323.2,	15%
Particulate < 20 mg/m^3	NSW TM-15, AS4323.2,	50%
Metals - Type I & II Substances in Aggregate	NSW TM-12,13 & 14+, USEPA M29*	100%+ *(50-200%)**
Sulfur Dioxide	NSW TM-4, USEPA M6C	15%
Velocity	AS4323.1, NSW TM-2, USEPA M2	5%
Volatile Organic Compounds (adsorption tube)	NSW TM-34, USEPA M18	25%

Key:

Unless otherwise indicated the uncertainties quoted have been determined @ 95% level of Confidence level (i.e. by multiplying the repeatability standard deviation by a co-efficient equal to 1.96) (Source – Measurement Uncertainty)

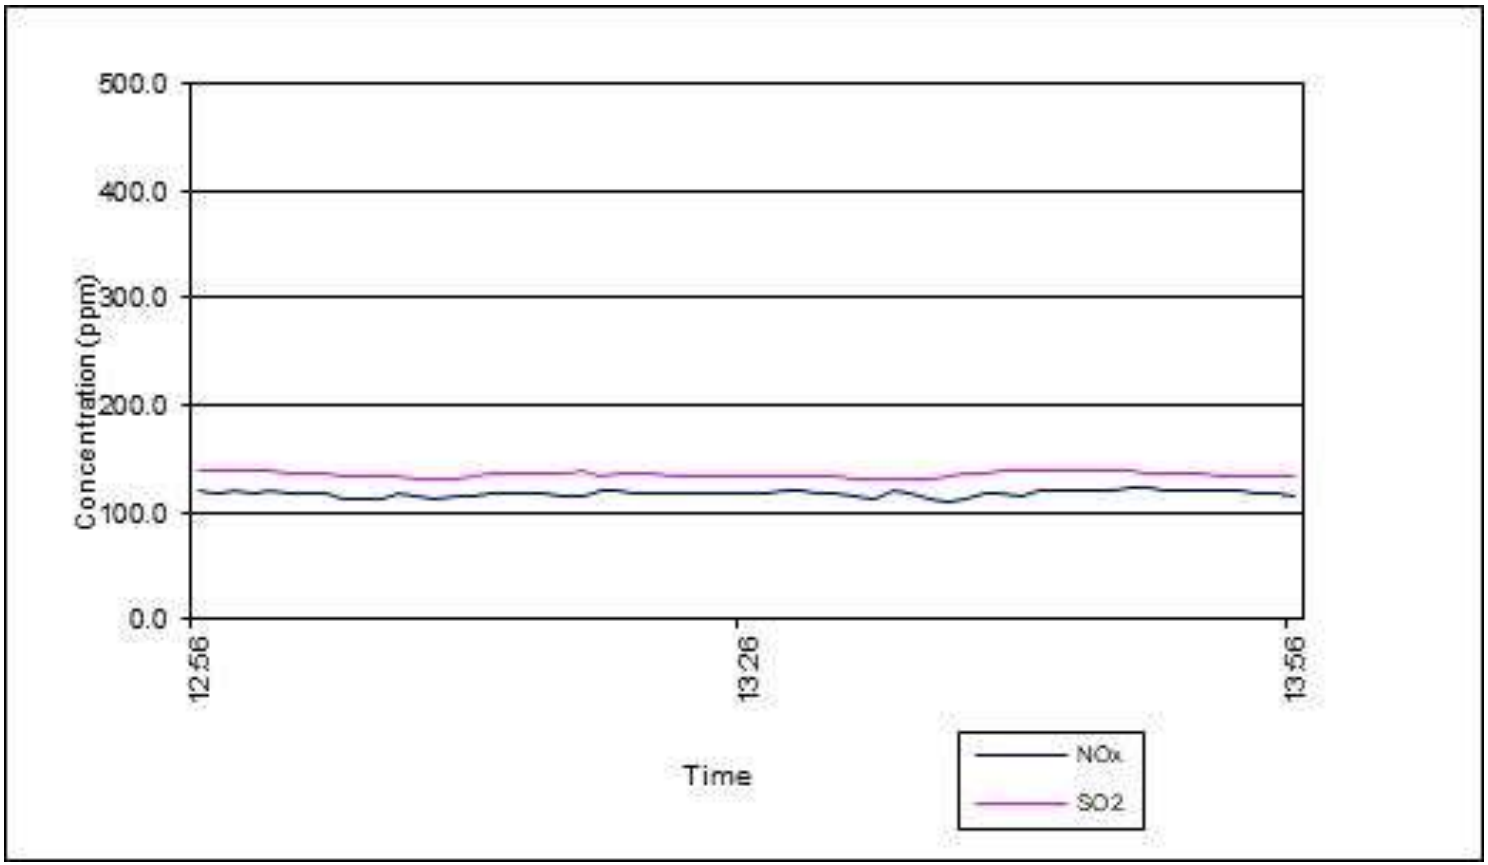
Sources: *Measurement Uncertainty – implications for the enforcement of emission limits by Maciek Lewandowski (Environment Agency) & Michael Woodfield (AEAT) UK*

Technical Guidance Note (Monitoring) M2 Monitoring of stack emissions to air Environment Agency Version 3.1 June 2005.

Note: ISO 9096 is for 20-1000 mg/m^3- which AS4323.2 is based on. Note DSEN 13284-1 testing for < 5 mg/m^3 correlates to 5 mg/m^3 with most quoted uncertainties of ± 5.3 mg/m^3 @ 6.4 mg/m^3. From Clean Air Engineering in the United States the lowest practical limit of USEPA M5 is 5 mg/m^3 under lab conditions.

