1. Introduction

Northrop Consulting Engineers Pty Ltd (Northrop) have been engaged by Sydney Business Park to prepare civil engineering design and documentation in support of a Development Application (DA) submission to Blacktown City (Council) for the proposed warehouse development at 4 Darling Street, Marsden Park (the site).

This report covers:

- Erosion and sediment control;
- Bulk earthworks;
- Stormwater quantity and quality management; and
- Water Sensitive Urban Design.

2. Related Reports and Documents

This report is to be read in conjunction with the following documents:

a. Development Application Documentation prepared by Northrop (refer Appendix A):
   - 172938-DAC01.01 Cover Sheet, Drawing Schedule and Locality Plan;
   - 172938-DAC02.01 Concept Sediment and Soil Erosion Control Plan;
   - 172938-DAC02.11 Sediment and Soil Erosion Control Details;
   - 172938-DAC03.01 Bulk Earthworks Cut and Fill Plan;
   - 172938-DAC04.01 Siteworks and Stormwater Management Plan – Sheet 01;
   - 172938-DAC04.02 Siteworks and Stormwater Management Plan – Sheet 02;
   - 172938-DAC04.03 Siteworks and Stormwater Management Plan – Sheet 03;
   - 172938-DAC04.04 Siteworks and Stormwater Management Plan – Sheet 04;
   - 172938-DAC05.11 Stormwater Longitudinal Section – Sheet 01;
   - 172938-DAC05.12 Stormwater Longitudinal Section – Sheet 02;
   - 172938-DAC05.13 Stormwater Longitudinal Section – Sheet 03;
   - 172938-DAC05.14 Stormwater Longitudinal Section – Sheet 04;
   - 172938-DAC05.15 Stormwater Longitudinal Section – Sheet 05;
   - 172938-DAC05.20 Stormwater Analysis Results;
   - 172938-DAC08.01 Catchment Plan;
   - 172938-DAC09.01 Typical Details – Sheet 01.
b. Marsden Park Industrial Precinct – Post Exhibition Water Cycle Management Strategy Report prepared by J. Wyndham Prince, 2011;
c. Road, Drainage and Basin Design: Marsden Park Industrial Stage 1.02B, prepared by Calibre;

e. Developer Handbook for Water Sensitive Urban Design prepared by Blacktown City Council 2013.

3. The Development Site

3.1. Site Description

Sydney Business Park is situated on the western side of Bells Creek between South Street and Castlereagh Freeway, which separates it from the suburbs of Hassall Grove and Bidwill. The subject site is within Blacktown City Council local government area and is part of the Marsden Park Industrial Precinct in the North West Growth Centre as presented in Figure 1.

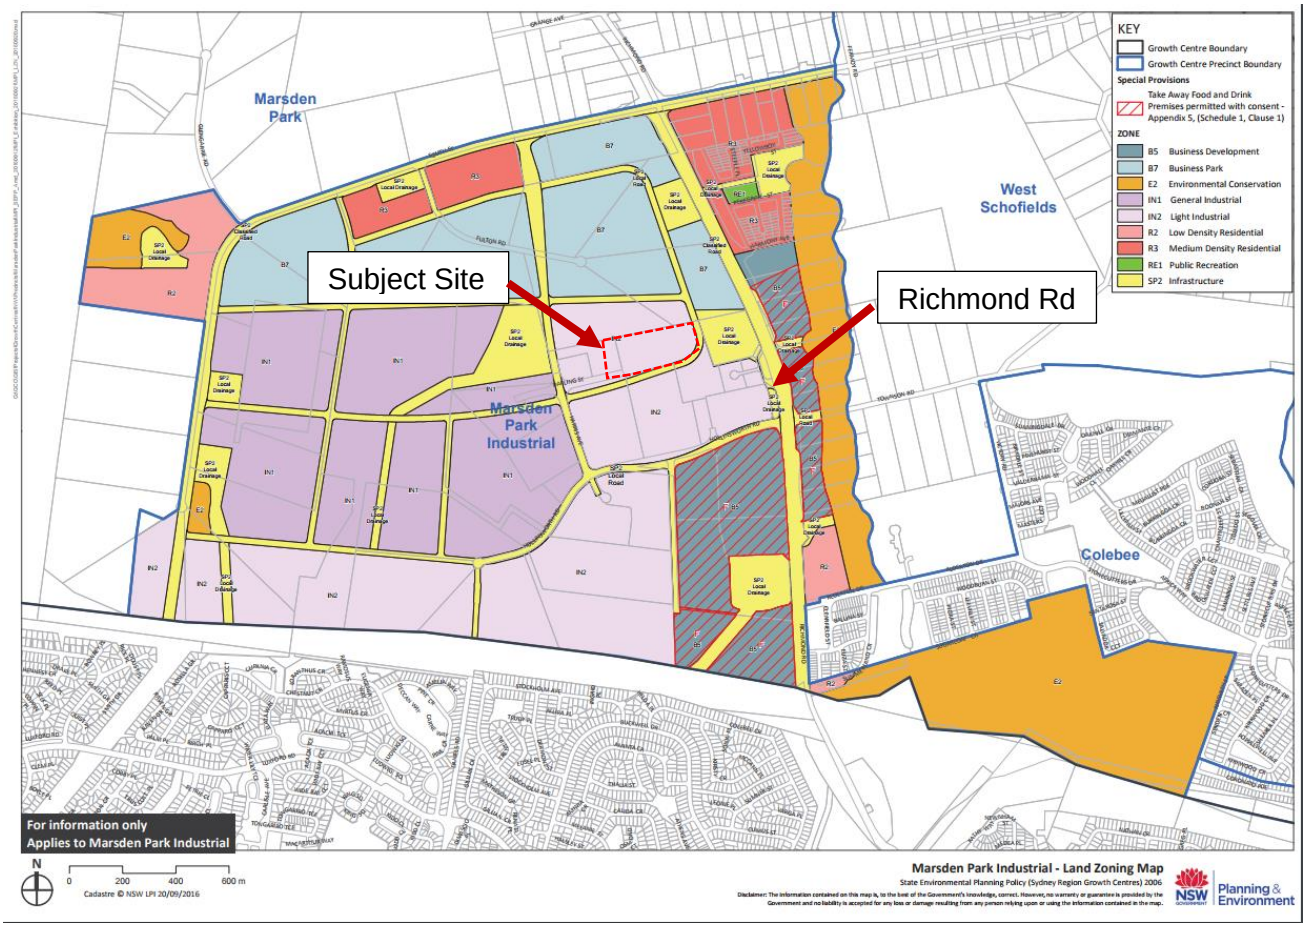

Figure 1 - Site Locality (Department of Planning and Infrastructure, 2013)

The site occupies approximately 5.72 hectares and is situated:

- West of Richmond Road;
- Near an existing regional on-site detention basin to the south east; and
- Adjacent to a vacant lot to the north, and a commercial development to the west.

Figure 2 - Site Plan (NEARMAP, 2018)

3.2. Proposed Development

The proposed development involves construction of a warehouse with associated office, loading dock, truck turning areas, car parking, a separate showroom building and landscape areas.

Refer to the architectural drawings prepared by Reid Campbell and Northrop's civil drawing package for more detailed site description.

The site currently falls to the south east corner. A portion of the site falls to the north. All surface runoff will be directed to the southern and eastern boundary. Stormwater runoff will be collected by a below ground pit and pipe stormwater drainage network.

