ANZECC	Australian, New Zealand Environment and Conservation Council
BTEX	Benzene, toluene, ethylbenzene and xylene
C6–C10	Light petroleum hydrocarbon chain fraction (for example, petrol)
C10–C16	Medium petroleum hydrocarbon chain fraction (for example, jet fuel, kerosene, diesel)
C16–C34	Heavy petroleum hydrocarbon chain fraction (for example, diesel, motor oils)
C34–C40	Heavy petroleum hydrocarbon chain fraction (for example, lube oils, fuel oils, waxes)
<1, <100	Less than the PQL, that is, less than 1 or 100 units
LNAPL	Light non-aqueous phase liquid
m AHD	Metres Australian Height Datum
mg/kg	Micrograms per kilogram
mg/L	Milligram per litre
ND (nd)	Not detected above the PQL
ppm	Part per million
PQL	Practical quantitation limit (of chemical concentration)
Redox potential	Reduction/oxidation potential
RPD	Relative per cent difference
TDS	Total dissolved solids, a measure of salinity
TRH	Total recoverable hydrocarbons
µg/L	Microgram per litre
µS/cm	MicroSiemens per centimetre; a measure of conductivity and salinity

EXECUTIVE SUMMARY

The Fairfield Sustainable Resource Centre (SRC) is a Council-operated recycling centre which accepts waste building material comprising terracotta, brick, concrete and asphalt and supplies aggregate, sand, topsoil and crushed concrete for construction and landscaping. It is understood that the Council intends to expand the SRC licensed area to include approximately 2.8 hectares (ha) to the east of the current SRC operational area, including filling in a gully within a former road reservation (Canal Road) between the current facility and the proposed expansion. The project will also include expanding a paved carpark area, construction of a flood compensation area to the north-east of the expansion area and creation of two new sedimentation basins, one in the north of the facility and one in the north-east corner of the expansion area. Fairfield City Council engaged WSP Australia Pty Ltd (WSP) to undertake a detailed site investigation (DSI) for the facility, including the expansion area, as part of the planning approvals process.

The objectives of the DSI were to:

- assess the condition of the soil in the proposed expansion area
- assess the groundwater quality beneath the expansion area
- assess the condition of soil, groundwater and any standing water present in the gully
- assess groundwater quality between the SRC facility and Prospect Creek.

The scope of work to meet the objectives comprises:

- desktop assessment of the history and current operation of the current SRC and the expansion area to select intrusive investigation locations
- intrusive investigation at 32 sampling locations comprising:
 - excavation of 27 test pits in the expansion area and adjacent to the gully
 - drilling and installation of 3 wells in the expansion area
 - drilling and installation of 2 shallow wells between the existing SRC facility and Prospect Creek
- surface water sampling of Prospect Creek upstream of the SRC facility, at the facility and downstream of the facility
- surface water sampling of standing water in the gully where Canal Road is proposed to be constructed.

The results of the investigation showed some contamination in the groundwater beneath the expansion area, likely a result of the landfill leachate. No human health risks related to the proposed operational increase of the use of the site were identified from soil or groundwater. The standing water in the gully and the samples of Prospect Creek found metals and hydrocarbons present. Hydrocarbons detected did not exceed any adopted assessment criteria and metals were considered to represent background conditions.

The soil and groundwater in the gully were unable to be assessed due to the vegetation present. However, test pits and soil bores were undertaken adjacent to the gully and a sample of the surface water outflow was collected. The outflow sample contained hydrocarbons, although no risks were identified.

Based on the results of the DSI the proposed redevelopment of the site, including the expansion of the SRC and filling in the gully, is not considered to represent a risk to human health or the environment. During the construction phase controls to limit dust generation and manage water runoff would be included in a construction environmental management plan. The presence of the landfill material is not expected to impact the proposed redevelopment due to the thickness of the capping material.

Soil excavated for the new sedimentation basin in the expansion area is considered likely to be suitable for reuse at the site, based on the sampling results from test pits in the proposed area. However, if soil is removed from the site it must be sampled for waste classification before disposal.

The areas of the site where the carpark expansion, sedimentation basin in the north-east of the facility and flood compensation area are proposed were not assessed during this investigation. However, only limited potential risks are associated with the carpark expansion and sedimentation basin, comprising management of spoil, dust generation and water runoff, which can be adequately managed during the construction phase under the construction environmental management plan. Soil sampling for waste classification should be undertaken on any spoil material created during these works. The flood compensation basin is discussed in a separate memorandum, as it was added to the scope after the fieldwork was completed.

The site is considered suitable for the continued use as a recycling centre, with no remediation recommended based on the findings of this investigation.

1 INTRODUCTION

1.1 BACKGROUND

Fairfield City Council covers 102 km² in the south-western Sydney metropolitan area, and serves approximately 205,000 residents. The Fairfield Sustainable Resource Centre (SRC) is a Council-operated recycling centre which accepts waste building material comprising terracotta, brick, concrete and asphalt and supplies aggregate, sand, topsoil and crushed concrete for construction and landscaping. The SRC has been in operation since 1997 and processes in excess of 180,000 tonnes of material per year.

It is understood that the Council intends to expand the SRC licensed area to include approximately 2.8 hectares (ha) to the east of the current SRC operational area, including filling in a gully within a former road reservation (Canal Road) between the current facility and the proposed expansion. The project will also include expanding a paved carpark area, construction of a flood compensation area to the north-east of the expansion area and creation of two new sedimentation basins, one in the north of the facility and one in the north-east corner of the expansion area.

A site layout plan is presented as Figure 1 in Appendix A. Fairfield City Council engaged WSP Australia Pty Ltd (WSP) to undertake a detailed site investigation (DSI) for the facility, including the expansion area, as part of the planning approvals process. The purpose of the DSI is to respond to the Planning Secretary's Environmental Assessment Requirements (SEARs) issued by the NSW Department of Planning and Environment (DPE) for the project, in particular the requirements for characterisation of:

- “water quality at the point of discharge to surface and/or groundwater against the relevant water quality criteria”
- “the nature and extent of any contamination on the site and a description of proposed management measures.”

The DSI was initially scoped to assess the expansion area only. However, after feedback from the DPE, now the Department of Planning, Industry and Environment (DPIE), it was broadened to include the currently licensed facility area, following the initial assessment work undertaken in 2017.

1.2 OBJECTIVES

The objectives of the investigations were to:

- assess the condition of the soil at the facility, including in the proposed expansion area
 - assess the groundwater quality beneath the expansion area
 - assess the condition of soil, groundwater and any standing water present in the gully
 - assess groundwater quality between the SRC facility and Prospect Creek.
-

1.3 SCOPE OF WORKS

The scope of work to meet the objectives comprises:

- desktop assessment of the history and current operation of the current SRC and the expansion area to select intrusive investigation locations
- intrusive investigation at 40 sampling locations comprising:
 - excavation of 27 test pits in the expansion area and adjacent to the gully
 - hand digging 8 locations in the existing facility

- drilling and installation of 3 wells in the expansion area
- drilling and installation of 2 shallow wells between the existing SRC facility and Prospect Creek
- surface water sampling of Prospect Creek upstream of the SRC facility, at the facility and downstream of the facility
- surface water sampling of standing water in the gully where Canal Road is proposed to be filled.

In addition, surface water sampling was undertaken in three rounds in 2018 and 2019 as part of a surface water discharge assessment at the request of the NSW Environment Protection Authority (EPA). The sampling was undertaken after periods of heavy rainfall when ponding was present in the northern portion of the site.

2 SITE LOCATION AND SETTING

2.1 SITE LOCATION AND IDENTIFICATION

The general site identification details are provided in Table 2.1.

Table 2.1 Site details

Site address	Corner of Hassall Street and Widemere Road, Wetherill Park
Site identification	Currently licensed area: Lots 35 and 37, Deposited Plan (DP) 3082 Lot 1, DP 368374 Lot 1, DP 515773 part Lot 1 and Lot 2, DP 620755 Lot 34, DP 657040 Expansion area: Lots 1 and 2, DP 620755 part Lot 1, DP 368374 part Lot 37, DP 3082 Proposed Canal Road: Lot 100 in DP 1220637 part Lot 1, DP 620755 part Lot 37, DP 3082 part Lot 35, DP 657040.
Site area	Currently facility area – approximately 17.5 ha Expansion area – approximately 2 ha Proposed Canal Road – approximately 6,000 m ²
Current site use	Recycling facility
Surrounding land uses	Commercial and light industrial properties are present to the south, beyond Hassall Street, and west. To the north and east is Prospect Creek, with recreational sporting facilities beyond.
Local government area and zoning	City of Fairfield LGA, zoned IN1, general Industrial, under <i>Fairfield Local Environmental Plan 2013</i> (Fairfield LEP)
Proposed site use	Recycling centre and internal roadway

2.2 SITE INSPECTION

A site inspection of the expansion area was undertaken in September 2017 at the time of the initial assessment, and a subsequent inspection of the currently licensed portion of the facility was undertaken in April 2020.

The main entrance to the facility is via a driveway from Widemere Road. Due to historical landfilling, two areas have been built up approximately 10 m above the surrounding topography, which generally slopes to the north down to Prospect Creek. The surface of both areas was covered by a compacted gravel road base to allow heavy vehicle access. These two elevated areas make up the majority of the southern portion of the SRC property, with vegetated slopes coming down in all directions to the natural ground level.

The larger elevated pad, approximately 5 ha, comprises the main recycling facility and includes the site office and maintenance building, the facility entrance, weigh station control office, two pugmills, a crusher two water reservoirs and numerous stockpiling areas. The smaller elevated pad, approximately 1.5 ha, comprises the expansion area and includes a third water reservoir and additional stockpiling areas. There are multiple concrete bunded quarantine bays in the western portion of the expansion area. The two pads are connected by an access road, running near the southern site boundary over the gully intended to be filled in to create Canal Road.

To the north-west of the larger elevated area is a smaller operational area of the site used as a weekend drop-off area for household recyclables. This area also has a paved entrance drive from Widemere Road, leading to an open paved area that surrounds a stand of mature trees.

2.3 TOPOGRAPHY AND SURFACE WATER DRAINAGE

The property that includes both the current facility and the proposed expansion area comprises a series of capped former landfill cells that are elevated between 5 and 10 m above the surrounding area. The natural ground surrounding the cells slopes down towards Prospect Creek, which forms the northern boundary of the majority of the property before passing through the north-western portion to the north of the existing facility.

The tops of the capped cells that make up the current facility and the expansion area are generally flat with slopes down in all directions at the edges of the cells. Between the current facility and the expansion area is a gully where Canal Road is proposed to be constructed.

Surface water in the operational areas is directed to three holding ponds, in the north-west and south-east of the current facility and in the south-west of the expansion area. For the surrounding area surface water is expected to drain to Prospect Creek. A buffer zone has been designated between the weekend drop-off area and Prospect Creek to allow for settling and filtering of any runoff before reaching the creek.

2.4 GEOLOGY

The regional map of the area (Department of Mineral Resources, 1983, Geological Series Sheet 9130, Edition 1, Penrith, Scale 1:100,000) indicates that the regional geology consists of Triassic Wianamatta Group shale, carbonaceous claystone, laminate, fine to medium grained lithic sandstone, rare coal and tuff.