1.3 CONTINUOUS LOGGED RECORD OF SO_2 AND NO_x – 1 APRIL 2020

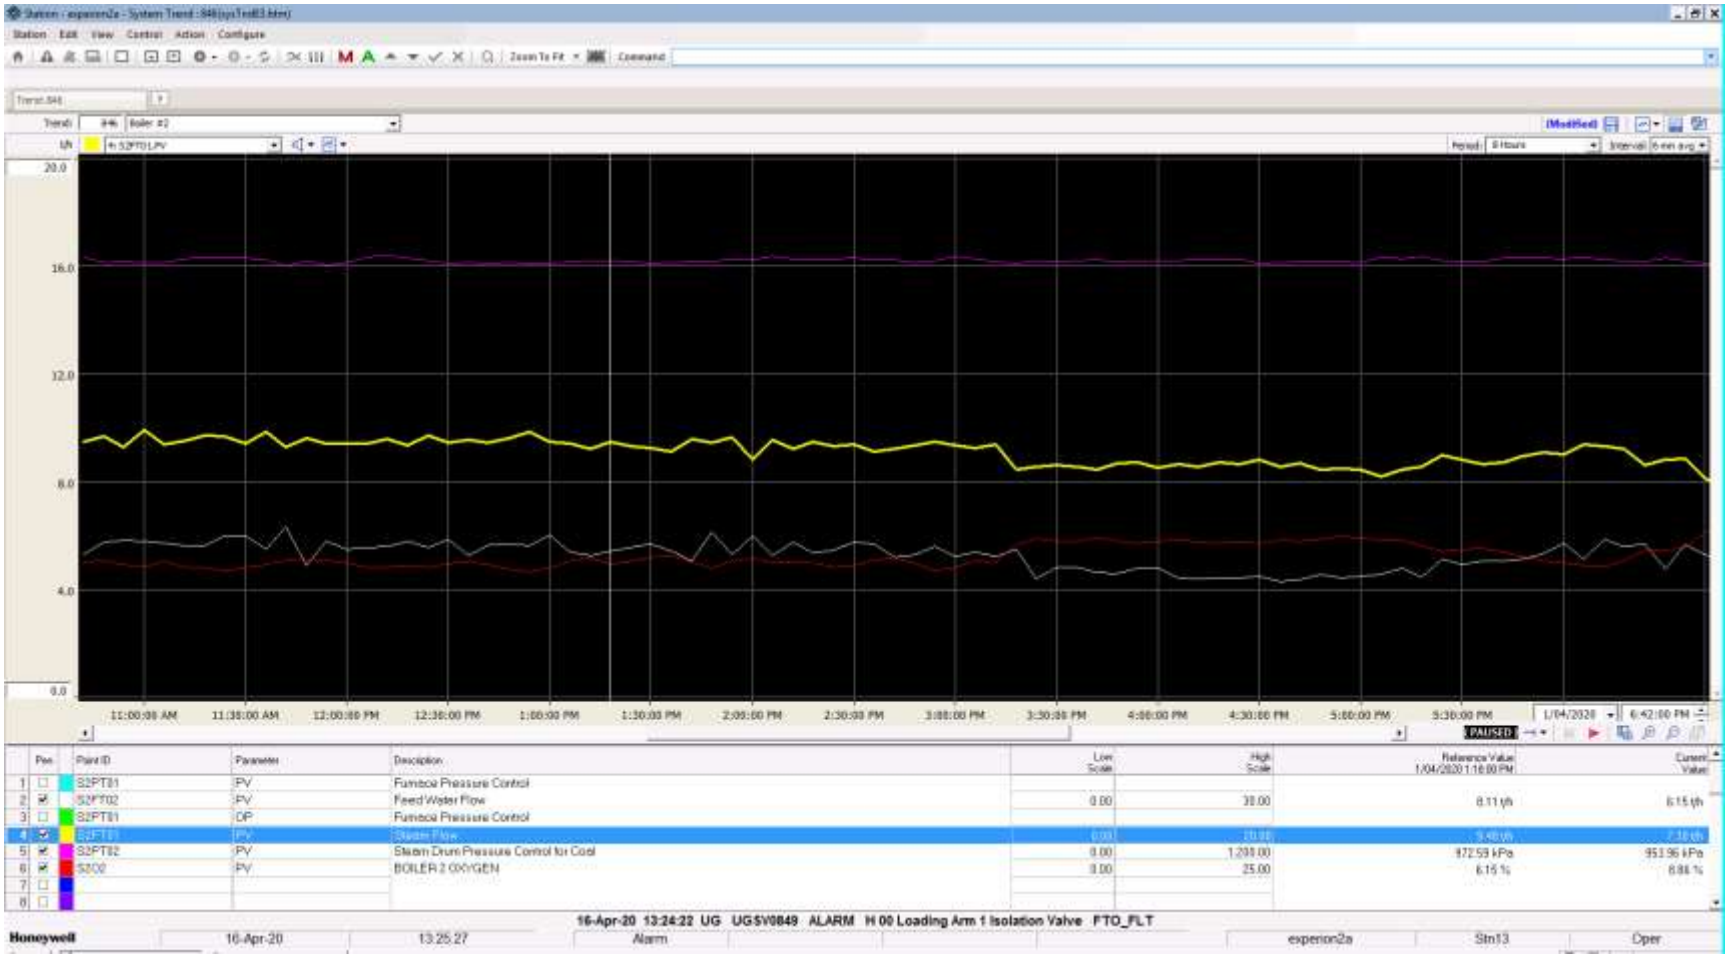
FIGURE 1-1 CONTINUOUS LOGGED TREND OF SO_2 AND NO_x IN PPM



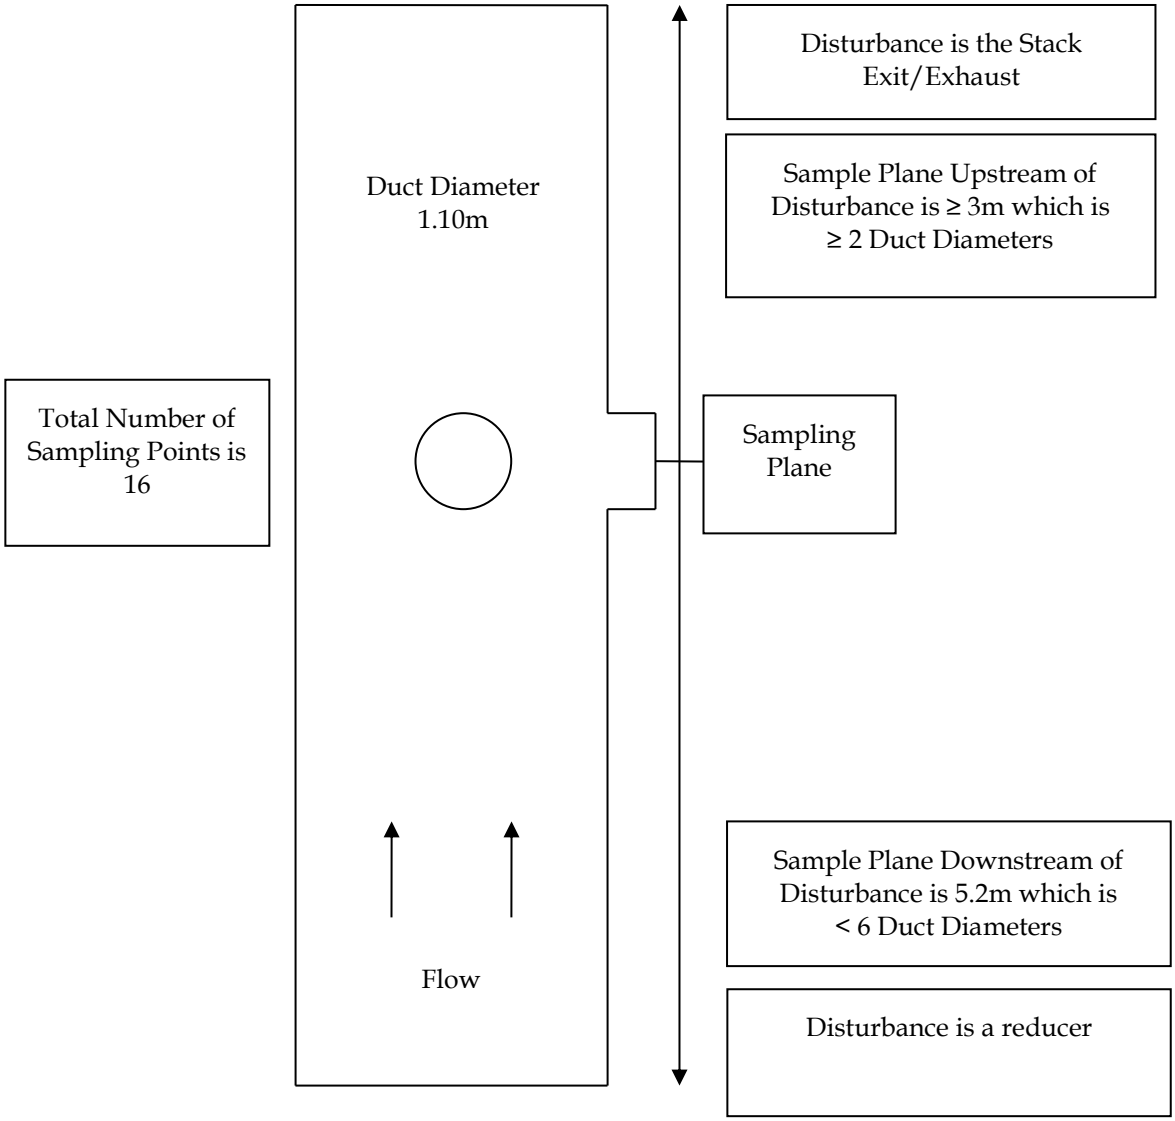
1.4 PROCESS DATA - BOILER NO. 2

Shoalhaven Starches personnel considered Boiler 2 was operating under typical conditions on the day of testing.

FIGURE 1-2 CONTINUOUS LOGGED TREND OF BOILER 2 STEAM FLOW OPERATING CONDITIONS



1.5 SAMPLING LOCATION – BOILER NO. 2



In the absence of cyclonic flow activity ideal sampling plane conditions will be found to exist at 6-8 duct diameters downstream and 2-3 duct diameters upstream from a flow disturbance. The sampling plane does not meet this criterion. Additional sample points were used in compliance with AS4323.1 as the sampling plane was non-ideal.

The sample plane however does meet the minimum sampling plane conditions; sampling plane conditions will be found to exist at 2 duct diameters downstream and 0.5 duct diameters upstream from a flow disturbance.

The location of the sampling plane complies with AS4323.1 temperature, velocity and gas flow profile criteria for sampling.

1.6 INSTRUMENT CALIBRATION DETAILS

SEMA Asset No.	Equipment Description	Date Last Calibrated	Calibration Due Date
867	Gas Meter	21-Feb-20	21-Feb-21
908	Gas Meter	14-Jun-19	14-Jun-20

Particle Test Report No. 2159

The analysis was commissioned by SEMA on behalf of:

Client	Organisation:	Shoalhaven Starches
	Contact:	John Studdert
	Address:	Bolong Road, Bomaderry, NSW 2541
	Telephone:	02 4423 8254
	Email:	John.studdert@manildra.com.au
	Project Number:	7050/S25389A/20
	Analysis Requested:	TM-15, OM-5
	Chain of Custody Number	S25586
	Date Analysis Completed:	2 April 2020
	No. of Samples Tested:	2
	Sample Locations:	EPL ID No. 45 (Boiler 2)
	Sample ID Nos.:	727893, 727894
	Filter ID Nos.:	15326, 15327

NATA accredited laboratory number 15043
Accredited for Compliance with ISO/IEC 17025 - Testing

Identification	The filters are labelled individually. Each label recorded the testing laboratory, sample number, sampling location (or Identification) sampling date and time and whether further analysis is required.

Test	*Analysis Test Method*
TSP	AS4323.2-1995 (R2014) (NSW TM-15)
PM_{10}	AS4323.2-1995 (R2014) (NSW OM-5)

Deviations from Test Methods	Nil

Issue Date

Client Details	
Client	Stephenson & Associates
Attention	Jay Weber
Address	PO Box 6398, Silverwater, NSW, 1811

Sample Details	
Your Reference	**7050**
Number of Samples	m29 sample train
Date samples received	03/04/2020
Date completed instructions received	03/04/2020

Analysis Details

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

Please refer to the last page of this report for any comments relating to the results.

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

The recommended maximums for analytes in urine are taken from "2018 TLVs and BEIs", as published by ACGIH (where available). Limit provided for Nickel is a precautionary guideline as per Position Paper prepared by AIOH Exposure Standards Committee, 2016.

Guideline limits for Rinse Water Quality reported as per analytical requirements and specifications of AS 4187, Amdt 2 2019, Table 7.2

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% – see ELN-P05 QA/QC tables for details; <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals (not SPOCAS); 60-140% for organics/SPOCAS (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Measurement Uncertainty estimates are available for most tests upon request.

Analysis of aqueous samples typically involves the extraction/digestion and/or analysis of the liquid phase only (i.e. NOT any settled sediment phase but inclusive of suspended particles if present), unless stipulated on the Envirolab COC and/or by correspondence. Notable exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, total recoverable metals and PFAS where solids are included by default.

Samples for Microbiological analysis (not Amoeba forms) received outside of the 2-8°C temperature range do not meet the ideal cooling conditions as stated in AS2031-2012.

Client Reference: 7050

Report Comments
Please note that Magnesium, Vanadium and Tin are not covered under USEPA m29 methodology but are accredited under in house methodology. Please note Container 5C was not supplied and therefore forms no part of Analytical Fraction 3C.

Analysis of Volatile Organic Compounds in Workplace Air by GC/MS

ND = Not Detected

Method : Analysis of Volatile Organic Compounds in Workplace Air by Gas Chromatography/Mass Spectrometry
Method Number : WCA 207
Limit of Quantitation : 5µg/section; 25µg/section for oxygenated hydrocarbons except acetone, MEK and MIBK at 5µg/section.
Brief Description : Volatile organic compounds are trapped from the workplace air onto charcoal tubes by the use of a personal air monitoring pump. The volatile organic compounds are then desorbed from the charcoal in the laboratory with CS_2. An aliquot of the desorbant is analysed by capillary gas chromatography with mass spectrometry detection.

PGME : Propylene Glycol Monomethyl Ether
PGMEA : Propylene Glycol Monomethyl Ether Acetate
DGMEA : Diethylene Glycol Monoethyl Ether Acetate

Measurement Uncertainty
The measurement uncertainty is an estimate that characterises the range of values within which the true value is asserted to lie. The uncertainty estimate is an expanded uncertainty using a coverage factor of 2, which gives a level of confidence of approximately 95%. The estimate is compliant with the "ISO Guide to the Expression of Uncertainty in Measurement" and is a full estimate based on in-house method validation and quality control data.

Quality Assurance
In order to ensure the highest degree of accuracy and precision in our analytical results, we undertake extensive intra- and inter-laboratory quality assurance (QA) activities. Within our own laboratory, we analyse laboratory and field blanks and perform duplicate and repeat analysis of samples. Spiked QA samples are also included routinely in each run to ensure the accuracy of the analyses. WorkCover Laboratory Services has participated for many years in several national and international inter-laboratory comparison programs listed below:-
- Workplace Analysis Scheme for Proficiency (WASP) conducted by the Health & Safety Executive UK;
- Quality Management in Occupational and Environmental Medicine QA Program, conducted by the Institute for Occupational, Social and Environmental Medicine, University of Erlangen – Nuremberg, Germany;
- Quality Control Technologies QA Program, Australia;
- Royal College of Pathologists QA Program, Australia.

EMISSION TEST REPORT NO.7051A

COMPLIANCE STACK EMISSION SURVEY – QUARTER NO. 4, 2019-2020

EMISSION POINT EPL ID 42 - (SERVING BOILER NO. 4)

SHOALHAVEN STARCHES PTY LTD

BOMADERRY, NSW

PROJECT NO.: **7051A/S25390/20**

DATE OF SURVEY: **24 APRIL & 21 MAY 2020**

DATE OF ISSUE: **22 MAY 2020**

NATA accredited laboratory number 15043.

Accredited for Compliance with ISO/IEC 17025 - Testing

1 EMISSION TEST REPORT NO.7051A

The sampling and analysis was commissioned by:

Client:	Shoalhaven Starches Pty Ltd
Contact:	John Studdert
Address:	Bolong Road, Bomaderry, NSW 2541
Telephone:	02 4423 8254
Email:	John.studdert@manildra.com.au
Project Number:	7051/S25390/20
Test Dates:	24 April & 21 May 2020
Production Conditions:	Boiler was operating at normal capacity during emission testing. See attachment B.
Analysis Requested:	Dry gas density, flow, moisture, molecular weight of stack gases, temperature, carbon monoxide, carbon dioxide, oxygen, nitrogen oxides, metals Type I and II, stack pressure, sulfur dioxide, total solid particulate matter and volatile organic compounds
Sample Locations:	EPL No.883; EPL ID No. 42 – Boiler No. 4 Stack
Sample ID Nos.:	See Attachment A

NATA accredited laboratory number 15043.

Accredited for Compliance with ISO/IEC 17025 - Testing

Identification	The samples are labelled individually. Each label recorded the testing laboratory, sample number, sampling location (or Identification) sampling date and time and whether further analysis is required.

