

Solar Access Analysis
for the proposed development known as
Australia Towers,
Sydney Olympic Park

April 4, 2011

Report Reference No. WA999-01F05(rev1)- SA Report

The work presented in this document was carried out in accordance with the Windtech Consultants Pty Ltd Quality Assurance System, which is based on Australian Standard / NZS ISO 9001.

This document is issued subject to review and authorisation by the Team Leader noted by the initials printed in the last column above. If no initials appear, this document shall be considered as preliminary or draft only and no reliance shall be placed upon it other than for information to be verified later.

This document is prepared for our Client's particular requirements which are based on a specific brief with limitations as agreed to with the Client. It is not intended for and should not be relied upon by a third party and no responsibility is undertaken to any third party without prior consent provided by Windtech Consultants Pty Ltd. This report should not be reproduced, presented or reviewed except in full. Prior to passing on to a third party, the Client is to fully inform the third party of the specific brief and limitations associated with the commission.

The information contained herein is for the purpose of wind, thermal and or solar effects only. No claims are made and no liability is accepted in respect of design and construction issues falling outside of the scope of this report.

1.0 Executive Summary

An analysis has been undertaken to assess the number of hours of direct solar access to the Living Areas and Private Open Spaces of each residential apartment of the proposed development known as Australia Towers, located at Sydney Olympic Park. The analysis of has been undertaken based on architectural drawings prepared by the project architect Bates Smart, received March 28, 2011 (drawing issue P5).

The solar access analysis is carried out using a 3D computer model of the proposed development and surrounding buildings. Topographical effects have also been included on the model. Shadows are able to be cast over the model based on the path of the sun on the mid-winter solstice (June 21). From this, the times of the day when direct solar access is available to the windows of the Living Areas of each residential apartment is determined. Furthermore, the times of the day when direct solar access is available to the Private Open Space (measured at the floor slab level) of each residential apartment is also determined. The results of this study are accurate to within 10 minutes.

The results are calculated on the mid-winter solstice (June 21), between 9am and 3pm. Note that there are a total of 588 residential apartments within the proposed development. Tower 1 contains 267, and Tower 2 contains 321. Furthermore, it should be noted that the louvre-screens along the side of some of the balcony areas of the development have been assumed to be orientated to allow direct solar access through the louvre-screen at the times when this would occur.

The results of the analysis are summarised as follows:

- 72% of the total number of residential apartments achieve at least 2 hours of direct solar access to the window(s) of the Living Area. This comprises of 63% of the apartments in Tower 1, and 79% of the apartments in Tower 2.
- 72% of the total number of residential apartments achieve at least 2 hours of direct solar access to the floor slab of the Private Open Space. This comprises of 63% of the apartments in Tower 1, and 79% of the apartments in Tower 2.

