1. INTRODUCTION

This civil report has been prepared by Bonacci Group (NSW) Pty Ltd to describe the civil works including the stormwater strategy associated with the State Significant Development Application (SSDA) for the Picton High School Redevelopment works.

This SSDA report incorporates the refurbishment of existing buildings, demolition of a number of existing buildings, construction of new buildings, internal roads and internal walkways. External works include the reconfiguration of lanes on Argyle Street, including the removal of on street parking and providing a dedicated right turning lane into the school bus stop, relocation of the pedestrian refuge island, and an extension to Wonga Road is proposed with a formalised cul-de-sac enabling rear access to the school.

This report addresses the redirected, upgraded (where required) and proposed new stormwater drainage networks related to the redevelopment of Picton High School, new road and pavement works, and bulk earthworks associated with the development. This design report also incorporates the water quality strategy for the site including a bio-retention basin to treat stormwater runoff in accordance with Wollondilly Shire Council requirements.

1.1. Objectives

The objectives of this State Significant Development Application (SSDA) report is to demonstrate compliance with all the requirements of *Wollondilly Shire Council DCP 2016, Design Specifications and Standard Drawings*, and *Water Sensitive Urban design Technical Guidelines* as follows:

- To design a stormwater trunk drainage system for the site to accommodate the stormwater runoff up to and including 100 year ARI storm events without having adverse impact to adjoining properties,
- To maintain the post development site discharge levels to pre development (both piped and overland) for all storm events up to and including 100 year ARI storm events,
- To maintain maximum post development discharge to the available capacity of the downstream stormwater network, and
- To provide a functional Water Sensitive Urban Design (WSUD) measures for the site to improve the water quality system overall and achieves the pollutant removal targets set by Council's *Water Sensitive Urban design Technical Guidelines*.

2. SITE DESCRIPTION

2.1. Location

The proposed development is located on the Picton High School Campus, 480 Argyle Street, Picton. The Campus is bordered by Argyle Street to the west and Wonga Road to the east. The proposed site is located within Wollondilly Shire Council Local Government Area (LGA). The locality map of the site is shown in [Figure 2-1](#) below.

Figure 2-1: Aerial View of Picton High School (Source: Google Maps)

2.2. Topography

The Campus generally slopes from South to North. The site gently grade to a centrally located south-north oriented sag, draining to a 1050diametre pipe in a northern easement connecting to Coachwood Crescent that ultimately drains to Redbank Creek. In major storm events, any overland flow generally flows northwards towards the easement linking the campus to Coachwood Crescent, following the existing topography.

2.3. Existing Documentation

The following relevant existing documentation has been referenced for the proposed design:

- Detail Survey including in ground services by CMS Surveyors, 2 March 2017,
- Geotechnical Investigation (Ref: 34252.02) by Douglas Partners Pty Ltd, 15 August 2017, and
- Tahmoor Coal Flood Impact Assessment (Ref: 34252.02) by WRM, 3 December 2014.

3. PROPOSED DEVELOPMENT

The proposed development comprises of the demolition of a number of existing buildings, construction or new buildings and refurbishing of the remainder of the existing buildings to provide permanent facilities for 1500 students, with core facilities for 2000 students, new school bus stop configuration on Argyle Street, new Wonga Road cul-de-sac and associated infrastructure. The Architectural site plan for the school is shown in [Figure 3-1](#) below.

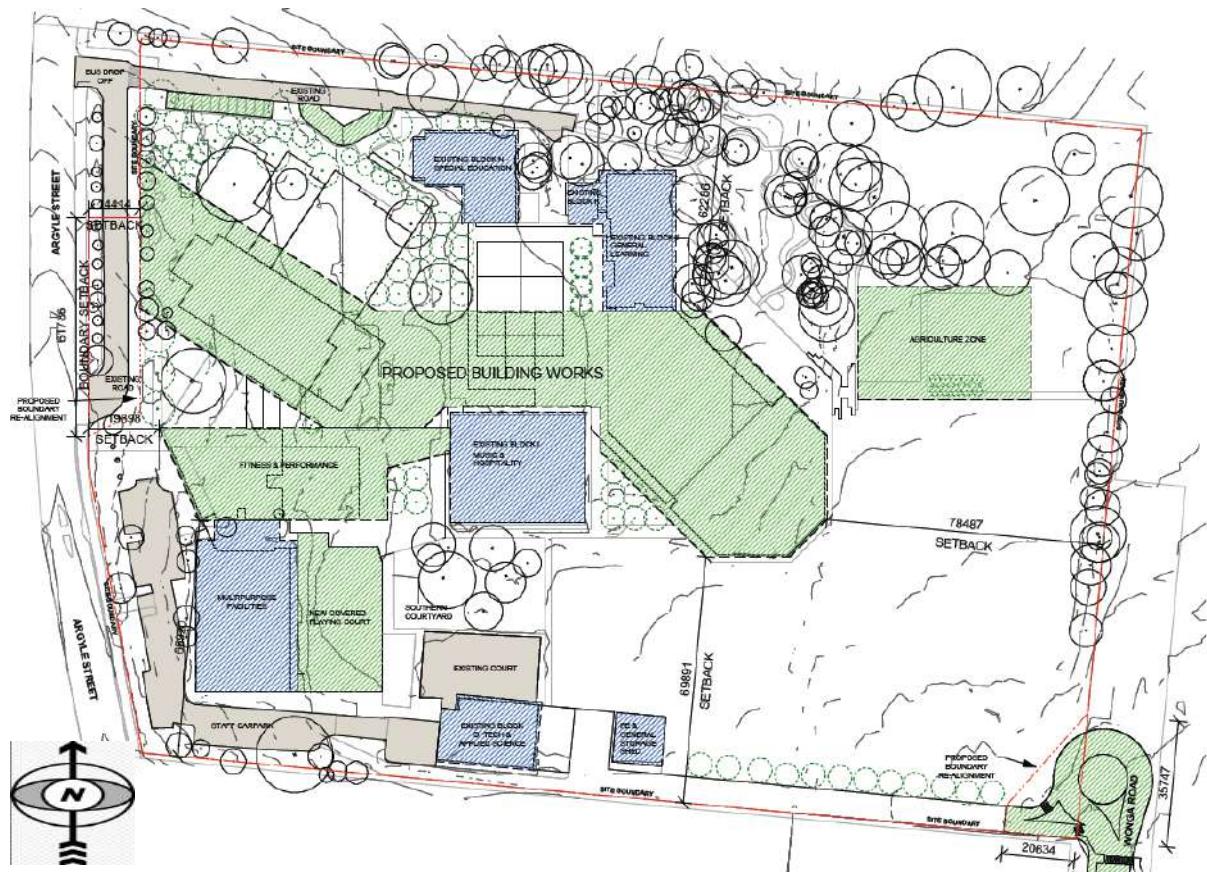

Figure 3-1: The Architectural Site Plan (by Billard Leece Architects)

3.1. Flood Impact Assessment

A flood impact assessment "Tahmoor Coal Flood Impact Assessment (Ref: 34252.02) by WRM, 3 December 2014" has been produced on behalf of Wollondilly Shire Council. This assessment identifies that the site does not experience flooding in major storm events.

As a result, the stormwater drainage network and surface levels are designed to protect the direct surface runoff away from building entry points.

The Tahmoor Coal Flood Impact Assessment by WRM is provided in [Appendix D](#).

3.2. Stormwater Drainage

3.2.1. Catchment Delineation

The Proposed Site is located within the existing Redbank Creek catchment. The campus is approximately 5.7 hectares and the catchment for the downstream 1050 diameter pipe is approximately 8 hectares.

A stormwater pit and pipe drainage system is proposed to service the site to replace the existing redundant drainage system, to service the school buildings and associated infrastructure post development.

As early works, prior to demolition works, a new stormwater drainage line will be constructed to service the retained buildings in the south-eastern quadrant of the campus. The stormwater strategy for the site is shown in Drawing C030.

3.2.2. Hydrology and Hydraulics

The stormwater drainage systems have been designed to cater for design storms up to and including 100 year ARI (1% AEP) storm events as per Wollondilly Shire Council DCP 2016, Design Specifications and Standard Drawings, and Water Sensitive Urban design Technical Guidelines.

The hydrology and hydraulic analysis for the proposed site was established using a DRAINS (computer program for hydrological and hydraulic assessment) model. The hydrological parameters used in DRAINS are in accordance with Wollondilly Shire Council's "*Design Specifications for Subdivision and Engineering Standard, 2016*".

The intensity-frequency-duration (IFD) data for the site was extracted from Australian Rainfall and Runoff Volume 1, 1987 (Also provided in D5 of *Design Specifications for Subdivision and Engineering Standard, 2016*) and is provided in **Appendix B**.

The DRAINS model was adopted to obtain permissible site discharge (PSD) for existing scenarios in accordance with "D5 of *Design Specifications for Subdivision and Engineering Standard, 2016*" and as well as to design the on-site detention tank. The Drains model flows were obtained for 5 year, 20 year and 100 year ARI storm events.

3.2.3. Permissible Site Discharge (PSD)

The proposed site is approximately 5.7ha in area. The impervious area of proposed site has decreased to 45% whereas the impervious area for the existing site is 47.5%. There is no formal on-site stormwater detention system on the current site. There does exist a depression immediately upstream from the headwall of the 1050 diametre Council pipe resulting in a theoretical storage volume of approximately 75m³.

The proposed development results in the reduction of total impervious area by 1430m². The proposed catchment plan is provided in **Appendix A**.