The development will comprise of roof catchments, hardstand catchments (car parking, loading dock and driveways) and landscaped areas. A portion of the roof catchment will be directed to a rainwater reuse tank. Any overflow from the rainwater tank will be discharged to the pit and pipe network. The rainwater tank will pre-treat captured runoff. Gross pollutant and coarse sediment traps at each surface inlet pit will provide pre-treatment to runoff from paved areas. Prior to discharging to Council's stormwater drainage network all surface runoff will be treated by a proprietary filtration system which is located at the downstream end of the drainage system.

On-site stormwater detention is not provided within the site. Stormwater quantity control is provided by a regional on-site detention basin located south east of the site.

4. Erosion and Sediment Control

Erosion and sedimentation control has been designed in accordance with Council requirements and the NSW Department of Housing Manual, “Managing Urban Stormwater Soil & Construction” 2004 prior to any earthworks commencing on site. The concept sediment and erosion control measures are documented in Northrop’s Development Application drawing 172938-DAC02.01.

4.1. Sediment Basin

A sediment basin has been designed to capture site runoff during construction and has been located towards the eastern side of the site, in the lowest point. The construction of the basin will be done in stages to enable maximum runoff capture assisted by the diversion of swales to capture and direct runoff to the basins.

Calculations to determine concept design basin sizes have been based on available geotechnical information regarding soil types and through the use of the Soils and Construction Volume 1 Manual.

To ensure the sediment basins are working effectively they are to be maintained throughout the construction works. Maintenance includes water removal by pumping to reach the minimum storage volume at the lower level of the settling zone. The settling zone will be identified by pegs to clearly show the level at which design storage capacity is available.

The pumped water from the sediment basins will be reused to irrigate areas of hydro-mulch and for dust control during construction.

Weirs are to be provided to control overflow for rainfall events in excess of the 100 year ARI storm event.

Below is the concept sediment basin sizing table.

Table 1 - Concept Sediment Basin Volumes

Basin	Catchment Area (Ha)	Volume Required (m^3)	Volume Provided (m^3)
South East	5.71	1228.57	1230

4.2. Construction Measures

Prior to any earthworks commencing, erosion and sediment control measures will have to be implemented in accordance with the approved drawings. The measures shown on the drawings describe the minimum treatment requirements. The contractor will be required to modify the erosion and sedimentation control measures to suit the construction program, sequencing and techniques. Erosion and sediment control measures include:

- A fence around the site.
- A security fence surrounding the site office area and the proposed sediment basins;
- Sediment fencing downstream of all disturbed areas, and any topsoil stockpiles;
- Installation of silt arrestors to collect site runoff and retain suspended particles;
- Dust control measures which includes covering stockpiles, maintain site fences and watering exposed areas;
- Placement of hay bales or mesh and gravel filters along proposed catch drains and around stormwater inlets pits; and
- The construction of temporary sediment basins as noted above in Section 4.1

5. Bulk Earthworks

The proposed works will consist of earthworks cut and fill operations to establish design levels. The levels have been designed to optimise cut to fill across the site and minimise the need to import or export material from the site. The existing site has a natural fall which runs throughout the site from North West side to the Eastern side. The majority of the cut will come from western side and used to fill the eastern side. This is represented on Northrop's Bulk Earthworks Drawing 172938-DAC03.01.

The bulk earthworks quantities are summarised in Table 2.

Table 2 - Concept Earthworks Volumes

Earthworks	Volume (m^3)
Cut	27,509
Fill	28,804
Balance	1,295 Import

Any stockpiled material, including topsoil, shall be located as far away as possible from any associated natural watercourses. Sediment Fences shall be installed on the downstream side of stockpiles and the embankment formation. All stockpiles and embankment formations shall be stabilised by hydro-seeding or hydro-mulching on formation.

The bulk earthworks cut/fill volumes provided are conceptual only and are subject to change pending final coordination and detailed design. It should be noted the above mentioned cut/fill operations have been calculated based on the following assumptions.

- No allowance for soil bulking factors;
- No allowance for spoil generated from utility service and stormwater drainage trenching;
- No allowance for spoil generated from water quality media; and
- A 330mm pavement depth

5.1. Construction Sequence

Bulk earthworks sequencing is as follows:

- Provision of site erosion and sediment control measures outlined in Section 4;
- Clearing of vegetation from the development site. Cleared vegetation will be either removed from site or mulched;
- Stripping and stockpiling of topsoil suitable for reuse;
- Inspection of exposed underlying material to ensure conformity with design assumptions and requirements;
- Placement of fill in layers not greater than 200mm in thickness and compacted to not less than 98% Standard Maximum Dry Density (SMDD) in accordance with the geotechnical report; and
- Spread topsoil to a maximum depth of 200mm and hydro-seed or hydro-mulch disturbed areas.

6. Stormwater Management Objectives and Controls

6.1. Development Control Plan Objectives

The stormwater management strategy for Sydney Business Park has been developed in accordance with the Water Sensitive Urban Design and Integrated Water Cycle Management, prepared by Blacktown City Council.

Blacktown City Council Integrated Water Cycle Management DCP (Ref. 6) states the following objectives:

(a) Protect and enhance natural watercourses and their associated ecosystems and ecological processes
(b) Minimise potable water demand and wastewater generation
(c) Minimise stream erosion by matching the post development runoff regime to the pre development or natural water runoff regime
(d) Mitigate the impacts of development on water quality and quantity;
(e) Mitigate the impacts of development on groundwater, particularly in saline groundwater environments;
(f) Ensure any changes to the existing groundwater regime do not adversely impact upon any other properties and the environment;
(g) Integrate water cycle management measures into the landscape and urban design to maximise amenity;
(h) Minimise the potential impacts of development and other associated activities on the aesthetic, recreational and ecological values of receiving waters;
(i) Minimise soil erosion and sedimentation resulting from site disturbing activities;
(j) Ensure the principles of ecologically sustainable development are applied in consideration of economic, social and environmental values in water cycle management.

The stormwater quantity and quality management for the subject site have been developed at a precinct planning level outlined in the “Marsden Park Industrial Precent- Post Exhibition Water Cycle Management Strategy Report” (J. Wyndham Prince, Feb 2011).

6.2. Stormwater Management Controls

Marsden Park Industrial Precent- Post Exhibition Water Cycle Management Strategy Report states that the sites catchment area will drain into the regional Basin I to ensure that peak post development discharges are restricted to pre development discharges and that the quality of the post development stormwater discharges meet the requirements of the NSW Department of Planning and Blacktown City Council.

A water quality treatment strategy proposed for the site has been designed to achieve the objectives (stated above) and controls as outlined below:

Controls are as follows:

- Rainwater tanks on each allotment, installed during building construction;
- Proprietary GPT units upstream of each stormwater discharge point to trunk drainage channels;
- On-lot water quality devices for commercial/industrial and medium/high density residential catchments;

- Precinct based bio-retention/filtration raingarden systems.

Stormwater quantity and quality management measures will be discussed in sections 7 and 8 of this report respectively.

7. Stormwater Quantity Management

7.1. Existing Catchment

The existing catchment for 4 Darling Street is approximately 5.64ha in size and is within the Bells Creek catchment area. The area generally drains from the West to East, with the site low point located in the south-eastern corner. The run off from the site area drains towards the regional Basin I which will discharge to culverts under Richmond Road and into tributaries of Bells Creek.