1.2 ESTIMATED UNCERTAINTY OF MEASUREMENT

Pollutant	Methods	Uncertainty
Moisture	AS4323.2, NSW TM-22, USEPA 4	25%
Nitrogen Oxides	NSW TM-11, USEPA 7E	15%
Oxygen and Carbon Dioxide	NSW TM-24, TM-25, USEPA 3A	1% actual
Carbon Monoxide	TM-32, USEPA 10	15%
Particulate > 20 mg/m^3	NSW TM-15, AS4323.2,	15%
Particulate < 20 mg/m^3	NSW TM-15, AS4323.2,	50%
Metals - Type I & II Substances in Aggregate	NSW TM-12,13 & 14+, USEPA M29*	100%+ *(50-200%)**
Sulfur Dioxide	NSW TM-4, USEPA M6C	15%
Velocity	AS4323.1, NSW TM-2, USEPA M2	5%
Volatile Organic Compounds (adsorption tube)	NSW TM-34, USEPA M18	25%

Key:

Unless otherwise indicated the uncertainties quoted have been determined @ 95% level of Confidence level (i.e. by multiplying the repeatability standard deviation by a co-efficient equal to 1.96) (Source – Measurement Uncertainty)

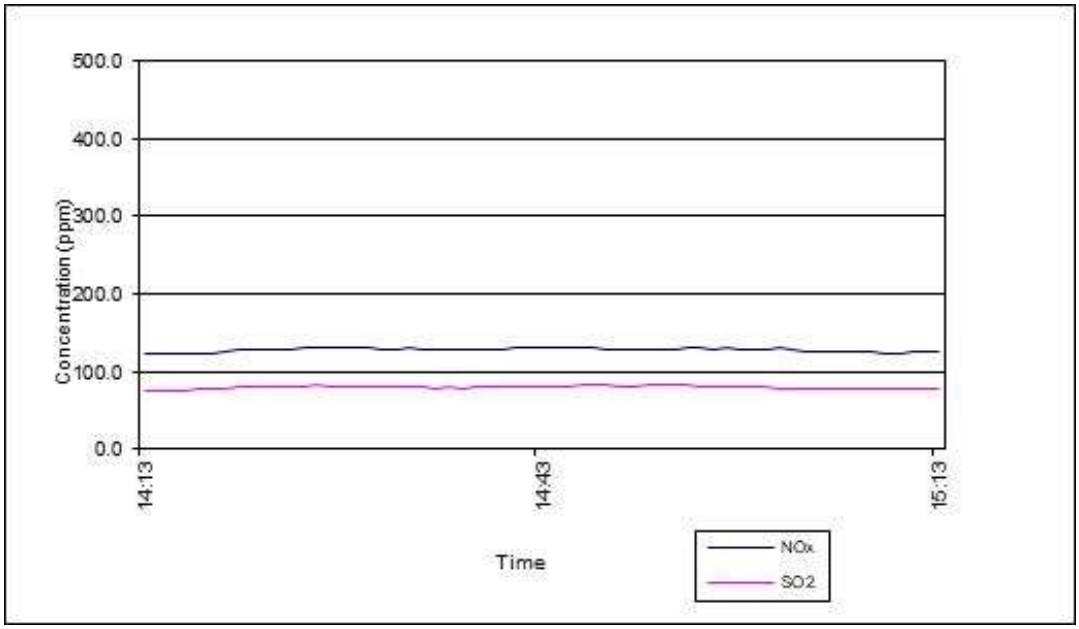
Sources: *Measurement Uncertainty – implications for the enforcement of emission limits by Maciek Lewandowski (Environment Agency) & Michael Woodfield (AEAT) UK*

Technical Guidance Note (Monitoring) M2 Monitoring of stack emissions to air Environment Agency Version 3.1 June 2005.

Note: ISO 9096 is for 20-1000 mg/m^3- which AS4323.2 is based on. Note DSEN 13284-1 testing for < 5 mg/m^3 correlates to 5 mg/m^3 with most quoted uncertainties of ± 5.3 mg/m^3 @ 6.4 mg/m^3. From Clean Air Engineering in the United States the lowest practical limit of USEPA M5 is 5 mg/m^3 under lab conditions.

1.3 CONTINUOUS LOGGED RECORD OF SO_2 AND NO_x - 24 APRIL 2020

FIGURE 1-1 CONTINUOUS LOGGED TREND OF SO_2 AND NO_x IN PPM



1.4 PROCESS DATA - BOILER NO. 4

Shoalhaven Starches personnel considered Boiler 4 was operating under typical conditions on the day of testing.

