# Flora and Fauna Assessment including Arborist Report

## Flora and fauna assessment report

for

**Kempsey District Hospital** 

Date: 13 May 2013

Document No: 1123-REP-23-ISS-6 Prepared for: Health Infrastructure

Prepared by: Abel Ecology

#### **Disclaimer**

This report has been prepared in accordance with the scope of services described in agreement between Abel Ecology and the Client.

In preparing this report, Abel Ecology has relied upon data, surveys and site inspection results taken at or under the particular time and or conditions specified herein. Abel Ecology has also relied on certain verbal information and documentation provided by the Client and/or third parties, but did not attempt to independently verify the accuracy or completeness of that information. To the extent that the conclusions and recommendations in this report are based in whole or in part on such information, they are contingent on its validity. Abel Ecology assumes no responsibility for any consequences arising from any information or condition that was concealed, withheld, misrepresented, or otherwise not fully disclosed or available to Abel Ecology.

The findings contained in this report are the result of discrete/specific methodologies used in accordance with normal practices and standards. To the best of our knowledge, they represent a reasonable interpretation of the general condition of the site in question. Under no circumstances, however, can it be considered that these findings represent the actual state of the site/sites at all points.

Any representation, statement, opinion or advice, expressed or implied in this publication is made in good faith but on the basis that Abel Ecology, its agents and employees are not liable (whether by reason of negligence, lack of care or otherwise) to any person for any damage or loss whatsoever, which has occurred or may occur in relation to that person taking or not taking (as the case may be) action in respect of any representation, statement, or advice referred to above. Any findings, conclusions or recommendations only apply to the aforementioned circumstances and no greater reliance should be assumed or drawn by the Client.

Furthermore, this report has been prepared solely for use by the Client. Abel Ecology accepts no responsibility for its use by other parties.

#### **Executive Summary**

A fauna and flora survey of the proposed Kempsey Hospital Redevelopment at Kempsey
4 Hospital ('the site' – Figure 1) was undertaken on the 1st January and 18th February 2013.

- 6 The relevant Director-General's requirement DGR 7 states:
  - "Address impacts on flora and fauna, including threatened species, populations and endangered ecological communities and their habitats and steps taken to mitigate any identified impacts to protect the environment."

The Flora and Fauna scope of works relates to:

# Enabling Works Phases 1 and 2 (subject to approval from Health infrastructure under a Review of Environmental Factors)

The majority of tree removals are associated with the Phase 1 and 2 Enabling Works for the Project, including those associated with the River St car park and building relocations to the north west and north east of the site. The car park construction is in this approval process.

#### Main works phase (subject to a State Significant Development Application)

20 Residual Jacaranda trees located to the north of the site, off Polwood St, will be removed during the Main Works Phase, along with the relocation of palms.

#### The following conclusions and recommendations apply:

- a) There is no impediment to the proposed works in the scope of this report. There is no unacceptable or significant impact on flora and fauna, including threatened species, populations and endangered ecological communities and their habitats.
  - b) Tree protection and tree removal will occur before other works.
- 28 c) Protection of trees to be retained and those adjacent to the works corridor is as per AS4970 Protection Of trees On Development Sites.
- 30 d) A works corridor is to be defined by temporary fencing so as to exclude machinery and materials from the area of trees beyond the works corridor.
- e) Certification of tree protection works by the project ecologist is required before other works commence in order to ensure protection of retained trees (REF works).
- 34 f) A landscape plan showing replacement planting for lost trees is recommended.
- g) For replacement of demolished trees and for any future landscaping Abel Ecology
   recommends a landscape plan with the inclusion of locally indigenous species, such as, but not limited to:
- i. Trees
   Red Cedar Toona australis

   40 Teak Flindersia australis

- Lilly Pilly Acmena smithii, Syzygium crebrinerve
- Black Bean Castanospermum australeRusty Fig Ficus rubiginosa
- 4 ii. Shrubs
  - Blueberry Ash Elaeocarpus reticulatus
- 6 Lilly Pilly Syzygium oleosum
- h) The Bangalow Palms and other Palms are recommended for transplanting on site so any possible use by native fauna is not lost.