The stormwater concept plans are shown in Drawing C030. A minimum 5 minutes time of concentration (t_c) has been adopted for existing impervious areas in the DRAINS model. The kinematic wave equation was used to determine the time of concentration for existing pervious areas. The kinematic wave equation in accordance with AR&R is set out below:

$$t_c = 6.94 * \frac{(L \times n^*)^{0.6}}{(I^{0.4} \times S^{0.3})}$$

where

L is the flow path length (m)

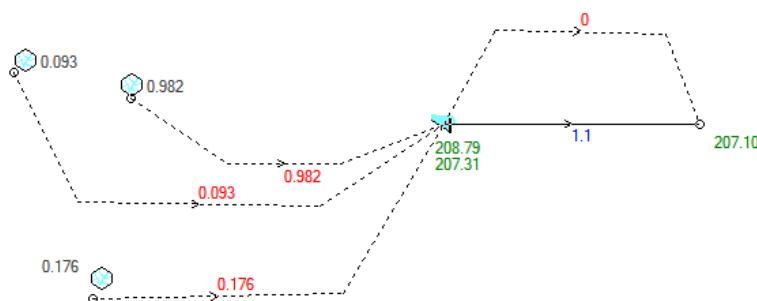

n^* is the surface roughness or retardance coefficient

I is the rainfall intensity (mm/hr)

S gradient of the flow path (m/m)

Tc is time of concentration (hrs)

To determine the PSD, the existing site has been divided into 3 main catchments: one for the existing school buildings (near west of the site), one for the existing grass field to the east of the site and one for the southern grassed areas. This has been modelled in DRAINS and a schematic diagram of DRAINS model (for the 5 year ARI) for existing scenario is shown below.

The permissible site discharge for the site are summarised in a tabular format below.

Table 3-1: Summary of PSD for the Site

Nodes	Location	Area (ha)	PSD (Permissible Site Discharge) (m³/s)			Impervious Time of Concentration (t _c) minutes
			5yr	20yr	100yr	
Ex. Outlet Discharge Level	Coachwood Crescent	5.76	1.1	1.54	1.89	5

3.2.4. Stormwater Analysis and Design

The proposed stormwater drainage network was designed using DRAINS software. All stormwater runoff from the school, associated infrastructure and landscape areas was captured and directed into the proposed new stormwater pit and pipe system. DRAINS was used to model the proposed network and to correctly size the inlet pits and the network pipes. A schematic diagram of DRAINS model for developed is shown below. The pits and pipes are design for 5% AEP for minor storms storm events. Overland flow paths were designed for 1% AEP for major storm events.

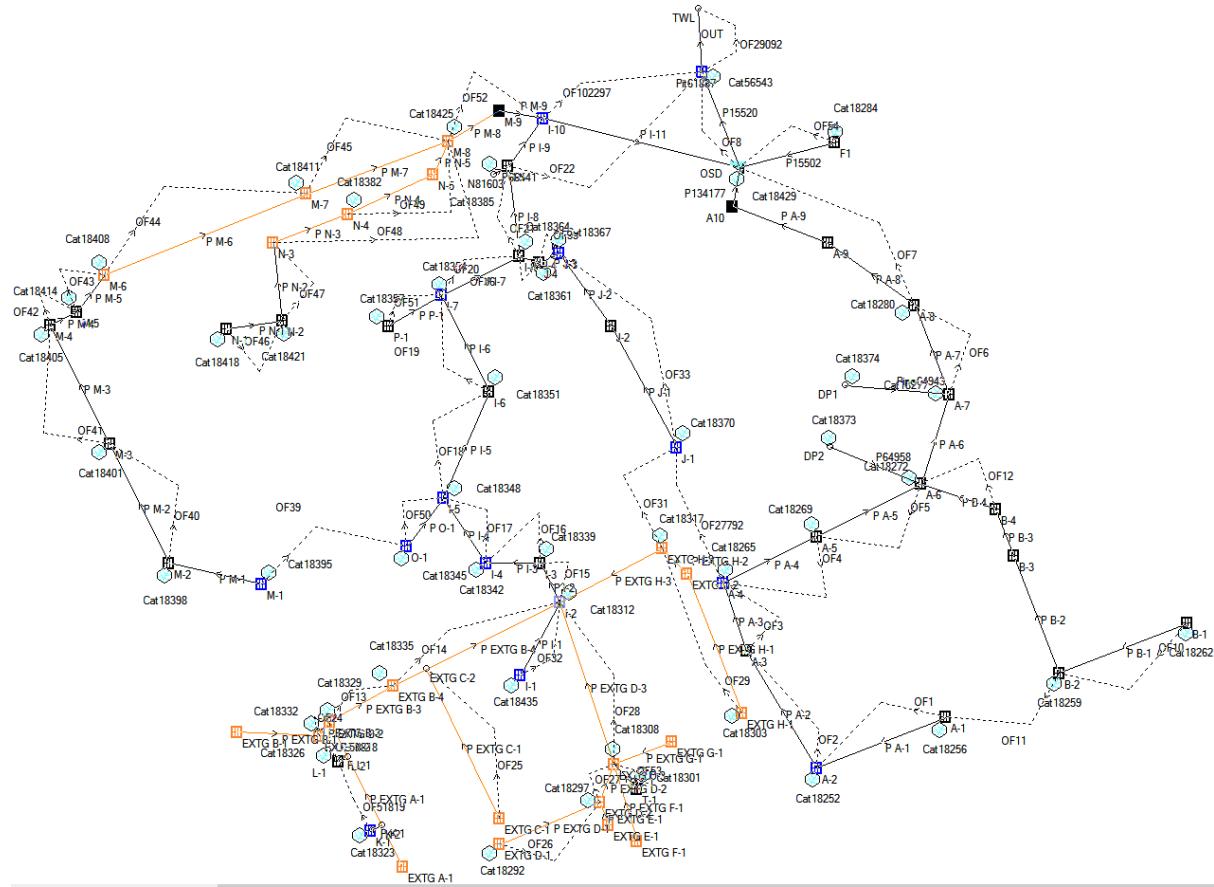

Figure 3-2: A Schematic Diagram of DRAINS (Hydrology and Hydraulics) Model for Developed Scenario

In order to meet pre-development flow requirements, the pit and pipe system shall be connected into a 500m³ on site detention (OSD) tank as shown in drawing C030. The OSD design has been based on an assumed tail water level of RL209 at the outlet of the existing 1050mm stormwater pipe for the 100 year ARI event. This level is assumed to be at top of grate level on Coachwood Crescent. Survey confirmation of this level is required for detailed design. The tail water level for 5 and 20 year ARI events are assumed to be free discharge. The details of the OSD design are summarised in table below:

Items	Design Storm Events (ARI)				
	5 years	20 years	100 years		
Total Discharge from Site (m ³ /s)	1.1m ³ /s	1.20m ³ /s	1.22m ³ /s		
Permissible Site Discharge (Refer Table 3-1) (m ³ /s)	1.1m ³ /s	1.54m ³ /s	1.89m ³ /s		
Total Volume Provided (m ³)	500				
Water Levels (mAHD)	211.07	211.32	211.51		
Discharge Control Outlets	Primary	580mm orifice			
High Early Discharge Weir Level (m)	RL211.00				
Tailwater Level in 100ARI	RL209.00				
OSD Surcharge level	RL211.60				

The model demonstrates that post development flows are less than permissible site discharge and therefore complies with Council's requirements. The stormwater strategy also demonstrates compliance to Council's requirement of ensuring that flows are within the capacity of the existing 1050mm stormwater pipe. This is seen in the DRAINS schematic below where there are no overflow from the existing headwall (which is to be demolished and reconstructed as a grated inlet pit) down the pedestrian walkway onto Coachwood Crescent in the 100 year ARI rainfall event.

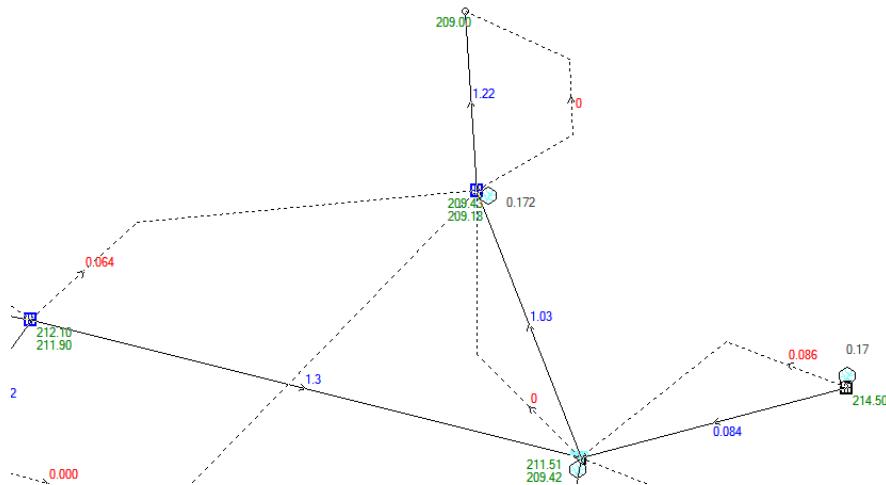

Figure 3-3 No overflow in the 100ARI event

3.3. Water Quality

The water quality treatment measure for the proposed for Picton High School is designed to satisfy all the requirements set by “*Wollondilly Shire Council’s Water Sensitive Urban Design Policy*” and “*Australian Runoff Quality – a Guide to Water Sensitive Urban Design*”. The water quality targets set by *Wollondilly Shire Council’s WSUD policy* are provided below:

- *Reduction of Mean annual Load of Gross Pollutants – 70% (greater than 5mm)*
- *Reduction of Mean annual Load of Total Coarse Sediment – 80% (0.1mm to 5mm)*
- *Reduction of Mean annual Load of Total Fine Sediment – 50% (less than 0.1mm)*
- *Reduction of Mean annual Load of Total Phosphorous – 45%*
- *Reduction of Mean annual Load of Total Nitrogen – 45%*

Currently the site does not have any stormwater quality treatment measures. The proposed strategy provides water quality measures specifically for the new school and associated infrastructure. The proposed water quality strategy for the site is described in detail below.