FIGURE 1-2 CONTINUOUS LOGGED TREND OF BOILER 4 STEAM FLOW OPERATING CONDITIONS AND OPACITY 24 APRIL

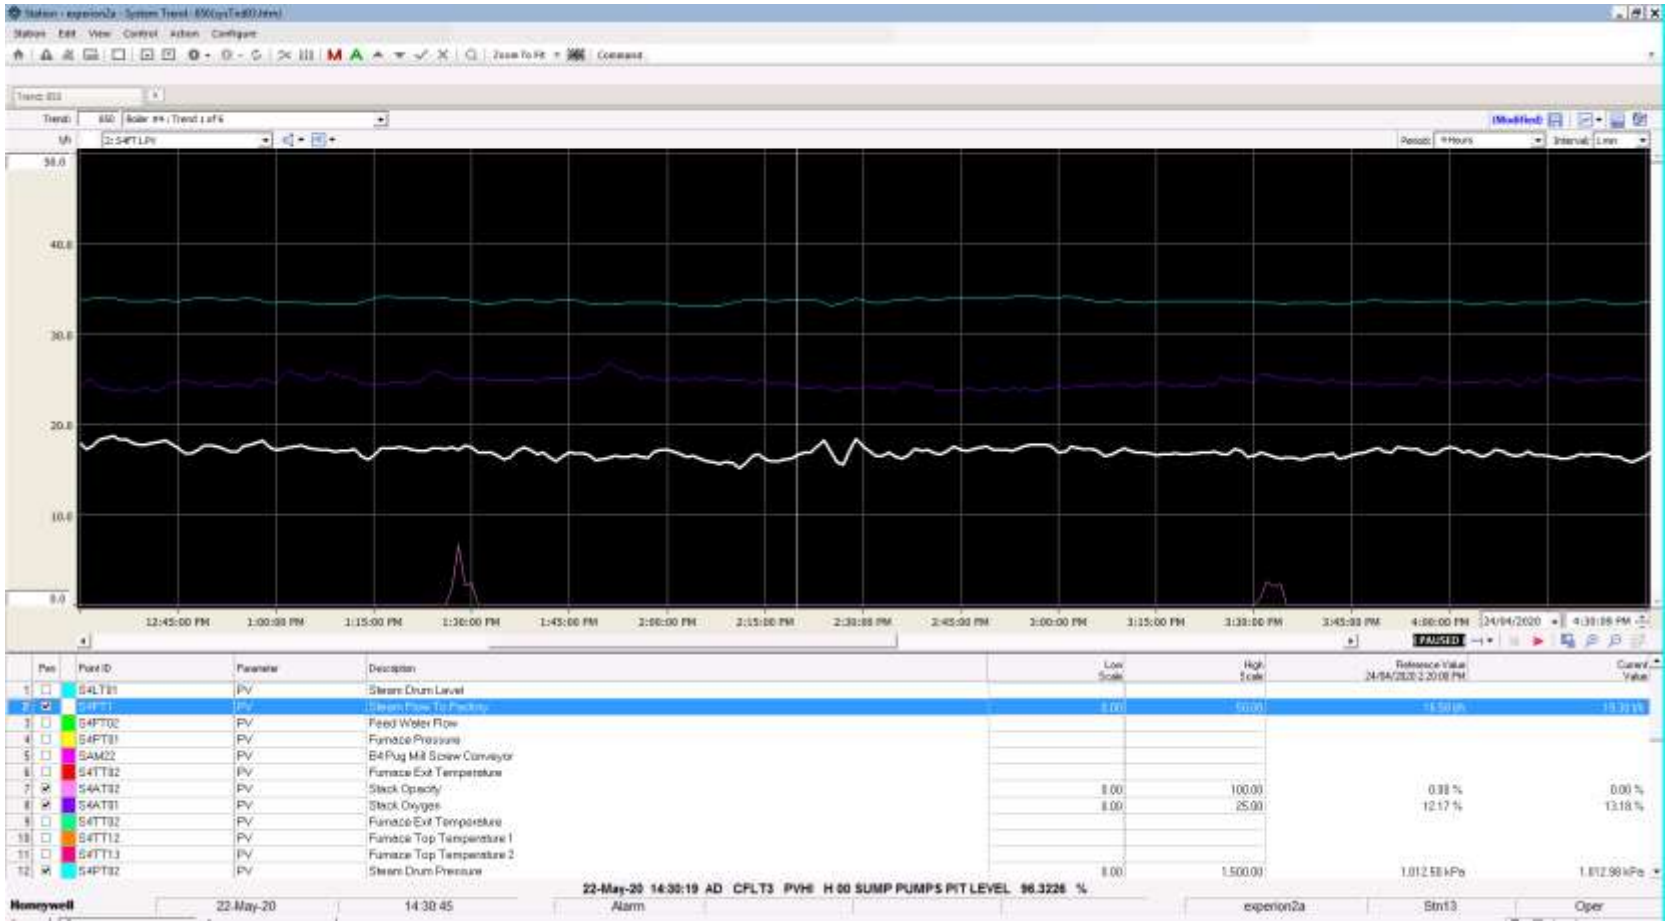


FIGURE 1-3 CONTINUOUS LOGGED TREND OF BOILER 4 STEAM FLOW OPERATING CONDITIONS *AND* OPACITY 21 MAY

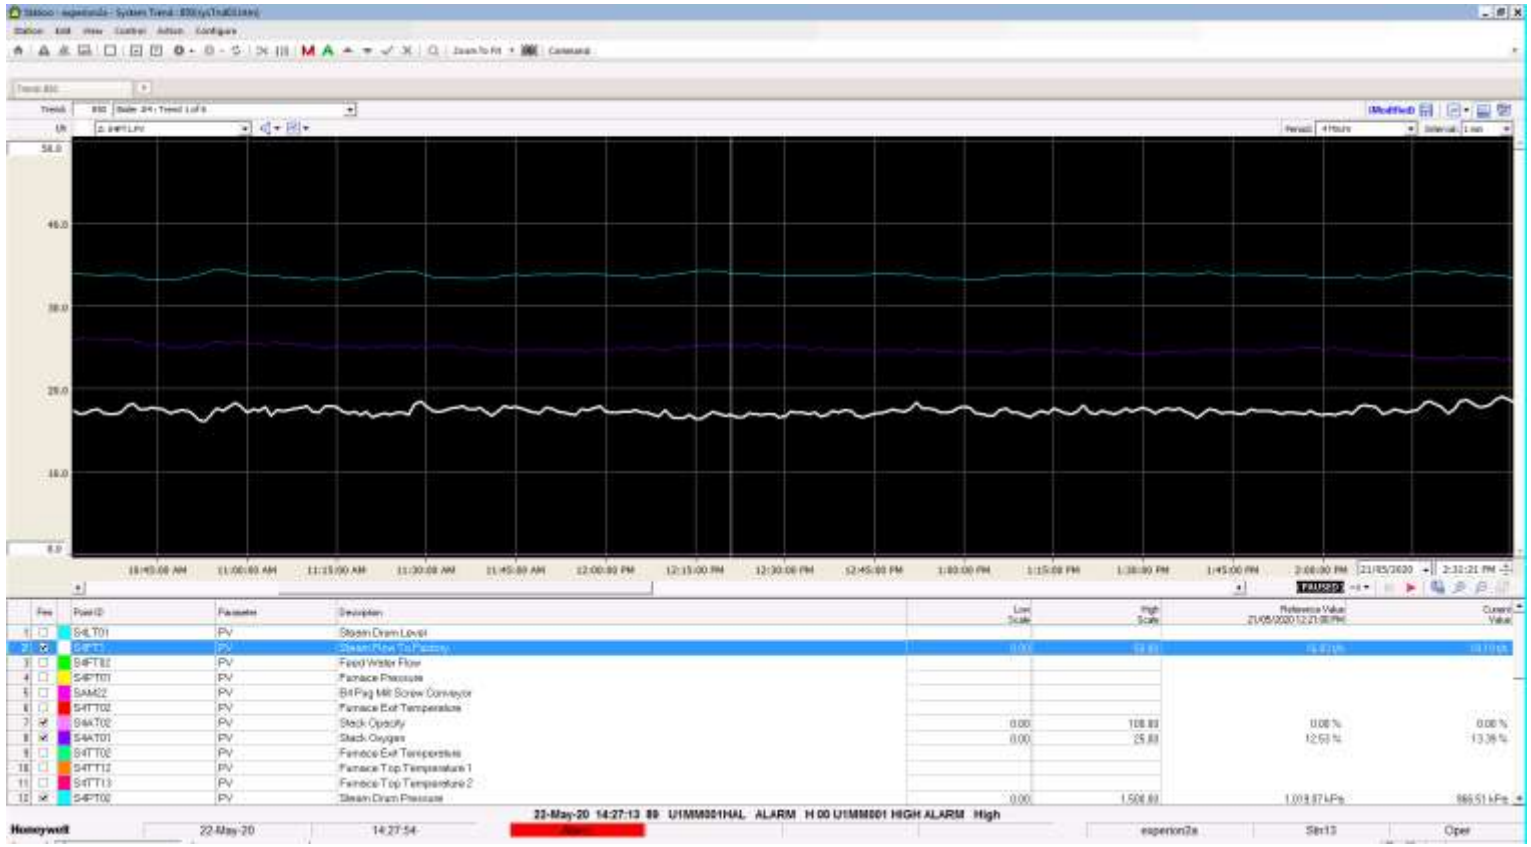
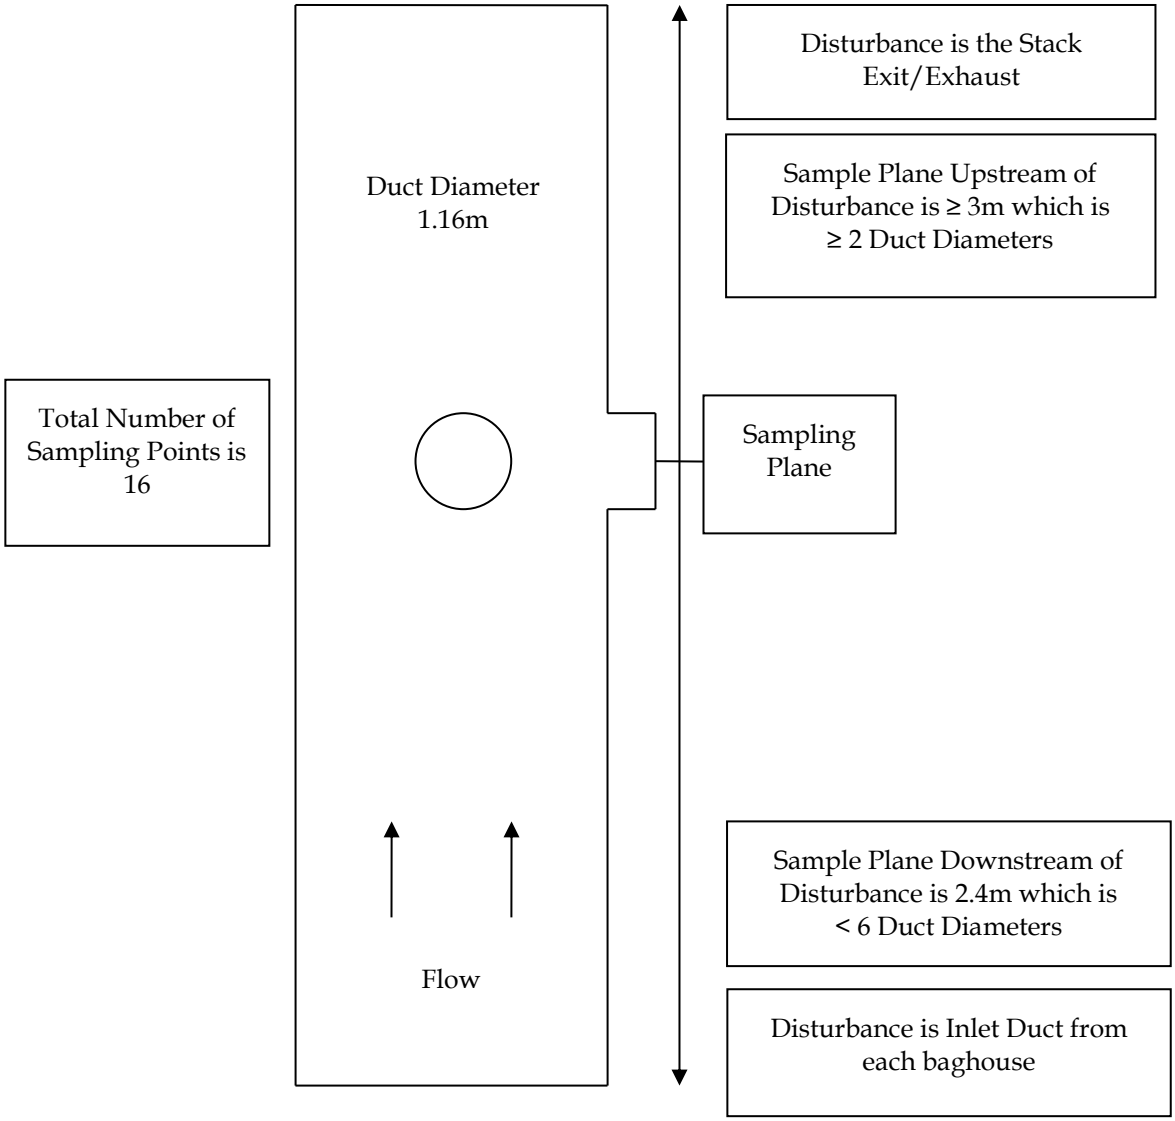


1.5 SAMPLING LOCATION – BOILER NO. 4



In the absence of cyclonic flow activity ideal sampling plane conditions will be found to exist at 6-8 duct diameters downstream and 2-3 duct diameters upstream from a flow disturbance. The sampling plane does not meet this criterion. Additional sample points were used in compliance with AS4323.1 as the sampling plane was non-ideal.

The sample plane however does meet the minimum sampling plane conditions; sampling plane conditions will be found to exist at 2 duct diameters downstream and 0.5 duct diameters upstream from a flow disturbance.

The location of the sampling plane complies with AS4323.1 temperature, velocity and gas flow profile criteria for sampling.

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

The recommended maximums for analytes in urine are taken from "2018 TLVs and BEIs", as published by ACGIH (where available). Limit provided for Nickel is a precautionary guideline as per Position Paper prepared by AIOH Exposure Standards Committee, 2016.

Guideline limits for Rinse Water Quality reported as per analytical requirements and specifications of AS 4187, Amdt 2 2019, Table 7.2

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% – see ELN-P05 QA/QC tables for details; <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals (not SPOCAS); 60-140% for organics/SPOCAS (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Measurement Uncertainty estimates are available for most tests upon request.

Analysis of aqueous samples typically involves the extraction/digestion and/or analysis of the liquid phase only (i.e. NOT any settled sediment phase but inclusive of suspended particles if present), unless stipulated on the Envirolab COC and/or by correspondence. Notable exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, total recoverable metals and PFAS where solids are included by default.

Samples for Microbiological analysis (not Amoeba forms) received outside of the 2-8°C temperature range do not meet the ideal cooling conditions as stated in AS2031-2012.

Client Reference: 7051

Report Comments

Please note that impinger 5C was not provided and hence has no contribution to Analytical Fraction 3C (for run 727899).

Please note that Magnesium, Vanadium and Tin are not covered under USEPA m29 methodology but are accredited under in house methodology.

Analysis of Volatile Organic Compounds in Workplace Air by GC/MS

ND = Not Detected

Method : Analysis of Volatile Organic Compounds in Workplace Air by Gas Chromatography/Mass Spectrometry
Method Number : WCA 207
Limit of Quantitation : 5µg/section; 25µg/section for oxygenated hydrocarbons except acetone, MEK and MIBK at 5µg/section.
Brief Description : Volatile organic compounds are trapped from the workplace air onto charcoal tubes by the use of a personal air monitoring pump. The volatile organic compounds are then desorbed from the charcoal in the laboratory with CS_2. An aliquot of the desorbant is analysed by capillary gas chromatography with mass spectrometry detection.

PGME : Propylene Glycol Monomethyl Ether
PGMEA : Propylene Glycol Monomethyl Ether Acetate
DGMEA : Diethylene Glycol Monoethyl Ether Acetate

Measurement Uncertainty
The measurement uncertainty is an estimate that characterises the range of values within which the true value is asserted to lie. The uncertainty estimate is an expanded uncertainty using a coverage factor of 2, which gives a level of confidence of approximately 95%. The estimate is compliant with the "ISO Guide to the Expression of Uncertainty in Measurement" and is a full estimate based on in-house method validation and quality control data.

Quality Assurance
In order to ensure the highest degree of accuracy and precision in our analytical results, we undertake extensive intra- and inter-laboratory quality assurance (QA) activities. Within our own laboratory, we analyse laboratory and field blanks and perform duplicate and repeat analysis of samples. Spiked QA samples are also included routinely in each run to ensure the accuracy of the analyses. WorkCover Laboratory Services has participated for many years in several national and international inter-laboratory comparison programs listed below:-
- Workplace Analysis Scheme for Proficiency (WASP) conducted by the Health & Safety Executive UK;
- Quality Management in Occupational and Environmental Medicine QA Program, conducted by the Institute for Occupational, Social and Environmental Medicine, University of Erlangen – Nuremberg, Germany;
- Quality Control Technologies QA Program, Australia;
- Royal College of Pathologists QA Program, Australia.

EMISSION POINT EPL ID 35 - (SERVING BOILERS NO. 5 & 6)

SHOALHAVEN STARCHES PTY LTD

BOMADERRY, NSW

PROJECT NO.: 7049/S25370A/20

DATES OF SURVEY: 8 APRIL 2020

DATE OF ISSUE: 30 APRIL 2020

NATA accredited laboratory number 15043.

Accredited for Compliance with ISO/IEC 17025 - Testing

1 EMISSION TEST REPORT NO. 7049

The sampling and analysis was commissioned by:

Client:	Shoalhaven Starches Pty Ltd
Contact:	John Studdert
Address:	Bolong Road, Bomaderry, NSW 2541
Telephone:	02 4423 8254
Email:	John.studdert@manildra.com.au
Project Number:	7049/S25370A/20
Test Date:	8 April 2020
Production Conditions:	Normal operating conditions, refer section 1.4
Analysis Requested:	Dry gas density, flow, moisture, molecular weight of stack gases, temperature, carbon monoxide, carbon dioxide, oxygen, nitrogen oxides, metals Type I and II, stack pressure, sulfur dioxide, total solid particulate matter and volatile organic compounds
Sample Locations:	EPL No.883; EPL ID No. 35 – Combined Stack Boilers No. 5 & 6
Sample ID Nos.:	See Attachment A

NATA accredited laboratory number 15043.