2.5 ACID SULFATE SOIL

A search of the Australian Soils Resource Information System (ASRIS, 2013) and ASS risk mapping published by the Office of Environment and Heritage (2013) indicated that the site is located in an area of low probability of acid sulfate soil occurrence. The site is not classified according to the Fairfield LEP maps.

2.6 HYDROLOGY

A review of the Department of Primary Industries registered groundwater bore database (<http://allwaterdata.water.nsw.gov.au/water.stm>) conducted on 21 May 2020 identified two registered groundwater bores at the site and seven registered bores located between 650 and 800 m to the west to south-west. The well details are summarised in Table 2.2.

Table 2.2 Registered groundwater bores

WELL ID	DISTANCE FROM SITE	REGISTERED USE	INSTALLED DEPTH	STANDING WATER LEVEL
GW103599	On SRC property	Monitoring	5 mBGL	NA
GW103600	On SRC property	Monitoring	5 mBGL	1 mBGL
GW105475	725 m south-west	Monitoring	9.5 mBGL	NA
GW111878	150 m west	Monitoring	5.5 mBGL	NA
GW111879	775 m west	Monitoring	5.8 mBGL	NA
GW111880	775 m south-west	Monitoring	6.2 mBGL	NA
GW105476	650 m west	Monitoring	9.5 mBGL	NA
GW111881	775 m west	Monitoring	6.5 mBGL	NA
GW105474	725 m south-west	Monitoring	9.3 mBGL	NA

Notes

mBGL – metres below ground level

NA – not available

The nearest surface water body is Prospect Creek, located 150 m north-east of the expansion area. Prospect Creek flows into the Georges River, approximately 8 km south-east of the site.

3 SITE BACKGROUND REVIEW

3.1 HISTORICAL AERIAL PHOTOGRAPH REVIEW

Historical aerial photographs of the site and vicinity were reviewed for the years 1965, 1978, 1991 and 2004 along with the current aerial. Aerial photographs are included in Appendix B. The details of the site and surrounding area in each photograph are summarised in Table 3.1.

Table 3.1 Historical aerial photograph review

YEAR	SITE CONDITIONS	SURROUNDING CONDITIONS
1965	The site and the remainder of the SRC are rural agricultural properties. A small group of buildings which may be rural farm buildings is present in the southern portion of the site.	The surrounding sites are rural residential and agricultural. Widemere Road, Hassall Street and Redfern Street are present. Prospect Creek is generally in its current alignment, although vegetation clearing is apparent along the banks.
1978	The western portion of the site appears to still be agricultural, although the use is unclear based on the quality of the photograph. The eastern portion has been cleared and appears to be in use as a land fill. One small building is present on the eastern portion and a group of structures is present in the south of the western portion.	Sites to the south appear to remain generally agricultural, although residential development has progressed to the south-east. Additional roadways have been constructed to the south. To the north and east, beyond Prospect Creek, a quarry operation is present.
1991	The site appears to have been filled and capped, and the gully in the west is apparent. The western portion of the SRC has large stockpiles of material present.	Properties to the south and west have been redeveloped for commercial or industrial uses. The Road layout is in its current configuration. The quarry to the north and east of Prospect Creek appears to have been largely filled and sport fields are being constructed.
2004	The site is in its current layout, with the SRC facilities present.	Density of commercial/industrial development to the west and south has increased. Vegetation around Prospect Creek is increased.
2016	No changes	No changes

3.2 NSW PUBLIC REGISTERS SEARCH

Searches were conducted of the NSW Environment Protection Authority (EPA) contaminated land public record (<http://app.epa.nsw.gov.au/prclmapp/searchregister.aspx>) and the *Protection of the Environment Operations Act 1997* (POEO) public register (<http://www.epa.nsw.gov.au/licensing-and-regulation/public-registers/about-prpoeo>). No contaminated sites were identified within 1 km of the site. Sites with environmental protection licenses within 1 km of the site are summarised in Table 3.2.

Table 3.2 Licensed sites

SITE	DISTANCE FROM SITE	LICENSED ACTIVITIES
ABC Paper & Paper Mills Pty Ltd	670 m south-west	Paper or pulp production
Architectural & Structural Adhesives Pty Ltd	500 m south-west	Chemical and/or waste generation or storage
Australian Comfort Group Pty Ltd	700 m south-west	Chemical production
Boral Recycling Pty Ltd	750 north-west	Waste storage and recovery
Drum Reconditioners (NSW) Pty Ltd	750 m west	Waste generation, processing and/or storage
Grima Environmental Services Pty Ltd	630 m south-west	Waste storage and recovery
ITW Australia Pty Ltd	300 m south-east	Petroleum and fuel production
Resourceco RRF Pty Ltd	900 m west	Waste storage and recovery
Steritech Pty Ltd	550 m west	Sterilisation activities
Tank Management Services Pty Ltd	800 m south-west	Waste processing

3.3 PRELIMINARY CONCEPTUAL SITE MODEL

Based on the site inspection and the desktop review of site setting and historical land use information, a preliminary conceptual site model (CSM) has been prepared. The CSM is summarised in Table 3.3.

Table 3.3 Preliminary CSM

Potential sources of impact	<p>The potential sources of impact identified are:</p> <ul style="list-style-type: none"> — historical land filling — uncontrolled fill material used for capping or levelling — fly tipping — stockpiling of fill material related to the SRC — pesticides/herbicides used historically to maintain the site — vehicle use associated with the SRC.
Potentially impacted media	<p>Soils: Impacts from fill or waste material, either surficial or buried in the landfill cells, surface application of pesticides/herbicides.</p> <p>Groundwater: Impacts from landfill leachate or migration from soil impacts.</p>

Contaminants of concern	<p>Contaminants of concern for the site comprise:</p> <ul style="list-style-type: none"> — polycyclic aromatic hydrocarbons (PAHs) — metals — asbestos — petroleum hydrocarbons as total recoverable hydrocarbon (TRH) and benzene, toluene, ethylbenzene, xylene and naphthalene (BTEXN) — organochlorine and organophosphorus pesticides (OCPs/OPPs) — polychlorinated biphenyls (PCBs).
Migration pathways	<p>Potential migration pathways include:</p> <ul style="list-style-type: none"> — runoff of surface contaminants in rain water — vertical migration of contaminants in soil from infiltration of rain water — horizontal migration of contaminants along the hydraulic gradient or through underground service trenches — volatilisation of hydrocarbon contamination — airborne migration of contamination in dust or vapour, or as fibres.
Potential receptors	<p>Based on the site setting, potential receptors comprise:</p> <ul style="list-style-type: none"> — site users, including SRC workers, truck drivers delivering or collecting material and excavation/maintenance workers — nearby site users which might be impacted by airborne contamination — maintenance workers in nearby service trenches — users of groundwater or surface downgradient of the site — underlying soil and groundwater — surface water bodies which may be impacted by runoff or groundwater from the site, e.g. Prospect Creek.
Potential exposure pathways	<p>Potential exposures pathways comprise:</p> <ul style="list-style-type: none"> — inhalation of dust, vapour or fibres by site users or nearby site users — ingestion of or dermal contact with contaminated soil by sites users — ingestion of or dermal contact with contaminated water downgradient of the site through extraction of groundwater or the use of downgradient surface water bodies for recreation.

4 DATA QUALITY OBJECTIVES

Systematic planning is critical to successful implementation of an environmental assessment and is used to define the type, quantity and quality of data needed to inform decisions. The United States Environmental Protection Agency has defined a process for establishing data quality objectives (DQOs), which has been referenced in the *National Environment Protection (Assessment of Site Contamination) Measure 1999* (NEPM; as amended 2013).

DQOs ensure that:

- the study objectives are set
- appropriate types of data are collected (based on contemporary land use and chemicals of concern)
- the tolerance levels are set for potential decision making errors.

The DQO process is a seven-step iterative planning approach. The outputs of the DQO process are qualitative and quantitative statements which are developed in the first six steps. They define the purpose of the data collection effort, clarify what the data should represent to satisfy this purpose and specify the performance requirements for the quality of information to be obtained from the data. The output from the first six steps is then used in the seventh step to develop the data collection design that meets all performance criteria and other design requirements and constraints. The DQO process adopted for the DSIs is outlined in Table 4.1.

Table 4.1 DQO process

STEP	DESCRIPTION	OUTCOMES
1	State the problem	The purpose of this assessment was to assess the potential risks related to the proposed expansion of the SRC and construction of Canal Road.
2	Identify the decisions/goal of the investigation	The decisions to be made based on the results of the investigation are as follows: <ul style="list-style-type: none">— Has the soil and groundwater been adequately sampled?— Were all the potential sources identified and targeted and contaminants of concern analysed?— Were any unacceptable risk to receptors identified?
3	Identify the inputs to the decision	The inputs required to make the above decisions are as follows: <ul style="list-style-type: none">— geological and hydrogeological data— concentrations of contaminants of concern in soil and groundwater— site assessment criteria (outlined in Section 6)— observation data including presence of odours or discolouration— distribution of identified contamination.
4	Define the study boundaries/ constraints on data	The boundaries of the investigation have been identified as follows: <ul style="list-style-type: none">— Spatial boundaries: the spatial boundary of the investigation area is defined as the geographical extent of the currently licensed facility, the expansion area and the proposed roadway between them. The potential receptors of concern were considered by the study although they are not included in the study boundaries.— Temporal boundaries: the date of the project inception to the completion of the fieldwork under the proposed investigation.

STEP	DESCRIPTION	OUTCOMES
5	Develop a decision rule	<p>The purpose of this step is to define the parameters of interest, specify the action levels and combine the outputs of the previous DQO steps into an ‘if...then...’ decision rule that defines the conditions that would cause the decision maker to choose alternative actions.</p> <p>The parameters of interest are concentrations of contaminants of concern in soil and groundwater. An assessment of the concentrations of the contaminants of concern is to be undertaken to assess the suitability for commercial/industrial land use and open space in certain areas of the site.</p> <p>Should concentrations exceed the adopted assessment criteria, further assessment and/or management options will be considered.</p>
6	Specify limits on decision errors	<p>The acceptable limits on decision errors to be applied in the investigation and the manner of addressing possible decision errors have been developed based on the data quality indicators (DQIs) of precision, accuracy, representativeness, comparability and completeness and are presented in Table 4.2 and 4.3.</p>
7	Optimise the design for obtaining data	<p>The purpose of this step is to identify a resource-effective data collection design for generating data that satisfies the DQOs.</p> <p>This assessment has been designed considering the available information regarding the site. The resource effective data collection design that is expected to satisfy the DQOs is described in detail in Section 5.</p> <p>To ensure the design satisfies the DQOs, DQIs have been established to set acceptance limits on field methodologies and laboratory data collected.</p>

DQIs for sampling techniques and laboratory analyses of collected soil and groundwater samples define the acceptable level of error required for this validation assessment. The adopted field methodologies and data obtained have been assessed by reference to DQIs as follows:

- precision: a quantitative measure of the variability (or reproducibility) of data
- accuracy: a quantitative measure of the closeness of reported data to the true value
- representativeness: the confidence (expressed qualitatively) that data are representative of each media present on the site
- comparability: a qualitative parameter expressing the confidence with which one data set can be compared with another
- completeness: a measure of the amount of useable data (expressed as a percentage) from a data collection activity.