Figure 3 below shows the pre-development catchment plan for Sydney Business Park area.

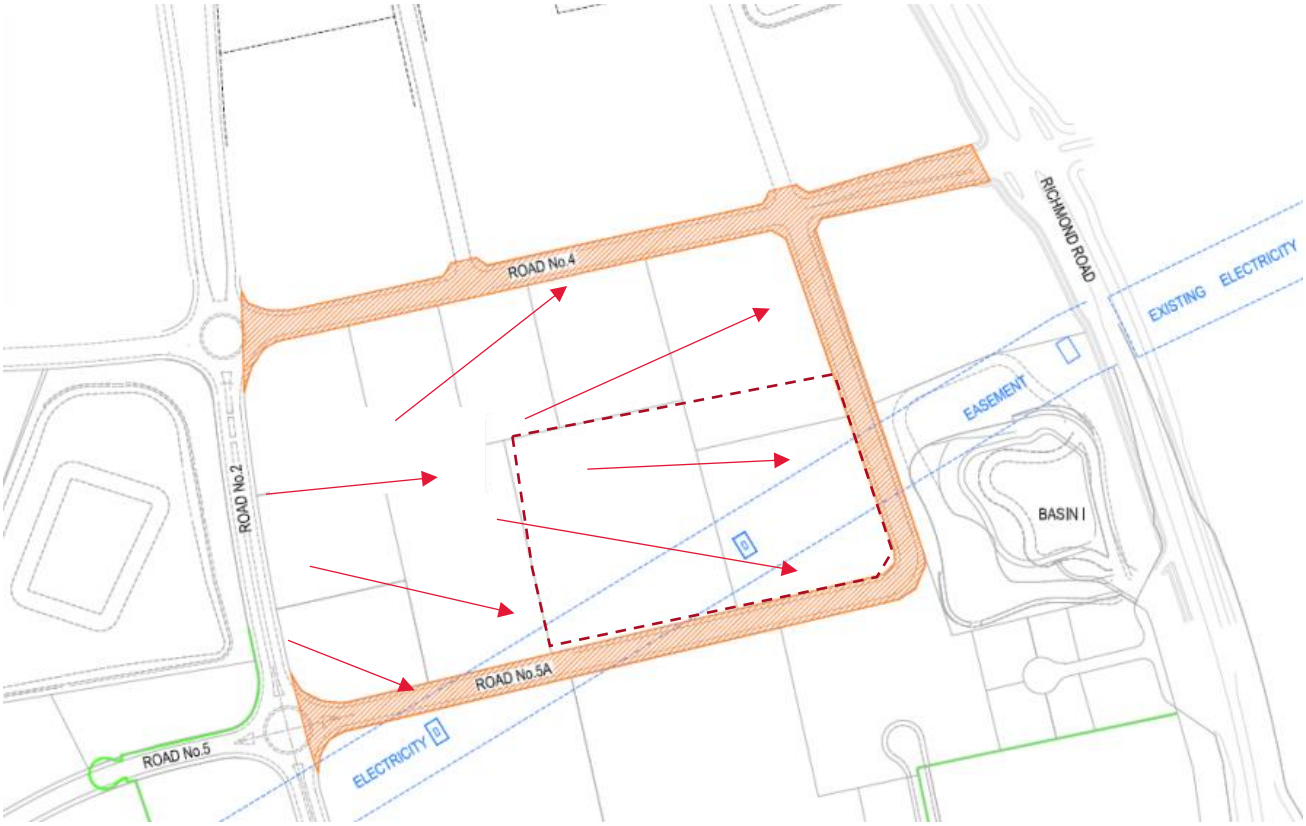

Figure 3 - Pre-Development Catchment Plan

Permissible site discharge rates (PSD) for each storm event were not calculated as the proposed Basin I is designed to restrict post development peak discharges from the site, to predevelopment levels for the 5 year and 100 year ARI storms events.

7.2. Stormwater Quantity Management Strategy

The stormwater quantity management strategy has been designed so that the run off from the various catchments will discharge to the external (road) stormwater drainage network, which discharges into the precinct based detention basin.

The site has been divided into catchments which can be referred in Figure 4.

Figure 4 - Catchment Areas

7.3. Hydrological Modelling

The Hydrology of the existing catchment and bio-retention raingarden sizes were modelled using DRAINS software. The existing slopes of the catchments were calculated based on site survey prepared by Freeburn Surveying (refer Appendix B).

In order to initialise the DRAINS model tail water levels were adopted from the hydraulic grade levels as documented in the construction certificate documentation for Marsden Park Stage 1.02B by Calibre Consulting.

A stormwater analysis of the network drainage system for a 20 and 100 year ARI indicated the Flow Depth and Velocity were all in accordance with council requirements. Refer to DRAINS Model and Longsection Results Drawing DAC05.11 to DAC05.15.

A gutter flow with analysis was prepared to support the modification of two existing pits that are located within the south-western driveway for the development. The proposed stormwater strategy includes converting these kerb inlet pits to v-grate pits and introducing kerb inlet pits downstream of the driveway. The flow width analysis results are included in Table 3 below and compare flow widths along the gutter under existing and proposed conditions. The existing conditions have been extracted from the construction certificate documentation for Marsden Park Stage 1.02B by Calibre Consulting.

Table 3 - Flow Width Analysis Results

Pit Number	Gutter Flow Width (m)	
	Existing	Proposed
Existing pit - 11/2 (as documented by Calibre)	1.61	0.78
Existing pit - 11/3 (as documented by Calibre)	1.78	1.01
Existing pit - 11/4 (as documented by Calibre)	1.76	1.27
Existing pit - 11/5 (as documented by Calibre)	1.94	1.55

8. Stormwater Quality Management

8.1. Adopted Water Quality Objectives

The main objectives for stormwater quality are indicated in Developer Handbook for Water Sensitive Urban Design V1.1 November 2013 and are presented in Table 4 below:

Table 4 - Water Quality Targets

Pollutant	% Reduction Post-Development Average Annual Load Reduction
Gross Pollutants	90
Total Suspended Solids (TSS)	85
Total Phosphorous (TP)	65
Total Nitrogen (TN)	45

8.2. Stormwater Quality Management Scheme

The first stage of the stormwater treatment train is pit inlet filter baskets (trash baskets). The filter baskets will provide pre-treatment by capturing gross pollutants and the coarser suspended solids. The secondary treatment is provided by proprietary filter cartridges and will remove nutrients such as nitrogen and phosphorous.

8.3. Rainwater Tanks

The rainwater tank will collect approximately one third of the roof water from the development which will pass through a first flush system prior to capture. The rainwater tank will be located adjacent beneath the carpark and incorporate a 100 year overflow to the external stormwater drainage network.

The collected water will be used for toilet flushing and landscape irrigation only. The tank will be equipped with the following:

- Solid access lid and step irons;
- High level overflow to external stormwater drainage network;
- Duty and standby pump configured for alternative operation;
- Mains water top-up; and
- Associated float valves and control panels.

A water balance model was created to determine the reduction in runoff days as a result of the rainwater tank. The following inputs were adopted:

- Rainfall and catchment data as per parameters discussed above;
- Roof area draining to tank approximately = 8,000 m^2
- Initial tank volume = 230,000L.