Accredited for Compliance with ISO/IEC 17025 - Testing

Identification	The samples are labelled individually. Each label recorded the testing laboratory, sample number, sampling location (or Identification) sampling date and time and whether further analysis is required.

1.2 ESTIMATED UNCERTAINTY OF MEASUREMENT

Pollutant	Methods	Uncertainty
Moisture	AS4323.2, NSW TM-22, USEPA M4	25%
Nitrogen Oxides	NSW TM-11, USEPA M7E	15%
Oxygen and Carbon Dioxide	NSW TM-24, TM-25, USEPA M3A	1% actual
Carbon Monoxide	TM-32, USEPA M10	15%
Particulate > 20 mg/m^3	NSW TM-15, AS4323.2,	15%
Particulate < 20 mg/m^3	NSW TM-15, AS4323.2,	50%
Metals - Type I & II Substances in Aggregate	NSW TM-12,13 & 14+, USEPA M29*	100%+ *(50-200%)**
Sulfur Dioxide	NSW TM-4, USEPA M6C	15%
Velocity	AS4323.1, NSW TM-2, USEPA M2	5%
Volatile Organic Compounds (adsorption tube)	NSW TM-34, USEPA M18	25%

Key:

Unless otherwise indicated the uncertainties quoted have been determined @ 95% level of Confidence level (i.e. by multiplying the repeatability standard deviation by a co-efficient equal to 1.96) (Source – Measurement Uncertainty)

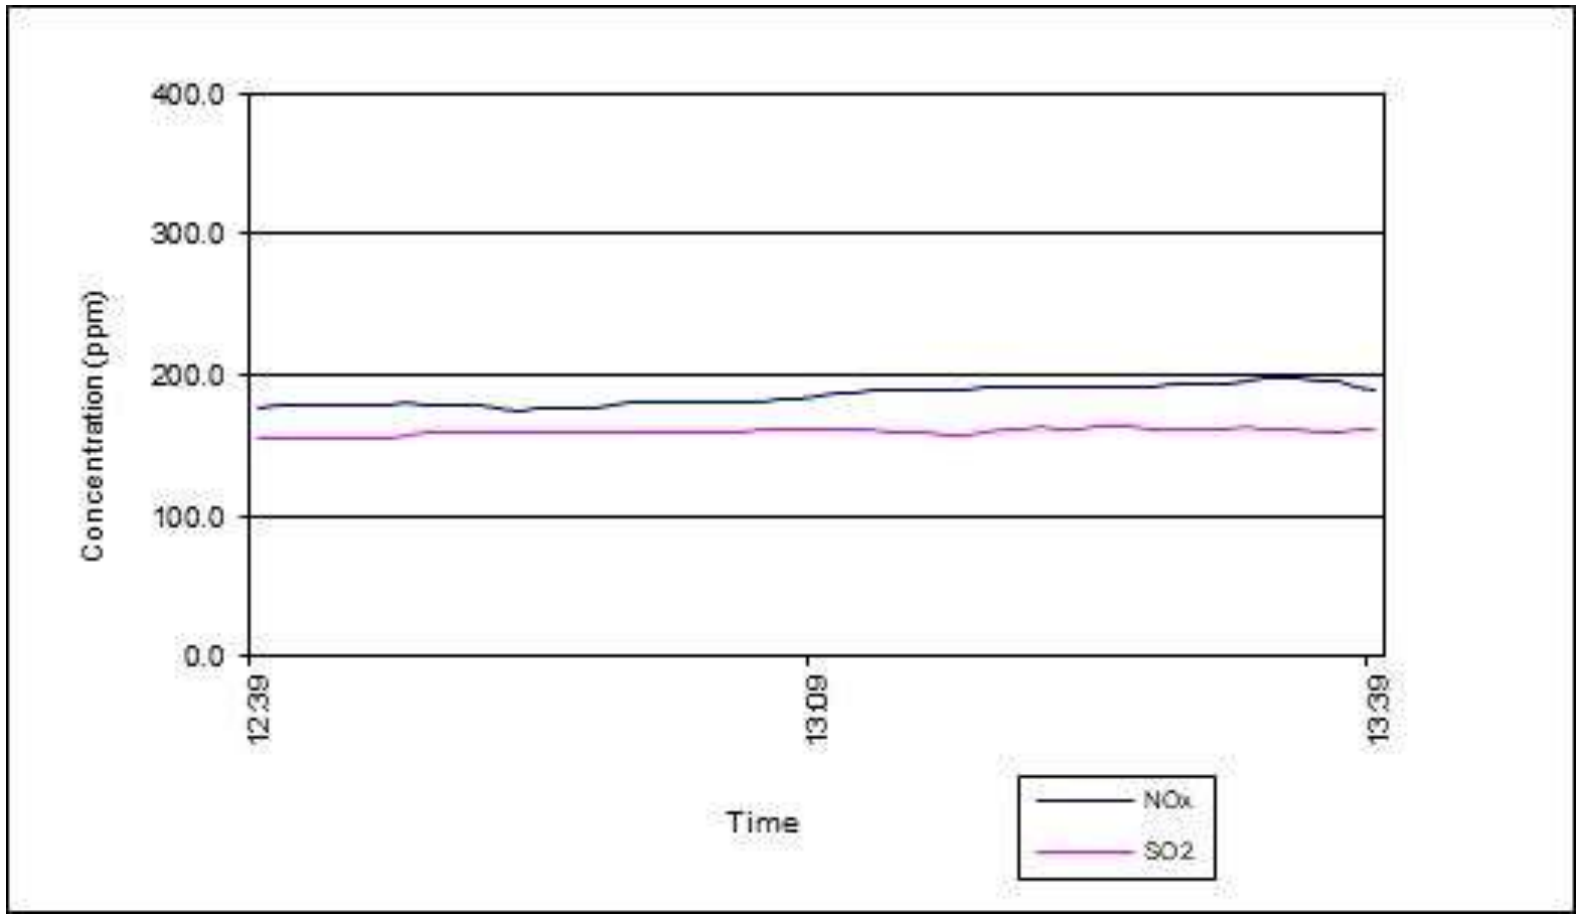
Sources: *Measurement Uncertainty – implications for the enforcement of emission limits by Maciek Lewandowski (Environment Agency) & Michael Woodfield (AEAT) UK*

Technical Guidance Note (Monitoring) M2 Monitoring of stack emissions to air Environment Agency Version 3.1 June 2005.

Note: ISO 9096 is for 20-1000 mg/m^3- which AS4323.2 is based on. Note DSEN 13284-1 testing for < 5 mg/m^3 correlates to 5 mg/m^3 with most quoted uncertainties of ± 5.3 mg/m^3 @ 6.4 mg/m^3. From Clean Air Engineering in the United States the lowest practical limit of USEPA M5 is 5 mg/m^3 under lab conditions.