A summary of the field and laboratory DQIs for the assessment are provided in Tables 4.2 and 4.3.

Table 4.2 DQIs for field techniques

DQI
Precision
Standard operating procedures (SOPs) appropriate and complied with
Collection of inter-laboratory and intra-laboratory duplicates
Accuracy
WSP SOPs appropriate and complied with

DQI
Collection of field blanks and trip blanks and trip spikes
Representativeness
Appropriate media sampled
Comparability
Same SOPs used on each occasion
Experienced sampler
Climatic conditions (temperature, rainfall, wind)
Same type of samples collected
Completeness
SOPs appropriate and complied with
All required samples collected

Table 4.3 DQIs for laboratory

DQI	ACCEPTABLE LIMITS
Precision	
Analysis of laboratory duplicates for contaminants of concern in soil	SOIL <10 x practical quantitation limit (PQL) – no limit >10 x PQL – 30% relative percentage difference (RPD) GROUNDWATER <10 x PQL – no limit >10 x PQL – 100% RPD
Laboratories certification	
Laboratories certification	National Association of testing Authorities (NATA) accreditation for analyses performed
Accuracy	
Analysis of laboratory prepared trip blanks (one per batch)	Below practical quantitation limits (PQLs) for contaminants analysed
Analysis of rinsate blanks (one per day)	Below PQLs for contaminants analysed
Analysis of laboratory blanks	Below PQLs for contaminants analysed
Analysis of laboratory matrix spikes, laboratory control samples and surrogate recoveries	As per laboratory acceptance criteria
Analysis of laboratory duplicates for contaminants of concern in soil	As per laboratory acceptance criteria
Representativeness	
All required samples analysed	As per Section 5

DQI	ACCEPTABLE LIMITS
Comparability	
Sample analytical methods used (including clean-up)	As per NEPM (2013)
Same units	Justify/quantify if different
Same laboratories	Justify/quantify if different
Sample PQLs	Less than nominated criteria
Completeness	
All critical samples analysed	As per Section 5
All required analytes analysed	As per Section 5
Appropriate methods and PQLs	As per NEPM (2013)
Sample documentation	Chain of custody documentation completed
Sample holding times complied with	As per laboratory requirements

5 SAMPLING AND ANALYSIS PROGRAM

5.1 SAMPLING RATIONALE

The sampling plan for the DSI comprised soil sampling by hand auger, test pitting and solid auger drilling method to target the investigation areas and to provide coverage across the site. Sampling locations are shown on Figures 2 and 3, Appendix A.

5.1.1 INITIAL INVESTIGATION

Twenty-seven test pits were excavated in a general grid pattern across the expansion area to characterise the soils, to a maximum depth of 3 m below ground level (mBGL). The test pits were proposed to extend into the landfill material; however, the thickness of the capping above the cell resulted in limited assessment of the landfill cell itself.

Six test pits were originally proposed to be installed in the gully to assess the soil conditions. These were changed to hand auger locations due to access concerns as the gully was densely vegetated at the time of the initial site visit. Access for the hand auger locations was also not possible, and no samples of soil were able to be collected from within the gully.

Three boreholes (BH01 to BH03) were undertaken to a maximum depth of 10.2 mBGL in the expansion area. Three shallower boreholes (BH04 to BH06) were undertaken to a maximum depth of 2.5 mBGL between the current operational site area and Prospect Creek. These boreholes were converted to monitoring wells to assess the groundwater condition in these areas of the site, except for BH06 where target depth could not be obtained.

A groundwater monitoring event (GME) was undertaken on the five monitoring wells by WSP to provide a baseline status of the groundwater contamination at the site, if any. Additionally, three surface water samples were collected from Prospect Creek and one from the gully on-site to assess surface water quality.

Soil and water sampling locations are shown on Figures 2 and 3 in Appendix A.

5.1.2 SURFACE WATER SAMPLING

The surface water sampling, undertaken at the request of the NSW EPA, was aimed at assessing the risk to Prospect Creek from runoff during and following periods of heavy rain. Sampling locations were based on the findings of a water pollution management assessment prepared by Mepstead and Associates Pty Ltd (Mepstead) in 2018. The assessment included mapping of surface water flows across the facility and preparation of a site water balance. The report found that in the north-western portion of the site, at the community recycling centre, surface water runoff would discharge to low-lying ground before reaching Prospect Creek, intended to be a buffer zone between the site and the creek. However, the report concluded that the buffer zone in this area was not considered sufficient to prevent untreated water from entering the creek during larger storm events.

To assess whether runoff from the site was reaching the creek, samples were collected from the following areas during and/or after heavy rain events:

- standing water in the north-eastern portion of the site (recycling drop-off centre)
- standing water in the buffer zone between the recycling drop-off centre and Prospect Creek
- Prospect Creek adjacent to the recycling drop-off centre.

During the first sampling event, the buffer zone wasn't sampled. Samples were collected from standing water on the SRC facility and the recycling centre and the creek was sampled.

Indicative sampling locations are shown on Figure 4 in Appendix A.

5.1.3 ADDITIONAL SOIL INVESTIGATION

Based on feedback from the DPIE the scope of work was extended to consider the current facility as well. The potential sources of contamination at the site are generally surficial, from material storage and/or plant, with the exception of the impact of the landfill cells. As the landfill cells represent a potential impact to groundwater and receivers of groundwater, this is considered to have been previously assessed by the groundwater assessment in the initial investigation. Therefore, the additional assessment was targeted to surface impacts.

To assess the current facility, eight boreholes were dug by hand auger, targeting areas of potential contamination based on the site use; material stockpiling and processing areas, the truck wash station, the storage shed and near an aboveground diesel storage tank. Three water samples were collected from the three surface water reservoirs.

Sampling locations are shown on Figure 5 in Appendix A.

5.2 FIELDWORK

5.2.1 SERVICE LOCATION

A desktop search for underground services using the ‘Dial Before You Dig’ service was undertaken prior to intrusive investigations. Sampling locations were then cleared prior to the commencement of intrusive works by an experienced service locator. The service locator was provided with information/plans from the relevant asset owners.

Sydney Water sewer assets located in close proximity to Prospect Creek were unable to be accurately identified by the service locator or Sydney Water. In addition, a gas pipeline was located in the vicinity of the creek. Based on this the three borehole locations planned for this area were undertaken by hand auger rather than using the Geoprobe drill rig to minimise risk.

5.2.2 INTRUSIVE INVESTIGATION WORKS, SOIL SAMPLING AND MONITORING WELL INSTALLATION

Following the clearing of locations, intrusive investigation works were undertaken on 27 and 28 September 2017 and 15 April 2020. During the initial investigation, soil assessment was undertaken by test pit, mechanical drilling and hand digging. Test pits were excavated across the expansion area to depths of between 1.6 and 3.1 mBGL under the supervision of a WSP environmental scientist. A Geoprobe drill rig was used by Matrix Drilling Pty Ltd (Matrix) under the supervision of an experienced WSP environmental scientist to manually advance three boreholes (BH01 to BH03) to a maximum depth of 10.2 mBGL. These boreholes were converted to groundwater wells to assess water quality of the regional aquifer. A hand auger was used to advance three boreholes (BH04 to BH06) to a maximum depth of 2.5 mBGL. Two of these boreholes, BH04 and BH05, were converted to groundwater wells to target shallow groundwater flowing into Prospect Creek. Target depth was unable to be obtained at BH06 due to refusal on compacted gravelly material.

The groundwater wells were installed using threaded Class 18 flush-jointed polyvinyl chloride (PVC) casing and screened with machine-slotted PVC pipe with a minimum outside diameter of 50 mm.

The additional investigation was completed by hand auger only, to a maximum depth of 1.1 mBGL. The majority of locations were less than 0.5 mBGL due to refusal on shallow, compacted gravel.

Soil samples were collected at regular intervals from the boreholes. A calibrated photo-ionisation detector (PID) was used to take the readings. PID readings can be used to aid in selecting soil samples for laboratory analysis.

Subsurface conditions were logged by an experienced environmental scientist. Soil samples were placed in 250 mL jars, leaving minimal headspace, and closed using Teflon-coated lids.

All soil samples were stored on ice in an esky and transported to the laboratory under chain of custody conditions.

Dedicated disposable nitrile gloves were worn for each sampling episode to minimise the potential for cross contamination. Sample containers were filled completely prior to being stored in an ice cooled esky and transported to the laboratory with the samples.

5.2.3 GROUNDWATER SAMPLING

A groundwater monitoring event was undertaken on the newly installed monitoring wells (MW01 to MW05) by an experienced WSP field scientist on 17 October 2017. Prior to sampling, all wells were gauged to check for the presence of light non-aqueous phase liquid (LNAPL) and establish standing water levels (SWLs) using an interface probe.

Groundwater samples were collected from each monitoring well using a low flow MicroPurge® kit at MW01, MW02 and MW03. A disposable bailer was utilised to sample shallow groundwater at MW04 and MW05. Groundwater samples were decanted directly into laboratory supplied containers. Groundwater field parameters including temperature, pH, reduction/oxidation potential (redox), electrical conductivity and dissolved oxygen were measured at each monitoring well during purging of the monitoring well, once parameters were stabilised groundwater samples were collected. The samples were delivered (on ice) to the selected NATA accredited laboratories under appropriate ‘chain of custody’ documentation.

5.2.4 SURFACE WATER SAMPLING

Surface water samples were collected in the drop-off centre, in the buffer zone between the drop-off centre and the creek, from Prospect Creek and from the three reservoirs at the SRC facility. The standing water samples in the drop-off centre and buffer zone were collected using disposable syringes to collect standing water and transfer it to laboratory-supplied bottles with the appropriate preservatives, where required. The samples from Prospect Creek and the reservoirs were collected in disposable bailers and decanted into appropriate bottles.

Standing water samples collected in June and October 2018 were filtered for dissolved metals analysis, but the samples collected in September 2019 were not filtered and were analysed for total metals. The samples collected from the reservoirs in April 2020 were also not filtered and total metals were analysed. This was done to assess the potential risk from use of the reservoir water for dust suppression, which could include the dispersal of suspended material containing metals.

5.3 LABORATORY ANALYSIS

Selected soil samples collected were submitted to the primary analytical laboratory for analysis for contaminants of concern at the targeted locations.

Primary samples and the intra-laboratory sample were analysed by Australian Laboratory Services Pty Ltd (ALS), with the soil and groundwater inter-laboratory duplicate sample analysed by Eurofins Environmental Testing Australia Pty Ltd (Eurofins). The laboratories are accredited by NATA for the analytical suites requested.

Tables 5.1 and 5.2 provides a summary of the laboratory analytical schedule for soil and groundwater samples analysed during the current investigation.