#### 1. Introduction

4

18

34

- A fauna and flora survey of the proposed development site at Kempsey Hospital ('the site' Figure 1) was undertaken on the 1st January and 18th February 2013.
  - The main aim of this survey was to determine whether the present proposal is likely to cause a
- 6 significant effect on any endangered ecological community, endangered population, threatened species or their habitats. This assessment is based on the seven factors listed in
- 8 Section 5A of the Environmental Planning and Assessment Act 1979, no. 203, (as amended).
- This assessment addresses both 'endangered' and 'vulnerable', as required by the Threatened Species Conservation Act, 1995 (TSC Act 1995). Throughout this report
- 12 'threatened' refers to those species and communities listed as 'endangered' or 'vulnerable' in Schedules 1 & 2 of the TSC Act 1995. 'Protected fauna' refers to any native bird, mammal
- 14 (except the dingo), reptile or amphibian in NSW.
- 16 Removal of trees is to be done under a Review of Environmental Factors.

#### 1.1 Planning relationships

#### 1.1.1 Legislation

- 20 i) Section 79C(1)(c) EP & A Act
  - j) TSC Act 1995
- 22 k) EPBC Act 1999

#### 2. The site and proposed development

#### 2.1 The proposal

- 26 The proposal (Figure 1) subject to approval by Health Infrastructure under a Review of Environmental Factors is to:
- Demolish some existing buildings and landscaped areas to construct a new building complex;
- Construct new car parks;
  - Construct new access roads including from Tozer St;
- Install new stormwater and sewer lines;
  - Install new high voltage electricity lines from Tozer St;

A number of trees are proposed to be removed for:

- the construction of buildings;
  - installation of services including stormwater, sewer and electricity;

14 May 2013 1123-REP-23-ISS-6 DD F&F 13May13.docx

aviation safety for the helicopter flight path.

Δ

2

4

A number of trees that are in very poor health or that are dying are also recommended for removal.

- 6 New stormwater drainage is to constructed to amplify existing drainage capacity. Stormwater is presently piped under River St and dispersed by a headwall at the top of a cliff
- 8 adjacent to the Macleay River. A new pipe and headwall will replace the existing structure and disperse stormwater further back from the cliff (subject to approval by Health
- 10 Infrastructure under a Review of Environmental Factors).
- A new sewer line and replaced boundary trap is proposed for the Tozer St boundary and new high voltage electricity supply provided from Tozer St to a new pole mounted substation.
  - A new landscape plan with replacement local native trees is recommended.

16

14

#### 2.2 Survey methodology

The site was inspected on 1st January and 18th February 2013 and trees proposed for removal or near proposed works were recorded, with any potential for fauna use assessed. Tree protection zones were calculated so that trees are to be either removed for construction or

protection zones were calculated so that trees are to be either removed for construction or appropriate protection measures applied.

22

#### 2.3 Site description

24 For the purposes of this report, the site is defined by property boundaries with the present study area confined to the footprint of the proposal and areas immediately adjacent.

26

28

There are no water bodies or creeks or remnant vegetation community on the site. Stormwater drainage is presently piped to the Macleay River under River Road and thence through a parkland.

30

The site is adjacent to a cemetery.

32

#### 2.4 Vegetation and fauna habitat description

- The site was cleared for construction of the hospital in 1881, with the Centenary celebrated in 1981 and a (now) heritage listed building constructed in 1913. Vegetation on site comprises
- planted specimen trees of mostly exotic species. Some remnant native trees occur along the western road reserve of River Road and on the bank of the Macleay River.

38

#### 3. Flora and fauna results

#### 2 3.1 Threatened flora and fauna

- There are no threatened species, populations and communities, or their habitats, listed in the TSC Act 1995 or EPBC Act 1999 known to applicant. No part of the land has been identified as critical habitat.
- Vegetation on the site comprises a planted landscape. Remnant native trees between River
- 8 St and the Macleay River have had the understorey removed and the grass layer mown. Trees to be removed or requiring protection due to proximity of works are shown below
- 10 (Section 5.2).