1.3 CONTINUOUS LOGGED RECORD OF SO_2 AND NO_x - 8 APRIL 2020

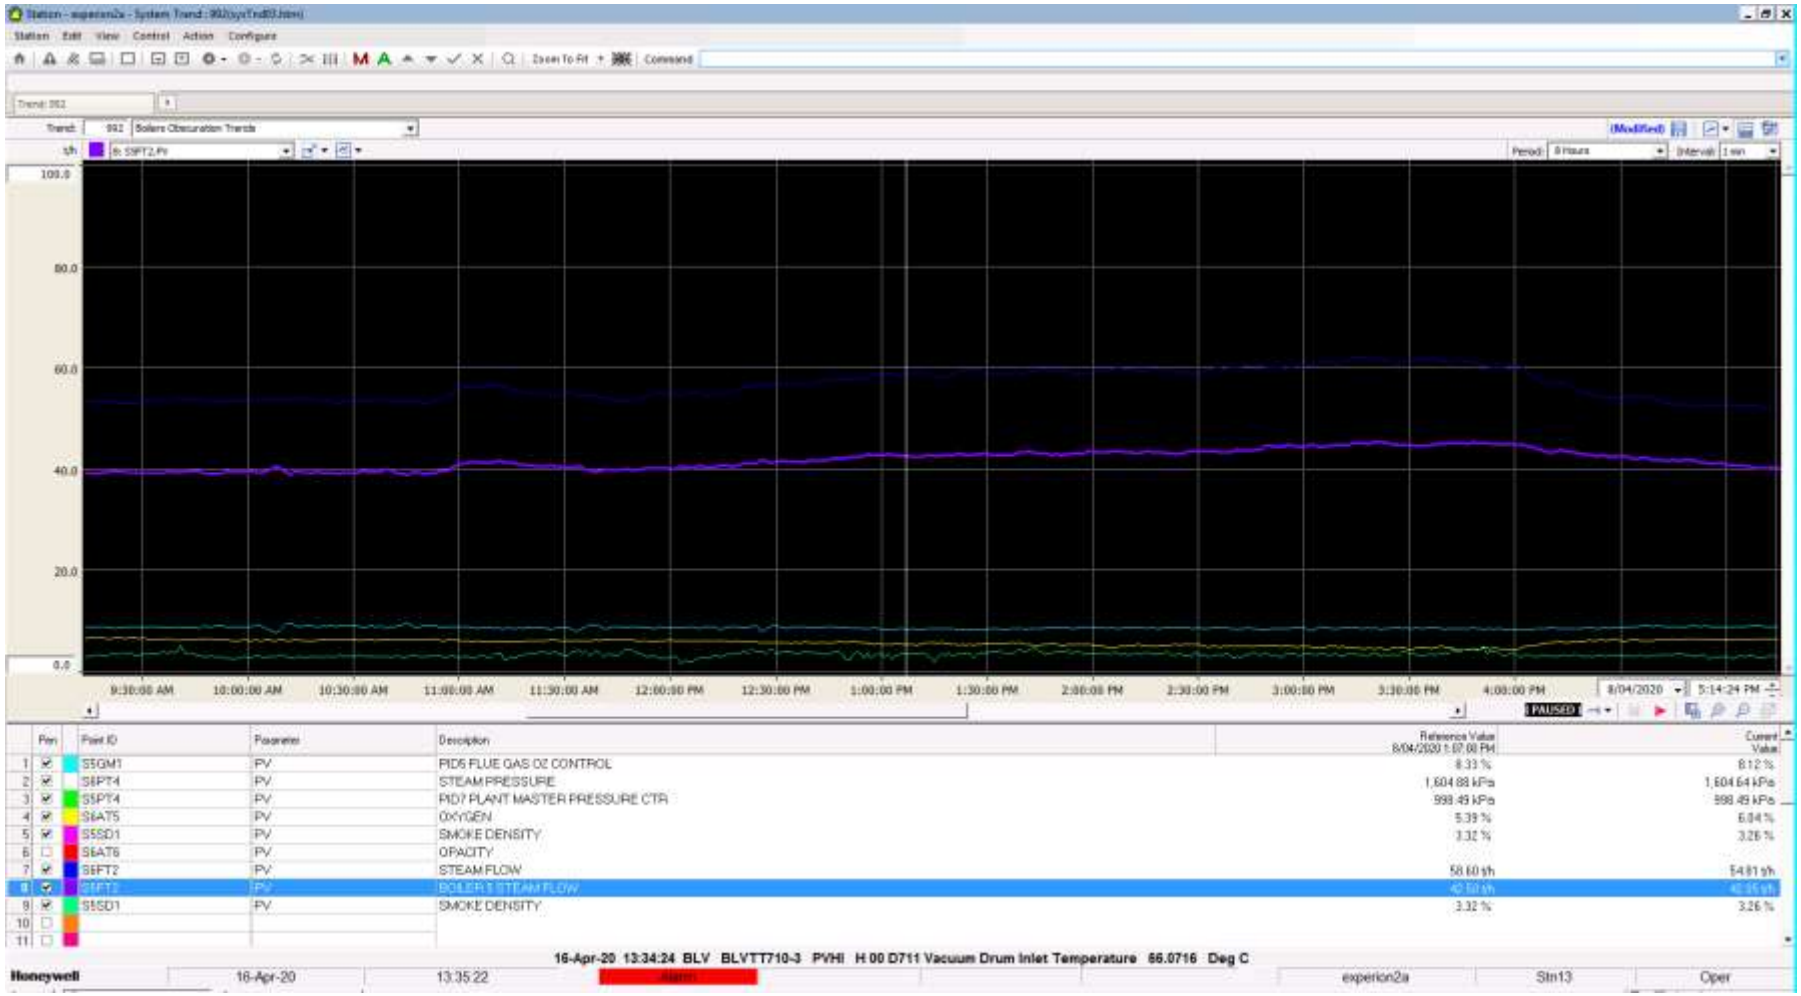
FIGURE 1-1 CONTINUOUS LOGGED TREND OF SO_2 AND NO_x IN PPM



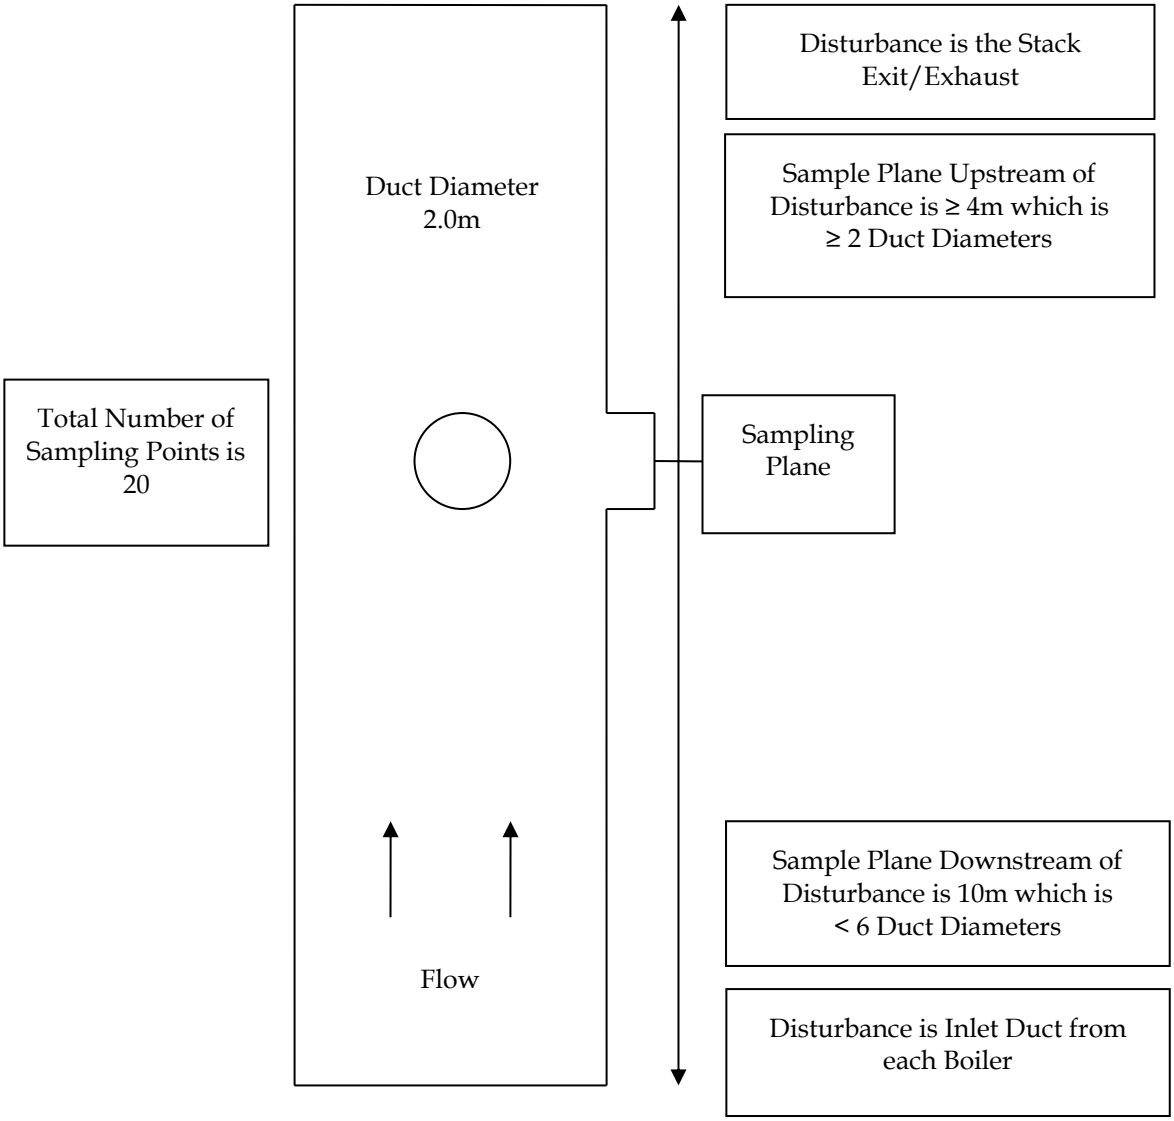
1.4 PROCESS DATA - BOILER NOS. 5 & 6

Shoalhaven Starches personnel considered Boilers 5 & 6 were operating under typical conditions on the day of testing.

FIGURE 1-2 CONTINUOUS LOGGED TREND OF BOILER 5 & 6 STEAM FLOW OPERATING CONDITIONS AND OPACITY



1.5 SAMPLING LOCATION – BOILER NOS. 5 & 6



In the absence of cyclonic flow activity ideal sampling plane conditions will be found to exist at 6-8 duct diameters downstream and 2-3 duct diameters upstream from a flow disturbance. The sampling plane does not meet this criterion. Additional sample points were used in compliance with AS4323.1 as the sampling plane was non-ideal.

The sample plane however does meet the minimum sampling plane conditions; sampling plane conditions will be found to exist at 2 duct diameters downstream and 0.5 duct diameters upstream from a flow disturbance.

The location of the sampling plane complies with AS4323.1 temperature, velocity and gas flow profile criteria for sampling.

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

The recommended maximums for analytes in urine are taken from "2018 TLVs and BEIs", as published by ACGIH (where available). Limit provided for Nickel is a precautionary guideline as per Position Paper prepared by AIOH Exposure Standards Committee, 2016.

Guideline limits for Rinse Water Quality reported as per analytical requirements and specifications of AS 4187, Amdt 2 2019, Table 7.2

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% – see ELN-P05 QA/QC tables for details; <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals (not SPOCAS); 60-140% for organics/SPOCAS (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Measurement Uncertainty estimates are available for most tests upon request.

Analysis of aqueous samples typically involves the extraction/digestion and/or analysis of the liquid phase only (i.e. NOT any settled sediment phase but inclusive of suspended particles if present), unless stipulated on the Envirolab COC and/or by correspondence. Notable exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, total recoverable metals and PFAS where solids are included by default.

Samples for Microbiological analysis (not Amoeba forms) received outside of the 2-8°C temperature range do not meet the ideal cooling conditions as stated in AS2031-2012.

Client Reference: 7049

Report Comments

Please note that Magnesium, Vanadium and Tin are not covered under USEPA m29 methodology but are accredited under in house methodology.

Please note that impinger 5C was not provided and hence has no contribution to Analytical Fraction 3C (for run727885).

Analysis of Volatile Organic Compounds in Workplace Air by GC/MS

A non-target compound was identified as 2-chloro-acrolein [CAS No: 683-51-2] with low probability of 15 out of 100 and was estimated at 81 µg per section.

ND = Not Detected

Method : Analysis of Volatile Organic Compounds in Workplace Air by Gas Chromatography/Mass Spectrometry
Method Number : WCA 207
Limit of Quantitation : 5µg/section; 25µg/section for oxygenated hydrocarbons except acetone, MEK and MIBK at 5µg/section.
Brief Description : Volatile organic compounds are trapped from the workplace air onto charcoal tubes by the use of a personal air monitoring pump. The volatile organic compounds are then desorbed from the charcoal in the laboratory with CS_2. An aliquot of the desorbant is analysed by capillary gas chromatography with mass spectrometry detection.

PGME : Propylene Glycol Monomethyl Ether
PGMEA : Propylene Glycol Monomethyl Ether Acetate
DGMEA : Diethylene Glycol Monoethyl Ether Acetate

Measurement Uncertainty
The measurement uncertainty is an estimate that characterises the range of values within which the true value is asserted to lie. The uncertainty estimate is an expanded uncertainty using a coverage factor of 2, which gives a level of confidence of approximately 95%. The estimate is compliant with the "ISO Guide to the Expression of Uncertainty in Measurement" and is a full estimate based on in-house method validation and quality control data.

Quality Assurance
In order to ensure the highest degree of accuracy and precision in our analytical results, we undertake extensive intra- and inter-laboratory quality assurance (QA) activities. Within our own laboratory, we analyse laboratory and field blanks and perform duplicate and repeat analysis of samples. Spiked QA samples are also included routinely in each run to ensure the accuracy of the analyses. WorkCover Laboratory Services has participated for many years in several national and international inter-laboratory comparison programs listed below:-
- Workplace Analysis Scheme for Proficiency (WASP) conducted by the Health & Safety Executive UK;
- Quality Management in Occupational and Environmental Medicine QA Program, conducted by the Institute for Occupational, Social and Environmental Medicine, University of Erlangen – Nuremberg, Germany;
- Quality Control Technologies QA Program, Australia;
- Royal College of Pathologists QA Program, Australia.

STACK EMISSION SURVEY – PARTICULATE MATTER

EMISSION POINTS

EPL ID 12 - STARCH DRYER NO. 1

EPL ID 14 - STARCH DRYER NO. 4 AND SPRAY DRYER

SHOALHAVEN STARCHES PTY LTD

BOMADERRY, NSW

PROJECT NO.: **7071/S25601/20**

DATE OF SURVEY: **14 MAY 2020, 30 JUNE 2020**

DATE OF ISSUE: **13 JULY 2020**

NATA accredited laboratory number 15043.

Accredited for Compliance with ISO/IEC 17025 - Testing

1 EMISSION TEST REPORT NO.7071

The sampling and analysis was commissioned by:

Client:	Shoalhaven Starches Pty Ltd
Contact:	John Studdert
Address:	Bolong Road, Bomaderry, NSW 2541
Telephone:	02 4423 8254
Email:	John.studdert@manildra.com.au
Project Number:	7071/S25601/20
Test Date:	14 May and 30 June 2020
Production Conditions:	Normal operating conditions, refer section 1.4.
Analysis Requested:	Dry gas density, flow, moisture, molecular weight of stack gases, temperature, total solid particulate matter and particulate matter less than 10 microns (PM_{10}).
Sample Locations:	EPL No.883; EPL ID No. 12 – Starch Dryer No. 1 Stack, EPK ID No. 14 – Starch Dryer No. 4, and Spray Dryer
Sample ID Nos.:	See Attachment A

NATA accredited laboratory number 15043.

Accredited for Compliance with ISO/IEC 17025 - Testing

Identification	The samples are labelled individually. Each label recorded the testing laboratory, sample number, sampling location (or Identification) sampling date and time and whether further analysis is required.