3.3.1. Water Quality Strategy

The water quality treatment measures for the site are provided to reduce pollutant loads due to the proposed development. Even though the total impervious area is reduced, as the works constitute a new development, the above water quality targets set by *Wollondilly Shire Council* will be adhered.

The water quality strategy for Picton High School incorporates a combination of swales, enviropods, stormwater filters and a bio-retention basin. Each stormwater drainage inlet pit within the school has been fitted with an enviropod. The stormwater runoff originating from the sportsfields is treated by passing through a swale before draining into the site OSD. All the roof and hard pavement runoff towards the west part of the site is treated by passing through enviropods and then draining into the site bio-retention basin, before draining into the site OSD.

Table 3-2: Summary of Sub-catchments and Water Quality Measures for overall Site

Sub-catchments	Area (ha)	Impervious Fraction (%)	WSUD Treatment Measures	Comments
NW ROAD	0.508	40	Enviropods, Bioretention	
SW ROAD	0.336	55	Enviropods, Bioretention	
NE GRASS	0.548	0	N/A	
SPORTSFIELD 1	0.458	0	Swale, Enviropods	
SPORTSFIELD 2	0.310	0	Swale, Enviropods	
SPORTSFIELD 3	0.651	0	Enviropods	
SPORTSFIELD 4	0.241	0	N/A	
SE ROAD	0.212	100	Enviropods	
Main School	2.500	70	Enviropods, Bioretention	
Total	5.764			

The properties of the individual WSUD measures are provided in **Appendix C**.

3.3.2. Water Quality Model

The water quality strategy for the proposed site was established using *MUSIC* [Version 6.2] model. The *MUSIC* model rainfall and evapotranspiration is determined from Bureau of Meteorology for Picton site. The Catchment summary along with WSUD measures for the site are already summarised in

Table 3-1 above. A screen shot of Music [version 6.2] model representing the site is provided in the figure below.

The Pollutant generation parameters for the site is attached in **Appendix C**.

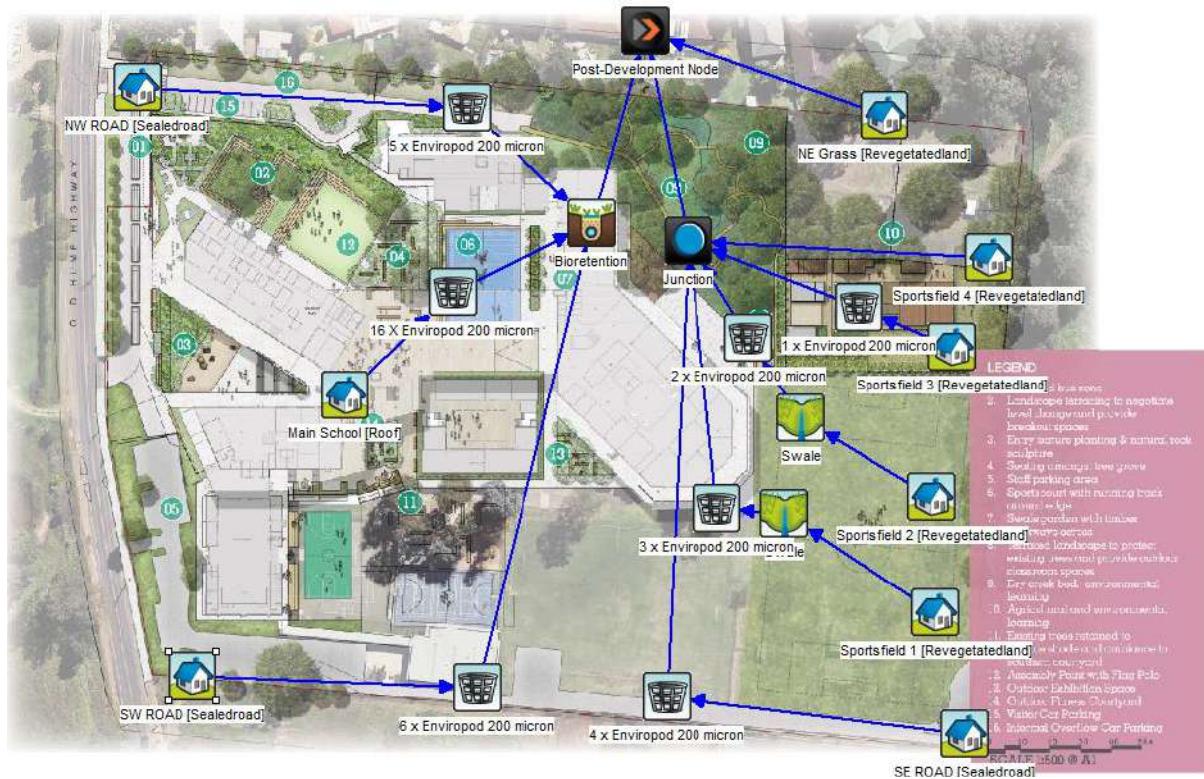

Figure 3-4: A Schematic Diagram of the Music Model.

3.3.3. Water Quality Results

The results of MUSIC modelling show that the pollutant removal rate achieves pollutant reduction targets provided in [Section 0](#). The results from the MUSIC model are shown as a screen shot below.

Treatment Train Effectiveness - Post-Development Node			
	Sources	Residual Load	% Reduction
Flow (ML/yr)	19.8	19.7	0.6
Total Suspended Solids (kg/yr)	1980	530	73.2
Total Phosphorus (kg/yr)	4.95	2.32	53.1
Total Nitrogen (kg/yr)	42.1	22.5	46.6
Gross Pollutants (kg/yr)	517	4.12	99.2

Figure 3-5: Music model Results

3.4. Soil and Water Management

The Soil and water management of the proposed site will be implemented during construction. The design of these measures is in accordance with the Landcom "Blue Book". Refer to drawings C005, C007 and C008 for the Soil and Water Management plan, Typical Detailing and the RUSLE Soil Loss calculation sheets.

For soil and water management of the site, the following measures are provided to minimise the risk of sediments being washed into neighbourhood property and erosion of the site.

- *A sediment fence/catch drain (or diversion bund) around the site,*
- *Temporary access to site with shaker pad,*
- *An indicative stockpile area with sediment fence around it during construction. The stockpile must be located out of water flow paths (and be protected by earth banks/drains as required), and*
- *Field inlet sediment traps.*