12

14

18

30

#### 4. Methodology

Tree assessments were undertaken on 1st January 2013.

- The SULE (Safe Useful Life Expectancy) method of tree evaluation was used to indicate tree suitability. Explanatory notes on SULE categories and terminology that may be used in this report are detailed in Appendix 1.
- The vitality and condition of trees was visually assessed from ground level using the VTA (Visual Tree Assessment) method (Mattheck, 1999). Setback distances were determined using the plans provided. Tree heights were determined by visual estimation compared with a 5 m height pole as shown in photographs of each tree (Section 5.2).

#### 5. Survey results

#### 5.1 Condition and vitality of trees on site

- The vitality and condition of trees is generally good. No trees of low vitality and/or poor structural integrity have a limited safe useful life.
- 28

  The trees on site are a planted mix of natives and exotics.

Local endemic tree species impacted or potentially affected identified within and adjacent to the site include:

Scientific name	Common name
Archontophoenix cunninghamiana	Bangalow Palm (planted)
Corymbia intermedia	Bloodwood
Eucalyptus microcorys	Tallowwood
Eucalyptus umbra	Stringybark
Ficus rubiginosa	Rusty Fig (planted)
Lophostemon confertus	Brush Box

# 5.2 Tree Schedule

The following tree schedule describes the numbered trees shown on the Tree Retention Plan. 7

Issue 6

14 May 2013 1123-REP-23-ISS-6 DD F&F 13May13.docx

## 6. Anticipated impact of the development to trees on site

#### 2 6.1 Tree retention

The proposal indicates the retention of trees within the site that are not affected by works.

Trees adjacent to works are to be protected by either standard tree protection measures for single trees or fenced as a stand as per Appendix 2.

6

#### 6.2 Tree removal

- 8 The proposal indicates the removal of the following trees.
  - TR12 Coral Tree
- 10 TR13 Spathodea
  - TR18 Gordonia axillaris
- 12 TR33 Crepe Myrtle
  - TR61 Callistemon
- 14 TR62 Jacaranda
  - TR63 Cheese Tree
- 16 TR64 Callistemon
  - TR65 Jacaranda
- 18 TR66 Jacaranda
  - TR67 Jacaranda
- 20 TR69 Jacaranda
  - TR70 Callistemon
- 22 TR71 Jacaranda
  - TR72 Jacaranda
- 24 TR73 Jacaranda
  - TR74 Jacaranda
- 26 TR75 Jacaranda
  - TR78 Jacaranda
- 28 TR79 Jacaranda
  - TR80 Jacaranda
- 30 TR81 Jacaranda
  - TR105 Shrub
- 32 TR106 Shrub
  - TR108 Jacaranda
- 34 TR109 Firewheel Tree
  - TR110 Bangalow Palm can be transplanted for future inclusion in landscaping.
- 36 TR111 Bangalow Palm can be transplanted for future inclusion in landscaping.
  - TR124 Bloodwood
- 38 TR125 Bloodwood
  - TR126 Bunya Pine
- 40 F100 Fig tree for flight path and road works

## 2 6.3 Works corridor fencing for retained trees

Some trees, in proximity to the proposed building and excavation works, are anticipated to sustain some root loss from the proposal. Protection measures are indicated in section 5.2 Tree Schedule. A works corridor is to be defined by temporary fencing as per Figure 5.

#### 6.4 Services

4

6

10

12

High voltage electricity supply, sewer and stormwater services all require trenching. Clearances are shown in the table in section 5.2 Tree Schedule above. A variety of small shrubs which are not numbered appear on some plans. Those shrubs may be removed where they are affected by proposed works. Other small and unnumbered shrubs are illustrated below.

Figure 11. Approximate line of trench for High Voltage cable where T1, T2 and Pine 60 are to be protected by temporary fencing

Figure 12. Tree TR13 Spathodea to be removed

## 7. Macleay River riparian zone works

The Macleay River, a fourth order tidal stream, is west of the proposed western car park (early works subject to approval from HI under a REF). NSW Office of Water Guidelines require works
 within 40 m of a fourth order stream to be assessed under the Water Management Act (WMA) 2000. The project does not require referral to NSW Office of Water.