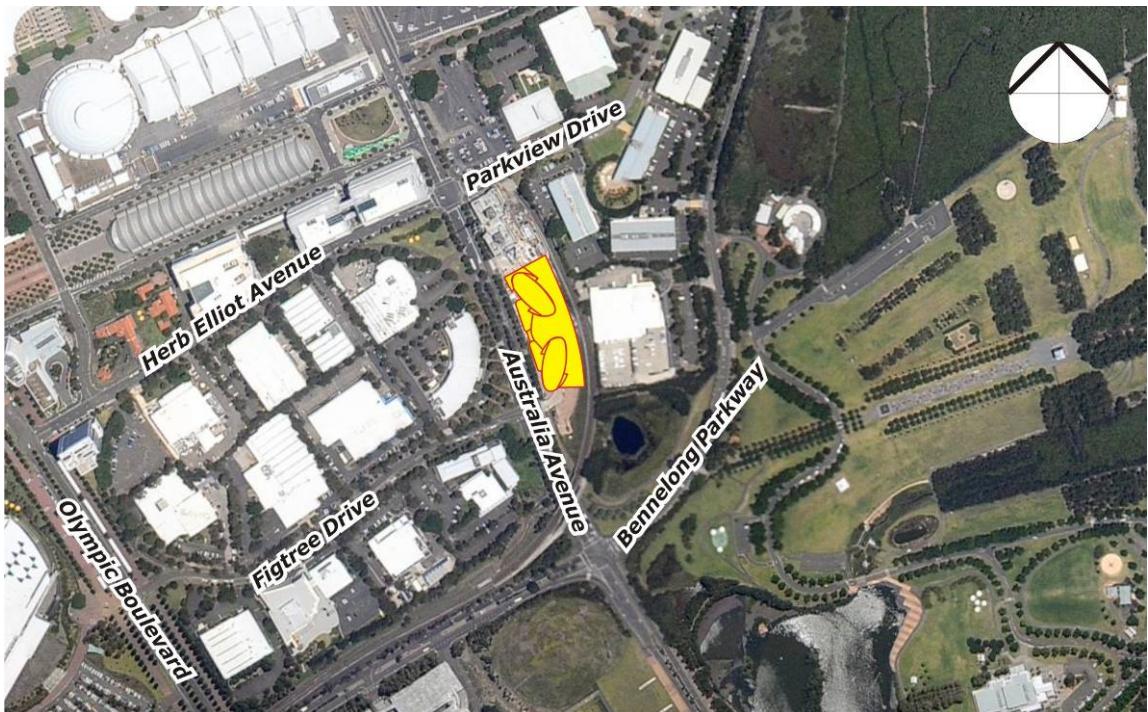

2.0 Description of the Proposed Development

The proposed development contains two residential buildings connected by a podium component at ground level. The podium component has a height of 2 storeys above the Australia Avenue street level. Towers 1 and 2 both have a generally elliptical floor plate. Tower 1 is located at the northern end of the site with its major axis aligned north-west to south-east, and is proposed to be 25 storeys tall (above the Australia Avenue street level). Tower 2 is located at the southern end of the site with its major axis aligned north to south, and is proposed to be 31 storeys tall (above the Australia Avenue street level). Four basement levels are proposed and will be used for car parking.

