Subject:

Don't Sacrifice Greater Western Sydney to Coal Seam Gas

### MY ADDRESS:

Re: Camden Gas Project Stage 3, Project Application 09\_0048

Please accept this as a submission on the Camden Gas Project Stage 3 Northern Expansion which is currently on public exhibition. I object to AGL's project application 09\_0048 to drill for coal seam gas in Western Sydney.

Please put the health and wellbeing of the people of Greater Western Sydney above the profits of AGL who plan to expand their gas field around and under people's homes and businesses.

I urge you to reject the proposal by AGL to drill 66 new coal seam gas production wells on the grounds that:

- Reports from Queensland and overseas show that there are serious risks to air quality and human health from unconventional gas drilling. However there have been no detailed studies done to quantify those risks especially in urban areas. The people of Camden and Campbelltown should not be treated like guinea pigs in a coal seam gas experiment.
- People's homes should not be undermined by coal seam gas drilling without their knowledge or permission.
- Homeowners face declining property values within and adjoining coal seam gas fields with some estimating house values may fall up to 30%.
- The integrity of gas wells can't be guaranteed and research from gas fields in Queensland and the US has shown many fail in their first few year. This will leave the community to deal with the impact of leaking wells on air quality and local water supplies.
- New research from Southern Cross University on methane gas leaks from coal seam gas fields has not been considered in the proposal. AGL has not conducted these studies to account for methane leakage on their existing coal seam gas wells.
- Despite research from the Queensland and the US suggesting ground water contamination and gas leaks from fracking, the proposal by AGL will allow fracking.
- The impacts of horizontal drilling have not been adequately considered in the Environmental Assessment.
- There are alternatives to coal seam gas, including renewable energy which can offer energy security without the unacceptable environmental and health risks posed by coal seam gas extraction.

Yours sincerely, belinda pace

Dear Sir/Madam

Re: Camden Gas Project Stage 3, Project Application 09\_0048

Coal Seam Gas mining in the metropolitan areas of Sydney contradicts the vision of the Metropolitan Strategy 2036 - To improve Sydney's environmental performance.

The impacts of Coal Seam Gas mining have not been independently and scientifically fully researched and remain largely unknown.

I am concerned that the air quality will decline with the added pollution.

I am concerned of the health impacts this will cause in the region.

Peoples general well being is something in which the populace as a whole has a stake in and therefore this application should **not** be approved.

Metropolitan Strategy 2036 mentions a sustainable Sydney, protecting our natural environment.

Coal Seam Gas mining is not ecologically sustainable. It does not conserve our water supply, on which life depends on.

Coal Seam Gas mining in our water catchment areas should not be allowed. We should be maintaining the quality and quantity of water available to the people of Metropolitan Sydney who make up approximately 63% of the total NSW population and not be wasting or contaminating it in any way. I am concerned that coal seam gas mining wastes and contaminates our water supply.

AGL's estimated that only about 5% of NSW's gas will be produced from the Camden Gas Project. How much water will be wasted or contaminated for this production?

Life does not depend on gas but life does depend on water.

I object to AGL's project application 09\_0048 to mine for coal seam gas (CSG) in Campbelltown and Camden. AGL's past breaches of its licence conditions should be taken into account. It is reasonable to expect that the conditions attached to any future development consent would **not** be obeyed. This application should **not** be approved.

I acknowledge that my name only will appear on my submission when publicly exhibited.

Yours sincerely

## Metropolitan Strategy - SUBMISSION

The Ingleburn Community Association Inc. consists of Ingleburn residents. Members of our association have veiwed the document Sydney over the next 20 years - A Discussion Paper May 2012.

Please find below our answers to questions raised in the discussion paper.

#### Housing our growing population.

The Strategy should continue to focus on the greenfield housing in the South West and North West Growth Centres and not on development in existing areas. The Strategy should **not** identify a role for the NSW Government to facilitate housing development in existing areas.

Affordable (Rental) Housing will be available only if returns on investment properties

Affordable (Rental) Housing will be available only if returns on investment properties are attractive. The Strategy can't control sufficient supply.

## Providing jobs and economic opportunities.

We believe there is no need for the Strategy to focus on new industrial land or Business Parks (Office Based employment) in our LGA (Campbelltown), we have sufficient existing areas.

## Providing efficient transport networks.

We think it is a good idea that the NSW Long Term Transport Master Plan and the Metropolitan Strategy are being developed concurrently.

#### Providing the infrastructure we need.

The NSW Government should be identified in the Strategy for bearing the cost of new infrastructure in growth areas.

## Providing equitable access to a great lifestyle.

The Strategy can protect areas that are important to the local community, in our LGA this would be the Scenic Hills, the Georges River and its catchment areas.

#### Protecting our environment and building resilience to natural hazards.

The Metropolitan Strategy can protect the natural environment by **not** allowing coal seam gas mining.

## Protecting productive rural and resource lands.

The Strategy should protect Sydney's rural landscape and water catchment areas by protecting the water table and **not** allowing any coal seam gas mining.

## Connecting the regions.

No Comment.

## Delivering the Strategy.

We would like to see an annual Metropolitan Strategy Update published.

We look forward to the draft strategy. Yours sincerely,

Mr Kerry Porter - Chairperson Ingleburn Community Association Inc.

Re: Camden Gas Project Stage 3, Project Application 09\_0048

#### I CONCUR WITH THE FOLLOWING MESSAGE IN ITS ENTIRETY!

Additionally, I would like to remind you that we are on the edge of an environmental calamity that is nearly unimaginable. If ,as seems more and more likely, the planet undergoes a temperature increase of 6 degrees C by the end of the century, our great grandchildren, if they survive the collapse of civilisation, will huddle in their underground bunkers and curse us for the fools we have become.

We need to urgently STOP the extraction of carbon fuels and INVEST in renewable energy infrastructure. I spent many years conducting mineral exploration for miners. I can tell you with authority that miners and especially the fraccers are robber barons who care nothing for our society our civilisation or the people. STOP them before they destroy our land our health and our future. For Gods sake STOP THEM NOW!

Please accept this as a submission on the Camden Gas Project Stage 3 Northern Expansion which is currently on public exhibition. I object to AGL's project application 09\_0048 to drill for coal seam gas in Western Sydney.

Please put the health and wellbeing of the people of Greater Western Sydney above the profits of AGL who plan to expand their gas field around and under people's homes and businesses.

Dear Sir/Madam

#### Re: Camden Gas Project Stage 3, Project Application 09\_0048

I object to AGL's project application 09\_0048 to mine for coal seam gas (CSG) in Campbelltown and Camden. The key reasons for my objection are stated below.

I am concerned that CSG mining is a technologically-evolving industry whose impacts have not been independently and scientifically fully researched and remain largely unknown. This view is supported by professional organisations and academics in evidence to the NSW Upper House and Senate Inquiries into Coal Seam Gas Mining in 2011 and by subsequent research here and overseas. We have had to rely on the industry for much of our information when the industry has a vested interest in the outcome. AGL is no different. It claims that the Camden Gas Project has been safely operating for 10 years. Yet we understand that impacts on groundwater and air quality have not been adequately monitored, and while AGL has been operating under an Environmental Protection Licence (EPL No. 12003), it has been allowed to self-monitor its compliance, self-investigate incidents and self-report such that we do not know what true impacts it may have had. Third party consultants and external laboratories that are engaged and paid for by the industry are not independent. Nor is any funded or cofunded research by the CSG mining industry. These lessons should have been learnt with asbestos in Australia and with 'Big Tobacco' in the USA. The National Water Commission in its Position Statement (3<sup>rd</sup> December 2010) said that impacts may emerge over a long time period. I am deeply concerned that the costs of unforeseen problems will be borne by the community and taxpayers after AGL is long gone from the area. This is grossly irresponsible.

Doctors for the Environment Australia claims that health impacts from CSG mining have not been assessed. Preliminary research from Queensland (e.g. by Southern Cross University in Tara) and overseas is deeply concerning, especially where fracking has been used. As at December 2011, 85% of the production wells in the Camden Gas Project had been fracked (evidence from the NSW Upper House Inquiry) with inadequate monitoring of its impacts on water in particular. AGL claims that the use of horizontal wells in the proposed Stage 3 will reduce the need for fracking, but it seems that this is not entirely true since it has reserved the right to frack these wells in the future if/when the technology becomes available. The size of the proposed well clusters and any fracking of horizontal wells are both new and untested here. It will therefore be entirely experimental with unknown outcomes on health and property including the possibility of subsidence under so many urban properties.

I am also concerned about evidence from Queensland and overseas on air quality and the cumulative impact of AGL's expansion into an area that already experiences incidents of unacceptable levels of air pollution (ozone and fine particles) associated with respiratory problems (NSW Environmental Protection Authority). AGL's past performance gives no confidence that it has <u>not</u> already contributed to this or that it can be managed in the future,

having admitted in August this year that it had not conducted continuous air monitoring at its Rosalind Park Gas Treatment Plant for three years in breach of its EPL No.12003.