6

A riparian corridor forms a transition zone between the land, also known as the terrestrial environment, and the river or watercourse or aquatic environment. Riparian corridors perform a range of important environmental functions such as:

10

8

providing bed and bank stability and reducing bank and channel erosion

12

protecting water quality by trapping sediment, nutrients and other contaminants

14

 providing diversity of habitat for terrestrial, riparian and aquatic plants (flora) and animals (fauna)

14

providing connectivity between wildlife habitats

16

conveying flood flows and controlling the direction of flood flows

18

providing an interface or buffer between developments and waterways
 providing passive recreational uses.

10

The protection, restoration or rehabilitation of vegetated riparian corridors is important for maintaining or improving the shape, stability (or geomorphic form) and ecological functions of a watercourse.

22

20

NSW Office of Water, July 2012 Controlled activities on waterfront land - Guidelines for riparian corridors on waterfront land

24

26

28

The top of bank for the Macleay River is adjacent to the water's edge at the east side and on the west side occurs as a flood plain. The ecological and functional eastern edge of the riparian zone is the base of a cliff that runs parallel to the river between River St and the river, as a discrete Vegetated Riparian Zone.

30

The elevation at the top of the cliff is 20 m and at the river bank approximately 2 m. 'Top of Bank' for the Macleay River is adjacent to the normal flow edge of the river.

32

34

The proposed work is on the top of the cliff, which as a dry forest is functionally significantly different from the ecological and hydrological riparian function of the river. There is no impact of works on the riparian zone.

36

38

The functions of the riparian zone are all met in the riparian corridor between the base of the cliff and the river, with the area between the top of cliff and River St being outside that zone.

40

42

Stormwater outlets or essential services are allowed in the Riparian Corridor. Works within the 40 m Riparian Corridor are permissible with appropriate offsetting and vegetation management.

Non riparian corridor works and activities can be authorised within the outer riparian corridor, 2 so long as the average width of the vegetated riparian zone can be achieved over the length of the watercourse within the development site. That is, where appropriate 50 per 4 cent of the outer vegetated riparian zone width may be used for non-riparian uses including asset protection zones, recreational areas, roads, development lots and infrastructure. 6

However, an equivalent area connected to the riparian corridor must be offset on the site.

Figure 13. Macleay River and proposed car park area

Approximate edge of 40m riparian zone shown in blue, yellow scale bar is 10m. Approximate location of new headwall is shown by a pink star.

The existing stormwater outlet headwall is adjacent to the cliff edge with water dispersing directly over the cliff. The proposed new headwall is adjacent to the edge of the cliff (Figure 14). There are no mature trees downslope of the headwall in the likely flow path of stormwater so no impact on trees is anticipated.

18

10

12

14

16

Figure 14. Approximate location of proposed new stormwater outlet

Note that water flows downslope from right to left.

8. Impact assessment

2

4

6

18

20

22

24

The site is not natural habitat for any species of flora or fauna, having been cleared more than 100 years ago and supporting recent horticultural landscape plantings. No species of threatened native fauna are likely to use the planted trees on site. The Bangalow Palms are recommended for transplanting on site so any possible use by native fauna is not lost.

12 The remnant trees adjacent to the Macleay River are in a mown park-like area. In that area two Bloodwood trees are to be removed. Those trees have no hollows for fauna occupation.

A planted Bunya Pine stands next to a house at the north side of the proposed car park off River St. A small planted Firewheel tree and a small planted fig tree are to be removed from

the grounds of the hospital.

A flora and fauna survey was carried out on 1st January and 20th February 2013 at the construction site to assess the likely impacts of construction on species present on the site, and whether there is likely to be any significant effect on any endangered ecological community, endangered population, threatened species or their habitats, as per the listings in the Threatened Species Conservation Act 1995 (TSC Act 1995) (state legislation) and the Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act 1999) (Commonwealth legislation). The survey was visual and trees found are detailed above.