The water usage was estimated using both Blacktown City Council's Developer Handbook for Water Sensitive Urban Design and Water by Design Draft Stormwater Harvesting Guidelines (by property type) guide.

- Development Type: Industrial Warehouse
- Total Roof Area: 8,000 m^2
- Total Bathrooms: 24
- Flushing Demand (kL/day/toilet): 0.1
- Total Average Daily Demand (kL/day): 2.4
- Total Landscape Area to be Irrigated by Rainwater Tank: 5,400 m^2
- Landscape Demand (kL/year/m^2): 0.4
- Total Average Daily Demand (kl/year): 2160

The results of the water balance model are shown in Figure 5 below.

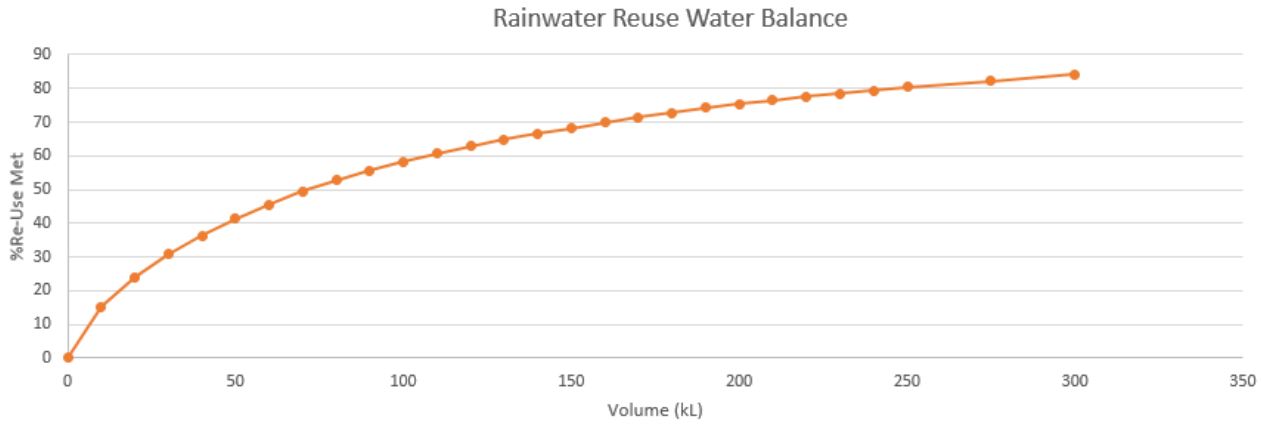

Figure 5 – Rainwater Reuse Graph

The results show that with a 230,000L tank the re-use demand met is 80.4%.

Due to the standard usage of non-potable water in the proposed development the 80% target required by Council is able to be achieved. The tank size has therefore been taken at a point where the demand/tank size relationship reaches 80% demand resulting in the 230,000L rainwater tank.

8.4. Rainfall Data

For the analysis of the MUSIC modelling, historical rainfall records were obtained from the Bureau of Meteorology for Station No. 067035 at Liverpool (Whitlam Centre). The MUSIC analysis was undertaken using a 6 min time step for year 1967 to 1976 of historical data.

The mean annual rainfall for the modelled data was 857mm.

The evapotranspiration values have been entered from the default data provided by the MUSIC software for the Sydney area.

8.5. Methodology

The water quality modelling software MUSIC v6 was used to analyse the performance of the treatment train. Figure 6 shows the MUSIC node and link diagram used to describe the proposed treatment train. The model has been built to assess the adequacy of the Stormwater treatment measure proposed and to ensure that the quality of stormwater meets the objectives prior to stormwater runoff leaving the site.

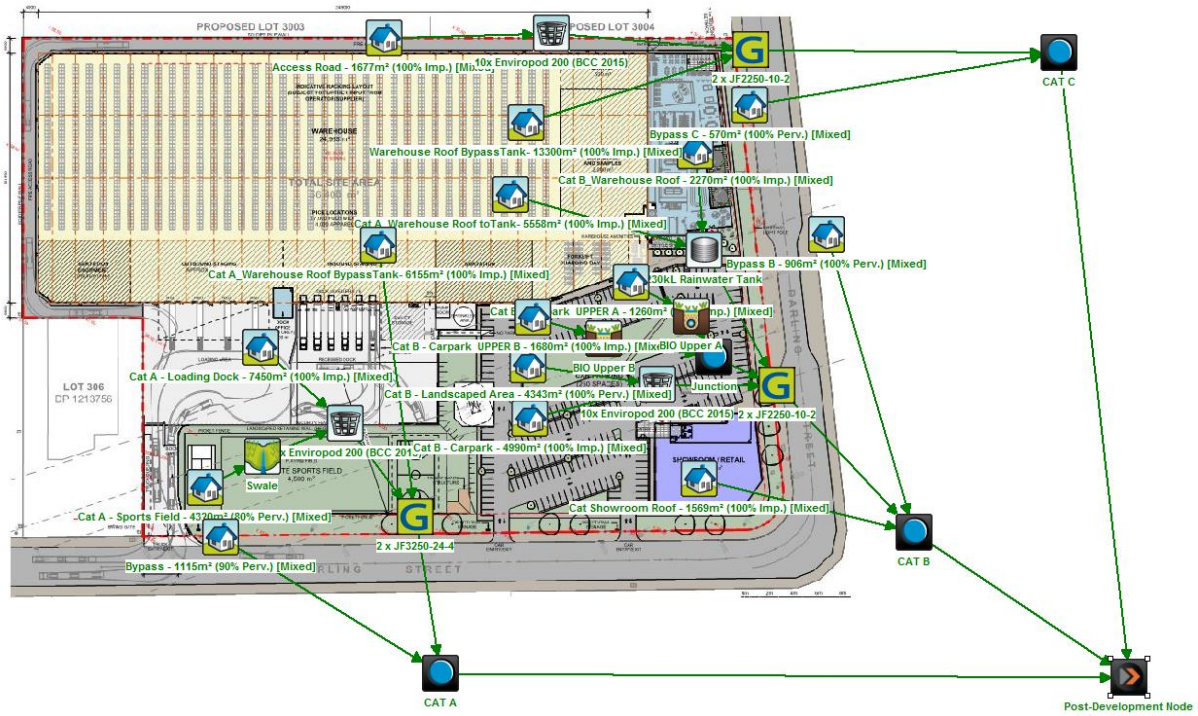

Figure 6 - MUSIC Link and Node Diagram

The following rainfall and runoff parameters shown in Table 5 have been utilised.