(1) Metals analysed include aluminium, arsenic, cadmium chromium, copper, lead, manganese, mercury, nickel and zinc; not all samples analysed for all metals

Analytical summary tables are presented in Appendix D, with quality assurance/quality control (QA/QC) summary tables in Appendix E. Laboratory reports are included in Appendix F.

5.4 SURVEYING OF MONITORING WELLS

WSP engaged Veris Surveyors to survey the monitoring wells (MW01 to MW05) in 2017. The survey included easting and northing coordinates for the monitoring wells and ground surface and top of standpipe elevation (Australian Height Datum). The surveying was undertaken on the 17 October 2017, survey data for the monitoring wells is provided in Appendix G.

6 ASSESSMENT CRITERIA

6.1 SOIL

6.1.1 HEALTH-BASED INVESTIGATION AND SCREENING LEVELS

The NEPM (2013) provides health investigation levels (HILs) and health screening levels (HSLs) for the assessment of impacted soil. HILs provide an assessment of potential risk to human health from chronic exposure to contaminants from dermal contact with soil, and have been developed based on land use setting. It is considered appropriate that the assessment considers the current and understood ongoing land use of the site. Based on this, the HIL D for commercial/industrial land use was adopted.

HSLs have been developed for selected petroleum compounds and fractions and are applicable to assessing human health risk via the vapour intrusion and inhalation pathway. The HSLs depend on specific soil physicochemical properties and land use scenarios. They apply to different soil types and depths. For the purpose of this assessment, the HSL D for commercial/industrial land use was adopted. HSLs have been adopted based on a subsurface comprising sand. This soil type has been selected based on site observations of the geology encountered.

HSLs are also provided for asbestos contamination in soil, for bonded ACM, friable asbestos (FA) and asbestos fines (AF). Comparison with asbestos HSLs has not been undertaken as asbestos testing was limited to presence/absence. Quantitative assessment of asbestos was not part of the current scope of work based on the assessment of the potential risk and proposed use of the site. For the current assessment the detection of asbestos has been adopted as an initial screening level for asbestos.

In addition, concentrations of hydrocarbons in soil have been compared to the HSLs for direct contact for commercial/industrial land use detailed in the Cooperative Research Council for Contamination Assessment and Remediation of the Environment (CRC CARE) Technical Report No. 10 (Friebel and Nadebaum, 2011).

The adopted criteria are summarised in Table 6.1.

Table 6.1 Soil assessment criteria – HILs/HSLs

NL Non-limiting due to maximum vapour concentrations being below the acceptable health risk level

To provide a qualitative assessment of the risk to maintenance/excavation workers from identified impacts in soil via inhalation pathways and dermal contact, concentrations of hydrocarbons have been compared to risk-based HSLs detailed in CRC CARE Technical Report No. 10 (Friebel and Nadebaum, 2011).

HSLs for vapour exposure pathways have been developed for site-specific factors including soil types (sand, silt and clay) and depths below surface. The values for sand have been adopted, and criteria for depths less than 2 m have been considered, as the criteria for depths greater than 2 m is non-limiting. The adopted criteria are outlined in Table 6.2.

Table 6.2 Soil assessment criteria – HSLs for maintenance/excavation workers

ANALYTE	HSLs FOR VAPOUR INTRUSION (IN SAND) (mg/kg)	HSLs FOR DIRECT CONTACT (mg/kg)

Naphthalene	NL	29,000

- No assessment criteria available

NL Non-limiting due to maximum vapour concentrations being below the acceptable health risk level

6.1.2 ECOLOGICAL INVESTIGATION AND SCREENING LEVELS

The NEPM (2013) provides ecological screening levels (ESLs) for TRH, BTEX compounds and benzo(a)pyrene for use as an initial screening risk assessment to determine whether laboratory analysed concentrations of contaminants potentially pose a risk to plant growth. For the purpose of this investigation, ESLs for ‘urban commercial/industrial’ land uses with fine-grained soil textures have been considered. These are outlined in Table 6.3.

Table 6.3 Soil assessment criteria - ESLs

ANALYTE	ESLs FOR URBAN COMMERCIAL AND INDUSTRIAL - COARSE (mg/kg DRY SOIL)
TRH F1	215
TRH >C ₁₀ -C ₁₆	170
TRH >C ₁₆ -C ₃₄	1,700
TRH >C ₃₄ -C ₄₀	3,300
Benzene	75
Toluene	135
Ethylbenzene	165
Xylene (total)	180
Benzo(a)pyrene	0.7

6.1.3 ECOLOGICAL INVESTIGATION LEVELS

The NEPM (2013) also provides ecological investigation levels (EILs), which were developed for metals, naphthalene and pesticides. The EILs take into consideration the physicochemical properties of soil and contaminants and the capacity of the local ecosystem to accommodate increases in the contaminant levels. The EILs are derived using the following equation:

$$EIL = \text{added contaminant limit (ACL)} + \text{ambient background concentration (ABC)}$$

The ABC is the background contaminant level and requires measurement at appropriate reference points at the site. The ACL, which is provided in the NEPM (2013), is the maximum contaminant concentration added to the naturally occurring background level, exceedances of which may result in adverse effects on plant health.

Tables 1B(4) and 1B(5) of the NEPM (2013) provide generic EILs for aged arsenic and lead, and fresh DDT and naphthalene in soils (irrespective of their physicochemical properties). Aged values are applicable for contamination present in soil for at least two years. EILs are provided for various land uses including ‘areas of ecological significance’, ‘urban residential and open space’ and ‘commercial and industrial’. The ‘urban commercial/industrial’ land use EILs have been considered for this investigation.

Site-specific EILs have been calculated using the CSIRO Ecological Investigation Level Calculation Spreadsheet provided online in the ASC NEPM Toolbox (<http://www.scew.gov.au/node/941>). The site-specific ABCs

Site specific EILs for chromium, copper, nickel and zinc were able to be calculated based on ABCs determined using uncontaminated samples from the perimeter of the expansion area (test pits TP09, TP14, TP21 and TP25 to TP27). Although the soil parameters used to calculate the site-specific ACLs (cation exchange capacity, pH and clay content) were not analysed for the samples taken, EILs were still able to be created using the site-specific ABCs and the most conservative ACLs.

Table 6.4 outlines the EILs (generic and derived) for this investigation.

Table 6.4 Generic and calculated EIL concentrations

ANALYTE	EILs FOR URBAN COMMERCIAL AND INDUSTRIAL - COARSE (mg/kg DRY SOIL)
Arsenic ¹	160
Chromium (III) ²	340
Copper ²	112
DDT ¹	640

- (2) Calculated using the site-specific ABCs and most conservative ACLs
- (3) NEPM (2013) Schedule B1 Table 1B(4) Generic added contaminant limits for lead in soils irrespective of their physicochemical properties

6.2 WATER

The NEPM (2013) also provides a framework for the use of investigation and screening levels based on a matrix of human health and ecological, soil and groundwater risks. NEPM Schedule B1 presents groundwater investigation levels (GILs) for protection of receiving waters (ecological protection) and for human health (drinking water guidelines). It is necessary to assess the potential uses and receptors of groundwater downgradient of the site in order to correctly apply the GILs. GILs are based on the following guidelines:

- Australian and New Zealand Conservation Council (ANZECC)/Agriculture, and Resource Management Council of Australia and New Zealand (ARMCANZ) 2000, *National water quality management strategy. Australian and New Zealand guidelines for fresh and marine water quality*. This guideline has been superseded by an online resource prepared by the Australian and New Zealand Governments (ANZG) in 2018.
- National Health and Medical Research Council (NHMRC)/National Resource Management Ministerial Council (NRMMC) 2011, *Australian Drinking Water Guidelines 6*.
- NHMRC 2008, *Guidelines for Managing Risk in Recreational Waters 2008*.

The NEPM (2013) also provides HSLs for selected petroleum compounds (TRH and BTEXN) and are used for assessing human health risk via vapour intrusion. Groundwater HSLs have not been derived for groundwater at less than 2 mBGL. As with the soil HSLs, the criteria are based on soil type, depth to impact and land use.

The adopted criteria are outlined in Table 6.3.

Table 6.5 Adopted water assessment criteria

7 QA/QC

Field sampling procedures conformed to WSP's QA/QC protocols to prevent cross-contamination, preserve sample integrity and allow for collection of a suitable data set. QA/QC sample results for soil and groundwater are presented in Tables C1, C2 and C3 in Appendix C. The laboratory reports and chain of custody documentation are provided in Appendix D.

Three intra-laboratory duplicate samples (QC01, QC04 and QA01) and three inter-laboratory duplicate samples (QC01A, QC04A and QA01A) were collected and analysed as part of the soil sampling.

Two intra-laboratory duplicate samples (QC01 and QA01) and two inter-laboratory duplicate samples (QC01A and QA01A) were collected and analysed as part of the groundwater and surface water sampling.

RPDs were calculated for the primary and duplicate sample for assessment of data quality, in particular for assessment of the reproducibility of the analytical data measurements or 'precision' given the adopted field and laboratory methods. The RPDs were calculated using the formula below, and the results are presented in Table E1 and E2 in Appendix E.

$$RPD\% = \frac{|Ro - Rd|}{|(Ro + Rd)/2|} \times 100\%$$

Where Ro is the primary sample and Rd is the primary duplicate.

The Australian standard for non-volatile and semi-volatile compounds in soil (AS 4482.1-2005) states that typical RPDs for non- and semi-volatile analytes in soil are 30% to 50%, and that results can be expected to be higher for organic analytes than inorganic and for low concentrations. No range is given for volatile RPDs or RPDs in groundwater. The NEPM (2013), Schedule B(3) states the soil RPDs should in general be less than 30%, with no groundwater RPD ranges given. The RPD groundwater acceptance criteria for this report have been set at 50% for semi-volatiles and 100% for volatile organics.

RPDs for soil duplicates exceeded the acceptance criteria for:

- the intra-laboratory duplicate QC01 for lead, RPD of 53%, and TRH C₁₆-C₃₄, RPD of 89%
- the intra-laboratory duplicate QC04 for copper, RPD of 34%, and nickel, RPD of 37%
- the intra-laboratory duplicate QA01 for fluoranthene, RPD of 46%, pyrene, RPD of 67%, and copper, RPD of 44%
- the inter-laboratory duplicate QC01A for 11 PAH compounds, RPDs of 95% to 178%, and lead, RPD of 49%
- the inter-laboratory duplicate QC04A for lead, RPD of 34%, and nickel, RPD of 37%
- the inter-laboratory duplicate QA01A for TRH >C₁₆-C₃₄, RPD of 35%, TRH >C₃₄-C₄₀, RPD of 33%, and copper, RPD of 31%.

RPDs for groundwater duplicates exceeded the acceptance criteria for the inter-laboratory duplicate QC01A for arsenic, RPD of 120%, and copper, RPD of 67%.

The RPD exceedances for metals in soil are marginally above the criteria and results were in the same order of magnitude. These are considered to represent variations in the soil conditions. RPD exceedances for TRH and PAHs results indicate heterogenous contamination is likely present. The results significantly below the assessment criteria for primary and duplicate samples. Based on this the potential variation in the soil results does not affect the outcome of the investigation.