4. SUMMARY

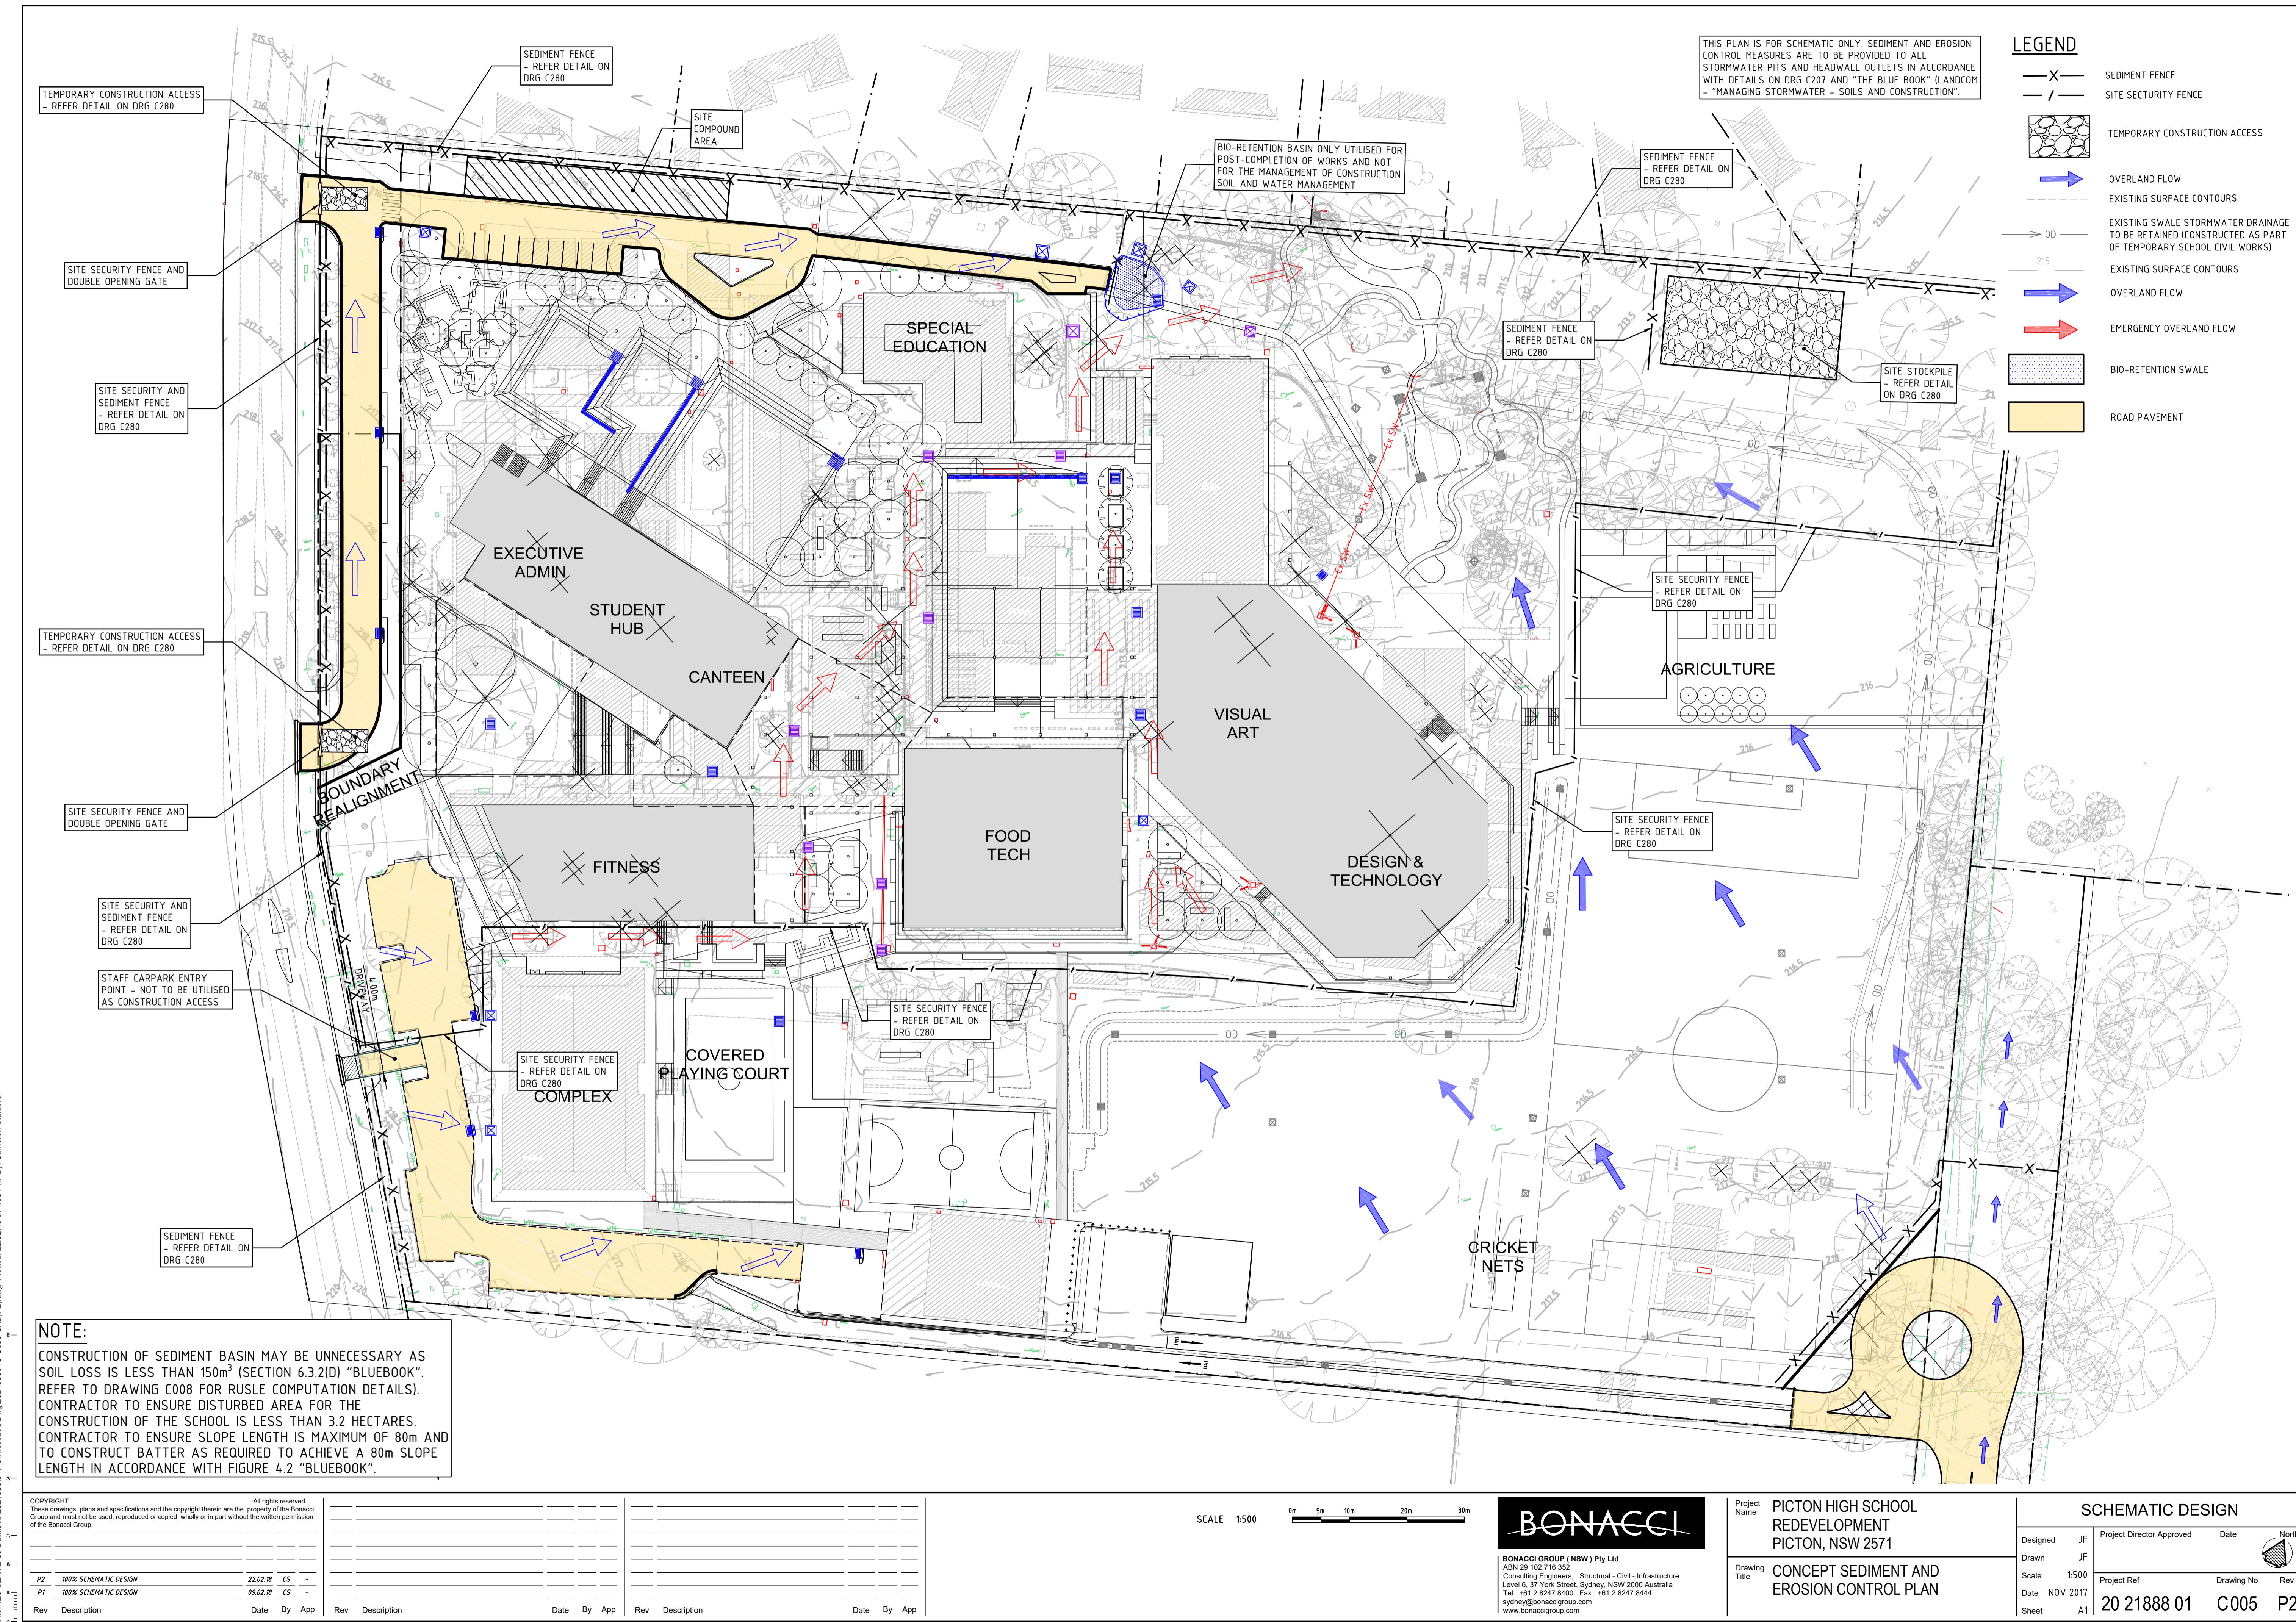

The civil design described in this report complies with Wollondilly Shire Council's *Wollondilly Shire Council DCP 2016, Design Specifications and Standard Drawings*, and *Water Sensitive Urban design Technical Guidelines* and "Australian Runoff Quality – a Guide to Water Sensitive Urban Design", Australian Standards and best-practiced principles.