Table 5 - Rainfall Runoff Parameters

Parameter	Recommended Values
Rainfall Threshold (mm/day)	1.4
Soil Storage Capacity (mm)	170
Initial Storage (% of Capacity)	30
Field Capacity (mm)	70
Infiltration Capacity Coefficient – a	210
Infiltration Capacity Exponent – b	4.7
Initial Depth (mm)	10
Daily Recharge Rate (%)	50
Daily Base flow Rate (%)	4
Daily Deep Seepage Rate (%)	0

The pollutant concentration parameters used in the model were based on information provided in "Using MUSIC in Sydney's Drinking Water Catchment", Sydney Catchment Authority, 2012. The parameters are listed in table below:

Table 6 - Water Quality Parameters for MUSIC Source Nodes

Land- Use Category		Log TSS (mg/L)		Log TP (mg/L)		Log TN (mg/L)	
		Storm Flow	Base flow	Storm Flow	Base Flow	Storm Flow	Base Flow
Roof Areas	Mean	1.30	1.20	-0.89	-0.85	0.30	0.11
	Std Dev	0.32	0.17	0.25	0.19	0.19	0.12
Road Areas	Mean	2.43	1.20	-0.30	-0.85	0.34	0.11
	Std Dev	0.32	0.17	0.25	019	0.19	0.12
Other Impervious Areas	Mean	2.15	1.20	-0.60	-0.85	0.30	0.11
	Std Dev	0.32	0.17	0.25	0.19	0.19	0.12
Pervious Areas	Mean	2.15	1.20	-0.60	-0.85	0.30	0.11
	Std Dev	0.32	0.17	0.25	0.19	0.19	0.12

8.6. Model Results

The results of the analysis showed the treatment train will achieve the water quality targets set out in Council's DCP. Table 7 below displays the effectiveness of the treatment train for the primary and secondary treatment.

The water quality model created using MUSIC software provides an indication of the pollutant removal rates expected when a treatment train of water quality measures is applied to the proposed layout of the development.

Table 7 - MUSIC Model Results

Pollutant	Before Treatment	After Treatment	% Reduction	% Objective	Compliance
Total Suspended Solids (kg/yr)	6800	621	90.9	85	OK
Total Phosphorus (kg/yr)	12.6	3.92	68.9	65	OK
Total Nitrogen (kg/yr)	81.2	35.2	56.6	45	OK
Gross Pollutants (kg/yr)	905	67.3	92.6	90	OK

8.7. Proposed Stormwater Treatment Train

In order to achieve the reduction targets the following treatment devices are required as part of the treatment train:

- Jellyfish Stormwater treatment

A total of six (6) cartridges, (2x) JF2250 and (2x) JF3250 are to be introduced to the design as a major filter device located at the end of the treatment train to treat all sub-catchments. This stormwater quality treatment technology incorporates a pre-treatment with light-weight membrane filtration and removes a high level and a wide variety of stormwater pollutants. The capture rates provided by the TARP- Field Study, 2012 and MRDC Floatables Testing, 2008:

  - TSS 89%
  - TN 51%
  - TP 59%
  - Litter 99%

- Bio-Swales

Bio Retention Swales (Bio-Swales) will act as secondary treatment for stormwater by detaining flows and promoting sedimentation. The media beds of the bio – retention system will be designed to 500mm deep with an average particle size of 0.5 mm and a hydraulic conductivity of 100 mm/hr with a minimum depth of storage above the media of 150mm. Direct filtration of particulate matter and nutrient stripping by bio films are established within the media bed and gravel layer.

The expected sediment and nutrient removal performance of the bio - retention systems was determined using the default parameters and equations provided in the MUSIC Blacktown City Council Nodes. Water quality reduction mechanisms in MUSIC are based on an exponential decay equation

- Stormwater360 Enviropod 200 Inserts

Enviropod 200 inserts will be used as a pre-treatment for stormwater runoff to capture litter and coarse sediment surface flows on the site. Enviropod inserts are to be installed on all surface inlet pits across the site. The following capture rates have been adopted for the MUSIC model, based on information provided by Stormwater360:

  - TSS 54%
  - TN 21%
  - TP 30%
  - Litter 100%

- 230kL Rainwater Tank

A 230kL rainwater tank will be implemented to capture stormwater runoff generated off the roof. The collected rainwater will be used for irrigation of the landscaped areas across the site and for toilet flushing.

8.8. Stream Erosion Index

As per Councils Development Control Plan 2015, Part J, Section 4.4, the development ensures that post development duration of stream forming flows are no greater than 3.5 times the pre-developed duration of stream forming flows.

Calculations of the Stream Erosion Index (SEI) have been completed as per Council's Developer Handbook for Water Sensitive Urban Design, adopted from the Draft NSW MUSIC Modelling Guide (Aug 2010). MUSIC v6 software has been used to estimate the SEI.

Estimating the critical flow

Step 1

$$t_c = 0.76A^{0.38} \qquad (A(km^2 = Ha/100), t_c(hour))$$

Total Area = 5.715 ha

$$t_c = 0.76 \times \frac{0.05715^{0.38}}{100}$$
$$t_c = 0.26\ hrs$$
$$t_c = 15.4\ mins$$

Step 2

With reference to the Rainfall Intensity Chart in the Engineering Guide for Development based on the 2 year ARI and calculated t_c in minutes.

$$I_2 = 64\ mm/hr$$

Step 3

$$C_2 = C_{10} \text{ x } FF_2$$

$$C_2 = 0.6 \times 0.74$$
$$C_2 = 0.444$$

Step 4

Rational Method

$$Q_2\left(\frac{m^3}{s}\right) = 0.278 \times C_2 \times I_2 \times \text{A}$$

$$Q_2\left(\frac{m^3}{s}\right) = 0.278 \times 0.444 \times 64 \times \frac{5.715}{100}$$

$$Q_2\left(\frac{m^3}{s}\right) = 0.452$$

Step 5

$$Q_{Crit}\left(\frac{m^3}{s}\right) = 0.25 \times 0.452$$

$$Q_{Crit}\left(\frac{m^3}{s}\right) = 0.113$$

Table 8 - SEI Flow Music Results

	Inflow Pre-development	Inflow Post-development
Flow (ML/yr)	1.76	5.40

Council's target for SEI is a value less than 3.5. The SEI for the development has been calculated using the following equation as per Council's guideline.

$$SEI = \sum(Q_{post} - Q_{critical}) \ / \ \sum(Q_{pre} - Q_{critical})$$

$$SEI = \frac{5.40 - 0.113}{1.76 - 0.113}$$

The resultant SEI for the proposed development **= 3.086**

After modelling, it was found that the Council's target for the SEI value less than 3.5 was achieved which demonstrates that the proposed waterway will be stable.

9. Conclusion

Based on investigations, analyses and designs, it is anticipated that there Blacktown City Council's stormwater quantity and quality measures will be met by the management measures proposed as part of the industrial development at 4 Darling Street, Marsden Park.

The Water Management Plan herein, proposes a series of individual elements arranged in a treatment train consisting of on-lot treatment, street level treatment and precinct based public domain infrastructure treatment measures. Suggested structural elements for the development include:

- Stormwater pit filter inserts
- Bio-Swales
- Proprietary filter cartridge systems downstream
- Rainwater reuse tank - 230,000L Tank.

The stormwater assessment report has been prepared to conform to the requirements of the Council's Growth Centre Precincts Development Control Plan (DCP) 2010 and Council's Engineering Guide for Development, 2005.

4. Volume of Sediment Basins, *Type D* and *Type F* Soils

Basin volume = settling zone volume + sediment storage zone volume

Settling Zone Volume

The settling zone volume for *Type F* and *Type D* soils is calculated to provide capacity to contain all runoff expected from up to the y-percentile rainfall event. The volume of the basin's settling zone (V) can be determined as a function of the basin's s

$$V = 10 \times C_v \times A \times R_{x\text{-day, y-\%ile}} \ (m^3)$$

where:

10 = a unit conversion factor

C_v = the volumetric runoff coefficient defined as that portion of rainfall that runs off as stormwater over the x-day period

$R_{x\text{-day, y-\%ile}}$ = is the x-day total rainfall depth (mm) that is not exceeded in y percent of rainfall events. (See Sections 6.3.4(d), (e), (f), (g) and (h)).