Allowing CSG mining in areas that are not zoned for heavy industry undermines zoning controls and confidence in the planning process, and creates severe land use conflicts, economic instability and inequity. It will disrupt religious communities whose vocations have so far been protected by the Scenic Hills zoning; it will place undue burden on small rural allotments whose capacity to cope is severely reduced by size (thereby threatening the survival of the entire historic Scenic Hills), and it is unsightly and unsafe in urban areas with a potential escalation in CSG mining incidents and accidents associated with the more intense urban activity (traffic, people etc.), the presence of children, and potential for vandalism. The consequent impact on land and house values for existing land and home owners may be devastating. For many people the home is their largest asset and is often leveraged to support small business. Any devaluation by bank assessors may destroy livelihoods and life savings.

I do not believe that the NSW Government's new regulations for CSG mining will ensure its safe operation here. As the only commercially producing CSG field in NSW, the Camden Gas Project has already been operating under consent conditions. Yet the NSW Government has not been able to ensure compliance, as evidenced by on-going breaches by AGL of its licence conditions, and the discovery of incidents that might not have been reported were it not for community vigilance, such as the Sugarloaf well incident in May 2011 in Menangle that allowed well contents to drift over Sydney's water channel and to nearby Glen Alpine houses.

The proposal poses risks to Sydney's water in general and to the South West in particular that have not been adequately assessed. While AGL claims that the *geology of the Sydney Basin is well known*, AGL's rationale for the constant modification of prior stages of the Camden Gas Project seems to contradict this, as does its admission to the Scenic Hills Association that it does not know where the aquifers here run to but *probably Sydney Harbour*. Potential impacts on Sydney Harbour, on the nearby Sydney Water Catchment, and AGL's proposal to run its gas gathering pipeline along Sydney's Upper Canal on public land are unacceptable risks to Sydney's water, and are an abuse of public property for the benefit of private investors.

AGL will continue to produce about 5% of NSW's gas from the Camden Gas Project according to evidence it gave under oath at the NSW Upper House Inquiry. The risks and potential costs to the community do not justify this, particularly since 150,000+ people already live and work in the immediate affected area, and this is in Sydney's south west growth corridor. It is socially, environmentally and economically unjustified, and has no social licence to operate here.

I acknowledge that my name will appear on my submission when publicly exhibited.

Coal Seam Gas Submission

Attachments:

Coal Seam Gas submission 2012.docx

To whom it may concern,

Attached is my submission for the proposed coal seam gas Camden project. I hope you will include my thoughts and concerns to the decisions to be made. Thank you,

Dimitra Papavasiliou

## **NSW Department of Planning**

I would like to state our concerns around the proposed coal gas mining which is to occur across Campbelltown Iga. I am currently working with the most vulnerable communities in Claymore, and would like to express my concerns over this proposal. The detrimental impacts of the implementation of this policy will present short term/long term costs for Claymore residents.

Claymore, and its surrounding suburbs have been marginalised by past policy decisions, including dislocation, minimal transportation, stagnant redevelopment plans, and low to none significant health/social infrastructures, including access to everyday shopping facilities (fresh fruit/vegetables).

This decision, if voted for, will reflect our inability to support our most vulnerable and disadvantaged. It will echo the continuous exploitation of the most marginalised. Claymore with a large population of children and young people (average age is 20) will have a compromised water system, and may have to deal with future health impacts, which have not been assessed.

Recent statistics and media attention, reflect the need to address and work to improve social outcomes for future communities, including those who are less likely to speak out, or may have become voiceless due to past experiences. We must work together to ensure that we provide environmental and social responsible decisions. Everyone has a right, no matter of their employment status, sex, or cultural background to live in a healthy, safe and connected community.

To say yes to Camden Gas Project, will subsequently be voting against these rights.

Thank you and we hope you will take these thoughts in consideration when making your decision.

Yours Sincerely,

Dimitra Papavasiliou

To:
Mining and Industry Projects

GPO Box 39
SYDNEY NSW 2001

Dear Sir/Madam

## Re: Camden Gas Project Stage 3, Project Application 09\_0048

I object to AGL's project application 09\_0048 to mine for coal seam gas (CSG) in Campbelltown and Camden. The key reasons for my objection are stated below.

I am concerned that CSG mining is a technologically-evolving industry whose impacts have not been independently and scientifically fully researched and remain largely unknown. This view is supported by professional organisations and academics in evidence to the NSW Upper House and Senate Inquiries into Coal Seam Gas Mining in 2011 and by subsequent research here and overseas. We have had to rely on the industry for much of our information when the industry has a vested interest in the outcome. AGL is no different. It claims that the Camden Gas Project has been safely operating for 10 years. Yet we understand that impacts on groundwater and air quality have not been adequately monitored, and while AGL has been operating under an Environmental Protection Licence (EPL No. 12003), it has been allowed to self-monitor its compliance, self-investigate incidents and self-report such that we do not know what true impacts it may have had. Third party consultants and external laboratories that are engaged and paid for by the industry are not independent. Nor is any funded or cofunded research by the CSG mining industry. These lessons should have been learnt with asbestos in Australia and with 'Big Tobacco' in the USA. The National Water Commission in its Position Statement (3<sup>rd</sup> December 2010) said that impacts may emerge over a long time period. I am deeply concerned that the costs of unforeseen problems will be borne by the community and taxpayers after AGL is long gone from the area. This is grossly irresponsible.

Doctors for the Environment Australia claims that health impacts from CSG mining have not been assessed. Preliminary research from Queensland (e.g. by Southern Cross University in Tara) and overseas is deeply concerning, especially where fracking has been used. As at December 2011, 85% of the production wells in the Camden Gas Project had been fracked (evidence from the NSW Upper House Inquiry) with inadequate monitoring of its impacts on water in particular. AGL claims that the use of horizontal wells in the proposed Stage 3 will reduce the need for fracking, but it seems that this is not entirely true since it has reserved the right to frack these wells in the future if/when the technology becomes available. The size of the proposed well clusters and any fracking of horizontal wells are both new and untested here. It will therefore be entirely experimental with unknown outcomes on health and property including the possibility of subsidence under so many urban properties.

I am also concerned about evidence from Queensland and overseas on air quality and the cumulative impact of AGL's expansion into an area that already experiences incidents of unacceptable levels of air pollution (ozone and fine particles) associated with respiratory problems (NSW Environmental Protection Authority). AGL's past performance gives no confidence that it has <u>not</u> already contributed to this or that it can be managed in the future,

having admitted in August this year that it had not conducted continuous air monitoring at its Rosalind Park Gas Treatment Plant for three years in breach of its EPL No.12003.

Allowing CSG mining in areas that are not zoned for heavy industry undermines zoning controls and confidence in the planning process, and creates severe land use conflicts, economic instability and inequity. It will disrupt religious communities whose vocations have so far been protected by the Scenic Hills zoning; it will place undue burden on small rural allotments whose capacity to cope is severely reduced by size (thereby threatening the survival of the entire historic Scenic Hills), and it is unsightly and unsafe in urban areas with a potential escalation in CSG mining incidents and accidents associated with the more intense urban activity (traffic, people etc.), the presence of children, and potential for vandalism. The consequent impact on land and house values for existing land and home owners may be devastating. For many people the home is their largest asset and is often leveraged to support small business. Any devaluation by bank assessors may destroy livelihoods and life savings.

I do not believe that the NSW Government's new regulations for CSG mining will ensure its safe operation here. As the only commercially producing CSG field in NSW, the Camden Gas Project has already been operating under consent conditions. Yet the NSW Government has not been able to ensure compliance, as evidenced by on-going breaches by AGL of its licence conditions, and the discovery of incidents that might not have been reported were it not for community vigilance, such as the Sugarloaf well incident in May 2011 in Menangle that allowed well contents to drift over Sydney's water channel and to nearby Glen Alpine houses.

The proposal poses risks to Sydney's water in general and to the South West in particular that have not been adequately assessed. While AGL claims that the *geology of the Sydney Basin is well known*, AGL's rationale for the constant modification of prior stages of the Camden Gas Project seems to contradict this, as does its admission to the Scenic Hills Association that it does not know where the aquifers here run to but *probably Sydney Harbour*. Potential impacts on Sydney Harbour, on the nearby Sydney Water Catchment, and AGL's proposal to run its gas gathering pipeline along Sydney's Upper Canal on public land are unacceptable risks to Sydney's water, and are an abuse of public property for the benefit of private investors.

AGL will only ever produce about 5% of NSW's gas from the Camden Gas Project according to evidence it gave under oath at the NSW Upper House Inquiry. This does not justify the risks and potential costs to the community, particularly since 150,000+ people already live and work in the immediate affected area, and this is in Sydney's south west growth corridor. It is socially, environmentally and economically unjustified, and has no social licence to operate here.

I acknowledge that my name will appear on my submission when publicly exhibited.

## Yours sincerely

Don't Sacrifice Greater Western Sydney to Coal Seam Gas

### MY ADDRESS:

Re: Camden Gas Project Stage 3, Project Application 09\_0048

Please accept this as a submission on the Camden Gas Project Stage 3 Northern Expansion which is currently on public exhibition. I object to AGL's project application 09\_0048 to drill for coal seam gas in Western Sydney.

Please put the health and wellbeing of the people of Greater Western Sydney above the profits of AGL who plan to expand their gas field around and under people's homes and businesses.

