Content:

I understand from the Environmental Assessment that additional water (quantity unstated) will be drawn from the Belubula River to support increased extraction rates. I am concerned that, even though the additional water needed is within the company's allocation, it will put additional stress on the Belubula River. This stream is already under severe stress, exacerbated by the threat of a new dam near Cranky Rock, and should have additional environmental flows, not increased extraction.

I am also concerned that the time-frame provided for comments is very short and that the documents provide very little information on the possible environmental impact, in particular how the increased extraction would affect the flora, fauna and aquatic ecosystem in times of low water flow.

It would seem to me that the original EA should have predicted the appropriate extraction rate and that there is now no doubt to modify this.