A = total catchment area (ha)

Sediment Storage Zone Volume

In the detailed calculation on Soil Loss Classes 1 to 4 lands, the sediment storage zone can be taken as 50 percent of the settling zone capacity. Alternately designers can design the zone to store the 2-month soil loss as calculated by the RUSLE (Sectio

Place an "X" in the box below to show the sediment storage zone design parameters used here:

	50% of settling zone capacity.
X	2 months soil loss calculated by RUSLE

Total Basin Volume

Site	C_v	$R_{x\text{-day, y-\%ile}}$	Total catchment area (ha)	Settling zone volume (m^3)	Sediment storage volume (m^3)	Total basin volume (m^3)

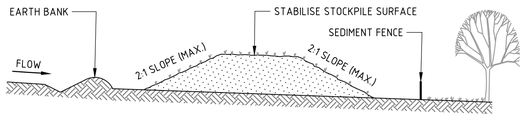
PROJECT: 4 DARLING STREET, MARSDEN PARK

DRAWING TITLE: CIVIL ENGINEERING WORKS DEVELOPMENT APPLICATION
CONCEPT SEDIMENT AND SOIL EROSION CONTROL PLAN

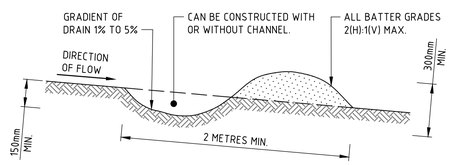
JOB NUMBER: 172938
DRAWING NUMBER: DAC02.01
REVISION: 02
DRAWING SHEET SIZE = A1



CONSTRUCTION NOTES

1. PLACE STOCKPILES MORE THAN 2m (PREFERABLY 5m) FROM EXISTING VEGETATION, CONCENTRATED WATER FLOW, ROADS AND HAZARD AREAS.
2. CONSTRUCT ON THE CONTOUR AS LOW, FLAT, ELONGATED MOUNDS.
3. WHERE THERE IS SUFFICIENT AREA, TOPSOIL STOCKPILES SHALL BE LESS THAN 2m IN HEIGHT.
4. WHERE THEY ARE TO BE IN PLACE FOR MORE THAN 10 DAYS, STABILISE FOLLOWING THE APPROVED ESCP OR SWMP TO REDUCE THE C-FACTOR TO LESS THAN 0.10.
5. CONSTRUCT EARTH BANKS (STANDARD DRAWING 5-5) ON THE UPSLOPE SIDE TO DIVERT WATER AROUND STOCKPILES AND SEDIMENT FENCES (STANDARD DRAWING 6-8) 1 TO 2m DOWNSLOPE.

STOCKPILES

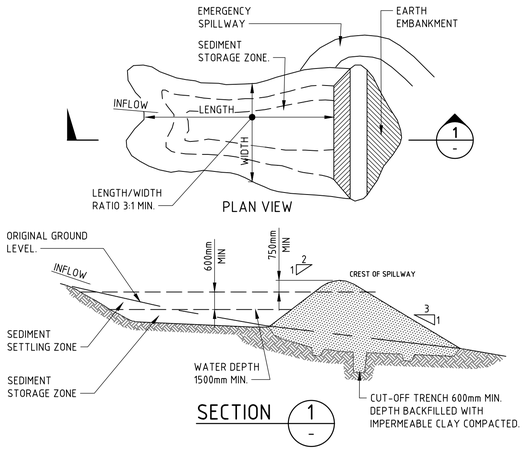


CONSTRUCTION NOTES

1. BUILD WITH GRADIENTS BETWEEN 1 AND 5 PERCENT.
2. AVOID REMOVING TREES AND SHRUBS IF POSSIBLE - WORK AROUND THEM.
3. ENSURE THE STRUCTURES ARE FREE OF PROJECTIONS OR OTHER IRREGULARITIES THAT COULD IMPEDE WATER FLOW.
4. BUILD THE DRAINS WITH CIRCULAR, PARABOLIC OR TRAPEZOIDAL CROSS SECTIONS, NOT V SHAPED.
5. ENSURE THE BANKS ARE PROPERLY COMPACTED TO PREVENT FAILURE.
6. COMPLETE PERMANENT OR TEMPORARY STABILISATION WITHIN 10 DAYS OF CONSTRUCTION.

NOTE: ONLY TO BE USED AS TEMPORARY BANK
WHERE MAXIMUM UPSLOPE LENGTH IS 80 METRES.

EARTH BANK - LOW FLOW (DRAINAGE SWALE)

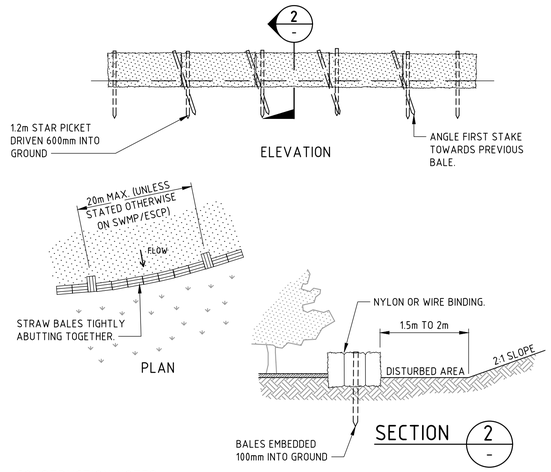


CONSTRUCTION NOTES

1. REMOVE ALL VEGETATION AND TOPSOIL FROM UNDER THE DAM WALL AND FROM WITHIN THE STORAGE AREA.
2. CONSTRUCT A CUT-OFF TRENCH 500mm DEEP AND 1200mm WIDE ALONG THE CENTRELINE OF THE EMBANKMENT EXTENDING TO A POINT ON THE GULLY WALL LEVEL WITH THE RISER CREST.
3. MAINTAIN THE TRENCH FREE OF WATER AND RECOMPACT THE MATERIALS WITH EQUIPMENT AS SPECIFIED IN THE SWMP TO 95 PER CENT STANDARD PROCTOR DENSITY.
4. SELECT FILL FOLLOWING THE SWMP THAT IS FREE OF ROOTS, WOOD, ROCK, LARGE STONE OR FOREIGN MATERIAL.
5. PREPARE THE SITE UNDER THE EMBANKMENT BY RIPPING TO AT LEAST 100mm TO HELP BOND COMPACTED FILL TO THE EXISTING SUBSTRATE.
6. SPREAD THE FILL IN 100mm TO 150mm LAYERS AND COMPACT IT AT OPTIMUM MOISTURE CONTENT FOLLOWING THE SWMP.
7. CONSTRUCT THE EMERGENCY SPILLWAY.
8. REHABILITATE THE STRUCTURE FOLLOWING THE SWMP.