I urge you to reject the proposal by AGL to drill 66 new coal seam gas production wells on the grounds that:

- Reports from Queensland and overseas show that there are serious risks to air quality and human health from unconventional gas drilling. However there have been no detailed studies done to quantify those risks especially in urban areas. The people of Camden and Campbelltown should not be treated like guinea pigs in a coal seam gas experiment.
- People's homes should not be undermined by coal seam gas drilling without their knowledge or permission.
- Homeowners face declining property values within and adjoining coal seam gas fields with some estimating house values may fall up to 30%.
- The integrity of gas wells can't be guaranteed and research from gas fields in Queensland and the US has shown many fail in their first few year. This will leave the community to deal with the impact of leaking wells on air quality and local water supplies.
- New research from Southern Cross University on methane gas leaks from coal seam gas fields has not been considered in the proposal. AGL has not conducted these studies to account for methane leakage on their existing coal seam gas wells.
- Despite research from the Queensland and the US suggesting ground water contamination and gas leaks from fracking, the proposal by AGL will allow fracking.
- The impacts of horizontal drilling have not been adequately considered in the Environmental Assessment.
- There are alternatives to coal seam gas, including renewable energy which can offer energy security without the unacceptable environmental and health risks posed by coal seam gas extraction.

Dear Sir/Madam

## Re: Camden Gas Project Stage 3, Project Application 09\_0048

I object to AGL's project application 09\_0048 to mine for coal seam gas (CSG) in Campbelltown and Camden. The key reasons for my objection are stated below.

I am concerned that CSG mining is a technologically-evolving industry whose impacts have not been independently and scientifically fully researched and remain largely unknown. This view is supported by professional organisations and academics in evidence to the NSW Upper House and Senate Inquiries into Coal Seam Gas Mining in 2011 and by subsequent research here and overseas. We have had to rely on the industry for much of our information when the industry has a vested interest in the outcome. AGL is no different. It claims that the Camden Gas Project has been safely operating for 10 years. Yet we understand that impacts on groundwater and air quality have not been adequately monitored, and while AGL has been operating under an Environmental Protection Licence (EPL No. 12003), it has been allowed to self-monitor its compliance, self-investigate incidents and self-report such that we do not know what true impacts it may have had. Third party consultants and external laboratories that are engaged and pald for by the industry are not independent. Nor is any funded or cofunded research by the CSG mining industry. These lessons should have been learnt with asbestos in Australia and with 'Big Tobacco' in the USA. The National Water Commission in its Position Statement (3<sup>rd</sup> December 2010) said that impacts may emerge over a long time period. I am deeply concerned that the costs of unforeseen problems will be borne by the community and taxpayers after AGL is long gone from the area. This is grossly irresponsible.

Doctors for the Environment Australia claims that health impacts from CSG mining have not been assessed. Preliminary research from Queensland (e.g. by Southern Cross University in Tara) and overseas is deeply concerning, especially where fracking has been used. As at December 2011, 85% of the production wells in the Camden Gas Project had been fracked (evidence from the NSW Upper House Inquiry) with inadequate monitoring of its impacts on water in particular. AGL claims that the use of horizontal wells in the proposed Stage 3 will reduce the need for fracking, but it seems that this is not entirely true since it has reserved the right to frack these wells in the future if/when the technology becomes available. The size of the proposed well clusters and any fracking of horizontal wells are both new and untested here. It will therefore be entirely experimental with unknown outcomes on health and property including the possibility of subsidence under so many urban properties.

I am also concerned about evidence from Queensland and overseas on air quality and the cumulative impact of AGL's expansion into an area that already experiences incidents of unacceptable levels of air pollution (ozone and fine particles) associated with respiratory problems (NSW Environmental Protection Authority). AGL's past performance gives no confidence that it has not already contributed to this or that it can be managed in the future,

having admitted in August this year that it had not conducted continuous air monitoring at its Rosalind Park Gas Treatment Plant for three years in breach of its EPL No.12003.

Allowing CSG mining in areas that are not zoned for heavy industry undermines zoning controls and confidence in the planning process, and creates severe land use conflicts, economic instability and inequity. It will disrupt religious communities whose vocations have so far been protected by the Scenic Hills zoning; it will place undue burden on small rural allotments whose capacity to cope is severely reduced by size (thereby threatening the survival of the entire historic Scenic Hills), and it is unsightly and unsafe in urban areas with a potential escalation in CSG mining incidents and accidents associated with the more intense urban activity (traffic, people etc.), the presence of children, and potential for vandalism. The consequent impact on land and house values for existing land and home owners may be devastating. For many people the home is their largest asset and is often leveraged to support small business. Any devaluation by bank assessors may destroy livelihoods and life savings.

I do not believe that the NSW Government's new regulations for CSG mining will ensure its safe operation here. As the only commercially producing CSG field in NSW, the Camden Gas Project has already been operating under consent conditions. Yet the NSW Government has not been able to ensure compliance, as evidenced by on-going breaches by AGL of its licence conditions, and the discovery of incidents that might not have been reported were it not for community vigilance, such as the Sugarloaf well incident in May 2011 in Menangle that allowed well contents to drift over Sydney's water channel and to nearby Glen Alpine houses.

The proposal poses risks to Sydney's water in general and to the South West in particular that have not been adequately assessed. While AGL claims that the *geology of the Sydney Basin is well known*, AGL's rationale for the constant modification of prior stages of the Camden Gas Project seems to contradict this, as does its admission to the Scenic Hills Association that it does not know where the aquifers here run to but *probably Sydney Harbour*. Potential impacts on Sydney Harbour, on the nearby Sydney Water Catchment, and AGL's proposal to run its gas gathering pipeline along Sydney's Upper Canal on public land are unacceptable risks to Sydney's water, and are an abuse of public property for the benefit of private investors.

AGL will only ever produce about 5% of NSW's gas from the Camden Gas Project according to evidence it gave under oath at the NSW Upper House Inquiry. This does not justify the risks and potential costs to the community, particularly since 150,000+ people already live and work in the immediate affected area, and this is in Sydney's south west growth corridor. It is socially, environmentally and economically unjustified, and has no social licence to operate here.

l acknowledge that my name will appear on my submission when publicly exhibited.

Don't Sacrifice Greater Western Sydney to Coal Seam Gas

#### MY ADDRESS:

Re: Camden Gas Project Stage 3, Project Application 09\_0048

Please accept this as a submission on the Camden Gas Project Stage 3 Northern Expansion which is currently on public exhibition. I object to AGL's project application 09\_0048 to drill for coal seam gas in Western Sydney.

Please put the health and wellbeing of the people of Greater Western Sydney above the profits of AGL who plan to expand their gas field around and under people's homes and businesses.

I urge you to reject the proposal by AGL to drill 66 new coal seam gas production wells on the grounds that:

- Reports from Queensland and overseas show that there are serious risks to air quality and human health from unconventional gas drilling. However there have been no detailed studies done to quantify those risks especially in urban areas. The people of Camden and Campbelltown should not be treated like guinea pigs in a coal seam gas experiment.
- People's homes should not be undermined by coal seam gas drilling without their knowledge or permission.
- Homeowners face declining property values within and adjoining coal seam gas fields with some estimating house values may fall up to 30%.
- The integrity of gas wells can't be guaranteed and research from gas fields in Queensland and the US has shown many fail in their first few year. This will leave the community to deal with the impact of leaking wells on air quality and local water supplies.
- New research from Southern Cross University on methane gas leaks from coal seam gas fields has not been considered in the proposal. AGL has not conducted these studies to account for methane leakage on their existing coal seam gas wells.
- Despite research from the Queensland and the US suggesting ground water contamination and gas leaks from fracking, the proposal by AGL will allow fracking.
- The impacts of horizontal drilling have not been adequately considered in the Environmental Assessment.
- There are alternatives to coal seam gas, including renewable energy which can offer energy security without the unacceptable environmental and health risks posed by coal seam gas extraction.

Yours sincerely, Will Pearson

Please accept this as a submission on the Camden Gas Project Stage 3 Northern Expansion which is currently on public exhibition. I object to AGL's project application 09\_0048 to drill for coal seam gas in Western Sydney.

This is a matter of principle. The people of Australia have not agreed to prioritising the interests of resource extraction above all other economic and social interests. Neither have they agreed to the gross misuse of scare water resources. Resource extraction is inappropriate in areas that are heavily populated; near tourist destinations; on good agricultural land; and areas of outstanding natural beauty.

As a resident of Northern New South Wales I write in solidarity with the people of Greater Western Sydney.

Please put the health and wellbeing of the people of Greater Western Sydney above the profits of AGL who plan to expand their gas field around and under people's homes and businesses.

I urge you to reject the proposal by AGL to drill 66 new coal seam gas production wells on the grounds that:

Dear Sir/Madam

#### Re: Camden Gas Project Stage 3, Project Application 09\_0048

I object to AGL's project application 09\_0048 to mine for coal seam gas (CSG) in Campbelltown and Camden. The key reasons for my objection are stated below.