Trip blank samples (TB) were provided by the laboratory and transported with each batch of samples to the laboratory for BTEX analysis. Two trip blanks were analysed during the soil sampling work and one during the groundwater

monitoring round. The results for each trip blank were below detection levels, suggesting that cross-contamination of volatiles did not occur during sampling and transport.

Quality assurance samples (TS) were spiked by the laboratory with a known concentration of BTEX compounds, transported with the other samples and analysed for these compounds at the completion of the fieldwork ('trip spike'). One trip spike was analysed during the soil sampling work and one during the groundwater monitoring round. Reported recovery rates of BTEX compounds ranged between 70–100%, within the acceptable range.

Results for the trip blank and trip spike are presented in Table E3 in Appendix E.

The sampling methods (including sample preservation, transport and decontamination procedures) and laboratory methods followed during this investigation works were consistent with standard protocols. It is therefore considered that the data is sufficiently precise and accurate for the purposes of this report.

8 INVESTIGATION RESULTS

8.1 SUBSURFACE CONDITIONS

8.1.1 GEOLOGY

The test pits and soil bores in the current facility and the expansion area encountered fill material used to achieve the current site level and shape. The fill material consisted of a predominantly low to medium plasticity clay with asphalt and gravel inclusions overlayed by the compacted gravel road base. Evidence of landfilling activities was observed at depths greater than 7.5 mBGL in boreholes on the northern boundary of the expansion area, installed to target regional groundwater.

Soil encountered adjacent to Prospect Creek during hand augering for MW04 through MW06 comprised sand or gravelly sand at the surface, underlain by clayey sand, sandy clay and/or clayey gravel from 1.5 mBGL.

No evidence of potential acid sulfate soil was encountered during the intrusive investigation.

Bore logs are presented in Appendix C.

8.1.2 GROUNDWATER

Three wells were installed and sampled in the expansion area (MW01, MW02 and MW03). Two wells were installed and sampled between the existing facility and Prospect Creek (MW04 and MW05). The wells were gauged prior to sampling for the depth to groundwater and to check for the presence of separate-phase hydrocarbons. No separate-phase liquids were found during gauging.

The depths to water were correlated to elevations using the survey data, showing that the groundwater in the expansion area ranged from 30.755 mAHD to 34.056 mAHD. The elevations indicate groundwater flow is to the west to north-west. The wells near Prospect Creek showed significantly lower groundwater elevation, of 26.662 mAHD and 26.111 mAHD, and support the groundwater flow to the west to north-west. The groundwater flow direction has been estimated based on limited data, and should be considered indicative only. However, the results support the assumed flow direction, based on the location of Prospect Creek and the regional topography.

Wells MW01 to MW03, in the expansion area, were monitored during sampling, with the following results:

- pH ranged from 6.50 to 7.11, indicating circumneutral groundwater.
- Electrical conductivity ranged from 3,440 µS/cm to 7,180 µS/cm, indicating variable but fresh groundwater.
- Redox, corrected to a standard hydrogen electrode by adding 199 to each reading, ranged from 37 mV to 87 mV, indicating anaerobic conditions.
- Dissolved oxygen ranged from 0.08 ppm to 0.33 ppm, indicating poorly oxygenated groundwater.

Wells MW04 and MW05 did not have enough water for field screening.

Gauging and monitoring data is summarised in Tables D7 and D8, Appendix D.

8.2 ANALYTICAL RESULTS

8.2.1 SOIL

Selected soil samples collected from test pits and soil bores were analysed for contaminants of concern. Soil samples were selected based on a combination of sample location (to provide site coverage) and field observations (to target areas of potential concern). Analytical results are summarised in Tables D1 to D6, Appendix D.

BTEXN, PCBs, pesticides and asbestos were not detected in any samples analysed.

TRH was detected in six out of eight samples in the current facility area and three samples in the expansion area. The TRH concentrations were between 110 mg/kg and 1,980 mg/kg, and were all below the adopted health and ecological criteria. The carbon fractions detected were between C₁₆ and C₄₀, indicating the source was likely heavier than diesel fuel. The majority of the detections were shallow, 1 mBGL or less, although one detection was in a sample taken at 9 mBGL in BH02. This may represent contamination from the landfill material in the cell beneath the expansion area.

PAHs were detected in 10 samples, 6 in the expansion are and 4 in the current facility. The results for total PAHs ranged from 0.5 mg/kg to 39.8 mg/kg. Detections were one to four orders of magnitude lower than the relevant health-based assessment criteria, although one exceedance of the ecological criteria for benzo(a)pyrene was noted. That sample, the duplicate sample collected at 1 mBGL in TP04, had the highest PAH concentrations detected in any sample analysed from the site. No other ecological exceedances were found for PAHs.

Metals were detected all samples, as arsenic, chromium, copper, lead, nickel and zinc. Concentrations were generally consistent across the site and all results were below the health and ecological assessment criteria. Some concentrations were elevated above the average for the site, primarily for zinc. Two zinc concentrations were above the EIL; however, these were collected from 7 and 9 mBGL and therefore are below the applicable depth. One elevated lead concentration was identified, at a depth of 7 mBGL in BH01, although it did not exceed the criteria.

8.2.2 GROUNDWATER

Groundwater analytical results are summarised in Tables D9 to D14, Appendix D.

Groundwater sampling results for the expansion area found hydrocarbons were present in samples from all three wells. Wells MW01 and MW02 had TRH indicative of diesel impact (>C₁₀-C₃₄ fractions), while MW03 had indications of petrol (C₆-C₁₀ and benzene) and diesel (C₁₀-C₃₄ and naphthalene). PAHs were present in the sample from MW03 only. Benzene and naphthalene in the sample from MW03 exceeded adopted criteria, for recreational water (benzene) and fresh water protection (naphthalene). Samples from MW04 and MW05, adjacent to Prospect Creek, were below reporting levels for TRH, BTEXN and PAHs.

Pesticides were below reporting levels for all samples analysed (MW01 to MW03 and MW05).

Metals were detected in samples from all wells, including some results exceeding the fresh water protection criteria for at least one of the following: arsenic, chromium, copper, nickel and zinc. The majority of the results were in a small range between the wells, indicating they may represent background concentrations. The arsenic result in MW01 and, to a lesser extent, nickel results in MW01 and MW03 were higher than other samples and likely evidence of contamination.

8.2.3 SURFACE WATER

8.2.3.1 INITIAL INVESTIGATION

Four surface water samples were collected during the initial investigation; three from Prospect Creek (SW01 to SW03) and one from the standing surface water in the gully where Canal Road is proposed (Outflow). Surface water analytical results are summarised in Tables D9 to D14, Appendix D.

The majority of analytes were not present in any of the surface water samples. TRH was detected in the outflow sample and in SW03, and toluene was detected in SW01, SW03 and the outflow sample. None of these analytes exceeded the adopted criteria. Metals were detected in the three creek samples, as copper, nickel and zinc, with zinc exceeding the freshwater protection criteria in samples SW01 and SW02. No metals were detected in the outflow sample. All other analytes were below PQLs.

8.2.3.2 SURFACE WATER SAMPLING

During the surface water sampling for the drop-off centre, TRH was detected in the recycling centre and creek samples during one round of sampling, in October 2018, although the fractions detected were different (TRH C₆-C₁₀ in the creek

and >C₁₆-C₄₀ in the recycling centre). Toluene and xylene were also detected in the creek sample in October 2018. No other TRH or BTEXN detections were present in the samples.

Metals were present in all samples, with copper exceeding the freshwater protection criteria every sample and zinc exceeded the criteria in every sample but one. The results for arsenic, cadmium, manganese and mercury were all either below PQLs or below the assessment criteria. Exceedances of freshwater protection criteria were present in at least one sample for aluminium, chromium, copper, lead, nickel and zinc. Copper exceeded the criteria in every sample and zinc exceeded the criteria in all but one sample, taken from the recycling centre. Comparison of the recycling centre samples to the buffer zone and creek samples generally shows that the concentrations in the recycling centre were similar to or lower than the samples from the buffer zone and creek.

Samples analysed for total metals in September 2019 were similar to or lower than the dissolved metals concentrations previously analysed. Based on these results, it is likely that there is limited impact from suspended solids on metals concentrations in the standing water during rain events.

The surface water sampling for the drop-off centre also included analysis of nitrate, nitrite, ammonia and phosphorus, to assess potential effect on the creek. The results showed that nitrate was higher in the creek than in the recycling centre or the buffer zone, while nitrite and ammonia had similar, low concentrations across the samples. Phosphorus was variable between the locations, but generally higher in the recycling centre and buffer zone samples.

8.2.3.3 ADDITIONAL INVESTIGATION

During the supplemental investigation in April 2020, samples were collected from the three surface water reservoirs on the site. These reservoirs are used for dust suppression, and if contaminants are present in the water they could subsequently cause contamination in other areas of the site.

The sample results showed that TRH was present in the samples from the reservoir in the south-east of the existing facility and south-west of the expansion area, both in the <C₁₆-C₃₄ fraction. Both detections were low. No other TRH was detected and BTEXN and PAHs were below the PQLs.

Metals were present in all three samples and exceeded freshwater protection criteria for chromium and copper in all samples and for lead, nickel and zinc in one sample. None of the samples exceeded the recreational criteria; although the water is not used for recreational purposes, these criteria assess the risk from incidental ingestion. PAHs were not detected above the PQLs in any of the samples.

9 DISCUSSION OF RESULTS

9.1 SOIL

The soil conditions at the site did not indicate any unacceptable risk to human health from the use of the site, for the currently licensed SRC facility or the expansion of the facility, although the ability to assess the material within the landfill cell was limited by depth. The soil results showed no human health criteria exceedances. One ecological exceedance was found, at a depth of 1 mBGL in the expansion area, for benzo(a)pyrene. As the facility and expansion area are of limited ecological value (e.g. they do not support flora or fauna habitats) no potential ecological risk is considered present in the expansion area. Surface runoff is diverted to the reservoirs on the site, and therefore potential ecological exposure from contamination running off-site is not considered to be a complete exposure pathway.

The proposed modification will include excavating a new sediment basin in the north-east of the expansion area. This excavation will be a maximum of 2 mBGL, and therefore is not anticipated to disturb the landfill cell, as the capping layer was at least 3 m thick based on the test pits excavated in the vicinity of the proposed basin. No structures with potential for vapour accumulation are anticipated as part of the proposed use, therefore even if material in the landfill cell contains significant contamination it would not represent a risk to future site users.

9.2 GROUNDWATER

Groundwater conditions beneath the expansion area indicate that some contamination is present, likely due to the landfill material. No human health risk to the future users of the site was identified, although the potential for human health or ecological risk to downgradient surface water receptors was present, for benzene, naphthalene and some metals.

The groundwater sampled between the current facility and Prospect Creek did not identify any human health or environmental risk from the SRC or the landfill leachate. No assessment between the expansion area and the creek was undertaken, however, the results of the expansion area groundwater samples did not find substantial contamination and is considered likely to diminish through dilution and degradation.