(APPLIES TO 'TYPE D' AND 'TYPE F' SOILS ONLY)

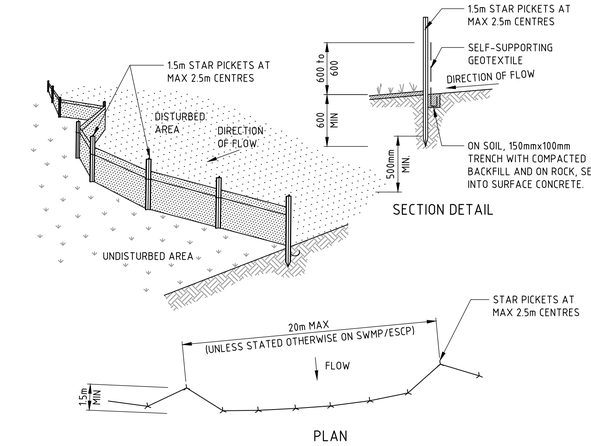
SEDIMENT BASIN



CONSTRUCTION NOTES

1. CONSTRUCT THE STRAW BALE FILTER AS CLOSE AS POSSIBLE TO BEING PARALLEL TO THE CONTOURS OF THE SITE.
2. PLACE BALES LENGTHWISE IN A ROW WITH ENDS TIGHTLY ABUTTING. USE STRAW TO FILL ANY GAPS BETWEEN BALES. STRAWS ARE TO BE PLACED PARALLEL TO GROUND.
3. ENSURE THAT THE MAXIMUM HEIGHT OF THE FILTER IS ONE BALE.
4. EMBED EACH BALE IN THE GROUND 75mm TO 100mm AND ANCHOR WITH TWO 1.2 METRE STAR PICKETS OR STAKES. ANGLE THE FIRST STAR PICKET OR STAKE IN EACH BALE TOWARDS THE PREVIOUSLY LAID BALE. DRIVE THEM 600mm INTO THE GROUND AND, IF POSSIBLE, FLUSH WITH THE TOP OF THE BALES. WHERE STAR PICKETS ARE USED AND THEY PROTRUDE ABOVE THE BALES, ENSURE THEY ARE FITTED WITH SAFETY CAPS.
5. WHERE A STRAW BALE FILTER IS CONSTRUCTED DOWNSLOPE FROM A DISTURBED BATTER, ENSURE THE BALES ARE PLACED 1 TO 2 METRES DOWNSLOPE FROM THE TOE.
6. ESTABLISH A MAINTENANCE PROGRAM THAT ENSURES THE INTEGRITY OF THE BALES IS RETAINED - THEY COULD REQUIRE REPLACEMENT EACH TWO TO FOUR MONTHS.

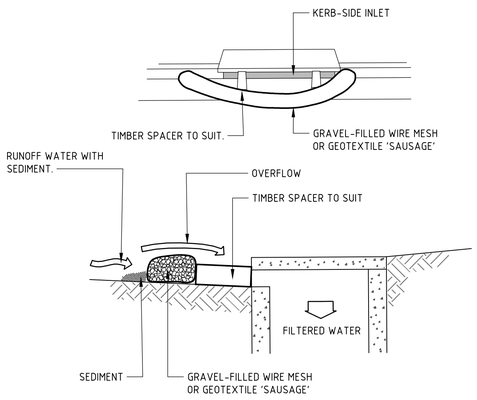
STRAW BALE FILTER



CONSTRUCTION NOTES

1. CONSTRUCT SEDIMENT FENCES AS CLOSE AS POSSIBLE TO BEING PARALLEL TO THE CONTOURS OF THE SITE, BUT WITH SMALL RETURNS AS SHOWN IN THE DRAWING TO LIMIT THE CATCHMENT AREA OF ANY ONE SECTION. THE CATCHMENT AREA SHOULD BE SMALL ENOUGH TO LIMIT WATER FLOW IF CONCENTRATED AT ONE POINT TO 50 LITRES PER SECOND IN THE DESIGN STORM EVENT, USUALLY THE 10-YEAR EVENT.
2. CUT A 150mm DEEP TRENCH ALONG THE UPSLOPE LINE OF THE FENCE FOR THE BOTTOM OF THE FABRIC TO BE ENTRENCHED.
3. DRIVE 1.5 METRE LONG STAR PICKETS INTO GROUND AT 2.5 METRE INTERVALS (MAX) AT THE DOWNSLOPE EDGE OF THE TRENCH. ENSURE ANY STAR PICKETS ARE FITTED WITH SAFETY CAPS.
4. FIX SELF-SUPPORTING GEOTEXTILE TO THE UPSLOPE SIDE OF THE POSTS ENSURING IT GOES TO THE BASE OF THE TRENCH. FIX THE GEOTEXTILE WITH WIRE TIES OR AS RECOMMENDED BY THE MANUFACTURER. ONLY USE GEOTEXTILE SPECIFICALLY PRODUCED FOR SEDIMENT FENCING. THE USE OF SHADE CLOTH FOR THIS PURPOSE IS NOT SATISFACTORY.
5. JOIN SECTIONS OF FABRIC AT A SUPPORT POST WITH A 150mm OVERLAP.
6. BACKFILL THE TRENCH OVER THE BASE OF THE FABRIC AND COMPACT IT THOROUGHLY OVER THE GEOTEXTILE.

SEDIMENT FENCE

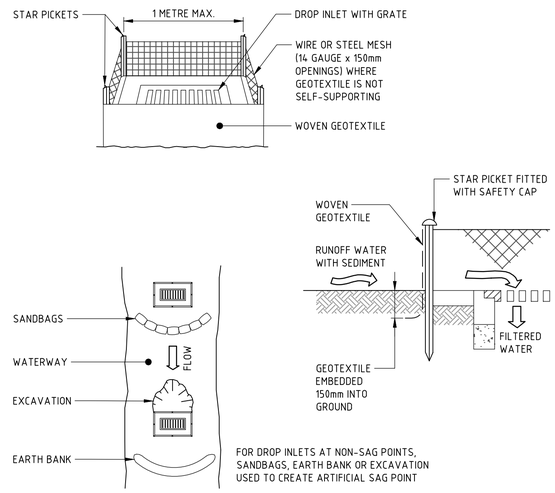


NOTE:THIS PRACTICE ONLY TO BE USED WHERE SPECIFIED IN APPROVED SWMP/ESCP.

CONSTRUCTION NOTES

1. INSTALL FILTERS TO KERB INLETS ONLY AT SAG POINTS.
2. FABRICATE A SLEEVE MADE FROM GEOTEXTILE OR WIRE MESH LONGER THAN THE LENGTH OF THE INLET PIT AND FILL IT WITH 25mm TO 50mm GRAVEL.
3. FORM AN ELLIPTICAL CROSS-SECTION ABOUT 150mm HIGH x 400mm WIDE.
4. PLACE THE FILTER AT THE OPENING LEAVING AT LEAST A 100mm SPACE BETWEEN IT AND THE KERB INLET. MAINTAIN THE OPENING WITH SPACER BLOCKS.
5. FORM A SEAL WITH THE KERB TO PREVENT SEDIMENT BYPASSING THE FILTER.
6. SANDBAGS FILLED WITH GRAVEL CAN SUBSTITUTE FOR THE MESH OR GEOTEXTILE PROVIDING THEY ARE PLACED SO THAT THEY FIRMLY ABUT EACH OTHER AND SEDIMENT-LADEN WATERS CANNOT PASS BETWEEN.