I am concerned that CSG mining is a technologically-evolving industry whose impacts have not been independently and scientifically fully researched and remain largely unknown. This view is supported by professional organisations and academics in evidence to the NSW Upper House and Senate Inquiries into Coal Seam Gas Mining in 2011 and by subsequent research here and overseas. We have had to rely on the industry for much of our information when the industry has a vested interest in the outcome. AGL is no different. It claims that the Camden Gas Project has been safely operating for 10 years. Yet we understand that impacts on groundwater and air quality have not been adequately monitored, and while AGL has been operating under an Environmental Protection Licence (EPL No. 12003), it has been allowed to self-monitor its compliance, self-investigate incidents and self-report such that we do not know what true impacts it may have had. Third party consultants and external laboratories that are engaged and paid for by the industry are not independent. Nor is any funded or cofunded research by the CSG mining industry. These lessons should have been learnt with asbestos in Australia and with 'Big Tobacco' in the USA. The National Water Commission in its Position Statement (3<sup>rd</sup> December 2010) said that impacts may emerge over a long time period. I am deeply concerned that the costs of unforeseen problems will be borne by the community and taxpayers after AGL is long gone from the area. This is grossly irresponsible.

Doctors for the Environment Australia claims that health impacts from CSG mining have not been assessed. Preliminary research from Queensland (e.g. by Southern Cross University in Tara) and overseas is deeply concerning, especially where fracking has been used. As at December 2011, 85% of the production wells in the Camden Gas Project had been fracked (evidence from the NSW Upper House Inquiry) with inadequate monitoring of its impacts on water in particular. AGL claims that the use of horizontal wells in the proposed Stage 3 will reduce the need for fracking, but it seems that this is not entirely true since it has reserved the right to frack these wells in the future if/when the technology becomes available. The size of the proposed well clusters and any fracking of horizontal wells are both new and untested here. It will therefore be entirely experimental with unknown outcomes on health and property including the possibility of subsidence under so many urban properties.

I am also concerned about evidence from Queensland and overseas on air quality and the cumulative impact of AGL's expansion into an area that already experiences incidents of unacceptable levels of air pollution (ozone and fine particles) associated with respiratory problems (NSW Environmental Protection Authority). AGL's past performance gives no confidence that it has <u>not</u> already contributed to this or that it can be managed in the future,

having admitted in August this year that it had not conducted continuous air monitoring at its Rosalind Park Gas Treatment Plant for three years in breach of its EPL No.12003.

Allowing CSG mining in areas that are not zoned for heavy industry undermines zoning controls and confidence in the planning process, and creates severe land use conflicts, economic instability and inequity. It will disrupt religious communities whose vocations have so far been protected by the Scenic Hills zoning; it will place undue burden on small rural allotments whose capacity to cope is severely reduced by size (thereby threatening the survival of the entire historic Scenic Hills), and it is unsightly and unsafe in urban areas with a potential escalation in CSG mining incidents and accidents associated with the more intense urban activity (traffic, people etc.), the presence of children, and potential for vandalism. The consequent impact on land and house values for existing land and home owners may be devastating. For many people the home is their largest asset and is often leveraged to support small business. Any devaluation by bank assessors may destroy livelihoods and life savings.

I do not believe that the NSW Government's new regulations for CSG mining will ensure its safe operation here. As the only commercially producing CSG field in NSW, the Camden Gas Project has already been operating under consent conditions. Yet the NSW Government has not been able to ensure compliance, as evidenced by on-going breaches by AGL of its licence conditions, and the discovery of incidents that might not have been reported were it not for community vigilance, such as the Sugarloaf well incident in May 2011 in Menangle that allowed well contents to drift over Sydney's water channel and to nearby Glen Alpine houses.

The proposal poses risks to Sydney's water in general and to the South West in particular that have not been adequately assessed. While AGL claims that the *geology of the Sydney Basin is well known*, AGL's rationale for the constant modification of prior stages of the Camden Gas Project seems to contradict this, as does its admission to the Scenic Hills Association that it does not know where the aquifers here run to but *probably Sydney Harbour*. Potential impacts on Sydney Harbour, on the nearby Sydney Water Catchment, and AGL's proposal to run its gas gathering pipeline along Sydney's Upper Canal on public land are unacceptable risks to Sydney's water, and are an abuse of public property for the benefit of private investors.

AGL will continue to produce about 5% of NSW's gas from the Camden Gas Project according to evidence it gave under oath at the NSW Upper House Inquiry. The risks and potential costs to the community do not justify this, particularly since 150,000+ people already live and work in the immediate affected area, and this is in Sydney's south west growth corridor. It is socially, environmentally and economically unjustified, and has no social licence to operate here.

I acknowledge that my name will appear on my submission when publicly exhibited.

Don't Sacrifice Greater Western Sydney to Coal Seam Gas

MY ADDRESS: 52b glen rd ourimbah

Re: Camden Gas Project Stage 3, Project Application 09\_0048

Please accept this as a submission on the Camden Gas Project Stage 3 Northern Expansion which is currently on public exhibition. I object to AGL's project application 09\_0048 to drill for coal seam gas in Western Sydney.

Please put the health and wellbeing of the people of Greater Western Sydney above the profits of AGL who plan to expand their gas field around and under people's homes and businesses.

I urge you to reject the proposal by AGL to drill 66 new coal seam gas production wells on the grounds that:

- Reports from Queensland and overseas show that there are serious risks to air quality and human health from unconventional gas drilling. However there have been no detailed studies done to quantify those risks especially in urban areas. The people of Camden and Campbelltown should not be treated like guinea pigs in a coal seam gas experiment.
- People's homes should not be undermined by coal seam gas drilling without their knowledge or permission.
- Homeowners face declining property values within and adjoining coal seam gas fields with some estimating house values may fall up to 30%.
- The integrity of gas wells can't be guaranteed and research from gas fields in Queensland and the US has shown many fail in their first few year. This will leave the community to deal with the impact of leaking wells on air quality and local water supplies.
- New research from Southern Cross University on methane gas leaks from coal seam gas fields has not been considered in the proposal. AGL has not conducted these studies to account for methane leakage on their existing coal seam gas wells.
- Despite research from the Queensland and the US suggesting ground water contamination and gas leaks from fracking, the proposal by AGL will allow fracking.
- The impacts of horizontal drilling have not been adequately considered in the Environmental Assessment.
- There are alternatives to coal seam gas, including renewable energy which can offer energy security without the unacceptable environmental and health risks posed by coal seam gas extraction.

Yours sincerely, Keren Peter

Dear Sir/Madam

#### Re: Camden Gas Project Stage 3, Project Application 09\_0048

I object to AGL's project application 09\_0048 to mine for coal seam gas (CSG) in Campbelltown and Camden. The key reasons for my objection are stated below.

I am concerned that CSG mining is a technologically-evolving industry whose impacts have not been independently and scientifically fully researched and remain largely unknown. This view is supported by professional organisations and academics in evidence to the NSW Upper House and Senate Inquiries into Coal Seam Gas Mining in 2011 and by subsequent research here and overseas. We have had to rely on the industry for much of our information when the industry has a vested interest in the outcome. AGL is no different. It claims that the Camden Gas Project has been safely operating for 10 years. Yet we understand that impacts on groundwater and air quality have not been adequately monitored, and while AGL has been operating under an Environmental Protection Licence (EPL No. 12003), it has been allowed to self-monitor its compliance, self-investigate incidents and self-report such that we do not know what true impacts it may have had. Third party consultants and external laboratories that are engaged and paid for by the industry are not independent. Nor is any funded or cofunded research by the CSG mining industry. These lessons should have been learnt with asbestos in Australia and with 'Big Tobacco' in the USA. The National Water Commission in its Position Statement (3<sup>rd</sup> December 2010) said that impacts may emerge over a long time period. I am deeply concerned that the costs of unforeseen problems will be borne by the community and taxpayers after AGL is long gone from the area. This is grossly irresponsible.

Doctors for the Environment Australia claims that health impacts from CSG mining have not been assessed. Preliminary research from Queensland (e.g. by Southern Cross University in Tara) and overseas is deeply concerning, especially where fracking has been used. As at December 2011, 85% of the production wells in the Camden Gas Project had been fracked (evidence from the NSW Upper House Inquiry) with inadequate monitoring of its impacts on water in particular. AGL claims that the use of horizontal wells in the proposed Stage 3 will reduce the need for fracking, but it seems that this is not entirely true since it has reserved the right to frack these wells in the future if/when the technology becomes available. The size of the proposed well clusters and any fracking of horizontal wells are both new and untested here. It will therefore be entirely experimental with unknown outcomes on health and property including the possibility of subsidence under so many urban properties.

I am also concerned about evidence from Queensland and overseas on air quality and the cumulative impact of AGL's expansion into an area that already experiences incidents of unacceptable levels of air pollution (ozone and fine particles) associated with respiratory problems (NSW Environmental Protection Authority). AGL's past performance gives no confidence that it has <u>not</u> already contributed to this or that it can be managed in the future,

having admitted in August this year that it had not conducted continuous air monitoring at its Rosalind Park Gas Treatment Plant for three years in breach of its EPL No.12003.