9.3 SURFACE WATER

The initial sampling of Prospect Creek showed that the majority of analytes did not change between the upgradient and downgradient samples. The exception was TRH, which increased significantly in the downgradient sample. The source of this contamination may be landfill leachate, based on the groundwater results in the expansion area and the outflow sample. The downgradient creek sample and outflow sample did not have any health or ecological criteria exceedances.

The surface water sampling undertaken for the recycling drop-off centre identified higher concentrations of metals in the creek samples than was found during the initial sampling in 2017. This is expected to be due to the influx of runoff into the creek from all sources during heavy rain events; the area surrounding the creek includes a number of industrial facilities and roadways which would contribute to contaminant loading. The standing water samples did indicate elevated concentrations of aluminium, copper and zinc, particularly, but did not show concentrations significantly higher than those measured in the creek.

The reservoir samples found some TRH present in one sample and metals across the samples. No human health exceedances were noted and the use of the water for dust suppression is not considered to pose a risk. Ecological criteria were exceeded in the reservoirs; however, they are not considered to be of any ecological value. The use of the water for dust suppression should not have significant effect on Prospect Creek as the runoff from the site is controlled.

9.4 REVISED CONCEPTUAL SITE MODEL

Based on the results of the investigation, a revised CSM has been summarised in Table 9.1.

Table 9.1 Preliminary CSM

Potential sources of impact	The potential sources of impact identified are: <ul style="list-style-type: none">— historical land filling— uncontrolled fill material used for capping or levelling— vehicle use associated with the SRC.
Potentially impacted media	Soils: Impacts from fill or waste material, either surficial or buried in the landfill cell. Groundwater: Impacts from landfill leachate or migration from soil impacts
Contaminants of concern	Contaminants of concern for the site comprise: <ul style="list-style-type: none">— metals— PAHs— petroleum hydrocarbons as TRH and BTEXN.
Migration pathways	Potential migration pathways include: <ul style="list-style-type: none">— runoff of surface contaminants in rain water— vertical migration of contaminants in soil from infiltration of rain water— horizontal migration of contaminants along the hydraulic gradient or through underground service trenches— volatilisation of hydrocarbon contamination— airborne migration of contamination in dust or vapour.
Potential receptors	Based on the site setting, potential receptors comprise: <ul style="list-style-type: none">— site users, including SRC workers, truck drivers delivering or collecting material and excavation/maintenance workers— nearby site users which might be impacted by airborne contamination— maintenance workers in nearby service trenches— users of groundwater or surface downgradient of the site— underlying soil and groundwater— surface water bodies which may be impacted by runoff or groundwater form the site, e.g. Prospect Creek.
Potential exposure pathways	Potential exposures pathways comprise: <ul style="list-style-type: none">— inhalation of dust, vapour or fibres by site users or nearby site users— ingestion of or dermal contact with contaminated soil by sites users— ingestion of or dermal contact with contaminated water downgradient of the site through extraction of groundwater or the use of downgradient surface water bodies for recreation.

No complete, current exposure pathways were identified based on the sampling results with the exception of metals in Prospect Creek exceeding the fresh water criteria, particularly during heavy rainfall events. This is considered to be

affected by the industrial setting of the creek and to include naturally occurring metals. Based on the findings that impact was present in the upgradient sample and in groundwater across the wells and in standing water and in the creek in a similar range it is not considered that the site is contributing significantly to the water quality of the creek.

10 CONCLUSIONS

Fairfield City Council engaged WSP to undertake a DSIR for the expansion area as part of the planning approvals process. The objectives of the DSIR were to assess:

- the condition of the soil in the current facility and the proposed expansion area
- the groundwater quality beneath the expansion area
- the quality of surface water collected from the site and used for dust suppression
- the condition of soil, groundwater and any standing water present in the gully
- groundwater quality between the SRC facility and Prospect Creek.

The results of the investigation showed some contamination in the groundwater beneath the expansion area, likely a result of the landfill leachate. No human health risks related to the proposed redevelopment of the site were identified from soil or groundwater. The standing water in the gully and the samples of Prospect Creek found metals and hydrocarbons present. Hydrocarbons detected did not exceed any adopted assessment criteria and metals were considered to represent ambient conditions.

The soil and groundwater in the gully were unable to be assessed due to the vegetation present. However, test pits and soil bores were undertaken adjacent to the gully and a sample of the surface water outflow was collected. The outflow sample contained hydrocarbons, although no risks were identified.

Based on the results of the DSIR neither the current operation of the facility or the proposed redevelopment of the site, including the expansion of the SRC and the filling of Canal Road, is considered to represent a risk to human health or the environment. During the construction phase controls to limit dust generation and manage water runoff would be included in a construction environmental management plan. The presence of the landfill material is not expected to impact the proposed redevelopment due to the thickness of the capping material.

Soil excavated for the new sedimentation basin in the expansion area is considered likely to be suitable for reuse at the site, based on the sampling results from test pits in the proposed area. However, if soil is removed from the site it must be sampled for waste classification before disposal.

The soil in the gully was unable to be sampled due to access restrictions. When it is cleared prior to construction of Canal Road additional soil sampling can be arranged, if required. However, no indications of contamination were identified.

The areas of the site where the carpark expansion, sedimentation basin in the north of the facility and flood compensation area are proposed were not assessed during this investigation. However, only limited potential risks are associated with the carpark expansion and sedimentation basin, comprising management of spoil, dust generation and water runoff, which can be adequately managed during the construction phase under the construction environmental management plan. Soil sampling for waste classification should be undertaken on any spoil material created during these works. The flood compensation basin is discussed in a separate memorandum, as it was added to the scope after the fieldwork was completed.

The site is considered suitable for the continued use as a recycling centre, with no remediation recommended based on the findings of this investigation.

11 LIMITATIONS

This Report is provided by WSP Australia Pty Limited (*WSP*) for Fairfield City Council (*Client*) in response to specific instructions from the Client and in accordance with WSP's proposal dated 23 September 2019 and agreement with the Client dated 13 December 2019 (*Agreement*).

11.1 PERMITTED PURPOSE

This Report is provided by WSP for the purpose described in the Agreement and no responsibility is accepted by WSP for the use of the Report in whole or in part, for any other purpose (*Permitted Purpose*).

11.2 QUALIFICATIONS AND ASSUMPTIONS

The services undertaken by WSP in preparing this Report were limited to those specifically detailed in the Report and are subject to the scope, qualifications, assumptions and limitations set out in the Report or otherwise communicated to the Client.

Except as otherwise stated in the Report and to the extent that statements, opinions, facts, conclusion and / or recommendations in the Report (*Conclusions*) are based in whole or in part on information provided by the Client and other parties identified in the report (*Information*), those Conclusions are based on assumptions by WSP of the reliability, adequacy, accuracy and completeness of the Information and have not been verified. WSP accepts no responsibility for the Information.

WSP has prepared the Report without regard to any special interest of any person other than the Client when undertaking the services described in the Agreement or in preparing the Report.

11.3 USE AND RELIANCE

This Report should be read in its entirety and must not be copied, distributed or referred to in part only. The Report must not be reproduced without the written approval of WSP. WSP will not be responsible for interpretations or conclusions drawn by the reader. This Report (or sections of the Report) should not be used as part of a specification for a project or for incorporation into any other document without the prior agreement of WSP.

WSP is not (and will not be) obliged to provide an update of this Report to include any event, circumstance, revised Information or any matter coming to WSP's attention after the date of this Report. Data reported and Conclusions drawn are based solely on information made available to WSP at the time of preparing the Report. The passage of time; unexpected variations in ground conditions; manifestations of latent conditions; or the impact of future events (including (without limitation) changes in policy, legislation, guidelines, scientific knowledge; and changes in interpretation of policy by statutory authorities); may require further investigation or subsequent re-evaluation of the Conclusions.

This Report can only be relied upon for the Permitted Purpose and may not be relied upon for any other purpose. The Report does not purport to recommend or induce a decision to make (or not make) any purchase, disposal, investment, divestment, financial commitment or otherwise. It is the responsibility of the Client to accept (if the Client so chooses) any Conclusions contained within the Report and implement them in an appropriate, suitable and timely manner.

In the absence of express written consent of WSP, no responsibility is accepted by WSP for the use of the Report in whole or in part by any party other than the Client for any purpose whatsoever. Without the express written consent of WSP, any use which a third party makes of this Report or any reliance on (or decisions to be made) based on this Report is at the sole risk of those third parties without recourse to WSP. Third parties should make their own enquiries and obtain independent advice in relation to any matter dealt with or Conclusions expressed in the Report.

11.4 DISCLAIMER

No warranty, undertaking or guarantee whether expressed or implied, is made with respect to the data reported or the Conclusions drawn. To the fullest extent permitted at law, WSP, its related bodies corporate and its officers, employees and agents assumes no responsibility and will not be liable to any third party for, or in relation to any losses, damages or expenses (including any indirect, consequential or punitive losses or damages or any amounts for loss of profit, loss of revenue, loss of opportunity to earn profit, loss of production, loss of contract, increased operational costs, loss of business opportunity, site depredation costs, business interruption or economic loss) of any kind whatsoever, suffered on incurred by a third party.

CERTIFICATE OF ANALYSIS

Work Order	ES1724542	Page	: 1 of 50
Client	WSP Australia Pty Ltd	Laboratory	: Environmental Division Sydney
Contact	MS AMY VALENTINE	Contact	: Loren Schiavon
Address	ABN: 80 078 004 798 GPO BOX 5394 SYDNEY NSW, AUSTRALIA 2001	Address	277-289 Woodpark Road Smithfield NSW Australia 2164
Telephone	+61 02 92725100	Telephone	+61 2 8784 8503
Project	2271108A Fairfield - SRC Assessment	Date Samples Received	29-Sep-2017 15:00
Order number	----	Date Analysis Commenced	03-Oct-2017
C-O-C number	----	Issue Date	06-Oct-2017 17:56
Sampler	----		
Site	----		
Quote number	EN/008/16		
No. of samples received	87		
No. of samples analysed	56		

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Descriptive Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW
Shaun Spooner	Asbestos Identifier	Newcastle - Asbestos, Mayfield West, NSW

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

∅ = ALS is not NATA accredited for these tests.

~ = Indicates an estimated value.

- EG005: Poor precision and poor spike recovery was obtained for Zinc on sample ES1724178-#001 due to sample heterogeneity. Results have been confirmed by re-extraction and reanalysis.
- EP080: The trip spike and its control have been analysed for volatile TPH and BTEX only. The trip spike and control were prepared in the lab using reagent grade sand spiked with petrol. The spike was dispatched from the lab and the control retained.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200: Negative results for vinyl tiles should be confirmed by an independent analytical technique.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benzo(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1,2,3,cd)pyrene (0.1), Dibenz(a,h)anthracene (1.0), Benzo(g,h,i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR.
Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: ES1724542	Page	: 1 of 10
Client	: WSP Australia Pty Ltd	Laboratory	: Environmental Division Sydney
Contact	: MS AMY VALENTINE	Telephone	: +61 2 8784 8503
Project	: 2271108A Fairfield - SRC Assessment	Date Samples Received	: 29-Sep-2017
Site	: ----	Issue Date	: 06-Oct-2017
Sampler	: ----	No. of samples received	: 87
Order number	: ----	No. of samples analysed	: 56

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Laboratory Control outliers occur.
- Duplicate outliers exist - please see following pages for full details.
- Matrix Spike outliers exist - please see following pages for full details.
- For all regular sample matrices, **NO** surrogate recovery outliers occur.