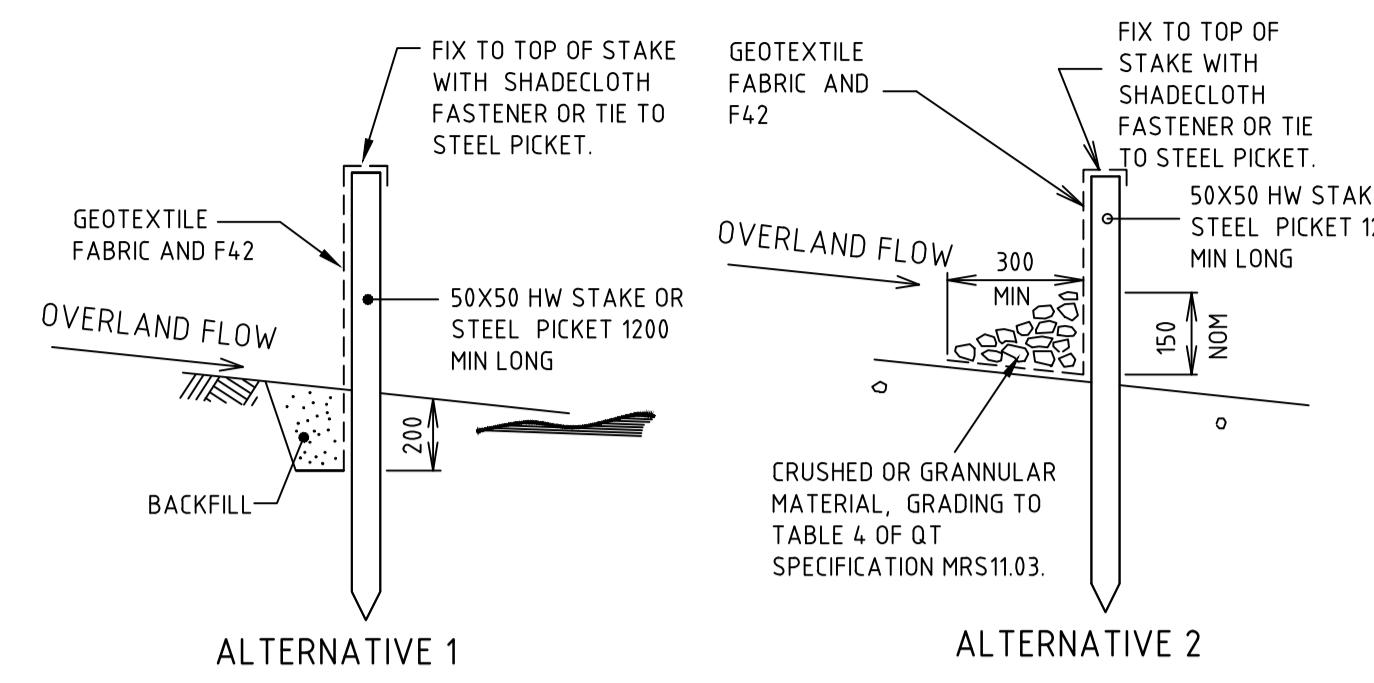

The proposed stormwater strategy for this State Significant Development Application (SSDA) demonstrates compliance with Wollondilly Shire Council water quantity requirements by limiting stormwater discharge to PSD up to and including 100 year ARI storm events and maintaining maximum post development discharge to the available capacity of the downstream stormwater network.

The proposed water quality improvement measures (demonstrated in [Section 3.3](#)) improve the existing stormwater quality conditions and fulfil all the requirements of Wollondilly Shire Council's *Water Sensitive Urban Design (WSUD) Technical Guidelines*.

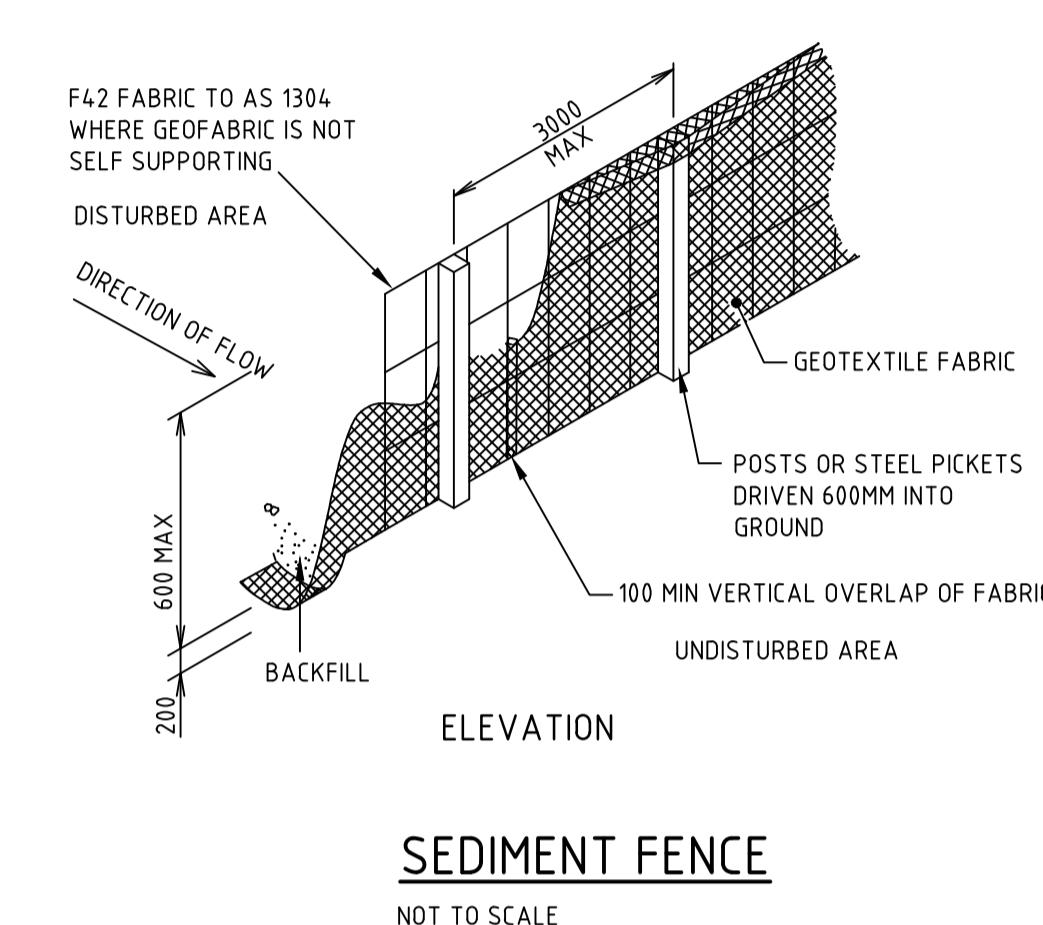

The proposed stormwater management strategy for the SSDA stated in this report demonstrate that it improves the existing stormwater drainage system by significantly reducing stormwater pollution and improving the overall water quality for the site.

ALTERNATIVE SEDIMENT FENCE

NOT TO SCALE

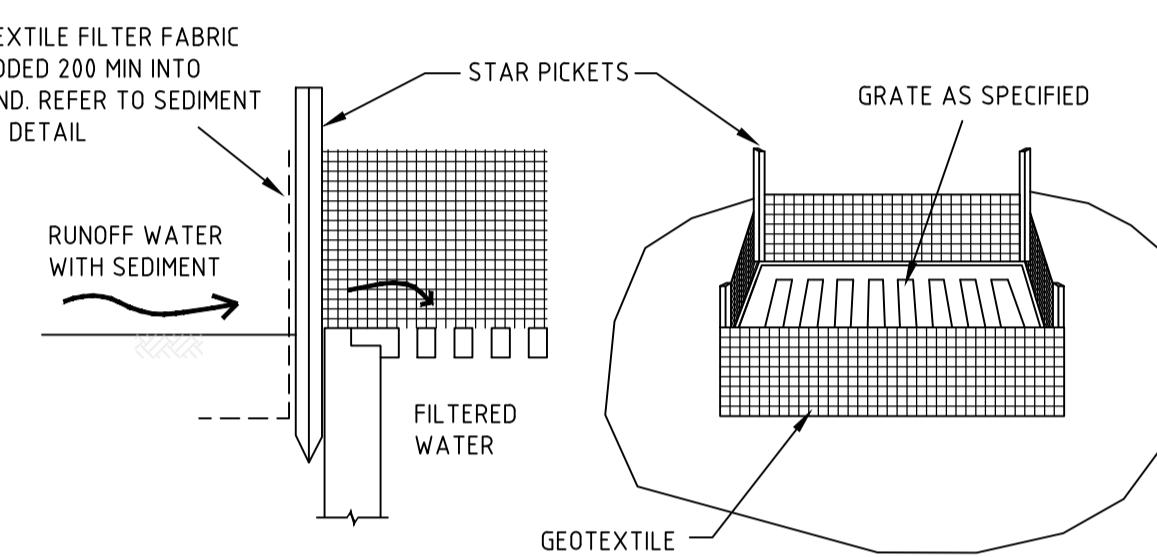

ALTERNATIVE SEDIMENT FENCE NOTES

1. INSTALL THIS TYPE OF SEDIMENT FENCE WHEN USE OF SUPPORT POSTS IS NOT DESIRABLE OR NOT POSSIBLE. SUCH CONDITIONS MIGHT APPLY, FOR EXAMPLE, WHERE APPROVAL IS GRANTED FROM THE APPROPRIATE AUTHORITIES TO PLACE THESE FENCES IN HIGHLY SENSITIVE ESTUARINE AREAS.
2. USE BENT TRENCH MESH TO SUPPORT THE F82 WELDED MESH FACING AS SHOWN ON THE DRAWING ABOVE. ATTACH THE JUTE MESH TO THE WELDED MESH FACING USING UV-RESISTANT CABLE TIES.
3. STABILISE THE WHOLE STRUCTURE WITH SANDBAG OR ROCK ANCHORING OVER THE TRENCH MESH AND THE LEADING EDGE OF THE JUTE MESH. THE ANCHORING SHOULD BE SUFICIENTLY LARGE TO ENSURE STABILITY OF THE STRUCTURE IN THE DESIGN STORM EVENT, USUALLY THE 10 YEAR EVENT.