Allowing CSG mining in areas that are not zoned for heavy industry undermines zoning controls and confidence in the planning process, and creates severe land use conflicts, economic instability and inequity. It will disrupt religious communities whose vocations have so far been protected by the Scenic Hills zoning; it will place undue burden on small rural allotments whose capacity to cope is severely reduced by size (thereby threatening the survival of the entire historic Scenic Hills), and it is unsightly and unsafe in urban areas with a potential escalation in CSG mining incidents and accidents associated with the more intense urban activity (traffic, people etc.), the presence of children, and potential for vandalism. The consequent impact on land and house values for existing land and home owners may be devastating. For many people the home is their largest asset and is often leveraged to support small business. Any devaluation by bank assessors may destroy livelihoods and life savings.

I do not believe that the NSW Government's new regulations for CSG mining will ensure its safe operation here. As the only commercially producing CSG field in NSW, the Camden Gas Project has already been operating under consent conditions. Yet the NSW Government has not been able to ensure compliance, as evidenced by on-going breaches by AGL of its licence conditions, and the discovery of incidents that might not have been reported were it not for community vigilance, such as the Sugarloaf well incident in May 2011 in Menangle that allowed well contents to drift over Sydney's water channel and to nearby Glen Alpine houses.

The proposal poses risks to Sydney's water in general and to the South West in particular that have not been adequately assessed. While AGL claims that the *geology of the Sydney Basin is well known*, AGL's rationale for the constant modification of prior stages of the Camden Gas Project seems to contradict this, as does its admission to the Scenic Hills Association that it does not know where the aquifers here run to but *probably Sydney Harbour*. Potential impacts on Sydney Harbour, on the nearby Sydney Water Catchment, and AGL's proposal to run its gas gathering pipeline along Sydney's Upper Canal on public land are unacceptable risks to Sydney's water, and are an abuse of public property for the benefit of private investors.

AGL will only ever produce about 5% of NSW's gas from the Camden Gas Project according to evidence it gave under oath at the NSW Upper House Inquiry. This does not justify the risks and potential costs to the community, particularly since 150,000+ people already live and work in the immediate affected area, and this is in Sydney's south west growth corridor. It is socially, environmentally and economically unjustified, and has no social licence to operate here.

I acknowledge that my name will appear on my submission when publicly exhibited.

Mining and Industry Projects
Department of Planning
GPO Box 39
SYDNEY NSW 2001

Dear Sir/Madam

### Re: Camden Gas Project Stage 3, Project Application 09\_0048

I object to AGL's project application 09\_0048 to mine for coal seam gas (CSG) in Campbelltown and Camden. The key reasons for my objection are stated below.

I am concerned that CSG mining is a technologically-evolving industry whose impacts have not been independently and scientifically fully researched and remain largely unknown. This view is supported by professional organisations and academics in evidence to the NSW Upper House and Senate Inquiries into Coal Seam Gas Mining in 2011 and by subsequent research here and overseas. We have had to rely on the industry for much of our information when the industry has a vested interest in the outcome. AGL is no different. It claims that the Camden Gas Project has been safely operating for 10 years. Yet we understand that impacts on groundwater and air quality have not been adequately monitored, and while AGL has been operating under an Environmental Protection Licence (EPL No. 12003), it has been allowed to self-monitor its compliance, self-investigate incidents and self-report such that we do not know what true impacts it may have had. Third party consultants and external laboratories that are engaged and paid for by the industry are not independent. Nor is any funded or cofunded research by the CSG mining industry. These lessons should have been learnt with asbestos in Australia and with 'Big Tobacco' in the USA. The National Water Commission in its Position Statement (3<sup>rd</sup> December 2010) said that impacts may emerge over a long time period. I am deeply concerned that the costs of unforeseen problems will be borne by the community and taxpayers after AGL is long gone from the area. This is grossly irresponsible.

Doctors for the Environment Australia claims that health impacts from CSG mining have not been assessed. Preliminary research from Queensland (e.g. by Southern Cross University In Tara) and overseas is deeply concerning, especially where fracking has been used. As at December 2011, 85% of the production wells in the Camden Gas Project had been fracked (evidence from the NSW Upper House Inquiry) with inadequate monitoring of its impacts on water in particular. AGL claims that the use of horizontal wells in the proposed Stage 3 will reduce the need for fracking, but it seems that this is not entirely true since it has reserved the right to frack these wells in the future if/when the technology becomes available. The size of the proposed well clusters and any fracking of horizontal wells are both new and untested here. It will therefore be entirely experimental with unknown outcomes on health and property including the possibility of subsidence under so many urban properties.

I am also concerned about evidence from Queensland and overseas on air quality and the cumulative impact of AGL's expansion into an area that already experiences incidents of unacceptable levels of air pollution (ozone and fine particles) associated with respiratory problems (NSW Environmental Protection Authority). AGL's past performance gives no confidence that it has <u>not</u> already contributed to this or that it can be managed in the future,

having admitted in August this year that It had not conducted continuous air monitoring at its Rosalind Park Gas Treatment Plant for three years in breach of its EPL No.12003.

Allowing CSG mining in areas that are not zoned for heavy industry undermines zoning controls and confidence in the planning process, and creates severe land use conflicts, economic instability and inequity. It will disrupt religious communities whose vocations have so far been protected by the Scenic Hills zoning; it will place undue burden on small rural allotments whose capacity to cope is severely reduced by size (thereby threatening the survival of the entire historic Scenic Hills), and it is unsightly and unsafe in urban areas with a potential escalation in CSG mining incidents and accidents associated with the more intense urban activity (traffic, people etc.), the presence of children, and potential for vandalism. The consequent impact on land and house values for existing land and home owners may be devastating. For many people the home is their largest asset and is often leveraged to support small business. Any devaluation by bank assessors may destroy livelihoods and life savings.

I do not believe that the NSW Government's new regulations for CSG mining will ensure its safe operation here. As the only commercially producing CSG field in NSW, the Camden Gas Project has already been operating under consent conditions. Yet the NSW Government has not been able to ensure compliance, as evidenced by on-going breaches by AGL of its licence conditions, and the discovery of incidents that might not have been reported were it not for community vigilance, such as the Sugarloaf well incident in May 2011 in Menangle that allowed well contents to drift over Sydney's water channel and to nearby Glen Alpine houses.

The proposal poses risks to Sydney's water in general and to the South West in particular that have not been adequately assessed. While AGL claims that the *geology of the Sydney Basin is well known*, AGL's rationale for the constant modification of prior stages of the Camden Gas Project seems to contradict this, as does its admission to the Scenic Hills Association that it does not know where the aquifers here run to but *probably Sydney Harbour*. Potential impacts on Sydney Harbour, on the nearby Sydney Water Catchment, and AGL's proposal to run its gas gathering pipeline along Sydney's Upper Canal on public land are unacceptable risks to Sydney's water, and are an abuse of public property for the benefit of private investors.

AGL will only ever produce about 5% of NSW's gas from the Camden Gas Project according to evidence it gave under oath at the NSW Upper House Inquiry. This does not justify the risks and potential costs to the community, particularly since 150,000+ people already live and work in the immediate affected area, and this is in Sydney's south west growth corridor. It is socially, environmentally and economically unjustified, and has no social licence to operate here.

I acknowledge that my name will appear on my submission when publicly exhibited.

Don't Sacrifice Greater Western Sydney to Coal Seam Gas

34 Daniel Drive, Goonellabah, NSW 2480

Re: Camden Gas Project Stage 3, Project Application 09\_0048

Please accept this as a submission on the Camden Gas Project Stage 3 Northern Expansion which is currently on public exhibition. I object to AGL's project application 09\_0048 to drill for coal seam gas in Western Sydney.

Please put the health and wellbeing of the people of Greater Western Sydney above the profits of AGL who plan to expand their gas field around and under people's homes and businesses.

I urge you to reject the proposal by AGL to drill 66 new coal seam gas production wells on the grounds that:

- Reports from Queensland and overseas show that there are serious risks to air quality and human health from unconventional gas drilling. However there have been no detailed studies done to quantify those risks especially in urban areas. The people of Camden and Campbelltown should not be treated like guinea pigs in a coal seam gas experiment.
- People's homes should not be undermined by coal seam gas drilling without their knowledge or permission.
- Homeowners face declining property values within and adjoining coal seam gas fields with some estimating house values may fall up to 30%.
- The integrity of gas wells can't be guaranteed and research from gas fields in Queensland and the US has shown many fail in their first few year. This will leave the community to deal with the impact of leaking wells on air quality and local water supplies.
- New research from Southern Cross University on methane gas leaks from coal seam gas fields has not been considered in the proposal. AGL has not conducted these studies to account for methane leakage on their existing coal seam gas wells.
- Despite research from the Queensland and the US suggesting ground water contamination and gas leaks from fracking, the proposal by AGL will allow fracking.
- The impacts of horizontal drilling have not been adequately considered in the Environmental Assessment. Houses near mine fields in the UK have blown up when a match was struck. Gas is bubbling from the Condamine River in Queensland. Gas WILL be leaked, and people WILL get sick and you don't have enough insurance to cover the legal and compensation costs.
- There are much better alternatives to coal seam gas, including renewable energy which can offer energy security without the unacceptable environmental and health risks posed by coal seam gas extraction.

Yours sincerely, Kerrie Pimm

Mining and Industry Projects Department of Planning GPO Box 39 SYDNEY NSW 2001

Sent by email to plan comment@planning.nsw.gov.au

Dear Sir/Madam

#### Re: Camden Gas Project Stage 3, Project Application 09\_0048

We object to AGL's project application 09\_0048 to mine for coal seam gas in Campbelltown and Camden. The reasons for our objection are stated below.