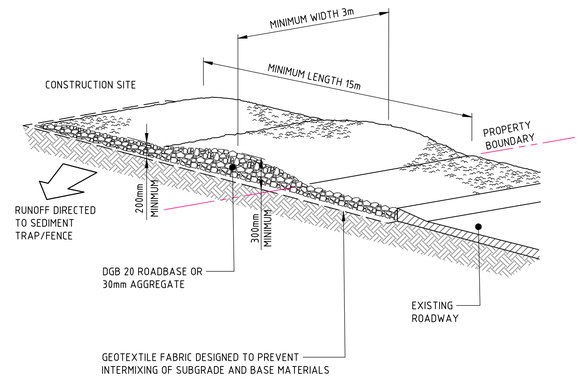
MESH AND GRAVEL INLET FILTER



CONSTRUCTION NOTES

1. FABRICATE A SEDIMENT BARRIER MADE FROM GEOTEXTILE OR STRAW BALES.
2. FOLLOW STANDARD DRAWING 6-7 AND STANDARD DRAWING 6-8 FOR INSTALLATION PROCEDURES FOR THE STRAW BALES OR GEOFABRIC. REDUCE THE PICKET SPACING TO 1 METRE CENTRES.
3. IN WATERWAYS, ARTIFICIAL SAG POINTS CAN BE CREATED WITH SANDBAGS OR EARTH BANKS AS SHOWN IN THE DRAWING.
4. DO NOT COVER THE INLET WITH GEOTEXTILE UNLESS THE DESIGN IS ADEQUATE TO ALLOW FOR ALL WATERS TO BYPASS IT.

GEOTEXTILE INLET FILTER



CONSTRUCTION NOTES

1. STRIP THE TOPSOIL, LEVEL THE SITE AND COMPACT THE SUBGRADE.
2. COVER THE AREA WITH NEEDLE-PUNCHED GEOTEXTILE.
3. CONSTRUCT A 200mm THICK PAD OVER THE GEOTEXTILE USING ROAD BASE OR 30mm AGGREGATE.
4. ENSURE THE STRUCTURE IS AT LEAST 15 METRES LONG OR TO BUILDING ALIGNMENT AND AT LEAST 3 METRES WIDE.
5. WHERE A SEDIMENT FENCE JOINS ONTO THE STABILISED ACCESS, CONSTRUCT A HUMP IN THE STABILISED ACCESS TO DIVERT WATER TO THE SEDIMENT FENCE.

STABILISED SITE ACCESS

Appendix B – Site Survey Plan

NOTES:

- THE POSITION OF FEATURES ARE INDICATIVE ONLY.
- SERVICES SHOWN HEREON HAVE BEEN LOCATED WHERE POSSIBLE BY FIELD SURVEY. PRIOR TO ANY EXCAVATION OR CONSTRUCTION ON THE SITE, THE RELEVANT AUTHORITY SHOULD BE CONTACTED FOR POSSIBLE LOCATION OF ANY OTHER SERVICES INCLUDING THOSE WHICH MAY BE UNDERGROUND.
- INDICATES EXISTING SURFACE LEVEL.
- CONTOURS SHOWN DEPICT THE GENERAL TOPOGRAPHY. THEY DO NOT REPRESENT EXACT LEVELS OTHER THAN AT SPOT LEVELS SHOWN.
- RELATIONSHIP OF IMPROVEMENTS TO BOUNDARIES IS DIAGRAMMATIC ONLY. WHERE OFFSETS ARE CRITICAL THEY SHOULD BE CONFIRMED BY FURTHER SURVEY.
- ONLY THE INDIVIDUAL STREET TREES WITHIN THE ROAD RESERVE ARE SHOWN. FURTHER FIELD INSPECTION SHOULD BE CARRIED OUT WHERE TREE DETAILS ARE CONSIDERED TO CRITICALLY AFFECT DESIGN. NO INDIVIDUAL TREES APART FROM AREAS OF TREES & BUSHLAND HAVE BEEN SHOWN.

NOTE:

THESE PLANS SHOULD BE READ IN CONJUNCTION WITH DIGITAL DATA ISSUED TO CLIENT. THE DIGITAL DATA CONTAINS NUMEROUS LAYERS OF INFORMATION WHICH ARE NOT SHOWN ON THESE PLANS FOR THE SAKE OF CLARITY.

A1 SHEET

Appendix C – Maintenance Schedule

4 Darling Street, Marsden Park

NORTHROP

Stormwater Maintenance Schedule

Prepared on 28.08.18

Site Description: The site is located on the eastern end of Darling Street
Site Area: 57,120 m2
Site Access: Direct access to the site via Darling Street

Inspected by: .....
Date of Inspection: .....
Next Inspection: .....

Items to be Inspected	Frequency	Performed by	Inspected		Maintenance		Mainenance Procedure	Initial
			Yes	No	Yes	No		
General								
Stormwater surface inlet pits	Four Monthly/Aftermajor Storm	Owner/Maintenance Contractor					Remove grate and inspect internal walls and base, repair where required. Remove any collected sediment, debris, litter and vegetaion. (eg. Vacum/ eductor truck) Inspect and ensure grate is clear of sediment, debris, litter and vegetation. Ensure flush placement of grate on refitment.	
General inspection of complete stormwater drainage system (that's visible - including roof gutters)	Bi-annually	Owner/Maintenance Contractor					Inspect all drainage structure noting any dilapidatin, carry out required repairs.	
Rainwater Tank								
First flush Device	6 monthly	Owner/Maintenance Contractor					Inspect first flush device to ensure correct operation. Remove accumlated litter and debris. If device is not functioning properly repair or replace.	
Internal inspection	6 monthly	Owner/Maintenance Contractor					Check for evidence of access by animals, birds or insect including the presence of mosquito larvae. If present, identify access point and close. If evidence of algae growth, find and close points of light entry.	
Tank and Lids	6 monthly	Owner/Maintenance Contractor					Check structural intergrity of tank inlcuding roof and access covers. Any dilapidation including holes or gaps are to be noted and repaired.	
Depth of Sediment within Tank	Every 2 Years	Owner/Maintenance Contractor					De-sludge tank(s) by engaging professional cleaner	
Bio-rentention Basin								
Basin and contributing areas are clean of debris and domestic litter	6 Monthly	Owner / Maintenance Contractor					Remove litter and debris within basin and in areas that is obstructing flows into basin.	
Inflow points - sediment accumulation / sediment erosion	6 Monthly	Maintenance Contractor					Replace any top soil in eroded area and grade accordingly. Remove any sediment and debris accumulation if present.	
Embankments	6 Monthly	Maintenance Contractor					Inspect embankments show no visible deformity. Repair and regrade embankments. Replace any plants / vegetation if required.	
Basin vegetation condition	3 Monthly	Maintenance Contractor					Ensure vegetation is still in place. Remove and replace any plants that are dead or beyond a reasonable level of rehabilitation. Trim vegetation to a height that is suitable for the plant type.	
Pond Lining	3 Monthly	Maintenance Contractor					Inspect pond lining for any visible damage. Remove and replace with new lining if required.	
Check vegetation is fertilised	6 Monthly	Maintenance Contractor					Where required fertilise plants with appropriate fertiliser for plant type.	
Enviropod								
Enviropod Pit Inserts	Refer Manufacturers Manual	Maintenance/ Specialised Contractor					Refer to manufacturers operation and maintenance manual.	
Jellyfish Cartridge Filters								
Filter Cartridge sump	Refer Manufactures Manual	Maintenance / Specialised Contractor					Refer to manufactures operation and maintenance manual.	
Chamber filter screen, weir, lid, diversion chamber	Refer Manufactures Manual	Maintenance / Specialised Contractor					Refer to manufactures operation and maintenance manual.