- Under Section 5A of the EP&A Act several factors (below) need to be considered in deciding whether there is likely to be a Significant effect on threatened species, populations or ecological communities, or their habitats. If there is likely to be a significant effect on
- 4 threatened species, etc., a Species Impact Statement is recommended.
- The Assessment of Significance (NSW Department of Environment and Climate Change, August 2007) states that "Proposed measures that mitigate, improve or compensate for the
- 8 action, development or activity should not be considered in determining the degree of the effect on threatened species, populations or ecological communities, unless the measure has
- 10 been used successfully for that species in a similar situation."

## 8.1 Assessment of significance

12

14

32

- a) in the case of a threatened species, whether the action proposed is likely to have an adverse effect on the life cycle of the species such that a viable local population of the species is likely to be placed at risk of extinction,
- No. Removal or modification of habitat will not affect survival of any species. Local populations of any threatened species are not likely to depend on any of the trees that are proposed for removal.
- b) in the case of an endangered population, whether the action proposed is likely to have an adverse effect on the life cycle of the species that constitutes the endangered population such that a viable local population of the species is likely to be placed at risk of extinction,
- 24 There is no endangered population on site.
- c) in the case of an endangered ecological community or critically endangered ecological community, whether the action proposed;
- 28 (i) is likely to have an adverse effect on the extent of the ecological community such that its local occurrence is likely to be placed at risk of extinction, or
- 30 There is no endangered ecological community or critically endangered ecological community on site.
  - (ii) is likely to substantially and adversely modify the composition of the ecological community such that its local occurrence is likely to be placed at risk of extinction
- There is no endangered ecological community or critically endangered ecological community on site.

- d) in relation to the habitat of a threatened species, population or ecological community:
- 2 (i) the extent to which habitat is likely to be removed or modified as a result of the action proposed, and
- The site does not support threatened species. Habitat to be removed comprises a variety of trees, mostly exotic. The five local native trees to be removed are few in number and in the
- 6 local context are an insignificant proportion of the local forest.
  - (ii) whether an area of habitat is likely to become fragmented or isolated from other areas of habitat as a result of the proposed action, and
- 10 No.

- The site does not support threatened species and none are likely to depend on the trees proposed for removal.
- 14 (iii) the importance of the habitat to be removed, modified, fragmented or isolated to the long-term survival of the species, population or ecological community in the locality,

Negligible.

- 18 The site does not support threatened species.
- e) whether the action proposed is likely to have an adverse effect on critical habitat (either directly or indirectly),
- No. Critical habitat has not been declared for any species in the locality.
- 24 f) whether the action proposed is consistent with the objectives or actions of a recovery plan or threat abatement plan,
- No particular plan applies to this site or the proposal.
- g) whether the action proposed constitutes or is part of a key threatening process or is likely to result in the operation of, or increase the impact of, a key threatening process.
- Yes. Removal of two remnant native trees (T124, T125) is 'Clearing of Native Vegetation', a Key Threatening Process (TSC Act 1995). However the proposal is to plant a range of species
- 32 to replace trees removed. The nature and extent of clearing is minor.
- 34 Conclusion
- The proposed activity is unlikely to have a significant effect on any species of community.

  Therefore a Species Impact Statement is not recommended.

## 9. Conclusions and recommendations

- 2 The following conclusions and recommendations apply:
  - a) There is no impediment to the proposed works in the scope of this report. There is no unacceptable or significant impact on flora and fauna, including threatened species, populations and endangered ecological communities and their habitats.
- 6 b) Tree protection and tree removal will occur before other works.
  - c) Protection of trees to be retained and those adjacent to the works corridor is as per AS4970 Protection Of trees On Development Sites.
- d) A works corridor is to be defined by temporary fencing so as to exclude machinery and materials from the area of trees beyond the works corridor.
  - e) Certification of tree protection works by the project ecologist is required before other works commence in order to ensure protection of retained trees (REF works).
    - f) A landscape plan showing replacement planting for lost trees is recommended.
- g) For replacement of demolished trees and for any future landscaping Abel Ecology recommends a landscape plan with the inclusion of locally indigenous species, such as, but not limited to:
  - i. Trees
- 18 Red Cedar Toona australis