- 1 Prove to me that the poisons you put into the ground have no effect on our water supply.
- 2 Prove to me that the poisons you put into the ground have no effect on my long term health, my children's health and my grand children's health.
- 3 Prove to me that the poisons you put into the ground will not escape up into the air and make our air quality much worse than what it is in Campbelltown.
- 4 What have you in place NOW that when you pollute our water supply you will be able to return it back to what it was and safe to drink.
- 5 Have you got in place NOW compensation so as to pay the price for our properties what it should be at the time when the values of our properties drop due to the destruction of the area by gas wells, trucks, bad water, poor air quality and sickness to our children?
- 6 Barry O'Farrell "A few household chemicals" only being used in fracking. I notice all of those chemicals have warnings on them as a hazard to health.

Yours sincerely

**Brian and Sandra Potts**

# Submission on the Response to Submissions and amended Development Application of AGL

Project application No. 09\_0048

Marylou Potts Pty Ltd objects to the proposed project. The reasons for the objection are set out in this submission

by Marylou Potts Pty Ltd (**MLPPL**) An incorporated legal practise December 2012

December 2012 © Marylou Potts Pty Ltd! Tuesday, 18 December 2012

#### **Executive summary**

### AGL fails to address MLPPL's issues raised in relation to Stages 1 and 2 of the CGP

Marylou Potts Pty.Ltd's (MLPPL) Submission argued there should be no development consent for Stage 3, the Northern Expansion, until a full groundwater study has been conducted on the groundwater in Stages 1 and 2 of the Camden Gas Project (CGP) that is within Petroleum Production Leases (PPL) 1, 2 and 4, which demonstrates there has been no pollution or contamination caused in Stages 1 and or 2 of the CGP.

AGL Upstream Investments Pty Ltd (AGL) has responded by outlining its groundwater assessment for the Stage 3 Northern Expansion. It has not responded at all to the issues raised by MLPPL or proposed to do anything to enlighten either Government or the community concerning whether or not Stages 1 and or 2 have caused pollution or contamination of groundwater.

AGL refers to Phases 1 and 2 Groundwater Assessment, and its Groundwater Management Plan (GMP). Phases 1 and 2 are irrelevant to the submission made by MLPPL as they relate only to Stage 3 areas in PPL5 and parts of PEL2, whereas MLPPL's submission relates to PPL's 1, 2 and 4,

Further, the GMP admits at para 5.2.2

"Currently no dedicated monitoring bores have been installed within deeper strata or the older fields of the CGP wellfield ... the operational gas wells themselves are used".

Dedicated monitoring of operating gas wells will not determine if there has been migration of drilling and or fraccing chemicals into the groundwater or surface water in PPLs 1, 2 or 4. Operational gas wells are not useful for monitoring whether the beneficial water resources in PPL's 1, 2 and 4 have been polluted or contaminated by migration of fraccing and drilling chemicals from the gas wells. What is needed are dedicated monitoring bores monitoring the beneficial water resources in the old gas field being in the areas of PPL's 1, 2 and 4, monitoring for the drilling and fraccing chemicals utilised by AGL in the drilling and fraccing of those wells in PPL's 1, 2 and 4.

MLPPL goes on to argue that the groundwater assessment of PPL's 1, 2 and 4 should be done by an independent expert, that it should be directed by the NSW Office of Water (NOW) and the results made immediately and publicly available (AGL should have no possible ability to withhold, tamper with or modify those results).

#### PAC terms of reference need to be expanded

MLPPL seeks an amendment of the Planning Assessment Commission's Terms of Reference, such that they include a requirement that before consideration of the granting of development consent is undertaken, that the ground and surface water in PPL's 1, 2 and 4 be monitored for the drilling and fraccing chemicals utilised by AGL in the wells in PPLs 1, 2 and 4. Further, that if those chemicals are found in the ground and or surface water in PPLs 1, 2 and or 4, that no development consent be granted for Stage 3 and AGL rehabilitate that water to its former condition.

A more detailed response is set out below.

#### MLP-01

MLP-01 argues it is yet to be determined whether there has been pollution or contamination of groundwater over the last 9 years in PPLs 1, 2 and 4 areas because no groundwater monitoring has been done in these areas.

#### Phase 1 Groundwater Assessment is irrelevant to MLPPL's submission

AGL responds by referring to a "Phase 1 Groundwater Assessment" which was undertaken for the project and is provided in Appendix B to this Submissions Report". That is irrelevant to MLPPL's submission. The "Phase 1 Groundwater Assessment" is not in PPL's 1, 2 or 4, but in PPL5 and parts of PEL 2 and only relates to Stage 3 Northern Expansion. Stating, in answer to the issue, that an assessment has been done elsewhere, is not a proper response.

The investigation needs to be made into the CGP Stages 1 and 2 areas of PPLs 1, 2 and 4, before consent is given to proceed in Stage 3,

MLPPL commends AGL's Phase 1 investigation and would seek that it be greatly expanded to include Stages 1 and 2 of the CGP in addition to PPL5 and PEL2 areas.

The Amended project area does not include PPLs 1, 2 and 4 and so is not relevant to MLPPL's submission.

#### Phase 2 Groundwater Assessment is irrelevant to MLPPL's submission

AGL also refers to the "Phase 2 Groundwater assessment". This assessment only relates to the Northern Expansion in PEL2 and PPL5. This is also not relevant to MLPPL's submission.

#### Groundwater Management Plan is irrelevant to MLPPL's submission

AGL also refers to its Groundwater Management Plan (GMP) in Appendix D. This states at para 5.2.2 "Currently no dedicated monitoring bores have been installed within deeper strata or the older fields of the CGP wellfield ... the operational gas wells themselves are used".

Dedicated monitoring of operating gas wells will not determine if there has been migration of drilling and or fraccing chemicals into the groundwater or surface water in PPLs 1, 2 or 4. What is needed are dedicated monitoring bores monitoring the beneficial water resources in the old gas field, being in the areas of PPL's 1, 2 and 4, monitoring for the drilling and fraccing chemicals utilised by AgL in the drilling and fraccing of the wells in these "older fields", in PPL's 1, 2 and 4. AgL admits this is yet to occur. MLPPL argues this must occur to determine the status of those water resources so as to demonstrate that AGL is not in breach of those PPLs, that its production activities are so far safe, and thereby to justify an expansion of its activities, Instead it currently proposes nothing to verify that Stages 1 and 2 have been safe.

Further, it is not clear in the GMP whether the monitoring is of the drilling and fraccing chemicals utilised by AGL. In MLPPL's view it is for these chemicals, BTEX and methane that the monitoring needs to be undertaken, anything else would be irrelevant.

MLP-02	MLP-02 argues the hydrochemistry and hydraulic connectivity between the coal seams and the beneficial water resources need to be tested in PPLs 1, 2 and 4 areas. This will determine whether there is any potential for pollution or contamination of the ground and surface waters.	AGL responds by referring to Phases 1 and 2 Groundwater assessment. Once again these assessments are not relevant to MLPPL's submission. Testing in another area completely does not answer the question. The assessment needs to be done in PPL's 1, 2 and 4. Phases 1 and 2 Groundwater assessment only relate to the Northem expansion in PPL5. The testing of hydrochemistry and hydraulic connectivity between the coal seams and the beneficial water resources needs to be undertaken in PPLs 1,2 and 4.  Reference is also made to the GMP, however as already stated, AGL admits no dedicated monitoring has been done in the older sites of the surface and ground water resources in those sites, AGL does state at para 5,2.2 of the GMP what it intends to do, but the only action which appears of utility to the issue raised by MLPPL is the "installation of a monitoring bore into the shallow alluvium aquifer (site yet to be identified)". A single monitoring bore for three PPL areas would appear to be an insufficient and inadequate monitoring of the activities in those three PPLs over the last 10 years of production.  MLPPL argues all water sources in the PPL1, 2 and 4 areas should be identified and tested for the drilling and fraccing chemicals utilised by AGL in the wells of these PPL areas. If these chemicals are found, no expansion should be allowed until it is demonstrated that these chemicals can be removed from the beneficial aquifers.
MLP -03	MLP - 03 argues pollution or contamination of Sydney's drinking water is unacceptable,	AGL responds by referring to Sections 3.4 and 3.5 of this submission report.  Para 3.4.1 of the Main Report states "AGL has a detailed knowledge of the local geology from collecting reliable data consequently the hydrogeology of the Camden Gas Project area is well understood." This statement is in direct contradiction to the GMP para 5.2.2 quoted above.  Para 3.4.1 of the Main Report states to address the issues concerned AGL is undertaking Phase 1 and 2 and the GMP. We remain with the issues raised above. No monitoring has been done in the older fields to date and MLPPL argues that it should be done to determine whether or not there has already been pollution or contamination caused by Phases 1 and or 2 of the CGP.
MLP-04	MLP - 04 sets out the potential impacts of CSG mining on groundwater.	AGL responds by stating it will not use BTEX chemicals. Not using BTEX is only one of a myriad of potential impacts on groundwater caused by CSG mining. None of the other impacts have been addressed by AGL. Further, this does not address the fact that BTEX chemicals are naturally occurring in the coal seam and the fraccing of the seam can lead to the release of these chemicals into the surrounding geology/hydrogeology.  Potential contamination of groundwater with methane has already been documented in USA. We know the Condamine river is currently bubbling with methane which Origin Energy claims is naturally occurring. The recent Southern Cross University studies of the SE Queensland Tara gas field indicate higher than normal levels of methane in the air. Without a baseline data and regular monitoring the detrimental impact of CSG mining on the environment and the community remain unknown. It is in the interests of AGL to ensure that the impact remains unknown so it may continue. It is up to the Government to ensure that entities that it licenses to exploit its natural resources do not cause more damage than the economic reward. Currently this is yet to be proven by AGL who has paid little more than \$460,000 in 2011 yet we have a community in NSW of some hundreds of thousands of people who are outraged by this activity.