Outliers : Analysis Holding Time Compliance

- **NO** Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- **NO** Quality Control Sample Frequency Outliers exist.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: SOIL

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Duplicate (DUP) RPDs							
EG005T: Total Metals by ICP-AES	ES1724178--001	Anonymous	Zinc	7440-66-6	55.2 %	0% - 20%	RPD exceeds LOR based limits
Matrix Spike (MS) Recoveries							
EG005T: Total Metals by ICP-AES	ES1724178--001	Anonymous	Zinc	7440-66-6	55.2 %	70-130%	Recovery less than lower data quality objective

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: SOIL

Evaluation: ✖ = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: SOIL

Evaluation: ✘ = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type	Analytical Methods	Method	Count		Rate (%)		Quality Control Specification

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 - 2004 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl ₂) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl ₂ which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Polychlorinated Biphenyls (PCB)	EP066	SOIL	In house: Referenced to USEPA SW 846 - 8270D Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 504)
Pesticides by GCMS	EP068	SOIL	In house: Referenced to USEPA SW 846 - 8270D Extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This technique is compliant with NEPM (2013) Schedule B(3) (Method 504,505)
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015A Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM amended 2013.
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270D. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 502 and 507)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260B. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM amended 2013.

Preparation Methods	Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges	EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM (2013) Schedule B(3) (Method 202)
Methanolic Extraction of Soils for Purge and Trap	* ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.

<i>Preparation Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
Tumbler Extraction of Solids	ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na ₂ SO ₄ and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions - Method: TRH C6-C36 - LTM-ORG-2010	Sydney	Oct 03, 2017	14 Day
Total Recoverable Hydrocarbons - 2013 NEPM Fractions - Method: TRH C6-C40 - LTM-ORG-2010	Sydney	Oct 03, 2017	14 Day
Total Recoverable Hydrocarbons - 2013 NEPM Fractions - Method: TRH C6-C40 - LTM-ORG-2010	Sydney	Oct 03, 2017	14 Day
BTEX - Method: TRH C6-C40 - LTM-ORG-2010	Sydney	Oct 03, 2017	14 Day
Polycyclic Aromatic Hydrocarbons - Method: LTM-ORG-2140 PAH and Phenols in Soils by GCMS	Sydney	Oct 03, 2017	14 Days
Organochlorine Pesticides - Method: LTM-ORG-2220 OCP & PCB in Soil and Water	Sydney	Oct 03, 2017	14 Day
Organophosphorus Pesticides - Method: LTM-ORG-2220 Organophosphorus Pesticides by GC-MS	Sydney	Oct 03, 2017	14 Day
Polychlorinated Biphenyls - Method: LTM-ORG-2220 OCP & PCB in Soil and Water	Sydney	Oct 03, 2017	28 Days
Metals M8 - Method: LTM-MET-3040_R0 TOTAL AND DISSOLVED METALS AND MERCURY IN WATERS BY ICP-MS	Sydney	Oct 03, 2017	28 Day
% Moisture - Method: LTM-GEN-7080 Moisture	Sydney	Oct 03, 2017	14 Day

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. All biota results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram

mg/L: milligrams per litre

ug/L: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100mL: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	Quality Systems Manual ver 5.1 US Department of Defense
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " - " in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q08	The matrix spike recovery is outside of the recommended acceptance criteria. An acceptable recovery was obtained for the laboratory control sample indicating a sample matrix interference
Q15	The RPD reported passes Eurofins mgt's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.

Order number	: ----	Date Analysis Commenced	: 19-Oct-2017
C-O-C number	: ----	Issue Date	: 01-Nov-2017 19:38
Sampler	: ----		
Site	: ----		
Quote number	: EN/008/17		
No. of samples received	: 13		
No. of samples analysed	: 13		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Celine Conceicao	Senior Spectroscopist	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Pabi Subba	Senior Organic Chemist	Sydney Organics, Smithfield, NSW
Raymond Commodore	Instrument Chemist	Sydney Inorganics, Smithfield, NSW
Sanjeshni Jyoti	Senior Chemist Volatiles	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

∅ = ALS is not NATA accredited for these tests.

~ = Indicates an estimated value.

- Amendment (01/11/2017): This report has been amended and re-released to allow the reporting of additional analytical data.
- EP080: Sample TRIP SPIKE contains volatile compounds spiked into the sample containers prior to dispatch from the laboratory. BTEX compounds spiked at 20 ug/L.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1,2,3,cd)pyrene (0.1), Dibenz(a,h)anthracene (1.0), Benzo(g,h,i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.

Analytical Results

Sampler	: ----	No. of samples received	: 13
Order number	: ----	No. of samples analysed	: 13

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Duplicate outliers occur.
- **NO** Laboratory Control outliers occur.
- **NO** Matrix Spike outliers occur.
- For all regular sample matrices, **NO** surrogate recovery outliers occur.

Outliers : Analysis Holding Time Compliance

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers exist - please see following pages for full details.

Matrix: WATER									Evaluation: ✗ = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: WATER

Evaluation: ✘ = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type	Analytical Methods	Method	Count		Rate (%)		Quality Control Specification
			QC	Regular	Actual	Expected

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Dissolved Mercury by FIMS	EG035F	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl ₂)(Cold Vapour generation) AAS) Samples are 0.45µm filtered prior to analysis. FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the filtered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl ₂ which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Polychlorinated Biphenyls (PCB)	EP066	WATER	In house: Referenced to USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Pesticides by GCMS	EP068	WATER	In house: Referenced to USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using 60mL DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3). ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for sparging.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
 A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results (regarding both quality and NATA accreditation).

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil results are reported on a dry basis, unless otherwise stated.
3. All biota results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the Sample Receipt Advice.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram

mg/L: milligrams per litre

ug/L: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100mL: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	Quality Systems Manual ver 5.1 US Department of Defense
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 50-150%-Phenols & PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.1 where no positive PFAS results have been reported have been reviewed and no data was affected.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash " - " in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1		Acceptance Limits	Pass Limits	Qualifying Code

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Ankit Joshi	Inorganic Chemist	Sydney Inorganics, Smithfield, NSW
Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

Ø = ALS is not NATA accredited for these tests.

~ = Indicates an estimated value.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Duplicate outliers occur.
- **NO** Laboratory Control outliers occur.
- Matrix Spike outliers exist - please see following pages for full details.
- For all regular sample matrices, **NO** surrogate recovery outliers occur.

Outliers : Analysis Holding Time Compliance

- **NO** Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers exist - please see following pages for full details.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: WATER

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EK055G: Ammonia as N by Discrete Analyser	ES1818150--001	Anonymous	Ammonia as N	7664-41-7	Not Determined	---	MS recovery not determined, background level greater than or equal to 4x spike level.
EK059G: Nitrite plus Nitrate as N (NOx) by Discrete Analyser	ES1817359--005	Anonymous	Nitrite + Nitrate as N	---	Not Determined	---	MS recovery not determined, background level greater than or equal to 4x spike level.

Outliers : Frequency of Quality Control Samples

Matrix Spikes (MS)					
TRH - Semivolatile Fraction	0	10	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: WATER

Evaluation: ✘ = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: WATER

Evaluation: ✘ = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type	Analytical Methods	Method	Count		Rate (%)		Quality Control Specification

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined separately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 4500-P H, Jirka et al (1976), Zhang et al (2006). This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
TKN/TP Digestion	EK061/EK067	WATER	In house: Referenced to APHA 4500 Norg - D; APHA 4500 P - H. This method is compliant with NEPM (2013) Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using 60mL DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for sparging.

ISO/IEC 17025 - Testing

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

Ø = ALS is not NATA accredited for these tests.

~ = Indicates an estimated value.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Duplicate outliers occur.
- **NO** Laboratory Control outliers occur.
- Matrix Spike outliers exist - please see following pages for full details.
- For all regular sample matrices, **NO** surrogate recovery outliers occur.

Outliers : Analysis Holding Time Compliance

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers exist - please see following pages for full details.

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: WATER

Evaluation: ✘ = Holding time breach ; ✓ = Within holding time.

Matrix: WATER									Evaluation: ✗ = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: WATER

Evaluation: ✘ = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type	Analytical Methods	Method	Count		Rate (%)		Quality Control Specification
			QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Dissolved Metals by ICP-MS - Suite A	EG020A-F	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. Samples are 0.45µm filtered prior to analysis. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined separately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 4500-P H, Jirka et al (1976), Zhang et al (2006). This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)

Preparation Methods	Method	Matrix	Method Descriptions
TKN/TP Digestion	EK061/EK067	WATER	In house: Referenced to APHA 4500 Norg - D; APHA 4500 P - H. This method is compliant with NEPM (2013) Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using 60mL DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for sparging.

ISO/IEC 17025 - Testing

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

Ø = ALS is not NATA accredited for these tests.

~ = Indicates an estimated value.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Duplicate outliers occur.
- **NO** Laboratory Control outliers occur.
- Matrix Spike outliers exist - please see following pages for full details.
- For all regular sample matrices, **NO** surrogate recovery outliers occur.

Outliers : Analysis Holding Time Compliance

- Analysis Holding Time Outliers exist - please see following pages for full details.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers exist - please see following pages for full details.

Outliers : Quality Control Samples

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: WATER									Evaluation: ✗ = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: WATER

Evaluation: ✗ = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type	Analytical Methods	Method	Count		Rate (%)		Quality Control Specification
			QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)							
Ammonia as N by Discrete analyser		EK055G	2	20	10.00	10.00	✓ NEPM 2013 B3 & ALS QC Standard
Nitrite and Nitrate as N (NOx) by Discrete Analyser		EK059G	2	20	10.00	10.00	✓ NEPM 2013 B3 & ALS QC Standard
Nitrite as N by Discrete Analyser		EK057G	2	15	13.33	10.00	✓ NEPM 2013 B3 & ALS QC Standard

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl ₂)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl ₂ which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 4500-NH ₃ G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 4500-NO ₂ - B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 4500-NO ₃ - F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined separately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite and Nitrate as N (NO _x) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 4500-NO ₃ - F. Combined oxidised Nitrogen (NO ₂ +NO ₃) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 4500-P H, Jirka et al (1976), Zhang et al (2006). This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	In house: Referenced to USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
Preparation Methods	Method	Matrix	Method Descriptions
TKN/TP Digestion	EK061/EK067	WATER	In house: Referenced to APHA 4500 Norg - D; APHA 4500 P - H. This method is compliant with NEPM (2013) Schedule B(3)

<i>Preparation Methods</i>	<i>Method</i>	<i>Matrix</i>	<i>Method Descriptions</i>
Digestion for Total Recoverable Metals	EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM (2013) Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation	ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for sparging.

Edwandy Fadjar	Organic Coordinator	Sydney Organics, Smithfield, NSW
Ivan Taylor	Analyst	Sydney Inorganics, Smithfield, NSW

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

∅ = ALS is not NATA accredited for these tests.

