**Re: 3 Murray Rose Avenue, Olympic Park  
Stormwater Concept**

Further to Sydney Olympic Park Authority's (SOPA) letter dated the 5 November 2012 regarding stormwater harvesting for reuse within the development.

We note that the plantroom roof area is approximately 640m<sup>2</sup>. Our intention is to divert that stormwater roof collection area to the WRAMS tank system (designed for peak demand) via a first flush device. An overflow from the WRAMS tank shall discharge stormwater via gravity to the stormwater infrastructure system located in Murray Rose Avenue.

This roof capture of stormwater will reduce the buildings demand on the existing WRAMS system available to the site. The WRAMS system is to supply water for flushing, irrigation, wash down and most importantly cooling tower water consumption.

We trust the above information is sufficient for your approval, however, should you require further information or wish to discuss any matter regarding the above design intent please do not hesitate to contact the undersigned.

Yours faithfully