MLP-05	MLP - 05 refers to the potential for subsidence to cause faulting and resultant hydraulic connectivity.	AGL refers to DC_14.  DC_14 refers to the subsidence report for the Stage 3 Northern Expansion. This is irrelevant to the point made by MLPPL which relates to Stages 1 and 2 of the CGP in PPLs 1, 2 and 4.
MLP-06	MLP - 06 argues AGL has obligations under its existing leases and licence to protect groundwater, yet it has done no monitoring to demonstrate that there is no pollution or contamination in Stages 1 and 2 of the CGP.	AGL responds by denying any current breach. Yet we still have no monitoring in Stages 1 and 2 CGP PPLs 1, 2 or 4 as admitted by AGL in Para 5.2.2 of its GMP.  No pollution has been identified, as none has been investigated.
MLP-07	MLP - 07 argues AGL is in breach of the Water Act for failing to have licences for its 123 wells.	AGL responds by stating its wells are licensed. Yet in AGL's EA for the Northern Expansion it admitted it had submitted an application for licences but the NOW was yet to grant the licences.
MLP-08	MLP - 08 argues there should be no grant of development consent for the Northern Expansion until it is clearly demonstrated that no pollution or contamination has occurred in Stages 1 or 2 of the CGP. That is yet to be demonstrated.	AGL responds by referring to its above responses. Those responses which relate to a totally different area are irrelevant to MLPPL's submission.

#### MLP-09

MLP - 09 argues the testing of Stages 1 and 2 should be done by an independent body, paid out of the AGL security and the results made publicly available.

AGL responds by referring to Phase 1 and Phase 2 Groundwater Assessments. This is not a response to the issue raised, ie Phases 1 and 2 Groundwater Assessments relate to the Stage 3 of the CGP only. MLPPL argues the testing should be done for Stages 1 and 2 of the CGP in PPL's 1, 2 and 4.

Given this is the longest running petroleum production field in NSW, surely it is in the interest of the NSW Government and AGL to ensure that Stages 1 and 2 of the CGP have not resulted in any pollution or contamination of the water resources of PPLs 1, 2 and 4. This should be clearly, transparently and thoroughly demonstrated before any further expansion occurs. If there is pollution and or contamination it raises serious doubts about the possibility of the continuation of the project particularly if those water resources cannot be remediated.

Surely this is the perfect opportunity to determine the environmental credentials of CSG production and its effects on water resources in these types of geological/hydrogeological circumstances. The public currently believes these activities are unsafe, and to date, we have no clear demonstration that they are not unsafe. In fact, in the only other CSG production field in NSW, ESG's PPL3, we now know that more than \$20 million needs to be spent to rehabilitate the environmental damage that has been done there. Further, there is an ongoing EPA investigation into PPL3, and Santos has advised a landholder that previously beneficial bore water in or in the vicinity of PPL3 can no longer be used by the landholder, as it is apparently poisonous.

Subject:

Don't Sacrifice Greater Western Sydney to Coal Seam Gas

# MY ADDRESS:

Re: Camden Gas Project Stage 3, Project Application 09 0048

Please accept this as a submission on the Camden Gas Project Stage 3 Northern Expansion which is currently on public exhibition. I object to AGL's project application 09\_0048 to drill for coal seam gas in Western Sydney.

Please put the health and wellbeing of the people of Greater Western Sydney above the profits of AGL who plan to expand their gas field around and under people's homes and businesses.

I urge you to reject the proposal by AGL to drill 66 new coal seam gas production wells on the grounds that:

- Reports from Queensland and overseas show that there are serious risks to air quality and human health from unconventional gas drilling. However there have been no detailed studies done to quantify those risks especially in urban areas. The people of Camden and Campbelltown should not be treated like guinea pigs in a coal seam gas experiment.
- People's homes should not be undermined by coal seam gas drilling without their knowledge or permission.
- Homeowners face declining property values within and adjoining coal seam gas fields with some estimating house values may fall up to 30%.
- The integrity of gas wells can't be guaranteed and research from gas fields in Queensland and the US has shown many fail in their first few year. This will leave the community to deal with the impact of leaking wells on air quality and local water supplies.
- New research from Southern Cross University on methane gas leaks from coal seam gas fields has not been considered in the proposal. AGL has not conducted these studies to account for methane leakage on their existing coal seam gas wells.
- Despite research from the Queensland and the US suggesting ground water contamination and gas leaks from fracking, the proposal by AGL will allow fracking.
- The impacts of horizontal drilling have not been adequately considered in the Environmental Assessment.
- There are alternatives to coal seam gas, including renewable energy which can offer energy security without the unacceptable environmental and health risks posed by coal seam gas extraction.

Yours sincerely, Sarah-jane Potts

Dear Sir/Madam

# Re: Camden Gas Project Stage 3, Project Application 09\_0048

I object to AGL's project application 09\_0048 to mine for coal seam gas (CSG) in Campbelltown and Camden. The key reasons for my objection are stated below.

I am concerned that CSG mining is a technologically-evolving industry whose impacts have not been independently and scientifically fully researched and remain largely unknown. This view is supported by professional organisations and academics in evidence to the NSW Upper House and Senate Inquiries into Coal Seam Gas Mining in 2011 and by subsequent research here and overseas. We have had to rely on the industry for much of our information when the industry has a vested Interest in the outcome. AGL is no different. It claims that the Camden Gas Project has been safely operating for 10 years. Yet we understand that impacts on groundwater and air quality have not been adequately monitored, and while AGL has been operating under an Environmental Protection Licence (EPL No. 12003), it has been allowed to self-monitor its compliance, self-investigate incidents and self-report such that we do not know what true impacts it may have had. Third party consultants and external laboratories that are engaged and paid for by the industry are not independent. Nor is any funded or cofunded research by the CSG mining industry. These lessons should have been learnt with asbestos in Australia and with 'Big Tobacco' in the USA. The National Water Commission in its Position Statement (3<sup>rd</sup> December 2010) said that impacts may emerge over a long time period. I am deeply concerned that the costs of unforeseen problems will be borne by the community and taxpayers after AGL is long gone from the area. This is grossly irresponsible.

Doctors for the Environment Australia claims that health impacts from CSG mining have not been assessed. Preliminary research from Queensland (e.g. by Southern Cross University in Tara) and overseas is deeply concerning, especially where fracking has been used. As at December 2011, 85% of the production wells in the Camden Gas Project had been fracked (evidence from the NSW Upper House Inquiry) with inadequate monitoring of its impacts on water in particular. AGL claims that the use of horizontal wells in the proposed Stage 3 will reduce the need for fracking, but it seems that this is not entirely true since it has reserved the right to frack these wells in the future if/when the technology becomes available. The size of the proposed well clusters and any fracking of horizontal wells are both new and untested here. It will therefore be entirely experimental with unknown outcomes on health and property including the possibility of subsidence under so many urban properties.

I am also concerned about evidence from Queensland and overseas on air quality and the cumulative impact of AGL's expansion into an area that already experiences incidents of unacceptable levels of air pollution (ozone and fine particles) associated with respiratory problems (NSW Environmental Protection Authority). AGL's past performance gives no confidence that it has <u>not</u> already contributed to this or that it can be managed in the future,

having admitted in August this year that it had not conducted continuous air monitoring at its Rosalind Park Gas Treatment Plant for three years in breach of its EPL No.12003.

Allowing CSG mining in areas that are not zoned for heavy industry undermines zoning controls and confidence in the planning process, and creates severe land use conflicts, economic instability and inequity. It will disrupt religious communities whose vocations have so far been protected by the Scenic Hills zoning; it will place undue burden on small rural allotments whose capacity to cope is severely reduced by size (thereby threatening the survival of the entire historic Scenic Hills), and it is unsightly and unsafe in urban areas with a potential escalation in CSG mining incidents and accidents associated with the more intense urban activity (traffic, people etc.), the presence of children, and potential for vandalism. The consequent impact on land and house values for existing land and home owners may be devastating. For many people the home is their largest asset and is often leveraged to support small business. Any devaluation by bank assessors may destroy livelihoods and life savings.

I do not believe that the NSW Government's new regulations for CSG mining will ensure its safe operation here. As the only commercially producing CSG field in NSW, the Camden Gas Project has already been operating under consent conditions. Yet the NSW Government has not been able to ensure compliance, as evidenced by on-going breaches by AGL of its licence conditions, and the discovery of incidents that might not have been reported were it not for community vigilance, such as the Sugarloaf well incident in May 2011 in Menangle that allowed well contents to drift over Sydney's water channel and to nearby Glen Alpine houses.