~ = Indicates an estimated value.

- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a,h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.
- Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) per the NEPM (2013) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a,h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero, for 'TEQ 1/2LOR' are treated as half the reported LOR, and for 'TEQ LOR' are treated as being equal to the reported LOR. Note: TEQ 1/2LOR and TEQ LOR will calculate as 0.6mg/Kg and 1.2mg/Kg respectively for samples with non-detects for all of the eight TEQ PAHs.
- EA200 'Am' Amosite (brown asbestos)
- EA200 'Cr' Crocidolite (blue asbestos)
- EA200 'Trace' - Asbestos fibres ("Free Fibres") detected by trace analysis per AS4964. The result can be interpreted that the sample contains detectable 'respirable' asbestos fibres
- EA200: Asbestos Identification Samples were analysed by Polarised Light Microscopy including dispersion staining.
- EA200 Legend
- EA200 'Ch' Chrysotile (white asbestos)
- EA200: 'UMF' Unknown Mineral Fibres. "-" indicates fibres detected may or may not be asbestos fibres. Confirmation by alternative techniques is recommended.
- EA200: For samples larger than 30g, the <2mm fraction may be sub-sampled prior to trace analysis as outlined in ISO23909:2008(E) Sect 6.3.2-2
- EA200: 'Yes' - Asbestos detected by polarised light microscopy including dispersion staining.
- EA200: 'No*' - No asbestos found, at the reporting limit of 0.1g/kg, by polarised light microscopy including dispersion staining. Asbestos material was detected and positively identified at concentrations estimated to be below 0.1g/kg.
- EA200: 'No' - No asbestos found at the reporting limit 0.1g/kg, by polarised light microscopy including dispersion staining.

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: ES2012822	Page	: 1 of 9
Client	: WSP Australia Pty Ltd	Laboratory	: Environmental Division Sydney
Contact	: MS AMY VALENTINE	Telephone	: +61 2 8784 8555
Project	: PS102981 Fairfield Sustainable Resource Centre	Date Samples Received	: 16-Apr-2020
Site	: ----	Issue Date	: 22-Apr-2020
Sampler	: Leila Bowe	No. of samples received	: 17
Order number	: ----	No. of samples analysed	: 16

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Duplicate outliers occur.
- **NO** Laboratory Control outliers occur.
- **NO** Matrix Spike outliers occur.
- Surrogate recovery outliers exist for all regular sample matrices - please see following pages for full details.

Outliers : Analysis Holding Time Compliance

- **NO** Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers exist - please see following pages for full details.

Regular Sample Surrogates

Sub-Matrix: WATER

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Samples Submitted							
EP075(SIM)T: PAH Surrogates	ES2012822-014	RSV3	Anthracene-d10	1719-06-8	116 %	27.4-113 %	Recovery greater than upper data quality objective

Outliers : Frequency of Quality Control Samples

Matrix: WATER

Quality Control Sample Type	Count		Rate (%)		Quality Control Specification
	Method	QC	Regular	Actual	
Laboratory Duplicates (DUP)					
PAH/Phenols (GC/MS - SIM)	0	9	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	11	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
PAH/Phenols (GC/MS - SIM)	0	9	0.00	5.00	NEPM 2013 B3 & ALS QC Standard
TRH - Semivolatile Fraction	0	11	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: SOIL

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 6.1 and Table 1 (14 day holding time).
Asbestos Identification in Soils	EA200	SOIL	AS 4964 - 2004 Method for the qualitative identification of asbestos in bulk samples Analysis by Polarised Light Microscopy including dispersion staining
Total Metals by ICP-AES	EG005T	SOIL	In house: Referenced to APHA 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3)
Total Mercury by FIMS	EG035T	SOIL	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl ₂) (Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl ₂ which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH - Semivolatile Fraction	EP071	SOIL	In house: Referenced to USEPA SW 846 - 8015A Sample extracts are analysed by Capillary GC/FID and quantified against alkane standards over the range C10 - C40. Compliant with NEPM amended 2013.
PAH/Phenols (SIM)	EP075(SIM)	SOIL	In house: Referenced to USEPA SW 846 - 8270E. Extracts are analysed by Capillary GC/MS in Selective Ion Mode (SIM) and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 502 and 507)
TRH Volatiles/BTEX	EP080	SOIL	In house: Referenced to USEPA SW 846 - 8260D. Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve. Compliant with NEPM amended 2013.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to AS 3550, APHA 3112 Hg - B (Flow-injection (SnCl ₂)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl ₂ which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	In house: Referenced to USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	In house: Referenced to USEPA SW 846 - 8270E Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)

Analytical Methods		Method	Matrix	Method Descriptions
TRH Volatiles/BTEX		EP080	WATER	In house: Referenced to USEPA SW 846 - 8260D Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
Preparation Methods		Method	Matrix	Method Descriptions
Hot Block Digest for metals in soils sediments and sludges		EN69	SOIL	In house: Referenced to USEPA 200.2. Hot Block Acid Digestion 1.0g of sample is heated with Nitric and Hydrochloric acids, then cooled. Peroxide is added and samples heated and cooled again before being filtered and bulked to volume for analysis. Digest is appropriate for determination of selected metals in sludge, sediments, and soils. This method is compliant with NEPM (2013) Schedule B(3) (Method 202)
Methanolic Extraction of Soils for Purge and Trap		ORG16	SOIL	In house: Referenced to USEPA SW 846 - 5030A. 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids		ORG17	SOIL	In house: Mechanical agitation (tumbler). 10g of sample, Na2SO4 and surrogate are extracted with 30mL 1:1 DCM/Acetone by end over end tumble. The solvent is decanted, dehydrated and concentrated (by KD) to the desired volume for analysis.
Digestion for Total Recoverable Metals		EN25	WATER	In house: Referenced to USEPA SW846-3005. Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM (2013) Schedule B(3)
Separatory Funnel Extraction of Liquids		ORG14	WATER	In house: Referenced to USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Volatiles Water Preparation		ORG16-W	WATER	A 5 mL aliquot or 5 mL of a diluted sample is added to a 40 mL VOC vial for sparging.

% Moisture	1	%	14

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions - Method: LTM-ORG-2010 TRH C6-C40	Sydney	Apr 24, 2020	14 Days
BTEX - Method: LTM-ORG-2010 TRH C6-C40	Sydney	Apr 24, 2020	14 Days
Total Recoverable Hydrocarbons - 2013 NEPM Fractions - Method: LTM-ORG-2010 TRH C6-C40	Sydney	Apr 24, 2020	14 Days
Total Recoverable Hydrocarbons - 2013 NEPM Fractions - Method: LTM-ORG-2010 TRH C6-C40	Sydney	Apr 24, 2020	14 Days
Polycyclic Aromatic Hydrocarbons - Method: LTM-ORG-2130 PAH and Phenols in Soil and Water	Sydney	Apr 24, 2020	14 Days
Metals M8 - Method: LTM-MET-3040 Metals in Waters, Soils & Sediments by ICP-MS	Sydney	Apr 24, 2020	180 Days
% Moisture - Method: LTM-GEN-7080 Moisture	Sydney	Apr 20, 2020	14 Days

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram

mg/L: milligrams per litre

ug/L: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100mL: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	US Department of Defense Quality Systems Manual Version 5.3
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.3 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpa, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
Q02	The duplicate %RPD is outside the recommended acceptance criteria. Further analysis indicates sample heterogeneity as the cause
Q15	The RPD reported passes Eurofins Environment Testing's QC - Acceptance Criteria as defined in the Internal Quality Control Review and Glossary page of this report.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction and analysis is reported.
A recent review of our LIMS has resulted in the correction or clarification of some method identifications. Due to this, some of the method reference information on reports has changed. However, no substantive change has been made to our laboratory methods, and as such there is no change in the validity of current or previous results.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Total Recoverable Hydrocarbons - 1999 NEPM Fractions - Method: LTM-ORG-2010 TRH C6-C40	Sydney	Apr 20, 2020	7 Days
BTEX - Method: LTM-ORG-2010 TRH C6-C40	Sydney	Apr 20, 2020	14 Days
Total Recoverable Hydrocarbons - 2013 NEPM Fractions - Method: LTM-ORG-2010 TRH C6-C40	Sydney	Apr 20, 2020	7 Days
Total Recoverable Hydrocarbons - 2013 NEPM Fractions - Method: LTM-ORG-2010 TRH C6-C40	Sydney	Apr 20, 2020	7 Days
Polycyclic Aromatic Hydrocarbons - Method: LTM-ORG-2130 PAH and Phenols in Soil and Water	Sydney	Apr 20, 2020	7 Days
Metals M8 - Method: LTM-MET-3040 Metals in Waters, Soils & Sediments by ICP-MS	Sydney	Apr 20, 2020	180 Days

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

****NOTE:** pH duplicates are reported as a range NOT as RPD

Units

mg/kg: milligrams per kilogram

mg/L: milligrams per litre

ug/L: micrograms per litre

ppm: Parts per million

ppb: Parts per billion

%: Percentage

org/100mL: Organisms per 100 millilitres

NTU: Nephelometric Turbidity Units

MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	US Department of Defense Quality Systems Manual Version 5.3
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient

QC - Acceptance Criteria

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.3 where no positive PFAS results have been reported have been reviewed and no data was affected.

WA DWER (n=10): PFBA, PFPeA, PFHxA, PFHpa, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. Organochlorine Pesticide analysis - where reporting LCS data, Toxaphene & Chlordane are not added to the LCS.
4. Organochlorine Pesticide analysis - where reporting Spike data, Toxaphene is not added to the Spike.
5. Total Recoverable Hydrocarbons - where reporting Spike & LCS data, a single spike of commercial Hydrocarbon products in the range of C12-C30 is added and it's Total Recovery is reported in the C10-C14 cell of the Report.
6. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore laboratory analysis is unlikely to be completed within holding time. Analysis will begin as soon as possible after sample receipt.
7. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of Recovery the term "INT" appears against that analyte.
8. Polychlorinated Biphenyls are spiked only using Aroclor 1260 in Matrix Spikes and LCS.
9. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
10. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N01	F2 is determined by arithmetically subtracting the "naphthalene" value from the ">C10-C16" value. The naphthalene value used in this calculation is obtained from volatiles (Purge & Trap analysis).
N02	Where we have reported both volatile (P&T GCMS) and semivolatile (GCMS) naphthalene data, results may not be identical. Provided correct sample handling protocols have been followed, any observed differences in results are likely to be due to procedural differences within each methodology. Results determined by both techniques have passed all QAQC acceptance criteria, and are entirely technically valid.
N04	F1 is determined by arithmetically subtracting the "Total BTEX" value from the "C6-C10" value. The "Total BTEX" value is obtained by summing the concentrations of BTEX analytes. The "C6-C10" value is obtained by quantitating against a standard of mixed aromatic/aliphatic analytes.
N07	Please note:- These two PAH isomers closely co-elute using the most contemporary analytical methods and both the reported concentration (and the TEQ) apply specifically to the total of the two co-eluting PAHs