Test	*Test Method Number for Sampling and Analysis*	*NATA Laboratory Analysis By: NATA Accreditation No. & Report No.*
Dry Gas Density	NSW TM-23, USEPA M3	SEMA, Accreditation No. 15043, Emission Test Report No. 7071
Flow	NSW TM-2, USEPA M2	SEMA, Accreditation No. 15043, Emission Test Report No. 7071
Moisture	NSW TM-22, USEPA M4	SEMA, Accreditation No. 15043, Emission Test Report No. 7071
Molecular Weight of Stack Gases	NSW TM-23, USEPA M3	SEMA, Accreditation No. 15043, Emission Test Report No. 7071
Particulate Matter less than 10 microns	NSW OM-5, USEPA 201A	SEMA, Accreditation No. 15043, Particle Test Report No. 2164 & 2168

Velocity	NSW TM-2, USEPA M2	SEMA, Accreditation No. 15043, Emission Test Report No. 7071

Deviations from Test Methods Nil.

Sampling Times NSW - As per Test Method requirements or if not specified in the Test Method then as per Protection of the Environment Operations (Clean Air) Regulations Part 2.

Reference Conditions NSW – As per

(1) Environment Protection Licence conditions, or

(2) Schedule 4 and 5 of the Protection of the Environment Operations (Clean Air) Regulations

All associated NATA endorsed Test Reports/Certificates of Analysis are provided separately in Attachment A.

Issue Date: 13 July 2020

Peter Stephenson
Managing Director

1.1 SUMMARY OF AVERAGE EMISSION RESULTS – TEST REPORT NO. 7071

Parameter	Unit of measure	Location EPL ID 12 (Starch Dryer No. 1)	Location EPL ID 14 (Starch Dryer No. 4)	Location Spray Dryer
		Tested: 14 May 2020 Average Result	Tested: 30 June 2020 Average Result	Tested: 30 June 2020 Average Result
Sampling times	hours	13:45-15:15	12:50-14:10	14:31-15:51
Temperature	^oC	38	39	71
Pressure	kPa	102.7	102.3	102.3
Velocity	m/s	6	22	8
Actual Volumetric Flow	am^3/s	13	22	12.1
Volumetric Flow	m^3/s	11	19	9.4
Moisture	%	1.6	3.4	3.5
Molecular Weight Dry Stack Gas	g/g mole	28.5	28.5	28.6
Dry Gas Density	kg/m^3	1.27	1.27	1.28
Oxygen	%	20.9	20.9	20.5
Particulate Matter less than 10 microns	mg/m^3	3	1.5	0.2
Total Solid Particulates	mg/m^3	4	3.0	0.3

Key to Table 1.1:

EPL	=	Environment Protection Licence
ID	=	identification no.
%	=	percentage
Conc.	=	concentration
--	=	Not referenced in EPL
^oC	=	degrees Celsius
<	=	less than
>	=	greater than
kg/m^3	=	kilograms per cubic metre
kPa	=	kilo Pascals
g/g mole	=	grams per gram mole
m^3/s	=	dry cubic metre per second 0^oC and 101.3 kilopascals (kPa)
m/s	=	metres per second
am^3/s	=	dry cubic metre per second @ in-stack conditions
mg/m^3	=	milligrams per cubic metre at 0^oC and 101.3 kilopascals (kPa) @ Reference Conditions (where specified)

1.2 ESTIMATED UNCERTAINTY OF MEASUREMENT

Pollutant	Methods	Uncertainty
Moisture	AS4323.2, NSW TM-22, USEPA 4	25%
Particulate > 20 mg/m^3	NSW TM-15, AS4323.2, USEPA 201A	15%
Particulate < 20 mg/m^3	NSW TM-15, AS4323.2, USEPA 201A	50%
Velocity	AS4323.1, NSW TM-2, USEPA M2	5%

Key:

Unless otherwise indicated the uncertainties quoted have been determined @ 95% level of Confidence level (i.e. by multiplying the repeatability standard deviation by a co-efficient equal to 1.96) (Source – Measurement Uncertainty)

Sources: *Measurement Uncertainty – implications for the enforcement of emission limits by Maciek Lewandowski (Environment Agency) & Michael Woodfield (AEAT) UK*

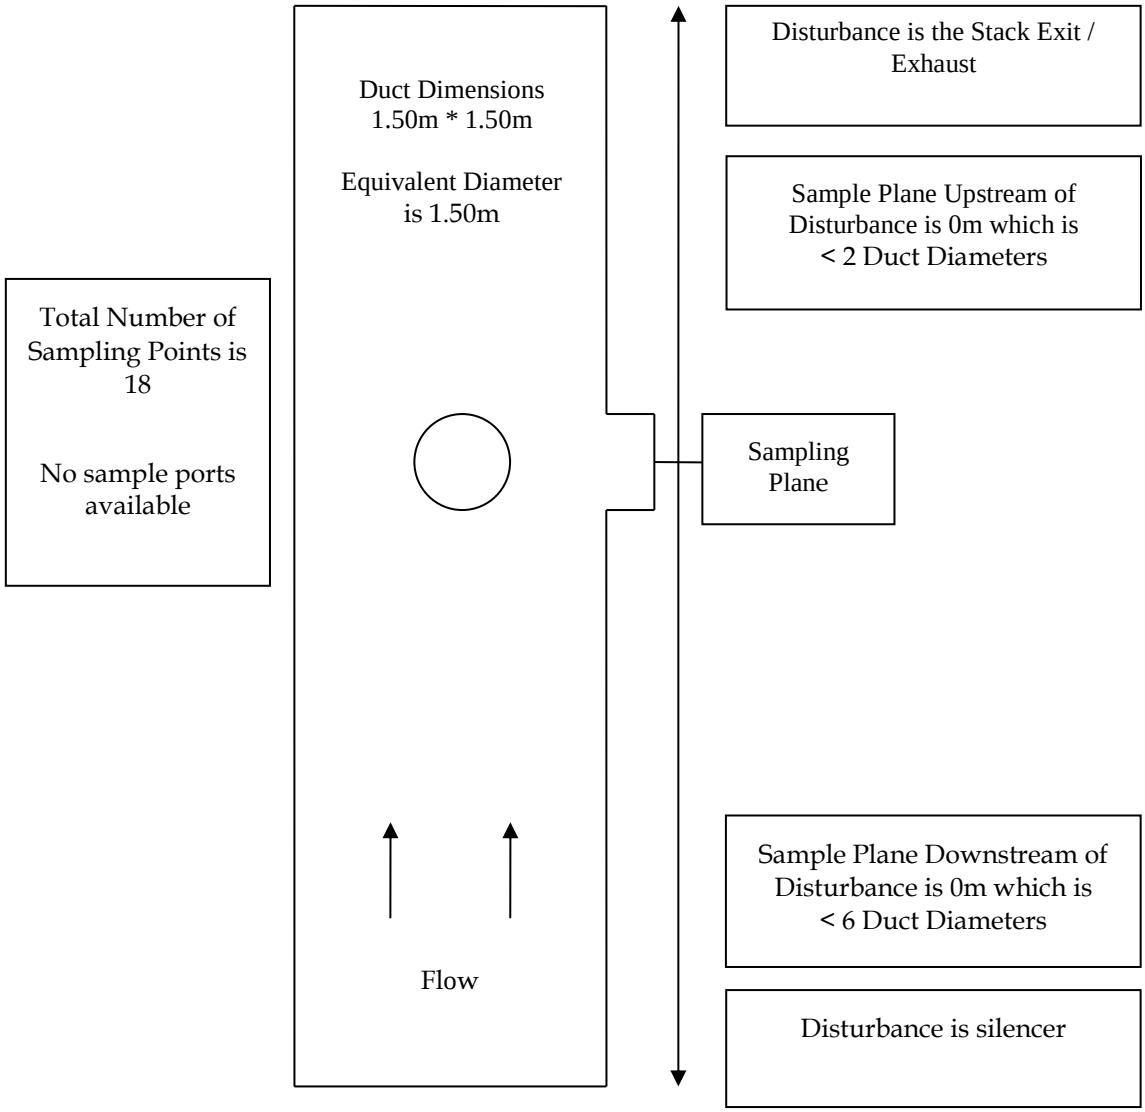
Technical Guidance Note (Monitoring) M2 Monitoring of stack emissions to air Environment Agency Version 3.1 June 2005.

Note: ISO 9096 is for 20-1000 mg/m^3- which AS4323.2 is based on. Note DSEN 13284-1 testing for < 5 mg/m^3 correlates to 5 mg/m^3 with most quoted uncertainties of $\pm$ 5.3 mg/m^3 @ 6.4 mg/m^3. From Clean Air Engineering in the United States the lowest practical limit of USEPA M5 is 5 mg/m^3 under lab conditions.

1.3 PROCESS DATA -

Shoalhaven Starches personnel considered Starch Dryer No.1, Starch Dryer No. 4, and the Spray Dryer were operating under typical conditions on the day of testing. Refer Shoalhaven Starches for details.

1.4 SAMPLING LOCATION – STARCH DRYER NO. 1



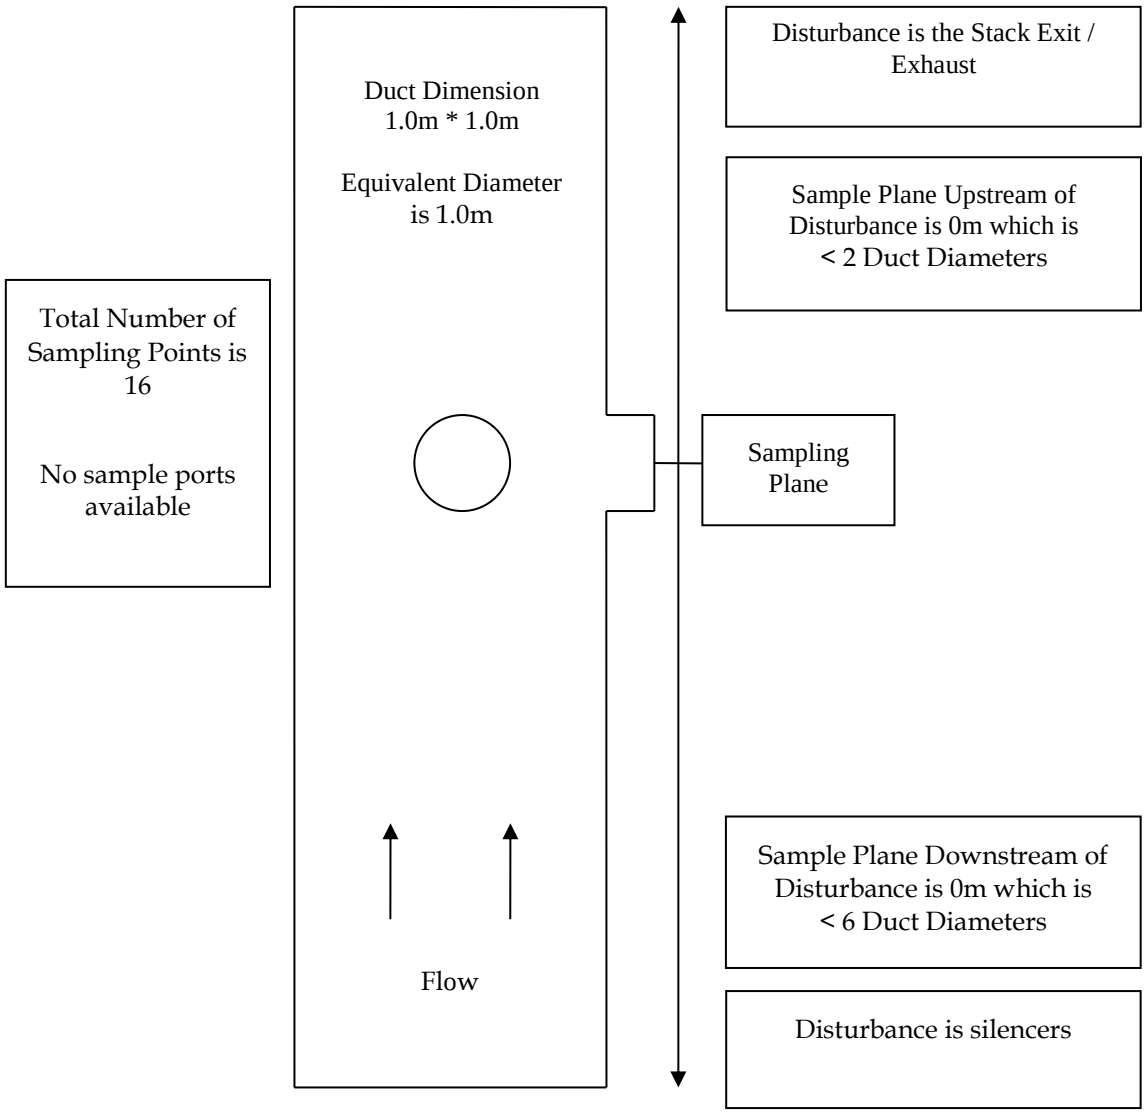
In the absence of cyclonic flow activity ideal sampling plane position will be found to exist at 6-8 duct diameters downstream and 2-3 duct diameters upstream from a flow disturbance. The sampling plane does not meet this criterion. Additional sample points were used in compliance with AS4323.1 as the sampling plane was non-ideal.