Teak Flindersia australis

20 Lilly Pilly Acmena smithii, Syzygium crebrinerve

Black Bean Castanospermum australe

- 22 Rusty Fig Ficus rubiginosa
  - ii. Shrubs
- 24 Blueberry Ash Elaeocarpus reticulatus Lilly Pilly Syzygium oleosum
- 26 h) The Bangalow Palms and other Palms are recommended for transplanting on site so any possible use by native fauna is not lost.

28

4

8

# Appendix 1. Safe Useful Life Expectancy (SULE) terminology and rationale

#### **Explanation of terminology**

d.b.h. - Acronym for trunk diameter at breast height (1.4m from ground level)

**Vitality** - Indicates the energy reserves of the tree and is determined by the observed crown colour and density, the percentage of dead/dying branches and epicormic growth. The vitality of the canopy and that of the root system is interdependent; root damage or heavy pruning draws on a tree's energy reserves. The tree's ability to initiate internal defence systems (compartmentalisation of damage) is reduced and it can also become predisposed to attack by insects and pathogens.

**Epicormic Growth** - The production of epicormic growth from dormant buds is a response to stress. Epicormic growth may be initiated by various causes such as branch loss, excessive pruning, fire damage, drought, defoliation and/or disease.

**Mycorrhizae/Rhizosphere** - Mycorrhizae are fungi that grow in symbiotic association with tree roots (especially the fine root hairs) and are attributed with increasing the uptake of nutrients, particularly phosphorus, and reducing infection from soil borne pathogens. They greatly increase the surface area of a tree's root system. Mycorrhizae require aerobic soil conditions and are reduced in number by compaction, waterlogging and overuse of soil fertilisers. Forest litter or similar mulch provides ideal conditions for the proliferation of Mycorrhizae. Rhizosphere is a term describing the peripheral area of a tree's root system where this symbiotic association most commonly occurs.

**Condition** - An evaluation of the structural status of the tree including defects that may effect the useful life of an otherwise healthy specimen. Such influencing factors include cavities and decay, weak unions between scaffolds (major branches) or trunks and faults of form or habit.

**Tree Hazard Potential** - An assessment of the risks associated with retaining a tree in its existing or proposed surroundings. Factors to consider are the growth characteristics of the species, tree vitality, condition and the frequency and type of potential targets. The impact the proposed works can have on tree vitality can only be assumed.

### **SULE** categories and subgroups

The various SULE categories indicate the safe useful life anticipated for an individual tree or for trees assessed as a group. Factors such as the location, age, condition and vitality of the tree are significant to the determination of this rating. Other influences such as the tree's effect on 'better' specimens and the economics of managing the tree successfully in its location are also relevant to SULE (Barrell 1993, 1995, 2001).

### 1 = Long SULE of >40 years

Α	В	С
Structurally sound in suitable	Suitable to retain with some	Significant status - requires
location	remedial care	special care to preserve

### 2 = Medium SULE of 15-40 years

Α	В	С	D
Lifespan limit	Eventual removal for	Remove for adjacent	Suitable with remedial
	safety or nuisance	trees or replanting	care

#### 3 = Short SULE of 5-15 years

Α	В	С	D
Lifespan limit	Eventual removal for	Remove for adjacent	Requires extensive
	safety or nuisance	trees or replanting	remedial care

#### 4 = Remove tree within 5 years

A Dead, dying or diseased	B Unstable or exposed by new clearing	C Structurally defective	D Damaged and unsafe	E Remove for adjacent trees or replanting	F Damaging existing structures	G Clearing will affect stability	H 4A-4G SULE category with high wildlife habitat value - could retain
------------------------------------	---	--------------------------------	----------------------------	---	---	---	---

#### 5 = Trees suitable to transplant

Α	В	С
Small trees less than 5m high	Young trees (<15yrs) over 5m	Height/width contained by
	high	pruning

## **Appendix 2. Tree Protection Guidelines**

#### A Pre-construction/Demolition Phase

The following methods are to be implemented to minimise potential damage to retained trees, e.g. from soil compaction and site activity. Trees are to be protected at all stages of the development, and growing conditions are to be improved within the Tree Protection Zone (TPZ). These guidelines are consistent with AS4970-2009 Protection of trees on development sites.