The proposal poses risks to Sydney's water in general and to the South West in particular that have not been adequately assessed. While AGL claims that the *geology of the Sydney Basin is well known*, AGL's rationale for the constant modification of prior stages of the Camden Gas Project seems to contradict this, as does its admission to the Scenic Hills Association that it does not know where the aquifers here run to but *probably Sydney Harbour*. Potential impacts on Sydney Harbour, on the nearby Sydney Water Catchment, and AGL's proposal to run its gas gathering pipeline along Sydney's Upper Canal on public land are unacceptable risks to Sydney's water, and are an abuse of public property for the benefit of private investors.

AGL will only ever produce about 5% of NSW's gas from the Camden Gas Project according to evidence it gave under oath at the NSW Upper House Inquiry. This does not justify the risks and potential costs to the community, particularly since 150,000+ people already live and work in the immediate affected area, and this is in Sydney's south west growth corridor. It is socially, environmentally and economically unjustified, and has no social licence to operate here.

I acknowledge that my name will appear on my submission when publicly exhibited.

Please accept this as a submission on the Camden Gas Project Stage 3 Northern Expansion which is currently on public exhibition. I object to AGL's project application 09\_0048 to drill for coal seam gas in Western Sydney.

The CSG industry is self interested, the risks are documented and their consequences are already being experienced by residents and constituents in Australia and overseas. Groundwater gets contaminated. Methane, the worst of all greenhouse gasses, escapes the harvesting process adding to the current problems of atmospheric upset. This madness must be stopped for our children's sake.

- There are alternatives to coal seam gas, including renewable energy which can offer energy security without the unacceptable environmental and health risks posed by coal seam gas extraction.

# melanie poyntz, of camden NSW, made the following submission on the project:

# **Camden Gas Project Stage 3 Northern Expansion**

# Objects to this project

As a camden resident I strongly object to the further expansion of Coal seam gas wells and exploratory sites.

This is a complete disregard for public health in newly developing estates with families and increased population.

The chemicals emitted are a health risk and no amount of chemical emissions is healthy for the environment, not to mention the water system, our rivers etc. This is blatant environmental negligence. If this goes ahead 20 years down the track. the land, water, wildlife and air quality will be destroyed and it will be too little to late, considering there is no complete study done that can 100% guarantee no environmental damage long term. Thank you for reading my submission against csg.

Dear Sir/Madam

# Re: Camden Gas Project Stage 3, Project Application 09\_0048

I object to AGL's project application 09\_0048 to mine for coal seam gas (CSG) in Campbelltown and Camden. The key reasons for my objection are stated below.

I am concerned that CSG mining is a technologically-evolving industry whose impacts have not been independently and scientifically fully researched and remain largely unknown. This view is supported by professional organisations and academics in evidence to the NSW Upper House and Senate Inquiries into Coal Seam Gas Mining in 2011 and by subsequent research here and overseas. We have had to rely on the industry for much of our information when the industry has a vested interest in the outcome. AGL is no different. It claims that the Camden Gas Project has been safely operating for 10 years. Yet we understand that impacts on groundwater and air quality have not been adequately monitored, and while AGL has been operating under an Environmental Protection Licence (EPL No. 12003), it has been allowed to self-monitor its compliance, self-investigate incidents and self-report such that we do not know what true impacts it may have had. Third party consultants and external laboratories that are engaged and paid for by the industry are not independent. Nor is any funded or cofunded research by the CSG mining industry. These lessons should have been learnt with asbestos in Australia and with 'Big Tobacco' in the USA. The National Water Commission in its Position Statement (3<sup>rd</sup> December 2010) said that impacts may emerge over a long time period. I am deeply concerned that the costs of unforeseen problems will be borne by the community and taxpayers after AGL is long gone from the area. This is grossly irresponsible.

Doctors for the Environment Australia claims that health impacts from CSG mining have not been assessed. Preliminary research from Queensland (e.g. by Southern Cross University in Tara) and overseas is deeply concerning, especially where fracking has been used. As at December 2011, 85% of the production wells in the Camden Gas Project had been fracked (evidence from the NSW Upper House Inquiry) with inadequate monitoring of its impacts on water in particular. AGL claims that the use of horizontal wells in the proposed Stage 3 will reduce the need for fracking, but it seems that this is not entirely true since it has reserved the right to frack these wells in the future if/when the technology becomes available. The size of the proposed well clusters and any fracking of horizontal wells are both new and untested here. It will therefore be entirely experimental with unknown outcomes on health and property including the possibility of subsidence under so many urban properties.

I am also concerned about evidence from Queensland and overseas on air quality and the cumulative impact of AGL's expansion into an area that already experiences incidents of unacceptable levels of air pollution (ozone and fine particles) associated with respiratory problems (NSW Environmental Protection Authority). AGL's past performance gives no confidence that it has <u>not</u> already contributed to this or that it can be managed in the future,

having admitted in August this year that it had not conducted continuous air monitoring at its Rosalind Park Gas Treatment Plant for three years in breach of its EPL No.12003.

Allowing CSG mining in areas that are not zoned for heavy industry undermines zoning controls and confidence in the planning process, and creates severe land use conflicts, economic instability and inequity. It will disrupt religious communities whose vocations have so far been protected by the Scenic Hills zoning; it will place undue burden on small rural allotments whose capacity to cope is severely reduced by size (thereby threatening the survival of the entire historic Scenic Hills), and it is unsightly and unsafe in urban areas with a potential escalation in CSG mining incidents and accidents associated with the more intense urban activity (traffic, people etc.), the presence of children, and potential for vandalism. The consequent impact on land and house values for existing land and home owners may be devastating. For many people the home is their largest asset and is often leveraged to support small business. Any devaluation by bank assessors may destroy livelihoods and life savings.

I do not believe that the NSW Government's new regulations for CSG mining will ensure its safe operation here. As the only commercially producing CSG field in NSW, the Camden Gas Project has already been operating under consent conditions. Yet the NSW Government has not been able to ensure compliance, as evidenced by on-going breaches by AGL of its licence conditions, and the discovery of incidents that might not have been reported were it not for community vigilance, such as the Sugarloaf well incident in May 2011 in Menangle that allowed well contents to drift over Sydney's water channel and to nearby Glen Alpine houses.

The proposal poses risks to Sydney's water in general and to the South West in particular that have not been adequately assessed. While AGL claims that the *geology of the Sydney Basin is well known*, AGL's rationale for the constant modification of prior stages of the Camden Gas Project seems to contradict this, as does its admission to the Scenic Hills Association that it does not know where the aquifers here run to but *probably Sydney Harbour*. Potential impacts on Sydney Harbour, on the nearby Sydney Water Catchment, and AGL's proposal to run its gas gathering pipeline along Sydney's Upper Canal on public land are unacceptable risks to Sydney's water, and are an abuse of public property for the benefit of private investors.

AGL will only ever produce about 5% of NSW's gas from the Camden Gas Project according to evidence it gave under oath at the NSW Upper House Inquiry. This does not justify the risks and potential costs to the community, particularly since 150,000+ people already live and work in the immediate affected area, and this is in Sydney's south west growth corridor. It is socially, environmentally and economically unjustified, and has no social licence to operate here.

I acknowledge that my name will appear on my submission when publicly exhibited.

Subject:

Don't Sacrifice Greater Western Sydney to Coal Seam Gas

### MY ADDRESS:

Re: Camden Gas Project Stage 3, Project Application 09 0048

Please accept this as a submission on the Camden Gas Project Stage 3 Northern Expansion which is currently on public exhibition. I object to AGL's project application 09\_0048 to drill for coal seam gas in Western Sydney.

Please put the health and wellbeing of the people of Greater Western Sydney above the profits of AGL who plan to expand their gas field around and under people's homes and businesses.

I urge you to reject the proposal by AGL to drill 66 new coal seam gas production wells on the grounds that:

- Reports from Queensland and overseas show that there are serious risks to air quality and human health from unconventional gas drilling. However there have been no detailed studies done to quantify those risks especially in urban areas. The people of Camden and Campbelltown should not be treated like guinea pigs in a coal seam gas experiment.
- People's homes should not be undermined by coal seam gas drilling without their knowledge or permission.
- Homeowners face declining property values within and adjoining coal seam gas fields with some estimating house values may fall up to 30%.
- The integrity of gas wells can't be guaranteed and research from gas fields in Queensland and the US has shown many fail in their first few year. This will leave the community to deal with the impact of leaking wells on air quality and local water supplies.
- New research from Southern Cross University on methane gas leaks from coal seam gas fields has not been considered in the proposal. AGL has not conducted these studies to account for methane leakage on their existing coal seam gas wells.
- Despite research from the Queensland and the US suggesting ground water contamination and gas leaks from fracking, the proposal by AGL will allow fracking.
- The impacts of horizontal drilling have not been adequately considered in the Environmental Assessment.
- There are alternatives to coal seam gas, including renewable energy which can offer energy security without the unacceptable environmental and health risks posed by coal seam gas extraction.

Yours sincerely, Jennifer Pyle