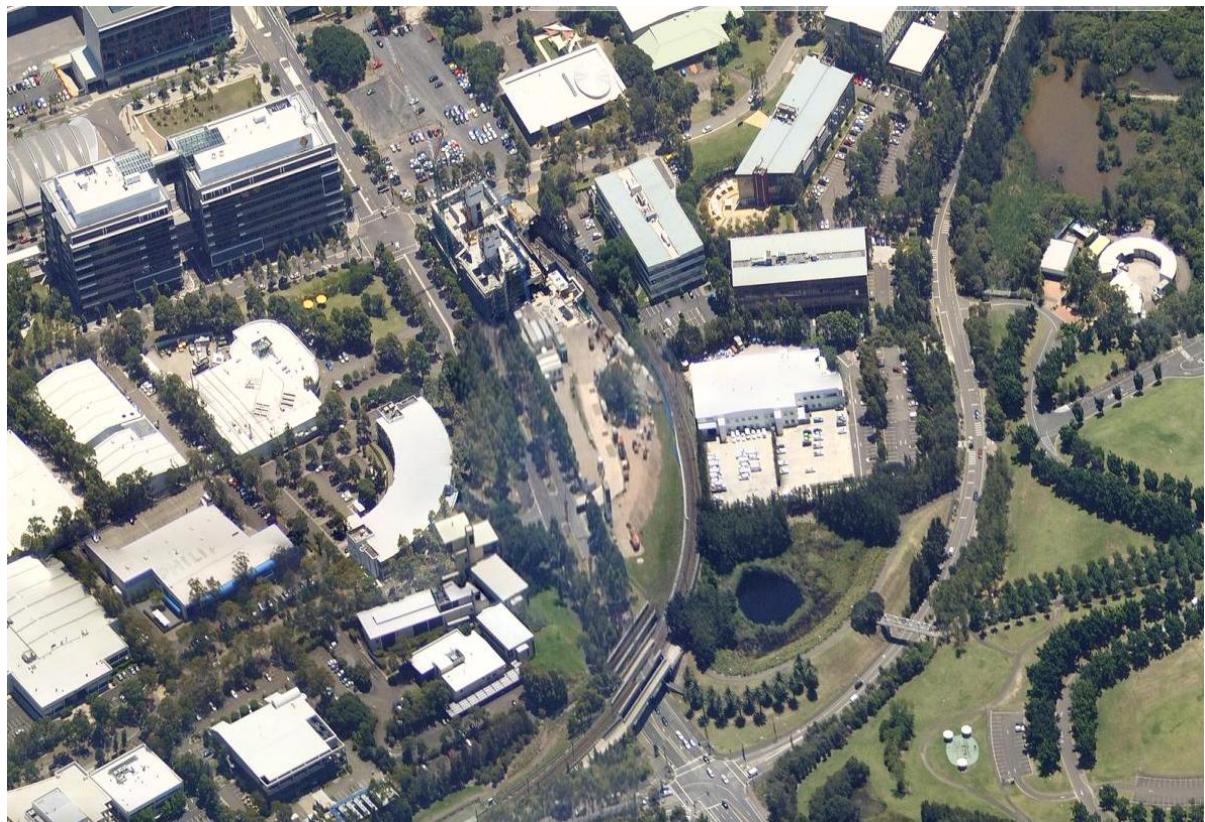

3.0 Description of the Site and Surrounds

The proposed development site is located on western side of Australia Avenue in Sydney Olympic Park. The site is bound by the Olympic Park railway line to the east, Australia Avenue to the west, and neighbouring the site to the north is Multiplex's residential development known as Site 3 North which is currently under construction and will have a height of approximately 25 storeys above ground. Further to the north of the site is Parkview Drive.

The landform in the local vicinity of the site is relatively flat, although there is a gradual fall down towards the lagoon within Bicentennial Park to the south-east. There is also a cutting for the railway line to the north-east of the development site. Aerial images of the existing site are shown in Figures 1a to 1c.

4.0 Solar Access Criteria

Part 03 (Building Design) for Building Amenity of the State Environmental Planning Policy No. 65 (SEPP65), known as the Residential Flat Design Code, requires that Living Rooms and Private Open Spaces for at least 70 percent of apartments in a development should receive a minimum of two hours direct sunlight between 9am and 3pm in mid-winter in dense urban areas.

5.0 Methodology

The solar access analysis is carried out using a 3D computer model of the proposed development and surrounding buildings. Topographical effects have also been included on the model. Perspective images of the computer model used for this study are shown in Figures 2a and 2b.

Shadows are able to be cast over the model based on the path of the sun on the mid-winter solstice (June 21). From this, the times of the day when direct solar access is available to the windows of the Living Areas of each residential apartment is determined. Furthermore, the times of the day when direct solar access is available to the Private Open Space (measured at the floor slab level) of each residential apartment is also determined. The results of this study are accurate to within 10 minutes.

6.0 Results

The number of hours of direct solar access to the Living Area and Private Open Space of each residential apartment of the subject development is presented in Table 1. The results are calculated on the mid-winter solstice (June 21), between 9am and 3pm. Note that the times that direct solar access occurs is also indicated in Table 1 (within an accuracy of 10 minutes). Note that there are a total of 588 residential apartments within the proposed development. Tower 1 contains 267, and Tower 2 contains 321. Furthermore, it should be noted that the louvre-screens along the side of some of the balcony areas of the development have been assumed to be orientated to allow direct solar access through the louvre-screen at the times when this would occur.

The results of the analysis are summarised as follows:

- 72% of the total number of residential apartments achieve at least 2 hours of direct solar access to the window(s) of the Living Area. This comprises of 63% of the apartments in Tower 1, and 79% of the apartments in Tower 2.
- 72% of the total number of residential apartments achieve at least 2 hours of direct solar access to the floor slab of the Private Open Space. This comprises of 63% of the apartments in Tower 1, and 79% of the apartments in Tower 2.