- A 1. All site workers are to be aware of relevant tree protection requirements. Nominated trees will be removed or transplanted as per the tree protection plan. An arborist is to supervise tree removal, pruning and transplanting and certify the completed works.
- A 2. All trees not nominated for retention are to be removed prior to any construction activity. Approved tree pruning and removal operations near retained trees are to be carried out in a way that avoids soil compaction and damage to canopy, trunk or roots. Works are to be supervised by an arborist or the person responsible for site management.
- A 3. Stumps are to be ground, not dozed or dug out, if in the vicinity of retained trees. Machinery (other than stump machines) is to be kept beyond the nominated protection zones of retained trees during all operations.
- A 4. A works corridor is to be defined by paraweb temporary fencing (or similar) and be certified prior to trenching works. Tree protection fencing is to be in place before the introduction of machinery or other materials to the site and before commencement of earthworks. Fencing is to be located to the distances specified in section 5.2, page 16, be of sturdy construction and retained in-situ during works unless altered by the project arborist. All site activities are excluded from this zone. Refer to Appendix 2 for specific minimum setback distances. AS4687 specifies applicable fencing requirements.
- A 5 The TPZ is to be mulched using material compatible with 'AS4454-2003 Composts, soil conditioners and mulches', e.g. decomposed leaf litter, and maintained at 50-100 mm depth. Some areas, e.g. turf, may not require mulch. Temporary irrigation may be required. Weeds are to be removed and controlled.
- A 6. Pruning is to be undertaken by suitably qualified, skilled and insured people to comply with AS4373-2007, Australian Standard: Pruning of Amenity Trees. Initial pruning provides adequate clearances and general crown maintenance. Flexible branches are to be tied back, not pruned.

#### **B** Construction Phase (Maintain tree protection fencing)

- B 1 Where access is required within a TPZ, temporary ground protection measures will be required (e.g. metal plates, rumble boards or exterior-grade ply over aggregate) capable of supporting the required load without deflection. Trunk protection may be required, e.g. battens wrapped around the trunk to a height of 2 m.
- B 2 Material stockpiles or dumps, parking, excavation, site sheds, preparation of chemicals, fires, wash down areas or similar are to be located clear of TPZs. Areas designated for such requirements are not to divert drainage water into tree protection areas.
- B 3 Machine trenching is to be excluded from the TPZ of retained trees. Any required root excavation inside a TPZ is to be done by hand and intact roots >40 mm in diameter are to be retained. Services are to be installed 100 mm clear of such roots. Damaged roots **must** be cut cleanly with sharp implements (backhoe blades and similar are excluded), with no root dressings or paints. Trenches are to be backfilled promptly to minimise soil desiccation. Underbore if no suitable alternative location is possible. All works within the TPZ are to be supervised by an arborist.

# Appendix 3. Company Profile

Abel Ecology has been in the flora and fauna consulting business since 1991, starting in the Sydney Region, and progressively more state wide in New South Wales since 1998, and now also in Victoria. During this time extensive expertise has been gained with regard to Master Planning, Environmental Impact assessments including flora and fauna, bushfire reports, Vegetation Management Plans, Management of threatened species, Review of Environmental Factors, Species Impact Statements and as Expert Witness in the Land and Environment Court. We have done consultancy work for industrial and commercial developments, golf courses, civil engineering projects, tourist developments as well as residential and rural projects. This process has also generated many connections with relevant government departments and city councils in NSW. Our team consists of four scientists and two administrative staff, plus casual assistants as required.

#### Areas of expertise

Aboriginal cultural heritage
Bushfire assessment and design
Ecology
Horticulture
Landscape design