NOTES:

- K-FACTOR AND GROUP C HYDROLOGIC GROUP BASED ON TABLE C21 "BLUEBOOK" PICTON LANDSCAPE.
- 5-DAY 85% RAINFALL DEPTH OF 34.1mm CHOSEN AS THE AVERAGE OF CAMDEN AND MITTAGONG LANDSCAPE IN TABLE 6.3a "BLUEBOOK" AS PICTON IS LOCATED IN BETWEEN THESE LOCATIONS.
- ANNUAL SOIL LOSS AS COMPUTED BY THE RUSLE EQUATION IS 114m³ PER YEAR DUE TO RELATIVELY FLAT SLOPE ON SITE (ASSUMED NOMINALLY 2% AS PROPOSED CONSTRUCTION WILL REQUIRE FLAT SURFACE FOR BUILDING SLAB). CONSEQUENTLY, CONSTRUCTION OF A SEDIMENT BASIN MAY BE UNNECESSARY FOR THE ULTIMATE SCHOOL CONSTRUCTION WORKS AS THE SOIL LOSS IS LESS THAN 150m³/yr (REFER TO SECTION 6.3.2(D) OF THE "BLUEBOOK"). CONTRACTOR IS TO USE ALTERNATE SEDIMENT CONTROL MEASURES SUCH THAT QUALITY OF RUNOFF IS OF AN ACCEPTABLE STANDARD PRIOR TO DISCHARGE.

SWMP Commentary, Detailed Calculations

Note: These "Detailed Calculation" spreadsheets relate only to high erosion hazard lands as identified in figure 4.6 or where the designer chooses to use the RUSLE to size sediment basins. The "Standard Calculation" spreadsheets should be used on low erosion hazard lands as identified by figure 4.6 and where the designer chooses not to run the RUSLE in calculations.

1. Site Data Sheet

Site Name: Picton High School

Site Location: Picton High School

Precinct:

Description of Site: Existing Picton High School (area nominally 3.2ha) to be demolished. Temporary School to be non disturbed during demolition of existing school

Site area	Site			Remarks
	Basin			
Total catchment area (ha)	3.2			
Disturbed catchment area (ha)	3.2			

Soil analysis

% sand (fraction 0.02 to 2.00 mm)				Soil texture should be assessed through mechanical dispersion only. Dispersing agents (e.g. Calgon) should not be used
% silt (fraction 0.002 to 0.02 mm)				
% clay (fraction finer than 0.002 mm)				
Dispersion percentage				E.g. enter 10 for dispersion of 10%
% of whole soil dispersible				See Section 6.3.3(e)
Soil Texture Group				See Section 6.3.3(c), (d) and (e)