However the sample plane also does not meet the minimum sampling plane position; sampling plane position will be found to exit at 2 duct diameters downstream and 0.5 duct diameters upstream from a flow disturbance. A suitable sampling plane should be sought fitting these criteria.

The location of the sampling plane complies with AS4323.1 temperature, velocity and gas flow profile criteria for sampling.

FIGURE D-1 STARCH DRYER NO. 1 – SAMPLE LOCATION

1.5 SAMPLING LOCATION – STARCH DRYER NO. 4



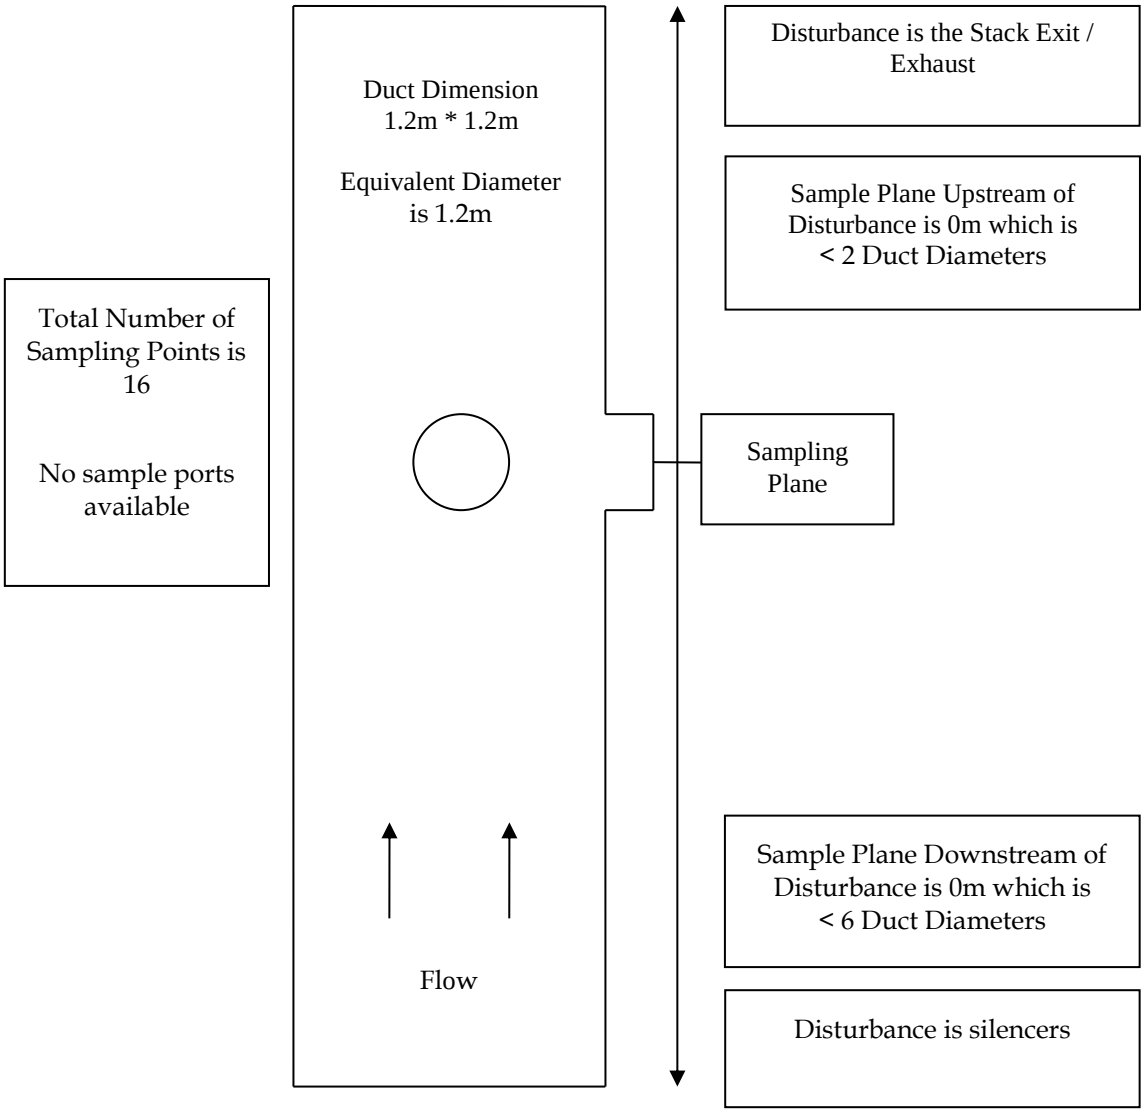
In the absence of cyclonic flow activity ideal sampling plane position will be found to exist at 6-8 duct diameters downstream and 2-3 duct diameters upstream from a flow disturbance. The sampling plane does not meet this criterion. Additional sample points were used in compliance with AS4323.1 as the sampling plane was non-ideal.

However the sample plane also does not meet the minimum sampling plane position; sampling plane position will be found to exit at 2 duct diameters downstream and 0.5 duct diameters upstream from a flow disturbance. A suitable sampling plane should be sought fitting these criteria.

The location of the sampling plane complies with AS4323.1 temperature, velocity and gas flow profile criteria for sampling.

FIGURE D-2 STARCH DRYER NO. 4 – SAMPLE LOCATION

1.6 SAMPLING LOCATION – SPRAY DRYER



In the absence of cyclonic flow activity ideal sampling plane position will be found to exist at 6-8 duct diameters downstream and 2-3 duct diameters upstream from a flow disturbance. The sampling plane does not meet this criterion. Additional sample points were used in compliance with AS4323.1 as the sampling plane was non-ideal.

However the sample plane also does not meet the minimum sampling plane position; sampling plane position will be found to exit at 2 duct diameters downstream and 0.5 duct diameters upstream from a flow disturbance. A suitable sampling plane should be sought fitting these criteria.

The location of the sampling plane complies with AS4323.1 temperature, velocity and gas flow profile criteria for sampling.

Flow	USEPA M2	SEMA, Accreditation No.15043 Emission Test Report No. 7093
Moisture	USEPA M4	SEMA, Accreditation No.15043 Emission Test Report No. 7093
Molecular Weight of Stack Gases	USEPA M3	SEMA, Accreditation No.15043 Emission Test Report No. 7093
Oxides of Nitrogen	USEPA M7E	SEMA, Accreditation No.15043 Emission Test Report No. 7093
Oxygen	USEPA M3A	SEMA, Accreditation No.15043 Emission Test Report No. 7093
Sampling Location	AS4323.1	SEMA, Accreditation No.15043 Emission Test Report No. 7093
Stack Pressure	USEPA M2	SEMA, Accreditation No.15043 Emission Test Report No. 7093
Stack Temperature	USEPA M2	SEMA, Accreditation No.15043 Emission Test Report No. 7093
Velocity	USEPA M2	SEMA, Accreditation No.15043 Emission Test Report No. 7093

Deviations from Test Methods Nil

Sampling Times NSW - As per Test Method requirements or if not specified in the Test Method then as per Protection of the Environment Operations (Clean Air) Regulations Part 2.

Reference Conditions NSW – As per

(1) Environment Protection Licence conditions, or

(2) Schedule 4 and 5 of the Protection of the Environment Operations (Clean Air) Regulations

Issue Date
30 July 2020

Managing Director

SUMMARY OF AVERAGE EMISSION RESULTS – TEST REPORT NO. 7093

Parameter	Unit of measure	Starch Dryer 1	Starch Dryer 4	Starch Dryer 5	Gluten Dryer 1	Gluten Dryer 2	Gluten Dryer 3	Gluten Dryer 4
		14/05/2020	30/06/2020	20/02/2020	14/05/2020	04/06/2020	14/05/2020	04/06/2020
Temperature	^oC	38	39	68	71	64	74	72
Pressure	kPa	102.7	102.3	102.7	102.5	93.2	102.5	102.2
Velocity	m/s	6	22	14	14	17	11	21
Volumetric Flow	m^3/s	11	18	49	15	12	36	30
Moisture	%	1.6	3.2	6.3	7.3	14	6.3	6.4
Molecular weight dry stack gas	g/g mole	28.9	28.9	28.9	28.9	28.9	28.9	28.9
Gas Density	kg/m^3	1.29	1.29	1.29	1.29	1.29	1.29	1.29
Nitrogen Oxides @ stack O_2	mg/Nm^3	ns	2	<2	8	2	12	2
Oxygen	%	20.9	20.9	20.8	20.9	20.9	20.9	20.6
Dryer auxiliary gas burner setting – (advised by operators)	%	nil	nil	266 m^3/hour	8	20	7	15

Key:
- ^oC = degrees Celsius
- kPa = kilo Pascal
- m/s = metres per second
- m^3/s = dry cubic metre per second 0^oC and 101.3 kilopascals (kPa)
- % = percentage
- g/g mole = grams per gram mole
- kg/m^3 = kilograms per cubic metre
- mg/Nm^3 = milligrams per cubic metre at 0^oC and 101.3 kilopascals (kPa)
- O_2 = oxygen
- ns = not sampled because an auxiliary gas burner is not fitted

ESTIMATED UNCERTAINTY OF MEASUREMENT

Pollutant	Methods	Uncertainty
Moisture	AS4323.2, USEPA 4	25%
Nitrogen Oxides	USEPA 7E	15%
Oxygen	USEPA 3A	1% actual
Velocity	AS4323.1, USEPA 2	5%

Key:

Unless otherwise indicated the uncertainties quoted have been determined @ 95% level of Confidence level (i.e. by multiplying the repeatability standard deviation by a co-efficient equal to 1.96) (Source – Measurement Uncertainty)

Sources: *Measurement Uncertainty – implications for the enforcement of emission limits by Maciek Lewandowski (Environment Agency) & Michael Woodfield (AEAT) UK*

Technical Guidance Note (Monitoring) M2 Monitoring of stack emissions to air Environment Agency Version 3.1 June 2005.