Rainfall data

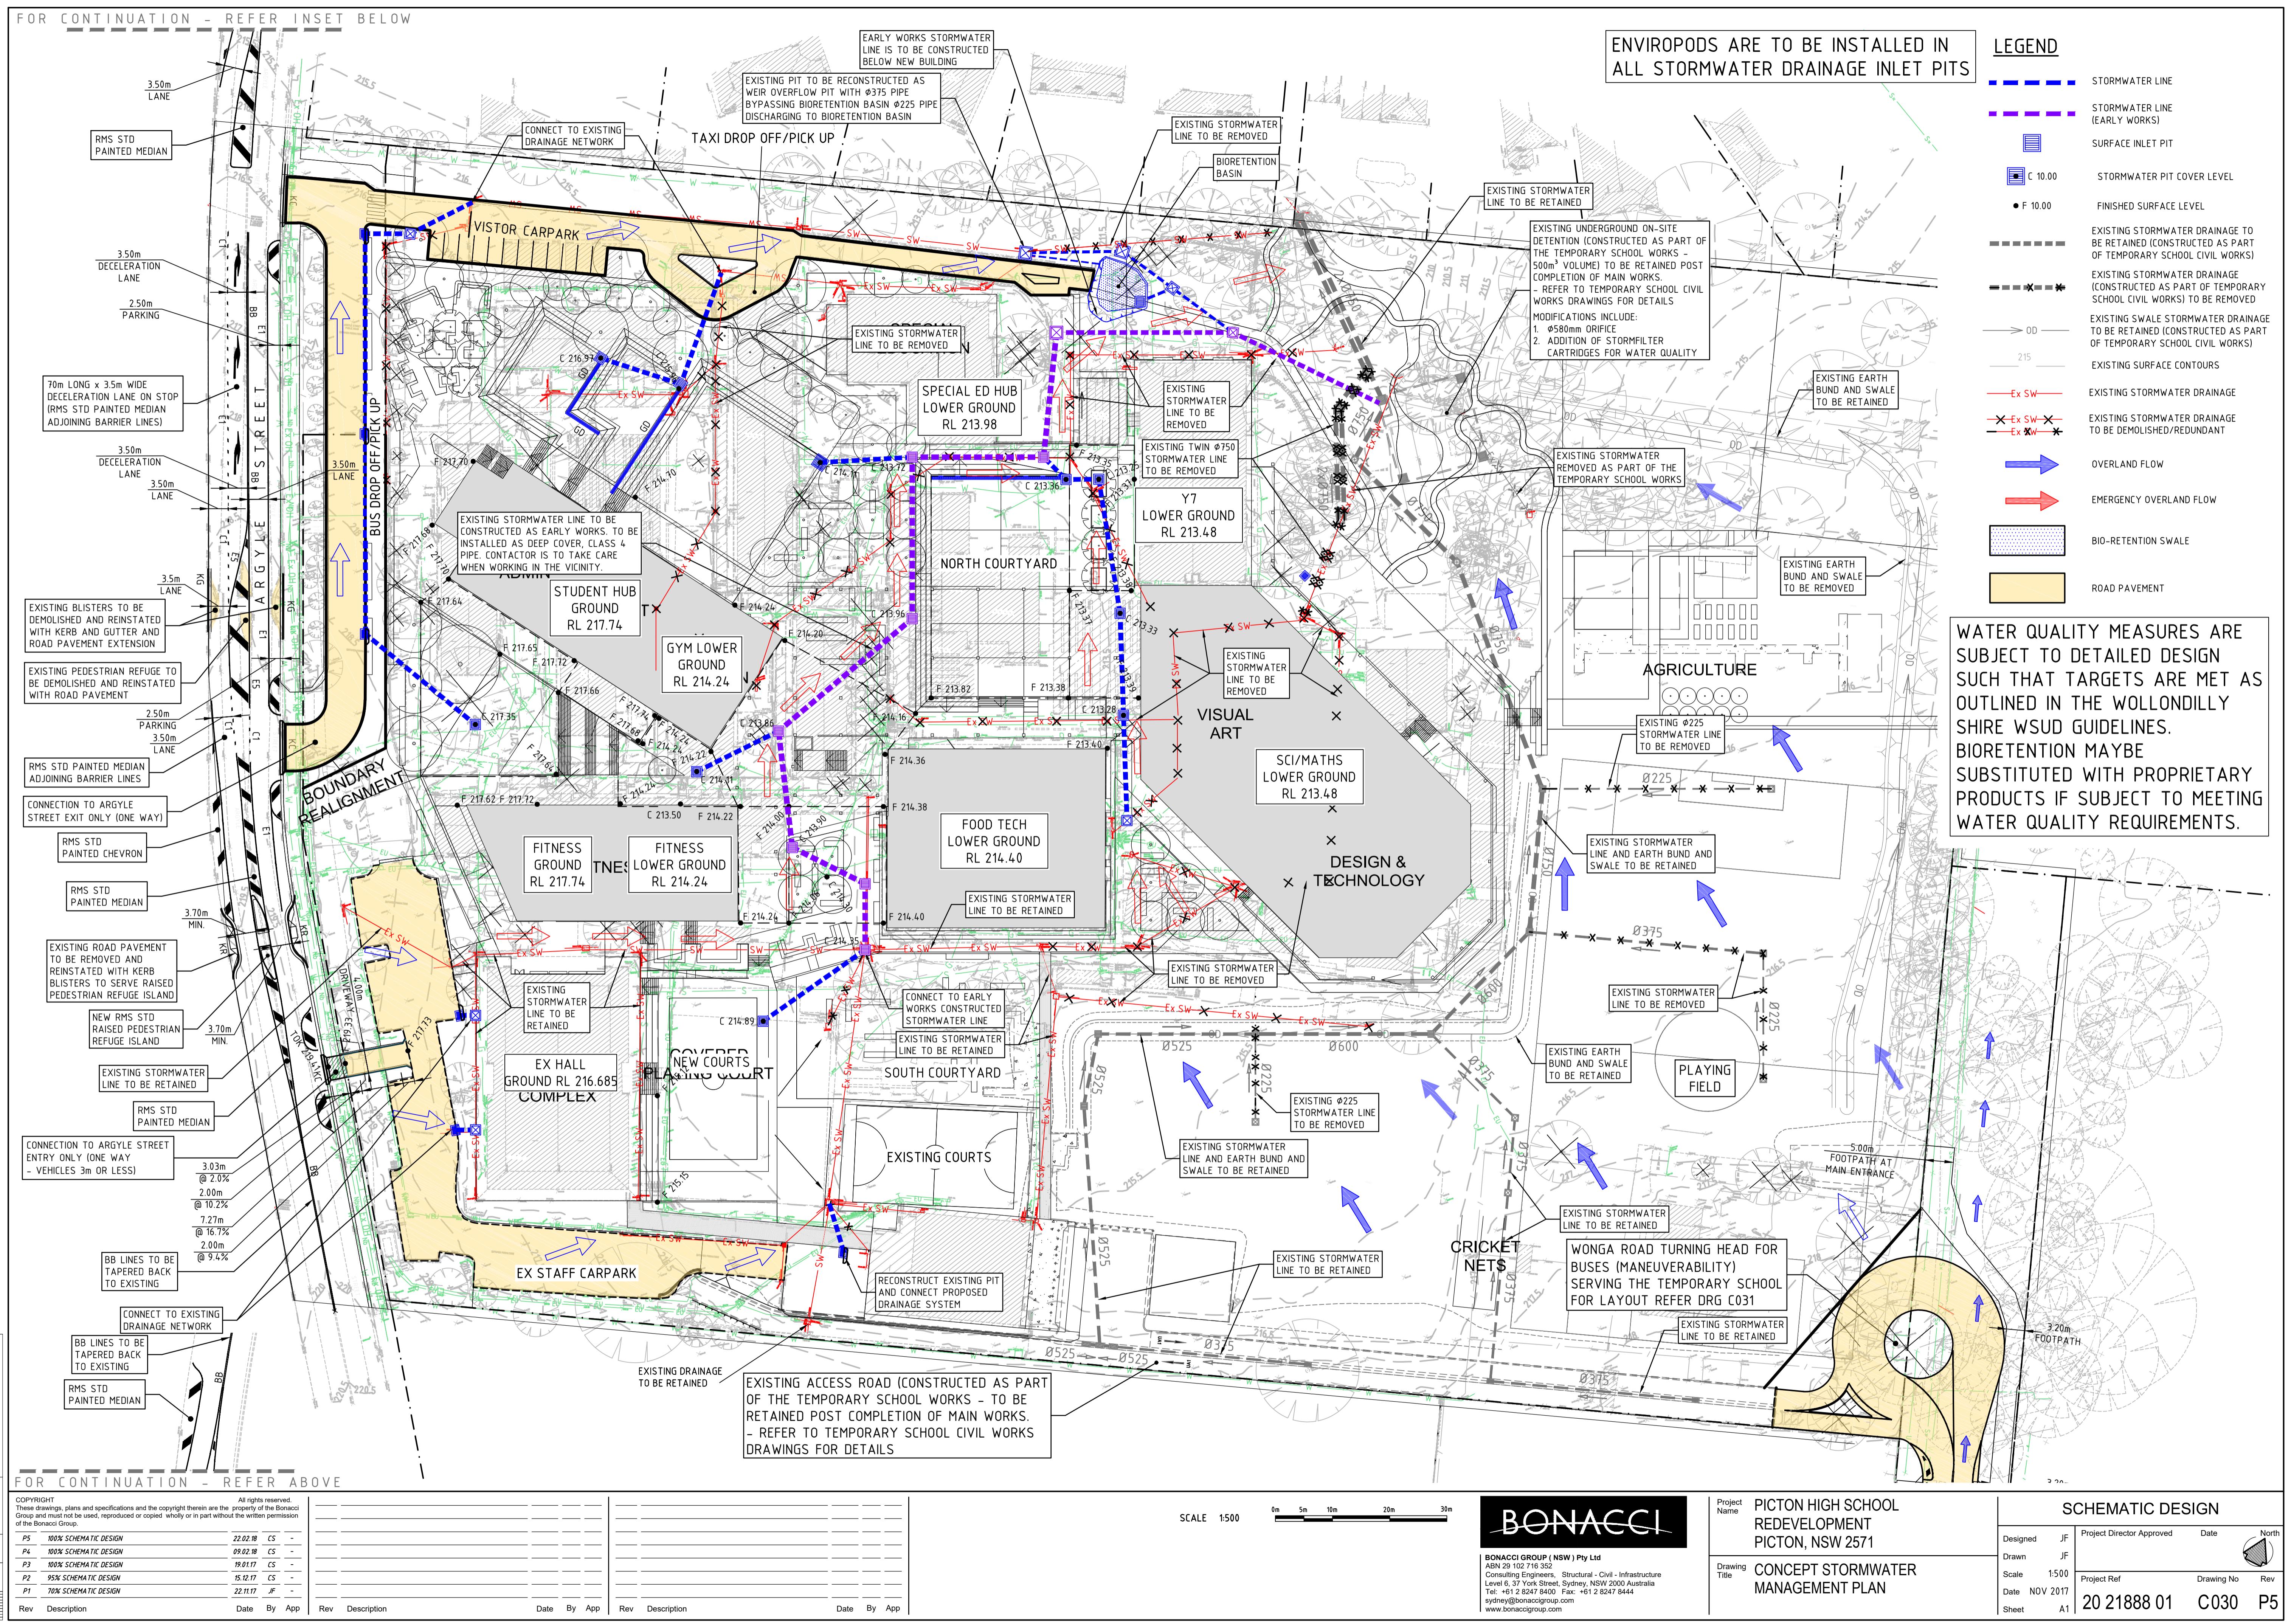

Design rainfall depth (days)	5				See Sections 6.3.4 (d) and (e)
Design rainfall depth (percentile)	85				See Sections 6.3.4 (f) and (g)
x-day, y-percentile rainfall event	34.1				See Section 6.3.4 (h)
Rainfall intensity: 2-year, 6-hour storm	10.6				See IFD chart for the site

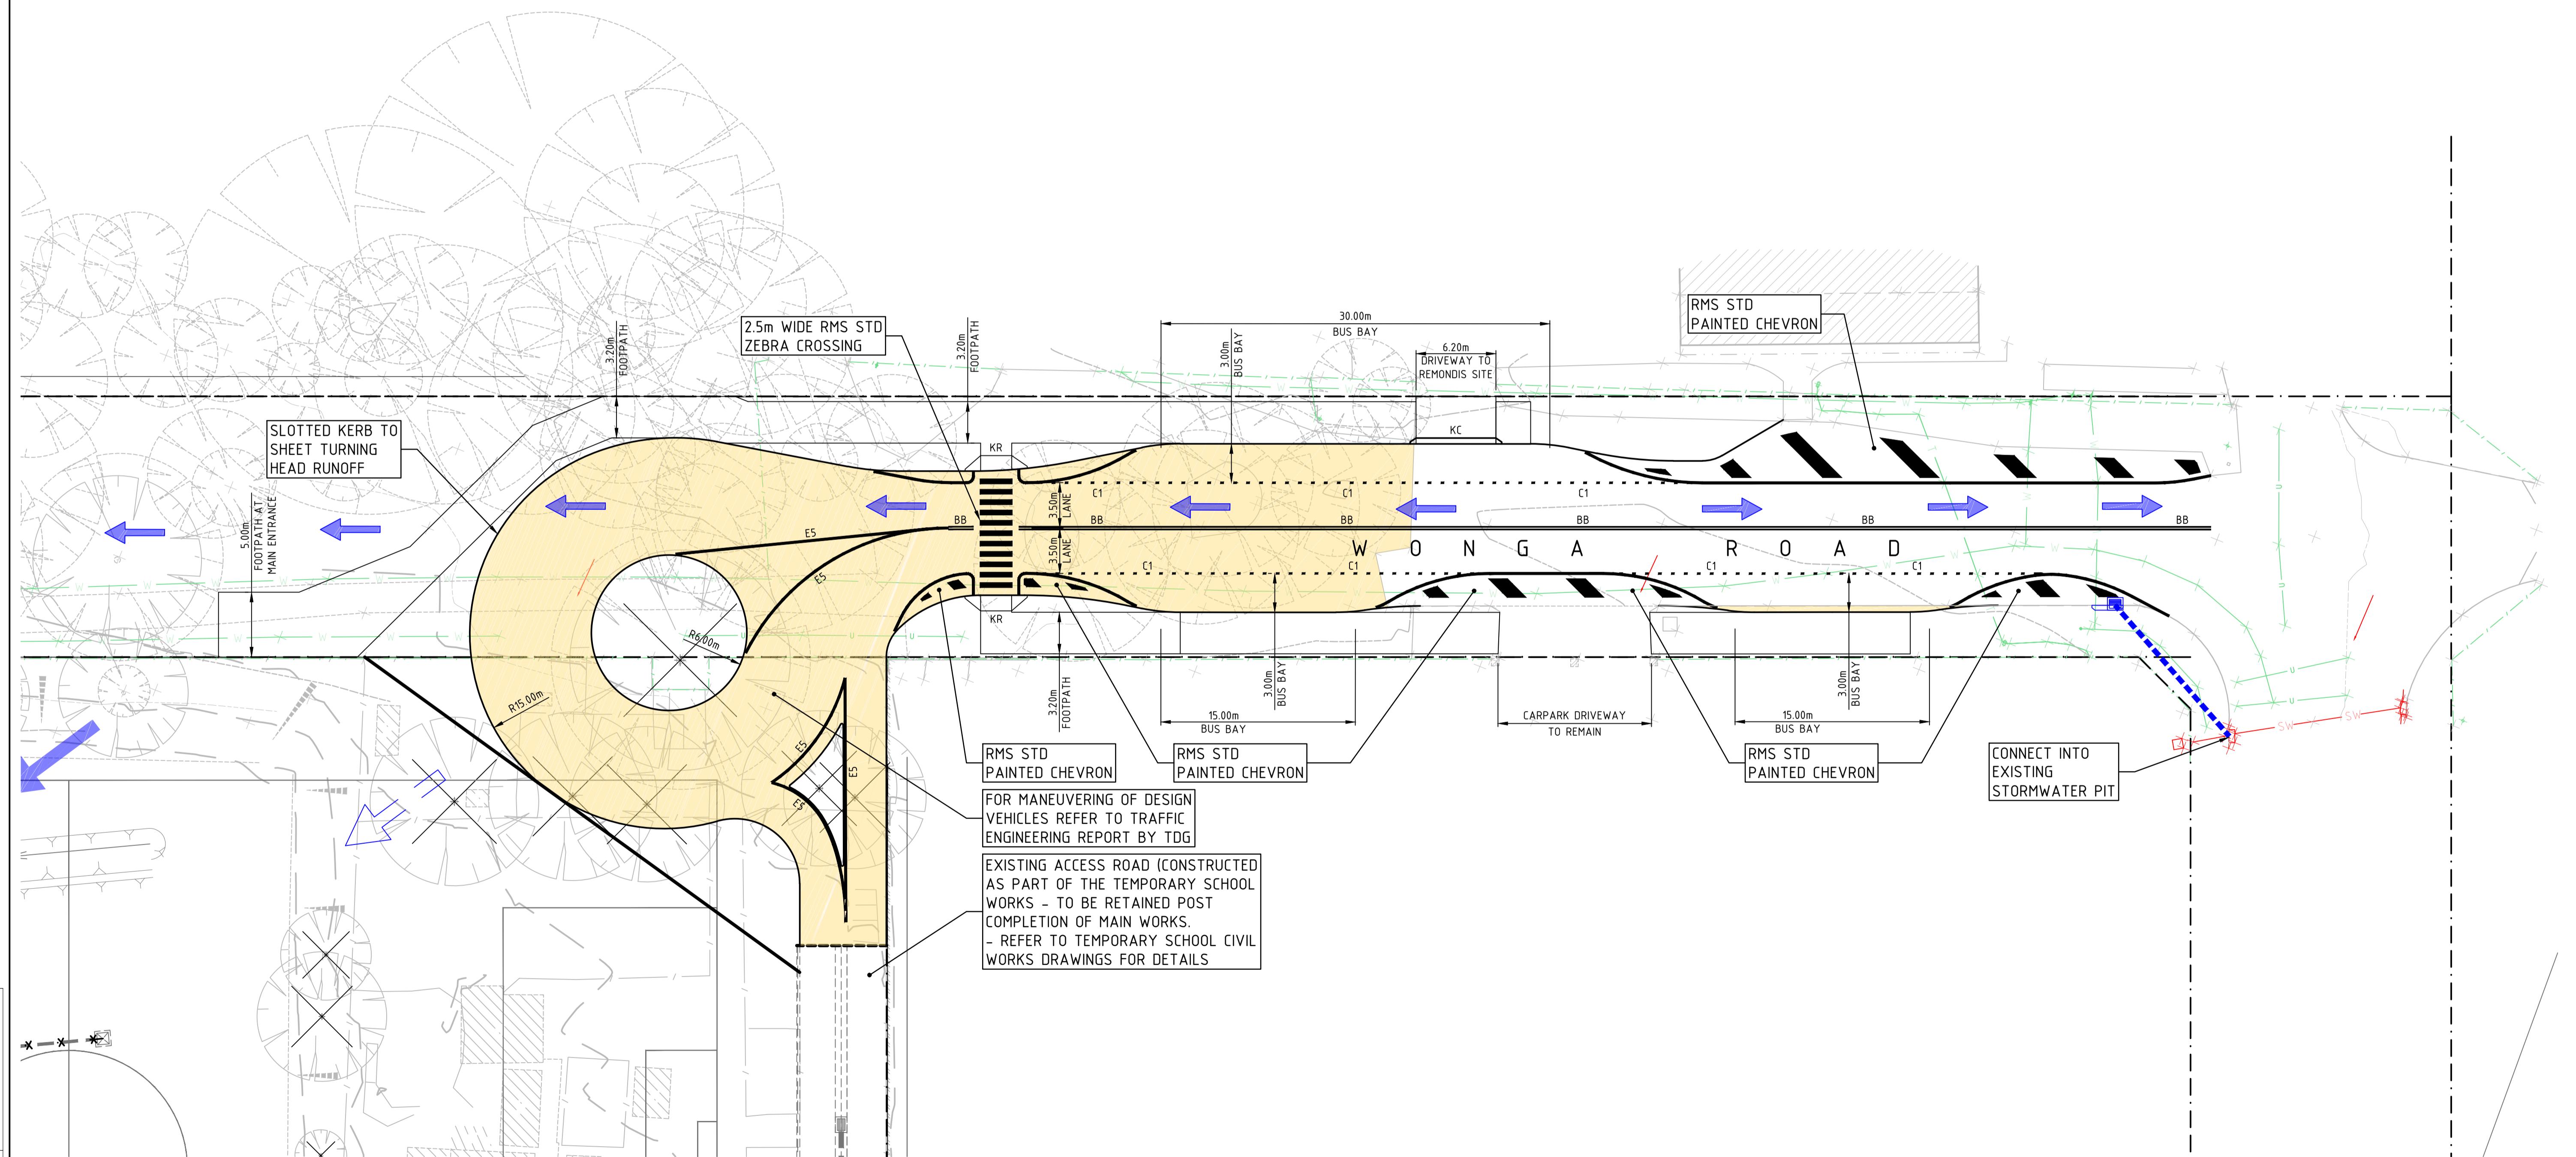

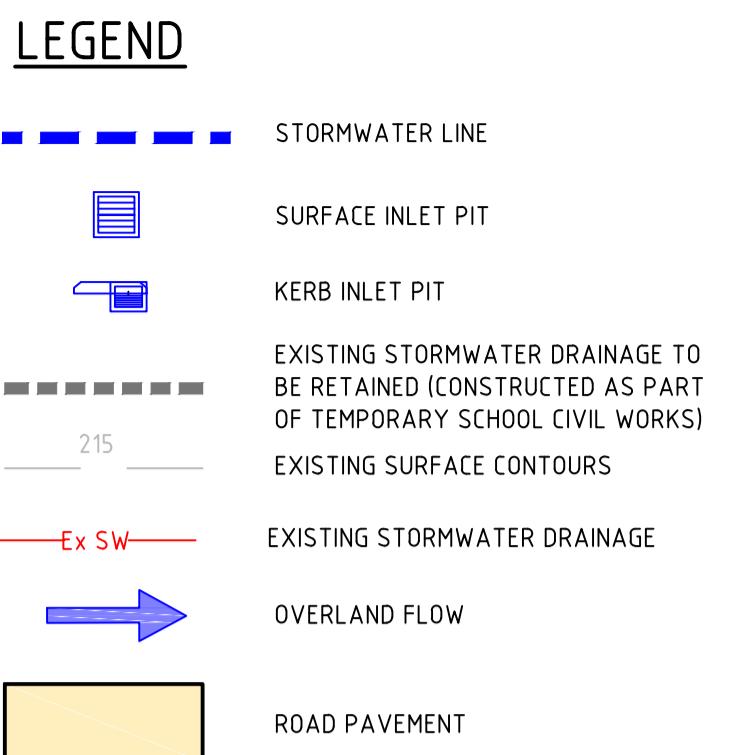

RUSLE Factors

Rainfall erosivity (R-factor)	2460				Automatic calculation from above data
Soil erodibility (K-factor)	0.034				
Slope length (m)	80				
Slope gradient (%)	2				
Length/gradient (LS-factor)	0.41				
Erosion control practice (P-factor)	1.3	1.3	1.3	1.3	1.3
Ground cover (C-factor)	1	1	1	1	1

Calculations

Soil loss (t/ha/yr)	45				
Soil Loss Class	1				See Section 4.4.2(b)
Soil loss (m³/ha/yr)	34				
Sediment basin storage volume, m³	19				See Sections 6.3.4(i) and 6.3.5 (e)

Run Log for Wollondilly Council Rev 12 run at 11:27:58 on 9/2/2018

Upwelling occurred at M-8 EXTG D-2

Freeboard was less than 0.15m at Pit61887 L-1 T-1 P-1 M-7 M-6 M-5 M-4 K-1 I-10 EXTG G-1
EXTG D-3

Flows were safe in all overflow routes.

5 year ARI results

DRAINS results prepared from Version 2017.07

Run Log for Wollondilly Council Rev 12 run at 11:47:40 on 9/2/2018

No water upwelling from any pit.

Freeboard was less than 0.15m at K-1

Flows were safe in all overflow routes.

Appendix C – MUSIC Model Source Parameters

MUSIC Rainfall – Runoff Parameters

Properties of Main School - Page 2 of 5 X

Rainfall-Runoff Parameters

Impervious Area Properties

Rainfall Threshold (mm/day)	1.40
-----------------------------	------

Pervious Area Properties

Soil Storage Capacity (mm)	170
Initial Storage (% of Capacity)	30
Field Capacity (mm)	70
Infiltration Capacity Coefficient - a	210.0
Infiltration Capacity Exponent - b	4.70

Groundwater Properties

Initial Depth (mm)	10
Daily Recharge Rate (%)	50.00
Daily Baseflow Rate (%)	4.00
Daily Deep Seepage Rate (%)	0.00

Swale

Properties of Swale

Location	Swale
Inlet Properties	
Low Flow By-Pass (cubic metres per sec)	0.000
Storage Properties	
Length (metres)	40.0
Bed Slope (%)	1.00
Base Width (metres)	1.0
Top Width (metres)	5.0
Depth (metres)	0.50
Vegetation Height (metres)	0.250
Exfiltration Rate (mm/hr)	0.00
Calculated Swale Properties	
Mannings N	0.118
Batter Slope	1:4
Velocity (m/s)	0.373
Hazard	0.186
Cross sectional Area (m^2)	1.5
Swale Capacity (cubic metres per sec)	0.559
